KEY DYNAMICS OF MISSIONARY ACTIVITY. As a population is missionized, new patterns of educational, familial, cultural, political, and economic life are introduced, and the indigenous “tradition” is reshaped on new foundations. The tendency to identify the universalistic message with the newly established patterns of life within the converted group is widespread. The vision “for all” once again becomes a vision “for us,” until such time as a new burst of piety and learning renews the awareness of the universalistic vision and revitalizes missionary efforts, demanding a purging of false tendencies to syncretism and closed localistic identity. Missionary religions are continually or episodically engaged in religious renewal and reformation from within. The great missionizing religions are in part to be contrasted with the occasionally proselytizing, primal, and localistic religions precisely by the enduring and recurring vitality of their universalizing, in contrast to the particularizing and syncretizing tendencies of the localistic religions. It is not surprising that missionary religions are those with authoritative scriptures and “orthodox” doctrines that serve as the standards for periodic renewal.

The great universalistic teachings of the missionizing religions are, however, always treasures borne in “earthen vessels,” to paraphrase Paul, the model of all Christian missionaries. And the line between the treasure and the vessel is frequently extremely fine. Early Buddhist missionaries, to cite another example, were sent out presumably armed with nothing but the pure and unadulterated message of Gauta-

ma's great discovery of the secret of true enlightenment. Wittingly or not, however, they carried with them both the philosophical presuppositions of Indian religious thought, which were the terms in which and through which the Buddha found his truth, and the political, social, and cultural patterns of Indian society. Theravāda Buddhism, as it missionized in Sri Lanka, Burma, and Thailand, brought with it metaphysical-moral assumptions and sociopolitical principles that derived from Hindu traditions and which, in part, the Buddha had sought to overcome and transcend. In Mahāyāna Buddhism as well, careful scholars can speak of the "Indianization of China."

Later, when this stream of Buddhism became wedded to motifs from Confucian and Daoist sources, its movement into Korea and Japan carried powerful elements from Chinese traditions, elements that also became wedded to Korean shamanism and Japanese Shintōism. And it is well known that both Christianity and Islam carried Greco-Roman patterns of thought, medicine, and political theory—as well as Hebraic understandings of ethical monotheism—with them as they expanded in the medieval periods. Islam has also always borne a certain Arabic cultural stamp wherever it goes, and Communism bears everywhere the marks of Germanic philosophy, French revolutionary zeal, and British economic dynamics from the days of the industrial revolution. Along with the gospel, modern Christian missions transmit Western definitions of human rights, democracy, and scientific methods in the fields of education, medicine, management, agriculture, and corporate organization. These cursory examples serve to illustrate the point that, while missionary activity must always be understood first of all in terms of the universal metaphysical-moral vision that calls it into being and gives it its transcultural *raison d'être*, it is always laden with particular philosophical, social, and cultural elements.

MISSIONS AND CULTURAL IMPERIALISM. The inevitable presence of intellectual and social assumptions and implications, even in the "purest" of faiths, has made missionary activity subject to the charge of cultural imperialism. But two factors differentiate missionary expansion from it. First, the truly religious missionary recognizes a distinction between the message and the accoutrements, the universalistic kernel and the incidental husk. However difficult it is to distinguish the two, the primary concern is with the former. Transformation of the latter is allowed in terms of and for the sake of the former. The imperialist understands the message only in terms of its sociocultural trappings in highly particularist ways. Imperialism obtains when, for example, Buddhism in Myanmar becomes identical with and a tool of the Burman peoples as opposed to those of the Chin, Kachin, or other Burmese peoples; when Christianity becomes "Aryanized" in the Nazi period or sanctifies apartheid as in South Africa; when Islam in, for instance, Malaysia, Iran, or Saudi Arabia is understood to be coterminous with the fate of the countries themselves; or when Communism is thought to be identical with "socialism in one country" and celebrated with a personality cult. These forms of cultural imperialism have

had their vicious corollaries in many lands wherever a particular social group, political hegemony, or economic advantage is confused with a universalistic religious message and spread by coercive means to colonize peoples in the name of religion.

Second, missionary activity is rooted in the fundamental assumptions that, once people are exposed to "the truth" that has been proclaimed, they will choose this truth and that they ought to be free to encounter and choose even "foreign" truth. Missions presuppose that a truly universalistic vision is convincing to the mind, compelling to the will, and attractive to the heart. Missions thus require, or provoke, a situation in which freedom of thought, choice, and affection can create new communities of conviction to celebrate and exercise what the will, mind, and heart have come to hold dear. However much missionary activity has been carried out hand in hand with cultural arrogance, military power, and economic opportunism, there has been and remains in principle a sharp tension between missionary efforts and imperialistic imposition of religion by force or "mind control," a fact increasingly documented by missiologists examining the relative validity of the charge that missions are but the ideological instrument of colonial practice. Those incapable of imagining a fundamental transformation of thought, disposition, and loyalty by conversion to a new religious insight, however, always attribute the change to nefarious interests.

It is certainly true that every missionizing religion has had periods during which something like the classic Islamic pattern could be documented. H. A. R. Gibb wrote of Islam that, "while the faith itself was not spread by the sword, it was under the wing of Muslim dominance that its missionaries found most favorable conditions for their activities of conversion. This view of Islam . . . was universally held by its adherents; the theologians found justification for it in the Koran, the jurists made it the basis of their expositions of Muslim law, and the mass of the people accepted it as a self-evident fact" (Gibb, 1932/1973, p. 56). Comparable patterns could be cited regarding periods of Buddhist expansion at the hands of pious war lords, Christian missions in Latin America, or Communist movements in eastern Europe. Nevertheless, the Qur'ān and the authoritative teachings of every other missionizing religion agree that forced conversion is false and that truly universal religion must depend on the freely convinced mind, will, and heart of the convert (although Communists held that changing the social conditions themselves would bring about the fading of religion and the turning to the true ideology of humanity). Thus, wherever missions go and do not immediately preclude other missionary efforts by force, they open up new vistas for mind, will, and heart, and thus for new social practices to which people are invited to turn.

REACTIONS OF MISSIONIZED PEOPLE. Every missionary religion must be received as well as propagated. Where it is not received, missionary activity dies, and doubt about the universality of the originating vision sets in. Where it is received

under coercion, and not in the mind, will, heart or the transformed customs of the people, the indigenous religion goes underground, eventually resurfacing as a revitalized rallying point to overthrow “foreign gods” or as a heterodox or heretical religion in contention with the one brought by missions. Where the missionary religion is received in the heart, will, and mind, newly converted people soon send out their own missionaries. But it is almost never received as given. It is filtered through the philosophical, sociopolitical, and historical perspectives of the recipients. The old traditions are almost never entirely abandoned. They are inevitably active in interpreting and modifying the new message, helping to at least partially purge it of missionary-borne incidental elements that can be seen as merely cultural biases or sociopolitical interests.

One of the most fascinating studies of the reception of a religion is that by Kenneth Ch'en (1973) of the way in which Buddhism was modified, acculturated, and indigenized in China. A message, such as that exported by Indian Buddhism, that called for the breaking of family ties and demanded that kings give honor to monks simply did not make sense in a culture where filial piety and homage to the emperor were absolutely central to both belief and social order. Ch'en demonstrates that, if one speaks of the “Indianization of China” with the spread of Buddhism, one must also speak of the “sinicization of Buddhism.” In China, key Buddhist texts were given fresh interpretation; apologetic literature, new poems, and new regulations for the community of monks were promulgated that modified or transformed aspects of the Buddhist message so that it could fit into, and in some ways revitalize, both the indigenous folk religions and of the Confucianism and Daoism of that land. Comparable stories can be told of every missionizing religion: the Christianity of the Copts in Northeast Africa is not the same as that of the Kimbanguists of West Africa; the Islam of Morocco differs from that of Mindanao in significant ways; Communism in North Korea is distinct from that of Cuba. This is so in spite of the fact that each of these great traditions tends to press the local society and culture in a distinctive direction.

In this connection it must be noted that some religions engage in missionary activity precisely as a result of being invited, sought, or adopted with great eagerness. In several places where traditional systems have been displaced by exploitative cultural contact, war, crop failure, or the failure of a social system to survive its own internal strains, missionary groups bearing universalistic messages are readily embraced, for they offer new symbolic and cognitive models by which life and its perplexities may be interpreted. Often the appropriation of a new religion is accompanied by a quest for new technological, educational, and sociopolitical frameworks for organizing the common life. Missionaries often agree that such a quest is implied by the core of their metaphysical-moral vision. Certainly a comparable phenomenon has occurred in quite different locales, as John Garrett (1982) has

shown in regard to the Pacific Islands and Frederick S. Downs (1983) has demonstrated concerning the Christianization of tribal peoples of Assam in the twentieth century. More ancient examples are the historic reception in the sixth and seventh centuries of Chinese Buddhism (and Confucianism) into Japan at the hands of the imperial court; the reception in the ninth to eleventh centuries of Eastern Orthodox Christianity into Russia, bringing with it Byzantine art, literature, and political theory; and the reception in the twelfth to fifteenth centuries of Islam (as mediated through India) in the Malay archipelago that was accompanied by aspects of mysticism and caste-related social patterns.

In almost no instance, however, is a new religion received without some resistance. This resistance is sometimes easily overcome. When the indigenous faith is a highly literate and complex religion, however, the resistance is usually prolonged and powerful. One of the dramatic examples of this resistance is that, while Buddhism originated in India and at one time had nearly swept the subcontinent, in the twenty-first century can be found there only in forms of neo-Buddhism newly reintroduced by Bhimo Rao Ambedkar and the Dalai Lama. This is because Hinduism reasserted itself by a ten-century-long process involving the adoption of some aspects of Buddhism (especially the revitalization of devotional practice in *bhakti*), the bloody slaughter of Buddhist monks, extensive philosophical argumentation, and an effort that was more organized than that of Buddhism. But the neo-Buddhism being introduced is taken as protests against the Hindu caste system, recently celebrated by some Dalit (outcaste) Christians. Similarly, Confucianism reasserted itself in China during the “neo-Confucian” period of renewal in the ninth century by a similar process—one that relegated the Buddhists and Daoists to an inferior status while borrowing some motifs from them. Islam encountered intellectual and military resistance when it threatened expansion into Europe from the time of Charlemagne through the Crusades. The Christianity that expanded into central Asia has been essentially stamped out, and what remains in western Asia is now weak and scattered because of Islamic resistance. Most Western Jews and Christians resist the Hindu, Islamic, and Buddhist missions as well as the host of hybrid or syncretistic cults rooted in these, or in some heterodox Christian faith, found in most of the major cities of the West. Meanwhile, indigenized forms of Christianity from Africa, Latin America, and Asia are challenging the kinds of Christianity that have developed in the West.

One notable feature of the phenomenon of “mission” and “resistance” is that missions that do not succeed among the intellectual and political-economic elites of a new country but that do succeed among the people become fatefully drawn into perennial tensions between the rulers and the ruled. If conversion is successful among the masses but not among leadership, intense resistance results. If conversion occurs only among marginal groups, ethnic conflict is frequent, and minorities are suspected of being agents of foreign power.

ers. If missions are successful among some sections of the leadership and among wide segments of the people, the stage is set for revolutionary change.

TYPES OF MISSIONARIES. In surveying mission and missionary activity, however, one must not only note the primacy of the metaphysical-moral vision—its relationship to social and cultural patterns, its patterns of reception, and resistances to it—one must also consider certain similarities of institutional form that are characteristic of missionary activity. What groups or classes of people undertake missionary activity, and how do they organize to do so?

On missionaries, merchants, and mercenaries. The earliest missionaries are, more often than not, traders or travelers with them. One does not have to accept the Marxist interpretation of the relationship between commercial exploitation and religion to observe that the spreading of a new religious insight repeatedly follows commercial traffic lanes—and that this insight is frequently borne by merchants. Further, it must be noted that both commercial and missionary activities can only be conducted in conditions of relative peace and stability. When that is disrupted, soldiers are frequently brought in to establish it, and they are accompanied by new waves of chaplains, who become missionaries. Since traders and soldiers vary widely in their behavior, from the relatively congenial to the simply marauding, missionary activity has often been conducted within networks of shifting alliances, both economic and military, on the far end of trade routes. It is not possible to make any single generalization about these relationships, however, for missionaries have resisted exploitative trade as often as they have benefited from it, and they have fought imperial “pacification” as often as they have been protected by it.

The cross-cultural frequency of missionary activity by merchants, however, invites speculation as to why this general class has played so significant a role in missionizing. Perhaps it is because merchants are people who seek increased opportunity by taking the risk of leaving the settled and accepted patterns of life at home. The very act of engaging in trade on a cross-cultural basis, however crass the individual motivation might be, requires a somewhat more cosmopolitan perspective on the world than is frequently present in those societies where religion and morality run in channels circumscribed by fixed economic roles and duties for people of each specific ethnic, gender, age, and class status. In addition those societies that send merchants farthest and equip caravans or ships the most extensively for trade are usually the more highly developed economically, politically, militarily, and socially. It would not be strange for them to hold the view that their “superiority” in this respect is due, in substantial part at least, to the “superior” religious, spiritual, and ethical foundations of their faith. In an influential study, Edward Said (1995) has argued that this accounts for the various condescending projections on Eastern cultures by Western merchants, soldiers, and missionaries.

Professional missionaries. New religions are seldom, if ever, however, fully developed in a new location by the sometimes quite unholy alliance of missionaries, merchants, and soldiers, or by general processes of cultural diffusion that accompany them. The introduction of a religion through commercial channels (the character and quality of which influence reception or resistance) has everywhere been succeeded by the arrival of professional missionaries. For most religions throughout most of history, the professional missionary has been monastic, that is, organized into ascetic, trained, and disciplined religious orders intentionally “homeless” for the sake of the metaphysical-moral vision held to be universally true.

Missionary monks and nuns attempt to spread their religious convictions by public proclamation and commentary on sacred texts at both popular and learned levels; by teaching hymns, chants, and prayers; by establishing new centers of worship where the truth they know can be celebrated; and by service—that is, by medical, educational, pastoral care, social relief, and advocacy. Needless to say all missionary religions have relied on “wondrous,” magical, or technological demonstrations of “spiritual” power from time to time. The stories well known in the West about saintly missionary monks, such as Patrick (387–493), Columba (c. 521–597), Boniface (d. 755), Ramón Lull (1232–1316), and Francis Xavier (1506–1552), are paralleled in the lore of Buddhism, in the formation of the *mathas* as a Hindu reaction to the challenge posed by Buddhism, and in the roles played by the “schools” of jurists and even more by the *Ṣūfī* orders of Islam.

To carry out their tasks, missionaries have four requirements. First, they must have a dedication, a commitment—a piety, if you will—linked to learning. Missionaries must be able to articulate the faith and to interpret it in intellectual and cultural terms that are foreign to them. They must be able to understand and put into perspective whatever they encounter in the course of their work. It is no accident that several sciences, including modern comparative linguistics and anthropology, to a large extent have their roots in missionary activity. Everywhere professional missionaries are given to literary activity—they have published apologetics, tracts, propaganda, and commentaries, and they are responsible for the composition and dissemination of poetry, song, and history.

Second, missionary professionals require a reliable institutional foundation, a polity, to sustain them. Missionary orders and societies are surely among the world’s first transnational, nonprofit corporations. These polities, however, are ever subject to incorporation into the existing polities of the host countries. Thus the Buddhist *saṃgha*, spread under the protectorate of kings, is ever tempted to become simply an instrument of state. Some converted Christian communities in India are always in peril of becoming more a subcaste than a church, and the *ṭarīqahs* of Islam tend to become simply trade guilds or sanctified tribal brotherhoods.

Third, missions require funding. Economic support may derive from state funds, charitable bequests, the establishment of plantations, handicraft manufacturing centers, agricultural communes, and religious taxes. The economic ties of a missionary enterprise with its country of origin or with the elites of the host country are the source of enormous distrust of missionary activity.

And fourth, missionaries must have a clear policy, one that coordinates strategies and tactics and prevents divergent teachings from confusing potential converts. These policies must cover such matters as how much of the indigenous culture to allow and what to disallow, how to deal with marriage practices, "pagan" festivals, various "fraternities" that are marginally stamped with traditional religious practices, and the like.

Indigenous missionaries. While most professional missionaries are sent to a foreign land, they can measure their success by whether or not they are replaced by indigenous lay or clerical missiologists. The mark of successful reception is that the newly converted themselves become motivated to spread the message to which they have been converted, both to others in their own land and to other lands, and to develop institutional and financial support systems for their own missionaries. It was largely Chinese Buddhists who missionized not only many parts of China but Korea and Japan after Indian and Tibetan Buddhists established monasteries in China and trained Chinese novices. It was Malay Muslims who missionized Indonesia and Mindanao after Arabic traders and missionaries brought the faith to the region. And it is Chinese, Indian, and Korean Christians who are spreading the faith in South and East Asia after most Western missionaries only come as short-term visitors or to provide support for specific projects. And in Africa and Latin America, local leadership has become the spearhead of massive growth. The direct knowledge of the language, culture, common worldviews, lifestyles, felt needs, and life's difficulties allows the message to become more directly pertinent and more thoroughly embedded in the life of the people. It also alters the contours of the faith and renders fresh theological perspectives, as seen in Christian history by the names of major branches of the Christian faith: Greek Orthodoxy, Roman Catholicism, German Lutheranism, Dutch Calvinism, the Anglican Church, and American Evangelicalism. Sometimes the organizations that once sent missionaries abroad find that the work is better done by believers who live there and that they must attend to the fact that the faith at home has become cool, routine, and so deeply enculturated that it needs renewal. They turn to the reevangelization of their home cultures or to fresh views of the global mission.

MODERN PRACTICES. Modern missionary efforts have been pursued not so much by monastic orders (although these orders continue to missionize around the world) as by non-monastic missionary "societies." This situation is prompted primarily by the rather unique developments of "free-church" Protestant polities, economic support systems, and

policies. While the established churches in Europe had been sending out monastic missionaries for centuries and the Moravians anticipated later developments, the formation of the London Missionary Society in 1795 inaugurated a new form of paraecclesial organization that continues in the twenty-first century and is emulated by non-Christian missionaries. Missionary societies, of which there are hundreds, raise funds by freewill contributions and form nonmonastic "voluntary associations" staffed by a combination of nonparochial clergy, lay professionals, and volunteers not only to save souls from "paganism" but to sweep away superstition and oppression; to offer agricultural, technical, medical, and educational assistance; and to engender a desire for democratic institutions, human dignity, self-sufficiency, and social liberation. Some modern theorists indeed suggest that these efforts at social service and social change are the very core of missionizing and theological renewal.

A notable example of the side effects of this pattern can be illustrated by reference to the Young Men's Christian Association (YMCA). The association was formed in England in 1844 as a part of a "home mission" voluntary association for youth flocking to the cities to get jobs in factories, and it attempted to provide a wholesome place where young men could find physical, mental, social, and spiritual benefit on a biblical foundation. The movement spread to North America and to most of the countries around the world where missions were active. It was often the agent of evangelization and the womb of efforts at social change by young men who came under its influence. Other religions responded by forming counterorganizations on a comparable basis. One can find not only the YMCA but the Young Women's Christian Association (YWCA), the Young Men's Buddhist Association, the Young Men's Hebrew Association, and the Young Men's Muslim Association, as well as youth hostels for Hindus scattered throughout much of Asia and in many parts of Africa and South America. Comparable developments could be documented regarding schools, colleges, presses, hospitals, orphanages, institutions for the handicapped, human rights advocacy groups, organizations for battered women, or substance abuse centers, all organized outside of traditional political, familial, and clerical control. Examples of such independent organizations exist in all the world religions. This not only introduces new principles of organization in more closed societies, it suggests the possibilities of converting traditions without converting whole populations. The proliferation of communities of a faith-based, voluntary-associational type is one of the most remarkable and explosive social effects of missionary activity in the twentieth century, one not fully documented on a comparative basis.

Increasingly, the great missionizing religions are confronting not only the primal or folk religions, where missionary activity has been most pronounced, and not only the social needs in various contexts, where missionary activity has been remarkable, but one another. Thus far missionary efforts with regard to the other great missionary religions have

been only marginally successful. This is in part because of severe restrictions on missionary activities in especially Islamic and Marxist lands and in parts of India, where induced conversion has been criminalized, but also because the world religions that have shaped complex civilization rarely had to confront one another directly and tend to do so only in intercultural clashes. In a globalizing age, however, when economic, political, educational, scientific, medical, technological, and cultural traditions shaped by these religions are interacting with great intensity and frequency, encounter is unavoidable. Although some theorists have argued that these religions are moving toward a great synthesis of world faiths (an essentially Hindu argument), others have attempted to find analogous meanings in shared symbolic patterns present in all religions as manifestations of the development of the species (an evolutionary argument), and still others have sought the common ethical teachings that can prevent mutual assassination (a natural-law argument). Still the way these religions will continue to deal with one another is not at all certain. None of the great faiths can be satisfied with a complete relativism, but some can recognize diversity. It is contrary to a deep faith and to missionary activity to hold that what is ultimately true about the divine and the realities of this world is only true for some in specific cultures, times, or places, even if all agree that people perceive the true state of affairs in somewhat different ways due to the influence of context, time, and space. Few think the world will soon, or ever, be converted to one faith only.

In the face of this development, a new set of writings about “theologies of religions” has begun to emerge. It is, in brief, an attempt to identify what the religions hold in common, where they differ, and in some measure how they have, can, or could mutually enrich and correct one another without losing integrity. It is the likely case that dedicated evangelists for one or another faith will confront the questions sooner or later, and it is surely the case that these questions are the most lively ones to be faced intellectually.

MISSIONS: BUDDHIST MISSIONS

The term *Buddhist mission* was invented in the 1830s to explain the religion's diffusion throughout Asia, and "missionary spirit" has been treated as an essential dimension of Buddhist spirituality in virtually all English-language works about Buddhism composed since. By the 1870s "Buddhist mission" had been theorized further by early historians of religions as a key plank in the subsequently ubiquitous disciplinary distinction between "missionary" or "world" religions (Buddhism, Islam, and Christianity) and "national" or "indigenous" religions (all the rest) which did not expand far beyond traditional geographical borders. Two proof-texts were singled out for citation in Western writings on Buddhist mission, namely, the Buddha's so-called great commission, and stories about the transmission of his religion associated with the age of King Aśoka (third century BCE).

The "great commission" is an ancient passage found already reworked in three canonical Buddha biographies, the *Mahāvagga* of the *Vinaya*, the *Mārasamyutta* of the *Samyutta Nikāya* and the *Mahāpadānasutta* of the *Dīghanikāya*. According to these accounts, after attaining enlightenment and gathering together his first followers (later reckoned to be sixty in number), the Buddha, realizing that all of them were already saints (*arhats*) who required no further guidance, gave them leave to depart, saying:

Wander about on wanderings, monks. For the good of many folk, for the happiness of many folk, out of compassion for the world, for the good and happiness of gods and men, don't two of you go by one [road]. Preach the *dharma*, monks, which is lovely at the beginning, lovely in the middle, lovely at the end, in meaning and sound. Demonstrate the purified celibate life which is fully complete. There are beings with little dust in their eyes; they are falling away from the *dharma* for not hearing it. There will be people who understand, monks.

According to later reckonings this occurred just after the concluding ceremony (Pali, *pavāraṇa*) of the first-ever Buddhist rains retreat (Pali, *vassa*), which for subsequent monastic and lay Buddhists became an annual time of renewal and recommitment.

The Buddha's actions in this moment were important to later Buddhists as a watershed in the history of the monastic community (*samgha*), especially in the emergence of monastic discipline (*Vinaya*). At that time none of the monastic rules had yet been promulgated—as perfected saints, the first sixty monks did not require rules. According to the *Mahāvagga* account, however, permitting them to preach to others while wandering about ultimately required the Buddha to promulgate the rules one after another because the people who heard them preach, and sometimes then joined the order, were not yet themselves enlightened. The passage in question was not portrayed as a commission to all Buddhists; the point was that only the first sixty (and presumably subsequent) saints were free to wander forth unguided by the

monastic discipline. But removed from such literary contexts, constructed grammatically to make the wandering dependent upon the preaching rather than the other way around (which is possible, though against the grain of the commentarial tradition), and translated into biblical English, this passage was easily read as a much-remarked parallel to Jesus' great (or apostolic) commission (*Mt.* 28:18–20).

All versions of the legend of King Aśoka agree that some favored patriarch of his, directly connected through pupillary succession to the Buddha himself, convened a great council at the conclusion of which monks were sent to "establish the Buddha's dispensation" (Skt., *śāsana*; Pali, *sāsana*) in various regions. The patriarch himself (or some special disciple) is said to have taken it to a region that the Buddha or the patriarch had foreseen would be a future Buddhist center. These legends, which emerged in oral traditions shortly after Aśoka and were composed in their surviving written forms beginning around the first century CE, include colorful stories about these monks' encounters in various regions, emphasizing their supernatural attainments. Though the oft-repeated claim that Aśoka himself sponsored this event is ungrounded—in the texts the patriarch, not the king, always provides the impetus to hold the council and send the dispensation to some far-off region(s)—the portrayal of these texts as "missionary" is understandable, for the basic themes also constituted important dimensions of nineteenth-century Christian missionary discourse.

But the wide divergence among various versions of this narrative—especially as regards the identity of the patriarch, his lineage, his sectarian affiliation, and the future Buddhist center—suggests that they are better viewed as specific, even polemical, claims about their own times than as windows into actual Aśokan history (there is no mention of Buddhist councils, nor of the dispensation-transmission, in the known Aśokan epigraphs; scholars now agree that the legendary "missions" cannot be read into the diplomatic embassies Aśoka does mention). As elaborated below, these stories enjoyed wide significance among later Buddhists, but in pre-colonial times these did not include the claim of nineteenth- and twentieth-century writers that Aśoka, the patriarch, or the "missionaries" (often said to be trying to fulfill the Buddha's great commission) were manifesting "missionary spirit," nor is there warrant for assuming that these legends were read as paradigms and guides for missionary service in the same way that the apostolic missions were significant to Christian missionaries.

Little else is cited in writings about "Buddhist mission," not only because these problematic examples were considered sufficient proof, but also because apart from them pre-modern Buddhists demonstrated no concern with "mission" in its nineteenth-century trappings. Aspects of what Christians consider "mission"—preaching, modeling, and advocating proper behavior; reproducing and disseminating texts; confronting religious others; traveling—certainly did concern Buddhists from ancient times, but the premodern tradi-

tion lacked specialized vocabulary for discussing them as “mission” (nor were there words for conversion, missionary spirit, or mission field), and the premodern tradition never produced missiological literature as such. “Mission” never figured in the systematic lists of practices, virtues, or spiritual attainments so carefully articulated by Buddhists around the world.

Indeed, until the late nineteenth century it was notoriously the case for Christian missionaries serving in Buddhist countries that then-contemporary Buddhists lacked any glimmer of “missionary spirit.” During the early nineteenth century, Buddhist monks allowed Christian missionaries to use their temples for rallies and politely refused challenges and taunts that they debate comparative doctrine or salvation; missionaries regularly complained that Buddhists would listen to sermons and even enact approbation without undergoing the existential “conversion” that was a hallmark of Christian missionary discourse and expectations. Rather than catalyze revision of the (Western, Christian) presuppositions that made “mission” an essential dimension of Buddhist religiosity, however, this actual lack of it was treated as a failure of Buddhists to live up to their own essence.

Nineteenth- and twentieth-century writings on Buddhist (and Muslim) mission made available for study an “other” mission to juxtapose with Christian mission. This comparative framework originally contributed to Christian missionary self-confidence, portraying their approach as a middle-ground between overly forceful (Muslim) mission and overly tolerant (Buddhist) mission. Beginning in the 1870s, however, a growing number of Western Buddhist sympathizers turned this discourse upside-down, using the “tolerance” of Buddhist mission to chastise Christian evangelism, a comparison that, eventually internalized by missionaries themselves, played an important role in the general abandonment of evangelical missions by mainstream Protestant churches since World War II. At the same time, as mentioned above, Buddhist mission was central to the classification of religions into “world” and “national” types, a classification whose persistence (sometimes in modified language) belies its foundation in fact, despite the problematically “missionary” framework through which the global reach strongly characteristic only of Buddhism, Christianity, and Islam has been theorized.

But “Buddhist mission” was an inadequate tool for understanding pre-nineteenth-century Buddhist history, sometimes misconstruing the spread of the dispensation and the functioning of the pan-Buddhist world on the basis of Christian presuppositions about how religions expand. Increasingly employing the context-appropriate language of traditional Buddhist historians—who discussed the “spreading out” or “establishment” of (some particular sectarian version of) the dispensation—recent scholars have been able to better understand the various important phenomena hitherto lumped together as “Buddhist mission.”

THE SPREAD OF THE DISPENSATION. Scholars agree on the basic chronology of this spread of the dispensation because its formal establishment regularly resulted in Buddhist construction projects that survive as archaeological evidence, the creation of monastic lineages and schools, and textual accounts of the event(s), preserved and embellished in the different regions. Even during the Buddha’s lifetime his community certainly had grown into a sizeable institution spread throughout the kingdoms of northeastern India; traditional accounts claim that thousands of people ordained or participated in the early community as laypeople. The Buddhist presence there and beyond was bolstered by Aśoka stupa building and other Buddhist projects that he and his successors undertook from the third century BCE to the third century CE. The earliest archaeological evidence of Buddhist practice in the northwest (Kashmir) and far south (Tamil Nadu and Sri Lanka) dates from about Aśoka’s time, while Buddhist texts agree in narrating the establishment of the dispensation in these secondary centers (Kashmir and Sri Lanka) as part of the Aśoka legend itself. The texts chronicle the northern transmission from Kashmir to modern Iran and Central Asia from the first century CE onwards in various kingdoms (the last was Tibet, during the seventh to eighth centuries) and China (first century), and from the latter to Korea (fifth century) and thence to Japan (sixth century); and the southern transmission from northeast and central India to Sri Lanka, and from there (or India directly) to kingdoms in modern Burma (fifth century), the Maldives (seventh century), the Malay Peninsula and Indonesian archipelago (fifth century), Thailand (seventh century), Cambodia (fifth century), southern Vietnam (fifth century), and Laos (twelfth century). Later Buddhists as far afield as China and southeast Asia sometimes directly extended the Aśoka legend—or even the Buddha’s own preaching career—to include their own kingdoms.

Like any schematization, however convenient, this one is deceptively neat. Archaeological and textual evidence suggests that Buddhists were present in various regions prior to the formal establishment of the dispensation there, and the sources leave no doubt that transregional transmissions continued to occur long after. Such efforts included numerous organized Chinese endeavors to bring additional texts and practices from India and Sri Lanka (especially from the fourth to seventh centuries) and corresponding Indian, Central Asian, and Sri Lankan embassies to China (during the first to ninth centuries); imperial exchanges of texts and *dharm*a-masters through which Chinese Buddhist schools were transplanted in Korea, Japan, and northern Vietnam (especially during the seventh to the ninth and twelfth centuries); formal diplomatic embassies to reestablish monastic higher ordination (*upasampada*) and transmit texts that traded the dispensation back and forth among the Theravāda Buddhist traditions of Sri Lanka, Burma, Thailand, Cambodia, and Laos (from the tenth to twenty-first centuries); and discussion and comparison of pan-Buddhist philosophies and practices at multicultural Buddhist universities (such as

Nālandā in modern Bihar, which flourished in the last centuries of the first millennium CE) and pilgrimage sites (most importantly Bodh Gayā, also in modern Bihar, which continued to function as a transregional Buddhist center from the time of Aśoka until about the thirteenth century, and has regained that significance from the nineteenth century to the present). Chinese translation of Sanskrit and Pali texts obtained in India and Sri Lanka (which was often compared with the voluminous output of Christian mission presses) lasted at least until the eighth century, while Tibetan translations of Indian and Chinese texts only began in the eighth century and Mongolia only received the dispensation, from Tibet, in the sixteenth century. Many vernacular translation projects around the globe are still on-going. In addition to these formal transmissions, groups of Buddhists periodically, from the Buddha's time to the present, have moved into new regions, establishing at the grass roots their own versions of the dispensation, at least through their presence, and often with much more lasting effect.

Further complicating the picture, these transmissions did not occur according to modern geographical and sectarian boundaries. Thus there were Buddhists in the Burmese kingdoms of Thaton, Pyu, and Arakan by the fifth century, but the (Theravāda) dispensation was formally established in Bagan in the eleventh century, while the continuing presence of northern Buddhist cults and texts in this subsequently officially Theravāda Buddhist region make certain that transmissions there were more multiple still. Moreover, in all regions the fortunes of a variety of different Buddhist schools (with different transmission histories) waxed and waned vis-à-vis each other as well as non-Buddhist religious orders. And throughout the Buddhist world, especially after it was dislocated by the rise of Asian Islam and virulent "national" religions such as Hinduism in India and Confucianism in China (tenth to twelfth centuries) there occurred a process of popularizing Buddhist teachings and practices through vernacular literatures and preaching, which effectively involved transmissions to people who ostensibly had already been Buddhist for centuries. These medieval popularizers—ranging from the authors of Sinhala devotional writings to charismatic Japanese figures like Ippen, Shinran, and Nichiren—expressed motivations to increase universal access to the *dharma*, which represents the closest Buddhist approximation of missionary spirit (mostly confined to what Christians called *home mission*). Clearly, the dispensation did not become established fully formed in a single moment anywhere in the Buddhist world.

No single reason accounts for all these transmissions; scholars have suggested various factors that contributed to the spread of the dispensation. One was certainly a willingness to share the *dharma*, which has characterized the whole tradition. In the earliest Buddha biographies the Brahmanical God implores a Buddha who is not inclined to preach that he nevertheless do so "for the good of many folk," echoing the precise language the Buddha uses later in these same

texts to dismiss the first sixty saints. The underlying virtue that motivates the Buddha to assent to preach is compassion (*karuṇā*), one of the four "godly states" (*brahmavihāra*) that constitutes buddhahood. Compassion is also singled out in the "great commission" passage as the reason monks should bother to preach while wandering about, and in the Aśoka legends compassion motivates the patriarch and his associates who established the dispensation abroad. Unlike missionary spirit or the desire to convert others, such compassion for others' suffering figures prominently in lists of virtues and accomplishments across the Buddhist tradition. In texts about the establishment of the dispensation, the corresponding emotion, on the part of the recipient, is pleasure (*pasāda*); in Buddhist hagiography such feelings of pleasure in Buddhist contexts prove ultimately salvific, whether in this or future lives. One of the few technical terms developed by early Buddhists that could correspond to *missionary* was *pasādaka*, or "pleaser," signaling the importance of generating this emotion on the part of those who would transmit the *dharma*.

The exercise of such compassion was facilitated by the fact that—unlike contemporary Jains and Ājīvikas—Buddhists suffered virtually no restrictions on travel; unlike contemporary Brahmans they did not have to adhere to inhibiting dietary or purificatory regimens. Coupled with the consistent attraction to Buddhist teachings and practices—perhaps in part for these reasons—evinced by an urban middle class that from the time of Aśoka onward was increasingly involved in transregional trade, these factors simply allowed Buddhists to be more mobile than their would-be competitors. Because there were also few restrictions on public preaching and no secret doctrines to be guarded, explications of the *dharma* must have occurred quite often and naturally wherever Buddhists went. The public, and no doubt publicized, support that Aśoka and subsequent Indian emperors gave the Buddhists would have increased their presence and prestige in various extra-Indic courts and cities.

In the process, what we might think of as Buddhist technologies quickly circulated across the northern (land-based) and southern (sea-based) Silk Routes. These technologies included magical and medical practices and texts (which overwhelmingly dominate the manuscript finds at archaeological sites along the northern Silk Route); meditative strategies; sociopolitical principles and organizational forms; banking and even the minting of coins; funerary rites; stone architecture and sculpture; literature and manuscript preparation; and a vernacular (*prakrit*) language that with minor modifications served as a *lingua franca* throughout South, Southeast, and Central Asia and through systematic translation intersected the east Asian *lingua franca* (Chinese). Such technologies could be adopted or participated in without any further claim upon the participant because there was no formal "conversion" requiring the renunciation of previous religious ideas and practices. The line between Buddhist and non-

Buddhist was left gray, it being unproblematic (as far as Buddhists were concerned) to continue practicing previous religions, save perhaps in terms of their unproductiveness in the Buddhist context. Those whose interest became more serious were always free to adopt the five, eight, or ten precepts of a layperson, or even to take robes. Another beneficial absence among Buddhists was exclusion based on wealth, class, caste, gender, age, or educational/professional background. These higher levels of participation involved increasingly strict disciplinary codes but still nothing approximating the nineteenth-century idea of “conversion.”

As the Buddhist presence in various kingdoms grew, and sectarian identities crystallized, Buddhist historians—like their nineteenth- and twentieth-century Western counterparts—tidied up this messy history by composing the regional accounts of the establishment of the dispensation (usually attached to Aśoka legends) mentioned above. These narratives hierarchically ordered various regional Buddhists within a single sectarian framework by making the entire regional dispensation derivative of (or preparatory for) a single original transmission portrayed in the sectarian garb of the monks and nuns who composed any particular account. These accounts always involve the approbation of a paradigmatic regional king (and archaeological evidence leaves no doubt that the support of royal families and other wealthy elites did contribute to the religion’s success wherever it went), thereby entailing sectarian appeals to royal power and patronage as well. On the other hand, these narratives located such regional Buddhist kingdoms and sectarian groups within the larger pan-Buddhist imperial situation and the larger universal *samgha* of a given period. These larger organizational structures involved their own hierarchical orderings based on highly contested interpretations of the Buddha’s teachings and practices and early Buddhist history; the different accounts of the establishment of the dispensation were therefore consequential in terms of transregional political and religious diplomacy, alliance and enmity, and prestige. As late as the fifteenth century, Burmese ambassador-monks greeted Sri Lankan hosts by invoking their shared version of the Aśokan transmission legend, and even in the nineteenth-century Burmese chronicle *Sāsanavamsa*, new claims associating this transmission with the kingdoms of peninsular southeast Asia were advanced.

This simultaneously local and transregional significance helps explain the widespread literary and sometimes liturgical veneration of the different enlightened monks and nuns who established any particular instance of the dispensation, like Mahinda and Sanghamittā in Sri Lanka, Sona and Uttara in Burma, Madhyantika in Kashmir, Padmasambhava in Tibet, Bodhidharma in China, and Upagupta throughout the northern Buddhist world. It also helps explain why the details are so contested across the different versions. But because they were deeply connected with Buddhist identity and portrayals of exemplary saints, these stories certainly also had more specifically religious significance through the ages. Be-

yond the polemics and politics they also effected feelings of gratitude for the efforts made by the “pleasers” who brought the dispensation to their kingdoms, renewed commitment to practice and, at least in the case of Upagupta, hope for worldly and spiritual assistance, and would have helped cultivate that compassion for others that lies at the heart of the tradition.

MODERN BUDDHIST MISSIONS. If the term *Buddhist mission* shows up the danger in cross-cultural application of categories derived from particular religions, it also exemplifies the powerful impact that scholarly discourses can have upon the actual practice of the religions they analyze. Reared on accounts that read mission into their sacred texts and history, beleaguered by criticisms that nonmissionary Buddhism is moribund, provoked to respond to Christian missionaries, and befriended by Westerners (including Christian and Jewish converts to Buddhism, among the first Buddhist missionaries proper) who though sympathizers with the Buddhists remained deeply immersed in missionary thinking, Buddhists throughout the twentieth century (especially in Sri Lanka, Burma, Thailand, and Japan) created actual Buddhist missionary societies in the very image of what Western writers said they ought to possess.

Beginning with the founding of the Maha Bodhi Society in Sri Lanka in 1891, these organizations—now numbering in the thousands and spread throughout the world—incorporated “missionary spirit” as such into their explications of Buddhist religiosity (often based on the “great commission” passage) and declared (first at the World Parliament of Religions in Chicago in 1893) a world Buddhist mission that has witnessed considerable success in the last century, especially in the West. Simultaneously, they adopted and transformed into particularly Buddhist enterprises numerous Christian missionary strategies, such as scripture and tract publication and distribution; “Sunday school” and other youth movements like the Young Men’s Buddhist Association (YMBA); revival rallies, temperance, and other social-reform movements; transregional ecumenical organization (most notably the World Fellowship of Buddhists, founded in 1956); study of foreign religions (and other schools of Buddhism) and interfaith dialogue; and the sponsorship of foreign Buddhist missions (ranging from Sri Lankan missionaries in India, Nepal, Cambodia, Vietnam, and Singapore to Japanese missionaries in Hawai’i and California).

Branch offices and full-fledged temple-monastery complexes representing a variety of Buddhist traditions have been established to serve immigrant Buddhist communities in major cities throughout the world, while simultaneously reaching out to non-Buddhists there. The twentieth century produced a vast discourse in English (and many other European and Asian languages) that is properly missiologic: biographies of famous Buddhist missionaries and eulogistic histories of various Buddhist missions, treatises on Buddhist missionary strategies and calls for expansion of Buddhism

based on global conversion statistics, discourse about competitor religions, missionary annuals and keepsake volumes, and missionary newspapers and websites. In addition, vernacular vocabularies have been developed; the term for *Buddhist missionary* used in southern Buddhist countries, *dharmadūta* (Skt., “emissary of the teachings,” sometimes wrongly conflated with the *dharmamahāmātas* or “righteous ministers” of the Aśokan inscriptions) was first coined as a Sinhala translation of the English word in a Christian missionary dictionary, published the same year the world Buddhist mission was declared. And in the late twentieth century, Buddhist missionaries in the West even developed formal conversion ceremonies to match the expectations of converts there.

This transformation of the religion (especially in elite, Westernized Buddhist circles) as appropriate to the nineteenth- and twentieth-century missionary-dominated global context for understanding and participating in human multi-religiosity reflects its unique adaptability to changing local circumstances (what has been called its “missionary tolerance”), perhaps the most important factor underlying all these instances of *dharmatransmission*. The creation of modern Buddhist missions was continuous with a long history of taking up and “Buddhicizing” non-Buddhist religious forms, ideas, and practices that truly does stretch back to the time of the Buddha himself; it has been nurtured in this case by an ability to find new meanings in the ancient Buddhist texts about preaching and hagiographies of the various “pleasers” of significance to different traditions, and by relaxing monastic discipline in contexts where specific minor rules prove unfeasible. Its results represent a modern transmission of the dispensation broader in scope even than the legendary accounts of the time of Aśoka.

BIBLIOGRAPHY

For all its ubiquity in Buddhological scholarship, “Buddhist mission” has actually received little direct scholarly attention. Though the details of the spread of the dispensation and later exchanges of it, in specific situations, have become increasingly well known, the idea itself has remained virtually unexamined since the 1830s. Probably the earliest use of the English term *Buddhist mission* was in George Turnour’s “Examination of the Pali Buddhistical Annals,” *Journal of Asiatic Society of Bengal* 7, no. 2 (1838): 687, 716–717, 1050. Prior to Jonathan S. Walters’s “Rethinking Buddhist Missions,” Ph.D. diss. (University of Chicago, 1992), only in one instance (C. A. F. Rhys Davids, *Outlines of Buddhism: A Historical Sketch* [London, 1938], pp. 90–96) was the construct “Buddhist mission” even questioned (Rhys Davids pointed out its inapplicability to the texts about Aśoka and its inconsistency with the utter lack of missiological literature in the premodern tradition, though she did not totally abandon the concept). But it was subsequently mentioned—and often made the underlying historical force—in virtually every English-language work on Buddhism, world religions, and especially Buddhist history published from Turnour’s day up

to and including the present; in this sense the bibliography on Buddhist mission nearly overlaps with the entire bibliography on Buddhism or, for that matter, “world religions.”

For an important theoretical statement of the idea of Buddhist mission and the configuration of the history of religions according to the distinction of “missionary” and “non-missionary” religions, see F. Max Müller, *On Missions: A Lecture Delivered in Westminster Abbey, on December 3, 1873* (New York, 1874). Walters’s dissertation (cited above) explores the sociohistorical context in which “Buddhist mission” was invented, reviews the whole genre of nineteenth- and twentieth-century writings on the topic, and contains extended emic analyses of the “great commission” and legends of the Aśokan establishment of the dispensation. The role of Buddhist mission in the big picture of nineteenth- and twentieth-century Buddhology, and alternatives to it, are explored further in Walters’s *Finding Buddhists in Global History* (Washington, D.C., 1998).

The most comprehensive and scholarly treatment of the global spread of the religion as a whole, which treats it in a specifically “missionary” framework, remains Erik Zürcher, *Buddhism: Its Origin and Spread in Words, Maps, and Pictures* (New York, 1962); on China in particular see Zürcher’s *The Buddhist Conquest of China* (Leiden, 1959; reprint, 1972). There have been many similar accounts of the rise and spread of Buddhism in India and abroad, more or less consciously reproducing this framework; a classic, much-read, and still readable example of the larger genre is James Bissett Pratt, *The Pilgrimage of Buddhism and a Buddhist Pilgrimage* (New York, 1928). For a reliable scholarly review of the rise and spread of the early tradition within India, also explained as Buddhist mission, the standard source remains Étienne Lamotte, *History of Indian Buddhism, from the Origins to the Śāka Era*, translated by Sara Webb-Boin (Louvain-la-Neuve, Belgium, 1988). Egil Lothe, “Mission in Theravada Buddhism,” Ph.D. diss. (University of Oslo, 1986), is an innovative attempt to read Pali scriptures about preaching for missiological insight. For more recent scholarship on the spread of the dispensation to the different Buddhist regions and their mutual exchanges (in much of which this “missionary” explanation has been abandoned or at least displaced), see the separate entries on those regional traditions and their bibliographies. Readers seeking a general introduction to the rise and extent of the pan-Buddhist world would also do well to consult Heinz Bechert and Richard Gombrich, eds., *The World of Buddhism: Buddhist Monks and Nuns in Society and Culture* (New York, 1984), a richly illustrated collection of essays on the different regions composed by eminent scholars.

For translations of early texts containing the great commission passage in its original literary frames, see C. A. F. Rhys Davids, trans., *The Book of Kindred Sayings (Samyutta-nikāya)*, vol. 1, pp. 128–159 (London, 1917) (S i.103–27 = *Mārasamyutta*); T. W. and C. A. F. Rhys Davids, trans., *Dialogues of the Buddha (Dīgha-nikāya)*, vol. 2, pp. 1–41 (London, 1959) (*Mahāpadāna-sutta*=D. ii. 1–54); and I. B. Horner, trans., *The Book of the Discipline (Vinaya-piṭaka)*, vol. 4: *Mahāvagga*, pp. 28–29 (Oxford, 1993). For texts of the legends of Aśoka and Chinese pilgrims’ accounts see the separate entry on Aśoka and its bibliography. An engaging primary source for memories of Indian and central Asian

dharma-transmitters in China is Kathryn Ann Tsai, trans., *Lives of the Nuns: Biographies of Chinese Buddhist Nuns from the Fourth to Sixth Centuries* (Honolulu, 1994). For the original text of a legend of a famous monk revered tradition-wide for success (and adventure) preaching to others, see Joel Teitelman, trans., *The Glorious Deeds of Pūrṇa: A Translation and Study of the Pūrṇāvadāna* (Surrey, U.K., 2000).

An enormous amount of primary ephemera related to modern Buddhist missions exists, but there is not yet a comprehensive scholarly account of them. The fieldwork presented in Lothe's dissertation (cited above) provides a useful entry point. A valuable collection of essays by Sri Lankan Anagārika Dharmapāla (1864–1933), the world's first Buddhist missionary proper, is Ananda Guruge, ed., *Return to Righteousness: A Collection of Speeches, Essays, and Letters of the Anagārika Dharmapala* (Colombo, Ceylon, 1965). The best documented modern Buddhist mission is to the United States; for important accounts of the establishment of the dispensation there (and in the West more generally), see Rick Fields, *How the Swans Came to the Lake: A Narrative History of Buddhism in America* (Boulder, Colo., 1981); Thomas A. Tweed, *The American Encounter with Buddhism, 1844–1912: Victorian Culture and the Limits of Dissent* (Bloomington, Ind., 1992); Stephen Batchelor, *The Awakening of the West: The Encounter of Buddhism and Western Culture* (Berkeley, 1994); Richard Hughes Seager, *Buddhism in America* (New York, 2000); and Charles S. Prebish and Martin Baumann, *Westward Dharma: Buddhism beyond Asia* (Berkeley, 2002). Paul David Numrich's *Old Wisdom in the New World: Americanization in Two Immigrant Theravada Buddhist Temples* (Knoxville, Tenn., 1996) analyzes fascinating field data on the sociology of Buddhist mission in Los Angeles and Chicago.

JONATHAN S. WALTERS (2005)

MISSIONS: CHRISTIAN MISSIONS

Mission, the extension of the church beyond its existing frontiers, has been characteristic of the Christian fellowship from its earliest beginnings. In its claim to universal relevance, the Christian church resembles the other great missionary religions, Buddhism and Islam, which are also alike in looking back to a single historic founder. "Go forth, therefore, and make all nations my disciples" (*Mt.* 28:19). It is perhaps doubtful whether Jesus of Nazareth expressed himself in precisely these terms; but there is no reason to suppose that his followers gravely misunderstood his intentions. His personal ministry was directed to Jews; but when he found among non-Jews what he recognized as adequate faith, he showed no inclination to exclude them from his fellowship.

THE EARLY FOLLOWERS OF JESUS. The earliest followers of Jesus seem to have understood the universal dimension of their faith as the fulfillment of Old Testament prophecy (*Isaiah*, *Zechariah*), according to which all nations would come up to Jerusalem to receive the law of the Lord in the form of the new covenant in Jesus. Two new factors reversed this original Christian understanding. The first was persecution, which led to many Christians being dispersed from Jerusa-

lem. The second was the adventurous spirit of certain Greek-speaking Jews who crossed over a well-marked boundary and in Antioch began to proclaim the gospel to non-Jews, apparently with considerable success. This new Christian perspective was rationalized by Saul of Tarsus, also called Paul, who, believing that he had received a commission as apostle of the Gentiles, worked out a master plan for establishing Christian groups in all the main centers of the Greco-Roman world. He looked to Rome, and beyond that even to Spain, the western limit of the Mediterranean world.

So great a project was far beyond the strength of one man, but the impulse given by Paul never died. The Christian proclamation was carried out almost entirely anonymously; indeed, the names of the founders of the great churches of the Roman empire remain for the most part unrecorded. Yet this early work had surprisingly rapid success. Within a century of the death of the founder, churches came into existence in many parts of Asia Minor, in Greece, in Italy, in Egypt, almost certainly in France and Spain, and perhaps even as far away as India. To this day, the Thomas Christians in Kerala claim that their church was founded by the apostle Thomas in person.

Whence this rapid success? By around AD 100, many more Jews lived outside Palestine than within its borders. The strict monotheism of the Jewish faith, and the high moral standards inculcated by their law, had attracted many to at least a partial acceptance of the Jewish faith, and this served for some as a preparation for the Christian gospel. In that hard and often cruel world, a fellowship of people who really loved one another and cared for one another's needs clearly had attractive power. The fervent expectations of the Christians, both for the world and for the individual, must have come as a message of hope to those who had none. Jesus became known as the Savior of the world.

PERSECUTION AND STABILIZATION. The persecutions to which the early Christians were periodically exposed seem to have done little to hinder the advance of their faith. Not all Christians were being persecuted all the time, and the number of martyrs was greatly exaggerated in tradition. To be sure, there were signs of hysteria among the faithful, and some failed to stand fast. But persecution often undermined its own purpose because the courage, dignity, and charity shown by martyrs often won the allegiance and admiration of some who might otherwise have remained indifferent. This has been a recurring phenomenon through the centuries up to the great persecution in Buganda in the 1880s, and in more recent events in Germany and Russia.

The great change in the Christian situation came in 313 when Constantine made Christianity the religion of the empire at a time when its followers cannot have numbered more than about 10 percent of the population. From that time on, the resemblance between Christianity and the other missionary religions has been startlingly close. From the time of Asoka in India (third century BCE) to Sri Lanka and Thailand in 1983, Buddhism has always maintained close relations

with the ruling powers. In all Muslim countries, and in all those which have come under Marxist domination, the identification of the state with religion or ideology has been undisguised and taken for granted. But since Christians claim to be followers of the Prince of Peace, close connections between interests of state and interests of religion have proved a burden and an embarrassment rather than a help. Justinian, who reigned from 527 to 565, seems to have been the first Roman emperor to accept coercion as a legitimate instrument of conversion to Christianity.

By the year 600, the Mediterranean world was almost entirely Christian, with outliers among the Goths, in the approaches to Inner Asia, in Ethiopia, and in what is now Sudan. At the end of the century, Gregory the Great (540–604) saw the importance of the world which lay north of the Alps and which was yet to be converted. Hence the pope's mission to the Angles in Kent. This was the first mission of the church to be officially organized; it paved the way for the central control over the missions which Rome exercised for many centuries.

A LONG PERIOD OF UNCERTAINTY. In the year 600, it might have seemed that the gospel was destined to carry all before it. Then suddenly everything went into reverse. In 610 an obscure prophet named Muhammad began to preach a new faith to the tribes of Arabia. By the time of his death he had given to these tribes unity, a simple demanding creed, and a sense of destiny. Only a century later, the Muslim armies were at Tours, in the very heart of France, and were repelled only by the vigor and military skill of Charles Martel (685–741). By that time the Christian churches had almost disappeared in Palestine, Syria, and Egypt, and were gravely threatened in Persia, North Africa, and large parts of Asia Minor. In 1453, the Turks succeeded in capturing Constantinople and destroying the Eastern Empire, which for a thousand years had been the bulwark of the Christian world. Many causes have been adduced for the disappearance of so many churches. Military weakness was no doubt one, but there were others as well: dissensions among Christians, the rise of national feeling in Egypt and elsewhere, and the superficiality of conversion in such areas as North Africa, where the church had failed to express Christian truth in the languages of the local people.

In this period, the wisdom of Gregory was vindicated. During the centuries between 632 and 1232, the Christian faith spread west, north, and east until the conversion of Europe was complete. There was a dark side to this advance. When at the end of the eighth century Charlemagne succeeded in conquering the long-refractory Saxons, he agreed to spare their lives on the condition that they accept baptism. It was only one of many regions in which cross and sword went together. In Scandinavia, conversion proceeded more easily. In many areas the ruler was the first to accept the faith, and this brought about a quiet revolution. Iceland seems to have been unique in accepting the faith (around 1000) by genuinely democratic methods. With the conversion of Jag-

iello (1383), king of the Lithuanians, conversion seems to have reached its natural term.

Monks and nuns played a creative part in the building of churches. In the remote places where they settled they introduced better methods of agriculture and new crops. They laid the foundations of literature in the languages of Europe. They gave to isolated peoples a sense of belonging to one great unity: the Catholic Church. Out of these beginnings grew the splendid cultures of medieval Europe.

Missionary activity sometimes took on the form of conflict between the old and the new. Such actions as Boniface's felling the oak of Thor at Geismar must not be misinterpreted as mere missionary vandalism. The people of that time believed that the powerful spirit who inhabited the oak would be able to take condign vengeance on any intruder, thus they expected Boniface to fall dead upon the spot. When he survived, they concluded that the god whom he preached was more powerful than their own.

The Eastern church, with its base in Constantinople, beginning with the conversion in 988 of Vladimir, grand duke of Kiev, created the great Slavonic cultures, the Christian origins of which are not disputed even by Marxist opponents of religion. These cultures survived the fall of Constantinople. During the fifteenth century, the faith was received by more remote peoples to the east and north, a process that continued until by the end of the nineteenth century it had reached the shores of the Pacific Ocean.

With the great Franciscan and Dominican movements of the thirteenth century, the missionary enterprise of the Western church looked beyond the limits of Europe; the "friars travelling abroad in the service of Christ" reached strange lands far afield. One of their most remarkable achievements was the creation of an archbishopric in Beijing; the first archbishop to fill the post, John of Monte Corvino, lived there from 1294 to 1328, greatly respected by all. But the church's hope of converting the Inner Asian peoples was frustrated by the Muslims' success in winning them to the Islamic faith. The lines of communication with Inner Asia were too tenuous, however, and in the fifteenth century the mission to China faded away. For the moment Christian expansion seemed to be at an end.

THE COLONIAL PERIOD. The last decade of the fifteenth century saw the discovery of America by Columbus in 1492 and the opening up of the sea route to India by Vasco da Gama in 1498. These two events changed the relationships between the nations of the world and in time gravely affected the presentation of the Christian gospel to the non-Christian world.

Roman Catholic monopoly. For two centuries the greater part of the missionary enterprise of the Western church was in the hands of the Portuguese, who, following the precedent of Muslim evangelism in Europe, expected their converts to accept Portuguese names, manners, and customs. There was, however, never total adoption of this

principle. By the end of the sixteenth century, the Portuguese had on their hands three considerable blocks of Indian Christianity. In those possessions which they directly controlled, the process of Europeanization was almost complete. The Thomas Christians in Kerala and the Parava converts on the coast of Coromandel, on the other hand, declared and maintained their intention to be and to remain Indian Christians, a stance from which they have not departed in four centuries.

Moreover, in these years two notable attempts were made to adapt Christian thought to the ideas and ways of Asia. The Italian Matteo Ricci in 1601 succeeded in reaching Beijing. He and his Jesuit colleagues, by mastering the Chinese language, winning the favor of the emperor and other leaders by their skill in astronomy and other sciences, and by adapting Christian faith to Chinese ideas, were able to maintain their mission, albeit with varying fortunes, through nearly three centuries. In southern India another Italian, Roberto de Nobili, learned Tamil and Sanskrit, and in order to win over the brahmins turned himself into a brahmin, and not without success. Unfortunately, in 1744 Rome condemned all such efforts at adaptation, thereby sterilizing the Roman mission for the next two hundred years.

Internationalization of missions. The Lutherans sent their first missionaries to India in 1706. In 1794 the English Baptists, represented by their great pioneer William Carey and his colleagues, set up their work in Bengal. Thus the enormous resources of the English-speaking world, followed by those of the Dutch, the Swiss, and Scandinavians, were let loose throughout the world.

From this time on, relations between the Western governments and Christian missionary forces became unimaginably complicated. On the whole, the British maintained an attitude of lofty neutrality toward missionary activity, modified by the personal interest of a number of Christian government officials. But as government financial aid became available for educational and medical programs and for other forms of service, the Christian missionaries in the forefront of such enterprises profited greatly, perhaps excessively, from the provision of such aid. On the other hand, in British India the Indian rulers prohibited all Christian propaganda in their areas; religious freedom in India was proclaimed not by the British but by the government of independent India after 1947. In northern Nigeria, the British clearly favored Islam at the expense of Christianity.

In German, Dutch, and Belgian colonies, the association of governments with missions was undesirably close. In China, because of Napoleon III's decision that all missionaries, of whatever nationality, must be in possession of French passports, Roman Catholic missions were inevitably stigmatized as dangerous and foreign. By contrast, Hudson Taylor, the director of the largest Protestant mission, instructed his missionaries that in case of trouble they were to turn not to consular authorities but to the local representatives of the Chinese governments.

A new factor emerged when the Japanese government showed itself as the great colonial power in the East. American missionaries in Korea sympathized deeply with Korean national aspirations and were opposed, though quietly and discreetly, to Japanese colonial enterprise.

Varieties of missionary enterprise. Over two centuries there has been significant diversification of missionary enterprise, including the activities of women missionaries, which indeed have been far more numerous and diverse than those of men. Almost every conceivable means of communication has been employed. Education, on the basis of the Christian conviction that all truth and all knowledge are from God, has been emphasized. Together with this priority has gone the widespread distribution of Christian literature in countless languages. Medical and social services were conceived and have been rendered by Christians, not as propaganda but as manifestations of the universal love of Christ, and they were perceived as such by many who were served. Public lectures to interested non-Christians have in many areas left deep impressions on the minds of the hearers, though debates between the adherents of different religious systems have tended more to exacerbation than to conviction. Preaching in the open air in villages and public places has made many hearers aware of the existence of alternative systems of belief. Quiet study groups, under the guidance of sympathetic Christians, have helped to clarify questions about Christian belief. Where no open propaganda has been permitted, the mere presence of loving Christians as neighbors has proved remarkably effective as witness to the faith.

The nature of conversion. No full and scientific study of the process of conversion in the non-Christian world has as yet been written. Undoubtedly in a number of cases the desire for social advancement and a better manner of life has played a powerful part. But is this a blameworthy motive in the case of those who have been subjected for centuries to ruthless oppression reinforced by religious sanction? For many, the gospel comes with promise of deliverance from the power of evil forces which are believed at all times to threaten and beleaguer the well-being of humans. For some, the gospel represents an immense simplification of religion. It has been stated that in India more people have been converted to Christianity by reading the first three chapters of *Genesis* than in any other way, for the majestic simplicity of these chapters appeals deeply to those perplexed by the complexity of Hindu mythology. Other converts, oppressed by the burden of sin, are drawn by the promise of forgiveness in Christ, so different from the inexorable law of *karman* in Hinduism. Others, conscious of moral infirmity, have come to believe that Christ can offer the inner rehabilitation which they feel they need. Yet others have been impressed by the intensity of mutual love manifest in the society of Christian believers. Varied as the process may be, in all there is a central unity. Christ himself stands at the center of everything. Only when the risen Christ is seen as friend, example, savior, and lord can genuine Christian conversion be expected to take place.

Conversion to Christ is not necessarily identical with acceptance of the church; but in the vast majority of cases this follows, though this second acceptance may prove to be more difficult than the first.

Missionary motives. For more than four centuries the Western powers have exercised a dominating influence on the destinies of the rest of the world. Since so many people, especially in Muslim countries, have identified the West with the Christian West, there has been a natural tendency to regard Christian missionary enterprise as no more than an expression of Western aggression and imperialism. How far is there any adequate basis for this equation?

Many careful studies of missionary motivation have been made. Clearly no human motives are entirely pure. But only in a minority of cases can it be shown that national and imperialistic motives have played a strong part in missionary devotion. More frequently the glory of Christ has been the central and dominant motive. Some missionaries have gone so far in identifying with those they have come to serve as to renounce their own nation and to accept naturalization in the countries they have made their own. All have accepted some measure of acculturation in new surroundings. All who have served long years in alien lands have accepted with equanimity the destiny of becoming strangers in their own homes. The number of missionary martyrs is legion, their sacrifice equaled only by the devotion of their friends in many nations around the world who have also given their lives in the service of Christ.

THE TWENTIETH CENTURY. When in 1910 the first World Missionary Conference was held at Edinburgh, twelve hundred delegates from all over the world (including, however, no Roman Catholic or Orthodox Christians) could look back on a century of almost unimpeded progress. Converts had been won from every form of religion. In almost every country—a notable exception being Tibet—churches had come into existence, and the process by which the foreign mission was being transformed into the independent self-governing church was well advanced.

The years which followed were marked by a number of major setbacks to Christian missionization, such as the Russian revolution and the fading of religion in many Western communities. Yet the *World Christian Encyclopedia*, edited by David B. Barrett (1982) makes it plain that the achievements of the prior seventy years had been greater than those of the preceding century. For the first time in history the possibility of a universal religion appeared a reality. Roughly one-third of the inhabitants of the world had come to call themselves Christians. The progress of Christian missions continues in almost every area of the world. In India, Christians, already the third largest religious community after Hindus and Muslims, are also the most rapidly increasing in number.

Hostile critics of the Christian enterprise have maintained that the gospel has failed to touch deeply the mind

and conscience of peoples outside the West, that the Christian churches in these areas are fragile and exotic blooms that came with the colonial powers, have been dependent exclusively on foreign aid and support, and that with the disappearance of the colonial powers these churches will also disappear. The twentieth century has shown that there is no ground at all for these expectations. After the communist takeover in China (1949), it was held even by a number of Christians that “missionary Christianity” in China had no roots and that there was little if any chance of its survival. When relaxation of government control occurred in 1980, however, it was revealed that several million Chinese had remained faithful to the Christian church. Chinese Christians have made known their determination to be fully independent of every kind of foreign control and to work out for themselves a form of Christian faith which will be genuinely Chinese. Elsewhere, if all foreign support has been compulsorily withdrawn, as in Burma, the churches have simply declared their maturity and have planned for a future of self-support and radical independence. Where this has taken place, accessions to the Christian faith have been more numerous than they were in the flourishing colonial days.

Changing world order. As a world phenomenon, the Christian church has not remained unaffected by the violent changes that have taken place in the troubled modern world. During the nineteenth century the dominant nations and the churches which were dependent on them assumed that they could plant Christian missions wherever they pleased, sometimes imposing their will by force on unwilling peoples. In the twentieth century all this has changed. A number of nations (e.g., Burma, Guinea, Saudi Arabia) prohibit all religious activity by foreigners which is directed at native citizens. A number of others make it very difficult for missionaries to obtain visas or residence permits. Yet others (e.g., Nepal) admit missionaries with few restrictions, but only on condition that they engage in what the government regards as nation-building activities (such as educational or medical services). Where all access is made impossible, churches in neighboring areas fall back upon the help that can be rendered by prayer alone.

The churches have gladly accepted the claim of these nations to independence and national dignity. No case is on record of a missionary leaving his or her assignment through unwillingness to accept the changed conditions of service. Christian witnesses have desired to stay on and to become in fact what they always wanted to be—servants of those to whom they came to minister. Even in China missionaries stayed on until it became clear that there was no longer any useful service that they could render. From Burma and other areas, foreigners withdrew because they felt that their work was done, since the local churches could carry on without their aid, and that their continued presence might embarrass—and possibly endanger—their Christian friends. Some have been deported, at very short notice, for political reasons.

Anti-Western sentiments and resentments have been strong in many countries of the world since the end of the

nineteenth century. Since 1947, decolonization has taken place with quite unexpected rapidity. Yet wounds remain. Some nations have desired to emancipate themselves from Western influences, but this has proved impossible. The more far-sighted leaders have seen it as their task to retain all that is valuable in the Western inheritance and at the same time to assert or to rediscover the integrity of their own national traditions.

From foreign mission to independent church. The major change in the twentieth century was the process of transfer of power from foreign mission to independent local church, a process almost complete by the end of the century in almost every country in the world. The churches in some emerging nations think that the process has not gone fast enough or far enough; that it is on the way cannot be doubted by any observer of the process of change. Where churches are still wrestling with the problems and the prejudices of the past, they may be unwilling to accept the help of foreigners. Where they have reached maturity, as in India and Korea, and are becoming aware of the immense tasks still before them, they are in many cases glad to accept the help of foreigners, provided that these are prepared to keep their proper place and to accept only such responsibilities for service or leadership as the local church may lay upon them. Nor need it be supposed that all missionaries will be from the Western world; missionary interchange among developing nations is one of the most interesting features of the contemporary situation.

The independence of churches outside Europe and North America is increasingly shown in a number of remarkable ways. One that has attracted considerable attention is the rise of African independent churches, all of which have grown out of the mission-controlled churches of the past. Some of these are unorthodox. But the great majority desire to remain part of the main lines of the Christian tradition and have yet to create for themselves a place in which to feel at home, to think out the gospel for themselves, and to decide for themselves which of the ancient traditions of Africa can be retained within the Christian structure. Many Christians, even in the mainstream churches outside the West, are rethinking their own past in the light of divine providence, expecting to find signs of the working of God no less in their own pre-Christian history than in the special history of which the Old and New Testaments are the record. Some in India, for example, have suggested that the Upanisads are the real "old testament" of the Indian Christian and should take rank at least on the same level as the Hebrew scriptures. The nature of this quest is neatly summed up in the title of a book by Raimundo Panikkar, *The Unknown Christ of Hinduism* (New York, 1981). Genuinely indigenous theology is still in its beginnings, and it has to be confessed that the reapings in this field are still rather scanty; but what there is gives promise of a richer harvest in days to come.

One reason for the Christian quest to discover Christ beyond the historical bounds of Christendom is to be found

in the remarkable resuscitation in the twentieth century of the ancient non-Christian faiths. Rediscovering the treasures of their own past, non-Christians feel able to approach Christians with renewed confidence and a sense of security. The Buddhist knows himself to be in contact with the great mystery of nothingness, the Hindu to be in contact with the unchangeable mystery of infinite being, the Muslim with the mystery of the infinite exaltation of God. There need be no Christian doubt about the greatness of these religions. Christian and non-Christian alike have much to teach one another in a manner different from that of the past.

The basis of this approach is a conventional rationale of mutual respect. Through centuries millions of men and women have lived by the teachings that they have received in these various religions, and, therefore, these may not be treated as though they did not matter, even though some of their teachings may be displeasing to the adherents of other religions. So one who engages in dialogue with those of faiths other than his own must come to it in the spirit Chaucer described in the words "gladly would he learn and gladly teach." Confident in the value of what he has experienced through his own faith, the Christian is able to delight in everything that he learns from others of what is true and good and beautiful, and at the same time maintain his hope that those who have seen in their own faith what he must judge to be partial may come to find the full-orbed reality of the true, the good, and the beautiful as he himself has seen it in Jesus Christ. If mission is understood in this sense, some of the asperities of the missionary approach in the past may be mitigated.

A NEW UNDERSTANDING OF MISSION. Almost all Christians who are members of churches outside Europe and North America are conscious of belonging to a single great worldwide fellowship, regardless of the denominational label they may bear. Several, though not all, are ardent supporters of contemporary ecumenical movements for the unity and renewal of the church. But they too are almost at one in holding that reconsideration of the meaning of the term *mission* is long overdue. Those who have traveled in the lands of older Christian traditions and sensed the decay in Christian allegiance of many in these countries are inclined to think that mission should be labeled as a product intended for universal and international export. In the past, the gospel traveled across continents and oceans almost exclusively in one direction. Has not the time come to establish two-way traffic, to have the gospel travel across continents and oceans in many directions? If this is true, the word *mission* may be in need of new and contemporary definition.

BIBLIOGRAPHY

The *World Christian Encyclopedia: A Comparative Study of Churches and Religions in the Modern World, A. D. 1900–2000*, edited by David B. Barrett (Oxford, 1982), is an astonishing

repertory of information about the Christian faith and all other faiths in all the countries of the world. The *Concise Dictionary of the Christian World Mission*, edited by Stephen C. Neill, Gerald H. Anderson, and John Goodwin (Nashville, 1971), gives in much more condensed form information on almost every aspect of the Christian mission. By far the most extensive survey of the whole field is K. S. Latourette's *A History of the Expansion of Christianity*, 7 vols. (New York, 1937–1945), to be supplemented by the same writer's *Christianity in a Revolutionary Age: A History of Christianity in the Nineteenth and Twentieth Centuries*, 5 vols. (New York, 1958–1963). My own *Christian Missions* (Baltimore, 1964) has gathered together information from many parts of the world.

No satisfactory history of Roman Catholic missions exists; the best so far is *Histoire universelle des missions catholiques*, 4 vols., edited by Simon Delacroix (Paris, 1956–1958). No English work on Eastern Orthodox missions can be recommended. Two works in German by Josef Glazik, *Die russisch-orthodoxe Heidenmission seit Peter dem Grossen* (Münster, 1954) and *Die Islammission der russisch-orthodoxe Kirche* (Münster, 1959), are classic.

Special studies of many areas are available. For China, K. S. Latourette's *A History of Christian Missions in China* (New York, 1929), is authoritative up to the date of publication. A reliable survey of what has been happening in China since 1948 remains to be written. My *History of Christianity in India*, 2 vols. (Cambridge, 1984–1985), provides substantial coverage. For Africa, C. P. Groves's *The Planting of Christianity in Africa*, 4 vols. (1948–1958; reprint London, 1964), is a work of patient research but is overweighted on the Protestant side.

Countless lives of Christians, Western, Eastern, and African, have been written, but almost all the older works need to be rewritten in the light of modern knowledge. As a notable example of a biography of a twentieth-century saint, mention may be made of Hugh Tinker's *The Ordeal of Love: C. F. Andrews and India* (New York, 1979). Georg Schurhammer's *Francis Xavier: His Life, His Times*, 4 vols. (Rome, 1973–1982) is a superb example of what can be achieved by intense industry continued over almost sixty years.

Peter Beyerhaus's *The Responsible Church and the Foreign Mission* (London, 1964) is a pioneer work on the transformation of a foreign mission into an independent local church. The works of Roland Allen, especially *Missionary Methods: St. Paul's or Ours?*, 6th ed. (London, 1968), let loose questionings and discussions which have continued to the present day.

On the Christian confrontation with the non-Christian religions, the World Council of Churches in Geneva has published a whole series of valuable books, under the editorship of Stanley J. Samartha. On contemporary trends in mission thinking and theology, the interconfessional and international series "Mission Trends," edited by Gerald Anderson and Thomas Stransky (Ramsey, N. J., 1974–), will be found full of up-to-date and relevant information on almost all matters related to the Christian mission.

STEPHEN C. NEILL (1987)

MITHRA. After Ahura Mazdā and together with Anāhitā, Mithra is one of the major deities of ancient Iran, one that later crossed the borders of the Iranian world to become the supreme god of a mystery religion popular throughout the Roman Empire. In the Avesta and the later Zoroastrian literature Mithra turns up frequently; indeed, an entire Avestan hymn is dedicated to him (*Yashts* 10). He was also the subject of the Mithrakāna, a great festival that took place annually in the seventh month of the Zoroastrian calendar, which was itself dedicated to him. He is known to us from many other sources: in the inscriptions of the Achaemenids, beginning with Artaxerxes II (404–359 BCE), he is mentioned and invoked together with Ahura Mazdā and Anāhitā; on the coins of the Kushan empire he is named as Mīro and is depicted as a solar deity; in Parthian and Sogdian Manichaeism he is the *tertius legatus*; in Persian Manichaeism, he appears as the *spiritus vivens*; and so forth.

Mithra is essentially a deity of light: he draws the sun with rapid horses; he is the first to reach the summit of Mount Harā, at the center of the earth, and from there watches over the entire abode of the Aryans; he shines with his own light and in the morning makes the many forms of the world visible. If his name is synonymous with the word *mithra*, meaning "contract, covenant," as Antoine Meillet (1907) suggests, his functions are not restricted to merely personifying that notion. In the Iranian world, besides being a deity of light with strong solar characteristics (which explains his identification with the Mesopotamian Shamash), Mithra has a clear significance as a warrior god. Thus, in relation to the gods of the Indo-Iranian pantheon, he is closer to Indra than to the Vedic Mitra. He also, however, has the traits of a divinity who ensures rain and prosperity and who protects cattle by providing it ample pasturage.

The cult of Mithra, together with that of Anāhitā, constitutes the principal innovation of Zoroastrianism as it evolved after Zarathushtra (Zoroaster) and represents its major compromise with ancient polytheism. It was probably Mithra's role as defender and guardian of *asha*, truth and order—the fundamental principle of earlier Indo-Iranian religion, as well as of Zoroastrianism—that redeemed him from Zarathushtra's original general condemnation of polytheism.

GHERARDO GNOLI (1987)
Translated from Italian by Roger DeGaris

MITHRAISM. The name *Mithraism*, with its equivalents in other languages, is a modern term for a cult known, at least to Christian writers and in later antiquity, as "the mysteries of Mithras," but for which the most neutral term is "the Roman cult of Mithras." Its usual organization was based on small, exclusively male groups that gathered for sacrificial meals in honor of the originally Indo-Iranian god Mitra/Mithra/Mithras. Owing to the virtually total loss of ancient discursive accounts, almost all important aspects of the cult are more contentious. Much of what passes as received knowledge about Mithraism has little or no evidential basis.

HISTORY OF RESEARCH. The mythological compilations of the High Renaissance, particularly L. G. Giraldi's *De deis gentium* (1548), assembled virtually all the classical texts relating to the god Mithras, then identified with Helios-Apollo, but these provided no coherent account either of the god or of the Roman cult. However, a handful of inscribed reliefs from Rome and elsewhere showing Mithras stabbing a bull to death enabled antiquarians such as Martin de Smet/Smetius (c. 1525–1578) and Steven Pigge/Pighius (1520–1604) to correctly identify them. Throughout the early modern period to 1700, the key text was *Statius Thebais* 1.719f.: *Persaei sub rupibus antri—indignata sequi torquentem cornua Mithram*, "[Apollo addressed as the god] who, beneath the rocks of a Persian cave, twists the resistful horns—Mithras." The god's act in stabbing the bull to death was understood as an allegory of the Sun's role in furthering agricultural fertility; indeed the god himself was often interpreted as the Good Husbandman. This assumption that Mithras was simply another name for the Sun-god underpinned all important studies over the following two centuries; such progress

as was made consisted in the description of new statues and reliefs, but much Mithraic imagery remained unintelligible, and thus prey to speculative evocation.

Given the essentially enigmatic character of the iconographical evidence, the device of allegorical interpretation could only be challenged by an appeal to history. Although Georg Zoega (1755–1809) had stressed the possible role of the Persian magi and the Cilician pirates mentioned by Plutarch, *Pompeius* 24, 631c, in transmitting the cult of Mithra from the East, a substantial effort at historicization was only possible once James Darmesteter (1849–1894) published his translation of the Iranian sacred books, the *Zend-Avesta* (1892–1893).

In 1889, inspired by the model of the Egyptian cult of Isis, the Belgian scholar Franz Cumont (1868–1947) advanced a view of the cult of Mithras as a syncretistic borrowing from Zoroastrian dualism, through the medium of Greek-speaking Iranian priests (*magousaioi*) who, he claimed, remained active in Anatolia after Alexander's conquest of the Persian Empire (336–330 BCE). Although no Iranian antecedent could be found for Mithras killing a bull (rather than Ahriman, the principle of evil; or the Saoshyant, at the end of the world), much of the iconography could, he thought, be referred to Zoroastrian precedent and thus explained. Cumont's main work (1896–1899), supported by a full archaeological inventory, provoked what would now be called a paradigm shift and continued to be the dominant account until the early 1970s. Its decline was provoked by two independent developments. First, the ever more hypothetical claims made by certain Iranists, for example Geo Widengren's (1907–1996) theories about ancient, non-Zoroastrian, Iranian religion, including the role of Aryan warrior-societies (*Männerbünde*) and supposed analogies with a Mazdakite revivalist sect, the al-Babakiyah, or Leroy A. Campbell's obsessively precise translation (1968) of every particular of Roman Mithraic imagery into Zoroastrian terms, tended to discredit the very idea of direct transmission. Second, it came to be realized that the Roman cult was much more independent of its presumed Iranian origins than Cumont allowed—by contrast with the cases of Cybele, Isis, and Iuppiter Dolichenus, for example, which were certainly maintained in the western Empire at least in part by actual Anatolian and Egyptian priests, there were traces in the West neither of the magi (*magousaioi*), nor of a fire-cult, nor of Mithra as god of the contract. As a result, with one or two exceptions, Iranists have now abandoned Mithraism to classical archaeologists and historians of Greco-Roman religion.

Since the 1970s, research has moved in three directions, all of which emphasize in different ways the Greco-Roman character of the cult. The first, picking up a suggestion by the Swedish scholar Martin P. Nilsson that Mithraism was the invention of an unknown religious genius, starts from the assumption that it was founded in Rome or Italy in the first century CE and stresses its integration into the hierarchical social system of the Empire (Merkelbach, 1984; Claus,

2000). Another approach has concentrated on the enigma of the bull-killing scene, and, in a reversion to Renaissance techniques of allegory, read it as a star-map, evoking either a particular season or an identification between Mithras and a constellation (Orion, Perseus, Auriga . . .) (e.g., Ulansey, 1991). A third approach has emphasized the cult's local diversity in the Roman world, employing the techniques of the "new" archaeology to establish new facts—for example, the contrast between the "Italian" sacrificial diet of at least some Mithraists in the northwest Empire (chickens, piglets) and the "Gallo-German" diet of local soldiers (mainly beef), or the probable date of particular celebrations (Martens and de Boe, 2004). Such facts have little to do with belief as traditionally understood, but emphasize instead the cult's lived ritual practice. At the same time, the archaeological evidence has greatly increased both in quantity and in quality: well over sixty Mithraic temples (modern term: *mithraeum*) were excavated between 1934 and 2004.

ORIGINS. Generally speaking, Iranists have wanted to find, like Cumont, a strong Iranian kernel, an actual pre-existing Iranian cult or myth. The main obstacle here has always been the energetic filtering of nonorthodox traditions from the Pahlavi sacred books of Zoroastrianism. Moreover it is difficult to isolate a meaningful group of distinctively Iranian features of the Roman cult. Indeed, one can list only the god's name itself, the god Areimanius, and two apparently Old Persian words, *nama* ("Hail!") and *nabarze(s)*, the latter of which is not recorded as such in Iranian sources but is found in the aristocratic personal name Nabarzanes. Moreover, if the cult had entered the Greco-Roman world from the eastern part of Anatolia (Cappadocia, Armenia Minor, Commagene), or from Parthia, one would have expected, as with Cybele, Isis, Iuppiter Dolichenus, and early Christianity, a clear pattern of evidence documenting its progress from east to west.

It is because it appears to provide such a bridge that Plutarch's statement that the Cilician "pirates" worshiped Mithra by means of special rites (*teletai*) on Mount Olympus in Lycia-Pamphylia during the late Republic (c. 67 BCE), and still did so in his own day, has to many seemed so decisively important. However to single out this cult (which is not Cilician but Lycian) is to overvalue one among several attested local cults of Mithra in Hellenistic Anatolia simply because it happens to be found in a written text and to take for granted what needs to be demonstrated, namely that Plutarch mentions it because he already knew about "our" Mithraism. While that is not absolutely impossible in the period 110 to 120 CE, it is much more likely that Plutarch was interested in Mithra(s) for the same reason that he was interested in Isis and Osiris, namely because, as a Platonist, he welcomed the late Stoic view that foreign mythologies contained traces of the truth revealed in primitive religion. However that may be, archaeologically speaking the cult is documented only 170 to 190 years later, in the mid-Flavian/early Trajanic period, more or less simultaneously in a number of widely scattered sites, sometimes in military contexts, such as at

Heddernheim/Frankfurt (Germania) and Carnuntum (Pannonia); sometimes in connection with the organized collection of tolls, such as at Novae (Moesia Inferior) and Pons Aeni (Raetia); and elsewhere again in relation to private harbour activities (Caesarea Maritima, Judaea). The earliest datable evidence from Rome, of the same period, is a statue, dedicated by a trusted, evidently rich slave of the Praetorian Prefect, of Mithras killing the bull. Such a pattern provides no clear support either to any strong Iranian thesis yet proposed nor to the more recent idea that the cult was founded in Italy; nor does the idea of a transition between a Lycian mountain-top cult and a private dining cult celebrated in pseudo-caves seem especially compelling.

Three weak Iranian scenarios have been offered, two of them emphasizing the cult's interest in astral-astrological phenomena. One of these is that a group of Stoicizing philosophers in Tarsus (Cilicia) seized upon the phenomenon of the "precession of the equinoxes" (the very gradual movement of the fixed stars around the pole of the ecliptic) supposedly discovered by Hipparchus in the late second century BCE. This group interpreted it as a "movement of the great cosmic axis," and made this into the central secret of a pre-existing local cult of Mithras, now identified as the constellation Perseus (Ulansey, 1991). Each one of these claims has been hotly disputed; the thesis rests undeniably upon misunderstandings both of Hipparchus and of his ancient reception. The second scenario is that the cult emanated from the court of Commagene, which had both the requisite Irano-Hellenic culture and familiarity with astrological lore, and which was dispersed early in the Flavian period (72 CE) (Beck, 1998). By contrast, the third, quasi-Cumontian scenario focuses on the Mithraic magical gems and sees the origins of the Roman cult in the lore of Hellenized magi offering magical healing at centers of existing mystery-cults, such as Samothrake (Mastrocinque, 1998).

Whatever the merits of these suggestions, it seems intuitively more plausible to suppose that the Roman cult developed, or was created, in the late Hellenistic or early imperial period out of the debris of ancient Iranian cult in Anatolia rather than that it was a genuine esoteric development among certain pre-Sassanian Zoroastrians somehow mediated across the culture gap between the Parthian and Roman Empires. Theophoric names, such as Mithres, Mithradates, and Mithratochmes, are widespread in Anatolia; by contrast with the case of Anāhīta, no major temple of Mithra survived the conquest, and such worship of him as continued must have been mainly private and local. Yet hints of the sporadic existence of public cult have turned up in western Anatolia, including Mithras-Helios at Oenoanda (Lycia) and a tantalizing but hopelessly fragmentary link between Mithras and the magi in relation to a temple in northwest Phrygia. One possibility is that the Mithrakana, the Iranian Fall festival, which continued to be celebrated in some places, was apparently restricted to men, and involved bull-sacrifice, provided the stimulus for the invention of a private Hellenistic cult

of moral self-affirmation, of the kind known from Philadelphia (Lydia), whose rules were allegedly revealed to a certain Dionysios by Zeus Eumenes around 100 BCE (Barton and Horsley, 1981).

However it is to be explained, the reappearance within the Roman cult of four themes already linked with Mithra in the Avestan Mithra-Yašt cannot be accidental: association with light, mighty strength, the bestowal of life and fortune, and knowledge of human actions. It is certainly important to remember that there is no archaeological trace of Christianity's westward progress in the first and second centuries CE, but, unlike Christianity, worshippers' relation to Mithras was to a significant degree based on vows and votive offerings, which required fixed places of worship where they could be set up. This point suggests a rapid, almost explosive, expansion in the Flavian period of one among several local Anatolian cults of Mithras, a cult which must already have been a bricolage of Iranian, Anatolian, and Hellenic themes. The scheme of the tauroctony itself is evidently borrowed from that of Nike (Victory) sacrificing, a type which experienced a marked revival in the Flavian, then in the Trajanic, period. Whether this successful cult was first practiced in Commagene, further north (Cappadocia, reduced to provincial status by Vespasian), or further west (Phrygia, Lycia) is unknown; the handful of Anatolian *mithraea* so far discovered are later and may be due to Roman influence.

THE ROMAN CULT. Two main difficulties, both exemplified in the work of Cumont (and many others), have stood in the way of an adequately historical account of Mithraism. One is the unitarian belief that evidence widely scattered in space and time could legitimately be fitted together to produce an account of a single, essentially unchanging, religion; the other is its classification as an oriental mystery-cult. The first legitimated the reading of monuments from different periods as evidence for the same unchanging reality; perhaps even more seriously, texts were treated as atemporal sources, blithely disregarding the argumentative contexts within which the supposed information occurred. The second meant that Mithraism was absorbed into a larger discourse about the originality and status of pagan religious thought, whose real subject was the priority or otherwise of the truth-claims of Christianity: the category *mystery-religion* was an invention of German Protestant historiography of the 1880s. Although the construction of typologies, for example, that of Ugo Bianchi (1979), may help to highlight major similarities and distinctions, they necessarily depend on received views and cannot respond to the implications of new discoveries, which may be considerable in the case of cults for which, as with Mithraism, the evidence is almost entirely archaeological. Moreover, it seems advisable on principle to disregard all evidence attested solely by Christian sources and wherever possible to rely on internal Mithraic evidence, such as the verse-lines from the Santa Prisca Mithraeum in Rome, circa 210 to 230 CE (Vermaseren and Van Essen, 1965).

A Weberian model would suggest a wide initial appeal crossing social boundaries, followed by consolidation within

a relatively homogeneous social stratum. The evidence, such as it is, however, indicates instead a continuous expansion of social and geographical range well into the fourth century, and a gradual acceptance as a Roman cult. A list of ninety-eight members accruing to a *mithraeum* in Virunum (Noricum) over a period of some eighteen years (183–201 CE) confirms that the typical urban adherent either occupied some function within imperial or local administration, as at Poetovio (Pannonia Superior), or belonged, as at Ostia, to the more prosperous urban craft-population descended from freedmen: the great majority of *cognomina* are Latin, implying that their holders were at least second-generation citizens; there are twenty-three Greek *cognomina*, two Celtic names, and only one (private) slave. Moreover, not a single woman is listed: the repeated attempts to show that women might belong to the cult are wishful thinking (Piccottini, 1994). Recent discoveries in the northwest provinces suggest that the belief that the cult was mainly attractive to soldiers is an error based on the accident of excavation: in this area, practically every *vicus*, even some villas (large farms), now appear to have had a *mithraeum*. Nevertheless, the discovery of a late second- to early third-century *mithraeum* inside the house of the military tribunes of senatorial rank (*tribuni laticlavii*) in the permanent camp of Legio II Adiutrix at Aquincum (Pannonia Inferior) both attests to the continuation of the early association between Mithraism and the military and suggests one likely means whereby the cult eventually came to the notice of the social elite.

The early archaeological evidence in the West confirms that three fundamental features of the cult were already established on its appearance in the Roman world: Mithras's cult title as (*Deus*) *Sol Invictus Mithras*, "Mithras, the divine never-vanquished Sun"; the interpretation of Mithras's act of killing the bull in both a cosmological and an anthropological sense; and a highly original conception of the *mithraeum* as sacred space, ambiguous between natural cave and human construct, between temple-cella and sacrificial dining room, and between a meeting place and a coded representation of the cosmos as a whole. Although the earliest evidence for a narrative that framed and commented on the central bull-killing act is late-Antonine, parts of it must have existed long before: the earliest evidence (140–160 CE) for an initiation ritual is the representation on a krater from Mainz (Germania Superior) of a seated member of the highest grade, Pater (Father), aiming an armed bow at a cowering naked initiand, in a clear reference to Mithras's mythical act in shooting an arrow to produce a stream that gushes from a rock (Beck, 2000). This in turn suggests that one motive for representing scenes of the sacred narrative was to establish mythic charters or analogies for initiatory and other ritual events. On the other face of the Mainz vessel is the earliest surviving representation of at least three of the grades: Miles (Soldier), Pater, and Heliodromus (Messenger of the Sun), who form a procession moving to the left. The rear is taken up by a smaller, fourth figure with a raised staff, perhaps a Corax (Raven). This procession has been interpreted as a rit-

ual reenactment within the *mithraeum* of the sun's course along the ecliptic (Beck, 2000).

All this suggests that what was initially attractive about the cult of Mithras was its integration of a distinctive (albeit generically familiar) cosmogony and cosmology with an image of a physically and morally steadfast hero, submissive to the will of the gods, a sort of Persian Herakles. One of the few genuinely internal statements we possess, from the Santa Prisca Mithraeum in Rome, runs: *Atque perlata humeris tuli[t] m[a]xima divum*, "And he has borne on his shoulders the gods' behests, to the very end" (Vermaseren and Van Essen, 1965: 204–205, line 9). Mithras offered a model, directed exclusively at men, of personal submission. This model was enforced, in evidently dramatic ways, by the humiliation, pain, and fear to which initiates were exposed, as on the Mainz vessel, and still more clearly in the podium paintings at S. Maria Capua Vetere (c. 220–240 CE) (Vermaseren, 1971).

At the same time, the death of the bull was interpreted as salvific: another (damaged) line at S. Prisca reads: *Et nos servasti . . . sanguine fuso*, "And you have saved us . . . by shedding (the) blood" (Vermaseren and Van Essen, 1965: 217–221, line 14). This salvation could be understood in different ways. In the early second century it was probably evoked primarily in the usual sense of divine protection and guidance. Salvation no doubt continued in some contexts and geographical areas always to be understood in those traditional terms. However, a generation later than the Mainz vessel, the Middle Platonist philosopher Celsus alludes (Origen, *Contra Celsum* 6.22) to an elaborate Mithraic scheme of a ladder representing the soul's ascent to the fixed stars (c. 175–180 CE). In the mid-third century the Neo-Platonist philosopher Porphyry cites a certain Euboulus for the claim that the Persian prophet Zoroaster was the first to dedicate a cave to Mithras, "creator and father of all," a cave which was artfully marked out with the symbols of the cosmos whose demiurge was Mithras (*De antro* 6); and the related claim that North and South (of the *mithraeum*) were associated with the entry and departure of souls into and out of the world (*De antro* 24). Turcan has argued that such claims represent a systematic distortion of Mithraic belief by Platonists for their own purposes (Turcan, 1975). Beck, on the other hand, has urged that Porphyry's data are to be taken at face value: the Mithraists designed and constructed their *mithraeum* as an image of the cosmos so as to be able to reenact a ritual of the descent and return of souls (Beck, 2000). The image of Mithras killing the bull is, inter alia, a representation of Mithras "seated at the equinoxes" (*De antro* 24). It is also a kind of explanatory commentary on the two central, albeit enigmatic, claims of Mithraism, that Mithras both is and is not identical with the Sun (*Deus Sol Invictus Mithras*), and that the universe is sustained by the "harmony of tension in opposition" (Beck and Gordon, 2005).

If Mithras's heroic feat of subduing and killing the bull began as a hunt, it ended as a sacrifice, the primal sacrifice,

which established the terms of the asymmetrical relationship between gods and men. It also offered a distinctive myth of the origin of cosmic order and civilized life (fire, agriculture). Ethically, the cult seems to have imposed strict self-discipline (Porphyry, *De antro* 15); soteriologically, it offered the promise of a gradual, differentiated, self-identification with Mithras. For example, the bull-killing scene has rightly been seen as representing an epiphanic moment (Zwirn, 1989); the grade Leo (Lion) evidently had a mystic link with that animal, which exists simultaneously on earth and in heaven (the constellation) and appears in numerous, albeit to us unintelligible, contexts in the iconography; the Pater in the procession scene at S. Prisca is represented as the god receiving the initiates. The principal ritual means of this self-identification was the shared sacrificial meal, which alluded to that eaten by Mithras and Helios/Sol (the Sun-god) immediately after the butchery of the bull, on a couch (*kline*) covered by its skinned hide, during the course of which the gods ate the grilled *splangkna* (heart, liver) and drank pure, unmixed wine. The krater containing this wine appears together with a snake and a lion on many German reliefs, and usable reproductions of it have been found widely in *mithraea*, such as at Tienen (Belgica), where the vessel was constructed in such a manner that the heated wine and water could be poured (or sucked) through the snake's mouth. The vine itself could be given a Mithraic meaning: on a probably Syrian relief now in the Israel Museum, Mithras, who, being born from a rock, had no mother whose milk he could drink, is depicted as a baby drinking the juice extruded from bunches of grapes—the wine of the feast is the civilized version of that primitive, natural juice.

Mithraism thus constituted an elaborate, self-conscious, meritocratic form of the cult community widespread in the western Roman Empire, whose most striking feature was that, despite being supra-regional (indeed, in the northwest and northeast provinces, virtually universal), it tenaciously retained its private character, and (except in military contexts) resisted absorption by the religio-political rhetoric of public religious institutions. Its self-consciousness as a cult is epitomized by the fact that, despite the marked regional variation, individuals could and did pass from one end of the Empire to the other and find a cult of Mithras recognizably the same as that which they already knew: there are several examples of miniature reliefs suitable for packing in one's luggage and several examples of reliefs fabricated in the Danube area but found in Germany, Italy, and Israel.

Another source of self-consciousness was the sense of being a foreign cult: relatively unhampered by implication in local (politico-social) meanings, Mithraism was able constantly to reinvent itself, not least among those with intellectual pretensions. An important recourse here was astronomy-astrology; another was the Greco-Roman reception of Persia. Statius, writing in the decade 80 to 90 CE, knew already that the bull was sacrificed inside a Persian cave, and we have no reason to doubt Euboulus's statement (mid-third century)

that the cult claimed to have been founded by the Persian sage Zoroaster. The systematic association that Celsus attests between planets and metals looks typical of the occultic preoccupation with (fanciful) list-making, whereas both Euboulus and a certain Pallas, cited by Porphyry, *De abstin.* 4.16, evidently tried to explain Mithraism by invoking metempsychosis and soul-journeys, beliefs which they knew to be “Persian” probably because they, or their sources, found them in pseudonymous texts purportedly by Zoroaster (the so-called Zoroastrian pseudepigrapha). At the same time there is evidence that some *mobeds* (Zoroastrian priests) in the Sassanian period did indeed believe in metempsychosis. The “Mithras Liturgy” in the Great Paris magical codex, which gives every appearance of including a mystic vision of the god, may also have been influenced by such ideas (Betz, 2003).

Mithraists themselves certainly drew upon analogous texts: the existence of a Mithraic god Areimanius, known from Rome and Aquincum, is best explained as a back-formation within Roman Mithraism owed to familiarity with descriptions of Persian religion by historians such as Theopompus and philosophers such as Eudemus of Rhodes and Hermippus “the Callimachean.” These accounts commonly represented Ahriman as Hades, god of the Underworld (de Jong, 1997). The Persian magi are cited in the *mithraeum* at Dura-Europos (Syria) as authority for the idea of “fiery breath,” possibly in relation to the end of the world, but more probably in relation to punishment for sin. The most striking example of a reference to Iranian ideas, however, is a fresco (c. 370–380 CE) in the *mithraeum* of Hawarti/Huarte near Apamea (Syria), where a group of ghastly decapitated human and demonic heads is depicted strung along a city-wall, each pierced, like representations of the evil eye, by a spear. The simplest explanation is that they evoke the descriptions of Mithras’s savage destruction of the enemies of religion, human and demonic, in the Mithra-Yašt, and that this is an example of late Mithraic borrowing—self reinvention—from authentic Sassanian Zoroastrianism. Such knowledge was probably passed through frontier cities such as Nisibis, which was ceded to the Sassanians in 363 CE, but continued even thereafter to be an important commercial and cultural bridgehead.

RICHARD GORDON (2005)

MOABITE RELIGION. In ancient times the land of Moab comprised the narrow strip of cultivable land on the Transjordanian Plateau east of the Dead Sea, between the escarpment and the Arabian Desert. This was an area about twenty-five kilometers wide and, during its periods of greatest strength, about ninety kilometers long, stretching the length of the Dead Sea. The main Moabite plateau extended from the Wādī al-Ḥesā (the biblical river Zered) at the south end of the Dead Sea to the Wādī el-Mūjib (the biblical river Arnon) at the midpoint. The northern portion of Moab from the Wādī el-Mūjib up to around Tell Ḥesbān (biblical Heshbon), however, was historically not as secure and seems to have been open to incursion, a fact that is illustrated by the Moabite Inscription (MI), the largest preserved Moabite text. Not many details are known about Moabite history, but Moab as an independent kingdom probably arose in the last centuries of the second millennium BCE and disintegrated in the mid-first millennium BCE (that is, c. 1300–600 BCE), falling first to the Assyrians and then to subsequent conquerors.

The Moabite religion seems to have shared several features with that of other Iron Age kingdoms in the region, such as Israel, Edom, and Ammon, and all of them probably inherited much from their Bronze Age "Canaanite" predecessors. However, while it used to be commonplace to claim that all four kingdoms had their own national god (Kemosh for Moab, Yahweh for Israel, Qaws for Edom, and Milkom for Ammon), it is perhaps better to be more cautious in view of the meager evidence outside the Bible. At any rate, the MI shows that King Mesha of the Moabites worshipped a patron deity (Kemosh), in whose name Mesha conducted warfare, made sacrifices, and consecrated sanctuaries and even the peoples he had defeated (compare the biblical *herem*, or "sacred ban"). The Moabite religion probably slowly disappeared as new religions such as that of the Nabateans entered the region at the end of the first millennium BCE.

SOURCES. The most important of the scarce textual sources concerning Moab and the Moabites are the Mesha Inscription (Donner and Röllig, 1966–1969) and the Hebrew Bible (Old Testament). Other relevant written evidence is preserved in a few other fragmentary Moabite inscriptions, several Moabite seals with inscribed personal names, and a handful of references to Moabite place or personal names in Assyrian and Egyptian texts. Archaeological remains have been uncovered as well; in addition to various regional surveys of the Transjordan, there are excavated sites such as Dhibān and Tell Ḥesbān to analyze.

DEITIES. Kemosh (or Chemosh) was presumably the chief deity of the Moabites, although they doubtless worshipped other gods as well. Kemosh is known from earlier times in Syria-Palestine, with the consonants *kmš* or *kmṯ* variously vocalized, having the phonological forms *kam(m)it* or *kam(m)ut*. For instance, at Ebla in the third millennium the deity was known as Kamish (^d*Ga-mi-iš* or ^d*Ga-me-iš*), and he played a significant role; he received sacrifices, possessed a sanctuary, and even had a month named after him. The deity may even have been the chief god of the city of Carchemish/Kār-Kamiš in northern Syria, since the very name signifies "quay or port of Kamiš." In Akkadian texts from the second millennium onward, the divine name appears as Kam(m)ush (^d*Ka-am-muš* or ^d*Ka-mu-uš*). Alphabetic texts from fourteenth-century Ugarit preserve *kmṯ* in combination with another divine name *zz* (*zz.w kmṯ*), and the resulting compound (perhaps pronounced *Zizzu-wa-Kamātu*), may or may not be related to the later Moabite deity. In Moabite texts (also written without vowels), the name is given as *kmš* and was possibly pronounced Kam(m)ash or Kam(m)ush (note the two Moabite royal names that appear in Akkadian as ^m*Ka-ma-as-ḥal-ta-a* and ^m*Kam-mu-su-na-ad-bi*). Finally, in the Bible, the name is written once as *Kēmiş* (Jer. 48:7) but otherwise as *Kēmōš*, which has become the conventional way of pronouncing this deity's name ever since.

The meaning of the name Kemosh in its nonbiblical forms may be "conqueror, subduer," from variously an adjective (*qaṭṭil*-pattern), a causative verbal adjective (*qaṭṭul*), or a nomen agentis (*qaṭṭāl*), from the same root as Akkadian *kamāšu* or *kamāsu*, which means "to bow or kneel." The Masoretic pronunciation *Kemosh* (*Kēmōš*) as it appears most often in the Bible is difficult to explain. The Greek Septuagint and Latin Vulgate versions of the Bible have instead *Khamōsl* *Chamos*, hinting that the correct vocalization of the Hebrew *Kemosh* should have been *kāmōš* from an original *kam(m)āš*. One suggestion for the Masoretic twist in pronunciation is that it was given the same vowels as *bē'ōš*, "stench." A similar treatment was given to other divine names in the Bible; for example, Ba'al, which is sometimes rendered as *bōšet*, "shame," or the pronunciation 'Aštōret ('Ashtoreth, for the goddess Astarte), whose two final vowels also reflect those of *bōšet*.

Personal names containing the element Kemosh attest to the god's popularity. The father of Mesha was possibly *kmšyt* (Kamash-yat, "Kemosh has given [a son]"). In seals, one finds among others the names *kmšyh* (may Kemosh live), *kmšm'š* (Kemosh is [my] gift), *kmš'm* (Kemosh is kin), *kmš'l* (Kemosh is god), *kmššdq* (Kemosh is righteous or Kemosh has done justly), *kmšdn* (Kemosh has judged), and *kmšntn* (Kemosh has given). In Assyrian texts recording tributes from Moab, one also finds royal names with *kmš*: Kamush-nadbi (^m*Kam-mu-su-na-ad-bi*, "Kemosh is my abundance"), Kamash-ḥalta (^m*Ka-ma-as-ḥal-ta-a*, "Kemosh is strength").

CHARACTERISTICS OF KEMOSH. In the MI, Kemosh is portrayed as a god of war who delivers his people, the Moabites, up to their enemies when he is angry and then “delivers” them and “returns” their land. Scholars as far back as Eusebius (c. 260–330 CE) have equated Kemosh with the Greek god of war, Ares, based especially on the fact that there was a town named Areopolis in the center of the Moabite region (although this may be a folk etymology). The so-called Shihān Warrior Stele, with its javelin-wielding figure, has also been interpreted as depicting a warrior deity, perhaps Kemosh.

Also in the MI, Kemosh accepts the consecration of the massacred populace under the name “‘Ashtar-Kemosh” (‘štr.kmš, MI, line 17). The “‘Ashtar” element is most likely the name of a well-known West Semitic astral deity ‘Ashtar/‘Athtar, combined with Kemosh in a compound name, as is not uncommon with West Semitic divine names (see above *zz.w kmš* at Ugarit). Another less likely option is that the name is that of Kemosh’s consort, a goddess—for example, the goddess Ishtar or Astarte. However, in West Semitic the goddess’s name should have a final *-t*, and the compound should thus have more likely been spelled ‘štr.kmš. At any rate, the basis for the association of Kemosh with ‘Ashtar is unknown, as the compound only appears in this single inscription.

In the Bible, the name Kemosh appears eight times (*Nm.* 21:29; *Jgs.* 11:24; *1 Kgs.* 11:7, 33; *2 Kgs.* 23:13; and *Jer.* 48:7, 13, 46), and Kemosh is said to be the god of the Moabites or, as in *Judges* 11:24, the god of the Ammonites.

Since Kemosh was worshipped throughout Syria-Palestine, one may also look to non-Moabite sources for relevant information. For instance, Kemosh may well have had a chthonic nature. In a Middle Assyrian copy of a Mesopotamian god list (*Cuneiform texts from Babylonian tablets in the British Museum* 24, 36:66), the Akkadian name ^d*Ka-am-muš* is equated with Nergal (god of war, death, and the netherworld). In a Mesopotamian lexical list, Kamush (^d*Ka-mu-uš* or ^d*Ka-muš*) appears as one of several possible readings of the Sumerogram GUD, which sometimes stands for Akkadian *eṭemmu*, “ghost, spirit” (Ea IV 142 = *Materials for the Sumerian Lexicon*, vol. 14, p. 361). In three Ugaritic invocations of gods (*KTU* 1.100:36; 1.107:41; and 1.123:5—the last two are incantations against serpent bites), there is a deity with a double divine name that may refer to Kemosh: *zz.w kmš* (*Zizzu-wa-Kamātu*). The *zz* element perhaps means “mud, clay” (compare Akkadian *tītu*, Hebrew *tīt*), a substance that in ancient Near Eastern texts is often said to be abundant in the netherworld. The location of the main cult place of *zz.w kmš* is said to be *hryt(h)* (see *KTU* 1.100:36), perhaps one of the two or three towns known by the name Hurriya in Syria and northern Mesopotamia.

OTHER MOABITE DEITIES. On the basis of Moabite place and personal names, it is possible to perhaps identify other deities in addition to Kemosh that were known or worshipped by the Moabites. The several occurrences of Ba‘al

(*b‘l*) as a theophoric element in personal names (e.g., *b‘lntn*, “Ba‘al has given”) and in place names (Ba‘al-pe‘or, Bamoth-ba‘al, Ba‘al-me‘on) might mean one of two things: either they indicate that the deity Ba‘al was worshipped by Moabites or else the word *ba‘al* was used to mean merely “lord” and could have referred to Kemosh himself. There are also combinations with ‘El in Moabite personal names, as in *mšpʿl* or Mishpaʿel, “El (or the god) is justice.” However, in these cases as well one does not know if the Canaanite deity ‘El is meant or simply the generic definition “god.” The Moabite place name Nebo in the MI (*nbb*) and the Bible may indicate that the Mesopotamian god Nabu was worshipped. The name Shalamanu (*Sa-la-ma-nu*) for a Moabite king in a Tiglat-Pileser tribute list may attest to worship of the god Shalman, and other Moabite personal names in published seals may perhaps attest to the knowledge of further deities in Moab. The name of the god Ḥoron may appear in the place name Ḥawronen (*ḥwrnm*) in the Mesha Inscription (line 32, compare the biblical *Hōrōnayim*, *Jer.* 48:34). Ḥoron was known as a deity of magic and exorcism in especially Ugaritic and Egyptian texts. Finally, the Bālu‘a stele bears iconographic witness to what is probably a god and goddess in front of a worshipper. The stele, which has Egyptianizing artistic elements, may or may not reflect Kemosh and a female consort.

SANCTUARIES OR TEMPLES. According to the MI, King Mesha built a “high place” (*bmt*, compare the Hebrew *bāmāh*) for Kemosh at Qarḥoh (perhaps a name for the acropolis or royal quarter of the city of Dibon, modern Dhībān). In another inscription also found at Dhībān, a sanctuary is mentioned that may have been devoted to Kemosh too (only the *k* of the god’s name is preserved). Excavations at Dhībān in 1955 suggested that the Iron Age II structure in Section L was the palace complex of Mesha, on the east side of which there may have been a sanctuary. In this vicinity a terra-cotta incense stand was found along with two female figurines. The fact that there was a Nabataean-Roman temple built much later on that site may indicate a continuous sacred tradition. There may also have been a sanctuary of Kemosh in Kir-hareseth (modern Kerak), and the Bible retains a tradition that Solomon made a high place to Kemosh at Jerusalem (*1 Kgs.* 11:7–8; *2 Kgs.* 23:13).

CULTIC PRACTICES. Information about sacrifices and rituals is scarce. In the Bible, however, Moabites are said to make sacrifices (presumably to Ba‘al) in *Numbers* 22:40–23:30 and to make sacrifices and burn incense in *Jeremiah* 48:35. *Numbers* 25:1–5 mentions sacrifices again as well as orgiastic practices carried out by Israelites with Moabite women in honor of Ba‘al of Pe‘or. Most shockingly of all, in *2 Kings* 3:4–27 the Moabite king Mesha is said to offer a human sacrifice. On this occasion, a campaign of King Jehoram of Israel (son of Ahaziah, son of Ahab) against Mesha ends with a siege at Kir-hareseth, the city in which Mesha had taken refuge. The Israelites are said to have withdrawn after Mesha sacrificed his oldest son on the city wall. Although one may doubt whether or not this story reflects merely a pejorative

tradition about the practices of Israelite enemies, there are other clues that suggest at least the possibility that the Transjordanian peoples were acquainted with human or child sacrifice. One notes that the Deir 'Allā inscriptions from the mid-eighth century BCE, which relate to a certain prophet Balaam (compare the biblical non-Israelite prophet of the same name in *Nm.* 22–24), have several key words that might indicate child sacrifice was practiced in the region (e.g., *nqr* “sprout” or “scion” for a human sacrificial victim, *mlk* as the word for a kind of offering). In fact, child sacrifice constitutes a highly debated topic in modern scholarship concerning the Phoenician and Punic world.

PRIESTS AND PROPHETS. *Jeremiah* 48:7 refers to priests of Kemosh, but evidence for other cultic practitioners is unknown. It has been suggested that line 32 in the MI, “Kemosh said to me, ‘Go down, fight against Ḥawronen,’” indicates divination of some sort, requiring a prophet or the like to obtain an oracle or vision from the deity. The hiring of Balaam by King Balak of Moab to curse the Israelites in *Numbers* 22–24 perhaps also indicates that the Moabites used seers and diviners.

SACRED WARFARE AND DIVINE INTERVENTION. In the MI, King Mesha says he dedicated to Kemosh the Israelite inhabitants of the cities 'Aṣaroth and Nebo. The idea of sacred battles and a consecrated massacre of peoples (including men, women, and children) is shared with the Hebrew Bible's theological accounts of the Israelite conquest of Canaan, in which Yahweh is said to demand such a destruction (with use of the root *ḥrm* in, for example, *Dt.* 7:2, 20:16–17; *Jos.* 6:17–19, 21; *1 Sm.* 15:3; compare line 17 of the MI). In fact, the MI can actually be seen as a religious document that has the same theological tone and envisions the same divine involvement in human affairs as the Hebrew Bible.

AFTERLIFE. There is no textual evidence for Moabite beliefs in an afterlife. However, the Iron Age II rock-cut tombs at Dhībān from around the time of Mesha contain mortuary goods such as pottery, jewelry, and at least one anthropoid clay coffin, suggesting a Moabite concern for proper burial with an eye to needs in the afterlife. There has also been some speculation that since Kemosh was perhaps associated with the gods of the netherworld, Moabites might have believed in some form of continued existence after death.

BIBLIOGRAPHY

An important modern body of studies on the MI and Moab is Andrew Dearman, ed., *Studies in the Mesha Inscription and Moab* (Atlanta, 1989); see especially Gerald L. Mattingly's “Moabite Religion,” pp. 211–238. Other studies include A. H. van Zyl, *The Moabites* (Leiden, Netherlands, 1960); Herbert Donner and Wolfgang Röllig, *Kanaanäische und aramäische Inschriften, I-III*, 2d ed., no. 181 (Wiesbaden, Germany, 1966–1969); H. P. Müller, “Chemosh,” in *Dictionary of Deities and Demons in the Bible*, 2d ed., edited by Karel van der Toorn, Bob Becking, and Pieter W. van der Horst, pp. 186–189 (Leiden, Netherlands, 1999); H. P. Müller, “Die Inschrift des Königs Mesa von Moab,” in *Texte aus der Umwelt des Alten Testaments* II/6, edited by O. Kaiser,

ISLAMIC MODERNISM
CHRISTIAN MODERNISM

MODERNISM: ISLAMIC MODERNISM

As is the case with a number of other Islamic discourses, it can be hard to locate the precise boundary of Islamic modernism. Few Muslims explicitly self-identify as “Muslim modernists,” instead referring to themselves simply as Muslims, Muslims involved in the process of reform and renewal, Muslims committed to democracy, or even Muslims intent on reviving the original spirit of Islam. In this essay, Islamic modernism is defined as those discourses of Islamic thought and practice in the last two centuries in which modernity itself is seen as a viable category to be engaged and drawn upon, not merely dismissed or used as a foil to define oneself against. In other words, advocates of Islamic modernism are not simply modern Muslims but those Muslims who see something (if not all) of modernity as a constitutive element of their worldview and practice.

As is the case with other intellectual and religious traditions, Islamic engagements with modernity have been neither static nor uniform. Traditions ranging from the revivalism of the eighteenth and nineteenth centuries to the rationalizing and Salafī tendencies of the early twentieth century, as well as liberal movements of the twentieth century onto the progressive Muslim movement of the twenty-first

century, can all be discussed under the broad parameter of Islamic modernism. At times, it has been difficult to locate the boundary between Islamic modernists and some nineteenth- and early twentieth-century Salafī thinkers. While both advocated fresh interpretations of the Qurʾān, the modernists tended to engage modernity explicitly, while many Salafīs couched their language in terms of the “righteous forefathers” (*al-salaf al-salih*), the generation of Muslims living with and immediately after the Prophet Muḥammad in the seventh century. As the Salafī movement has become more intertwined with Wahhabism in the later half of the twentieth century, the overlap between modernists and Salafīs has greatly been reduced.

The discourse of modernity itself has not stayed static, as it has come under severe critique and contestation from feminists, environmentalists, Marxists, subalterns, and others. As the discourse of modernity continues to change, so do the Muslims’ engagement with modernity.

There has also been a long-running tendency among Western journalists and even some scholars to look at the more conservative articulations of Islam (such as those of some traditional religious scholars) and even Muslim extremists as somehow representing “real” Islam. Subsequently, these same sources have not adequately engaged Muslim modernists, who are unfairly dismissed as lacking a constituency or influence. Even more problematic is the view that any explicit reimagining of Islam is no longer proper Islam. Lord Cromer, the British high commissioner in colonized Egypt, once said: “Islam reformed is Islam no longer.” That attitude misses out on the vigorous and dynamic debates that are going on within not only modernist circles but also much wider segments of Muslim societies.

WESTERNIZATION AND ISLAMIC PARADIGMS. Part of the difficulty in establishing the proper boundaries of Islamic modernism has to do with the way that the legacy of Islamic thought in the modern era is conceived. Many Western scholars (such as Bernard Lewis and others) have seen modernity as the exclusive offspring of the West. As a result, they approach any other civilization that engages modernity through the lens of “westernization.” There is no doubt that the encounter with Western institutions and thought has had a profound impact on Islamic modernism both positively (emphasis on human rights, constitutional forms of government, adoption of science, etc.) and negatively (colonialism, support for autocratic regimes). At the same time, many of the issues that Islamic modernism engages today, such as human rights, democracy, gender equality, and the like, are truly seen as universal struggles. Furthermore, most Muslims who engage these issues frame their own discourse not as a borrowing or “influence” from Western discourses but rather as a part of indigenous Islamic interpretations. Positioning the Muslims’ struggles in these universal arenas as perpetually derivative vis-à-vis Western paradigms robs them of their own legitimacy and dynamism.

The above debate is also related to when one begins the history of Islamic modernism. The older paradigm that viewed Islamic thought as being hopelessly stagnated before being jolted into a renaissance by its interaction with European colonialism is now critiqued by many scholars. Without diminishing the profound experience of responding to the shock, inspiration, and violation of the colonial experience, it is also important to realize that some of Islamic modernism also taps into important reform traditions such as Shāh Walī Allāh of Delhi (d. 1762) and many others that predate the full-blown experience of colonialism.

Many Muslim modernists have readily acknowledged their interactions with Western models, institutions, and figures. At the same time they have been careful to cast their movement in decidedly Islamic terms. Perhaps the most common strategy for presenting modernism as an indigenously and authentically Islamic movement is through the framework of *ijtihād*. *Ijtihād* initially had a narrower meaning, referring to the process whereby Muslim jurists would arrive at rulings for unprecedented cases. Modernists have gradually expanded the definition of *ijtihād* to mean critical, independent reasoning in all domains of thought. In other words, the proper domain of *ijtihād* was taken to be not just Islamic law but rather all aspects of thought. In an egalitarian move, modernists often hold that it is not just jurists but all Muslims who have the responsibility to carry on *ijtihād*. The majority of Islamic modernist writers emphasize the need for *ijtihād*, often juxtaposing it polemically against *taqlīd*. As with *ijtihād*, modernists often came to reinterpret *taqlīd*. *Taqlīd* had originally meant simply following a school of Islamic law, or a designated authority (*marjaʿ*) in the case of Shīʿī Muslims. For modernists, who wished to highlight independent critical reasoning, *taqlīd* came to mean blind imitationism, becoming a symbol of everything they held to be wrong with Islamic thought.

Like many other Muslims, modernists have also cast their own struggles as perpetuating the spirit of the Qurʾān and the teachings of the Prophet Muḥammad. Modernists often insist that the egalitarian spirit of the Qurʾān in areas ranging from women’s rights to religious pluralism should take precedence over more conservative later rulings. The distinction between essence and manifestation (universals and particulars, or other similar dichotomies) is a common motif in the history of modern religious thought. Many modernists also argue for a situated and contextualized reading of the Qurʾānic revelations.

Modernists find Qurʾānic precedence for their own critique of tradition-embedded injustice by pointing to Qurʾānic voices (such as Abraham and Muḥammad) who challenged their own community, which had insisted on continuing “the ways of the forefathers.” In appealing to prophetic legitimization, many modernists have recorded the conversation between Prophet Muḥammad and a companion named Muʾādh ibn Jabal (d. 627). Muʾādh stated that if he found no explicit guidance in the Qurʾān or the pro-

phetic *sunnah*, he would rely upon his own independent reasoning. While the systematic nature of this anecdote may well belie a later juridical desire to legitimize their own methodology, it has served as a powerful tool for modernists to sanctify their own appeal to *ijtihād*.

Modernists also tapped into other traditions of Islamic legitimacy that predated the encounter with Europe. One of their most powerful means of legitimizing themselves was by adopting the title of “renewer” (*mujaddid*), which recalled a statement attributed to the Prophet Muḥammad: “God sends to this nation at the beginning of every century someone who renews its religion.” In doing so, modernists could lay claim to carrying the mantle of Islamic renewal, following established masters such as Abū Ḥāmid al-Ghazālī (1058–1111) whose *Iḥyā’ ‘ulūm al-dīn* (*Revivification of Religious Sciences*) had explicitly evoked the theme of rejuvenation and renewal after death and stagnation.

RELIGIOUS AUTHORITY. The crisis of contemporary Islam is inseparable from the struggle over defining Islam and the concomitant question of who gets to define Islam, using what sources and which methodologies. The question of authority in Islam is today—and has always been—a contested one. It has often been noted that there is no formal church structure in Islam, thus making the base of religious authority more fluid. However, the lack of a formal structure of authority does not mean that there is *no* religious authority in Islam. Competing groups of Muslims claim authority for themselves by appealing to religious language and symbols. Foremost among them have been the religious scholars (*‘ulamā’*) and the mystics (Ṣūfīs) of Islam. However, Sufism is a contested category today, and many in the Muslim community who gravitate towards Salafism view Ṣūfīs with skepticism. For example, the mainstream Muslim organizations in the United States, such as the Islamic Society of North America (ISNA) and the Islamic Circle of North America (ICNA), avoid almost all mention of Sufism (and also Shiism). Ismā‘īlīs, particularly those under the leadership of the Aga Khan, are arguably the most cosmopolitan and modernity accommodating of Muslims, yet they too are seen by some conservative Sunnī Muslims as suspect.

The majority of Muslims turn to the *‘ulamā’*, religious scholars, for religious guidance. However, many *‘ulamā’* today are ill equipped to handle the more sophisticated aspects of modernity. Traditional *madrasah* institutions in many Muslim-majority countries no longer offer the highest level of critical thought. Whereas these institutions historically attracted the brightest minds in the community, today they are often a haven for those who have been unable to gain admittance to more lucrative medicine, engineering, and computer science programs. By and large, there are very few *madrasahs* for the training of *‘ulamā’* in a curriculum that takes modernity in the sense of engagements with modern philosophy, sciences, politics, economics, and the like seriously. Ironically, while it is precisely modernist Muslims who are often best suited to handle those decidedly modern pa-

rameters, many community members view the same scholars with some skepticism because modernists are not usually products of the *madrasah* system. This skepticism of the community members reveals a great deal about the presuppositions of many contemporary Muslims regarding the “purity” of Islamic knowledge and how it may be “contaminated” by Western training. Ironically, this compartmentalized view of knowledge contradicts both medieval philosophical notions and certain contemporary rigorous interpretations of Islam. As early as the ninth century, the philosopher al-Kindī had stated: “We should not be ashamed to acknowledge truth and to assimilate it from whatever source it comes to us, even if it is brought to us by former generations and foreign peoples.” This epistemological pluralism is also echoed in the works of the Iranian modernist intellectual ‘Abd al-Karim Soroush, who states: “I believe that truths everywhere are compatible; no truth clashes with any other truth. . . . Thus, in my search for the truth, I became oblivious to whether an idea originated in the East, or West, or whether it had ancient or modern origins.”

The vision of Islam espoused by many modernists is a more liberal, inclusive, humanistic, and even secular interpretation of Islam that is greatly distrustful of Islamist political discourses. By “secular” what is intended is a model of social relations in which the boundaries between religious discourse and political legitimacy are not collapsed, not one in which one would seek an exile of the religious from all of the public domain. The modernists’ suspicion of models of government that base themselves on Islamic discourses often provides their critics with ammunition to accuse them of laxness of religious practice. Whether it is warranted or not, modernists have often been perceived as being less observant than their conservative coreligionists.

THE TWENTIETH CENTURY. One of the characteristics of the modernist movement in the twentieth century was its transregional, translinguistic, and transnational character. While figures such as ‘Abduh and Rida worked in Egypt, others such as Sayyīd Aḥmad Khān, Muḥammad Iqbal, and Fazlur Rahman hailed from South Asia. Figures such as Jamāl al-Dīn al-Afghānī moved with seeming ease from Iran and Afghanistan to the Ottoman Empire. One could mention other well-known figures such as the Malaysian Chandra Muzaffar, Indonesians Aḥmad Ḥassan and Nurcholish Madjid, the Algerian/French Mohamed Arkoun, and American Amina Wadud to give a sense of its global reach.

Still, moving toward and into the twentieth century, a few Islamic modernists stood out above the rest. Almost all later modernists engaged the following figures explicitly or implicitly.

Jamāl al-Dīn al-Afghānī (1838–1897). Along with his disciple ‘Abduh, al-Afghānī is seen as the most important of the nineteenth-century Muslim modernists. When in the Sunnī Arab world, he adopted the name Afghānī to distance himself from his Iranian Shī‘ī heritage. He was instrumental in arguing for a vision of Islam that adopted modern sci-

ences. He is a good example of the ambiguity many modernists have vis-à-vis realpolitik, now supporting the British imperial forces, now opposing them.

Muhammad ‘Abduh (1849–1905). Along with al-Afghānī, he published the highly influential *al-‘Urwa al-wuthqa* (*The Firmest Handle*), a title that harkens back to Qur’an 2:256. Initially exiled from Egypt, ‘Abduh eventually returned to head al-Azhar. Generally considered the most influential of the nineteenth-century Muslim modernists in terms of his impact on later thinkers, ‘Abduh was responsible for many reforms in the educational system.

Rashid Rida (1865–1935). Rida was a link between ‘Abduh and twentieth-century modernists. His *al-Manar* was one of the most important means for disseminating modernist ideas. He too talked explicitly about the need for renewal (*tajdid*) and renewing (*tajaddud*), connecting it back to the aforementioned *ḥadīth* that God sends a renewer (*mu-jaddid*) at the beginning of every century.

Muḥammad Iqbal (1877–1938). Iqbal is widely credited for having been the philosophical inspiration behind the creation of the state of Pakistan. One of the few Islamic modernists with serious interest in poetry and mysticism, he is remembered for having argued for the importance of dynamism in Islamic thought. His widely influential *The Reconstruction of Religious Thought in Islam* simultaneously harkens back to Abū Ḥāmid al-Ghazālī as it pushes the discourse into the twentieth century.

Fazlur Rahman (1919–1988). A British-trained scholar of Islam, he highlighted the importance of educational systems in the reinvigoration of Islam. For the last twenty years of his life he taught at the University of Chicago, beginning a long legacy of exiled Muslim intellectuals who took up teaching posts in Europe and North America. A fierce critic of fundamentalism, Rahman is usually acknowledged as the doyen of Islamic modernism in the latter half of twentieth century. Unlike many modernists, Rahman was profoundly steeped in the tradition of Islamic philosophy, especially that of Mullā Ṣadrā (d. 1632).

PROGRESSIVE ISLAM. The most significant development in modernist Islamic thought in the last generation has been the various understandings of Islam that go under the rubric of “progressive Islam.” Fully immersed in postmodern critiques of modernity, progressive Islam both continues and radically departs from the 150-year-old tradition of liberal Islam. Many nineteenth- and early twentieth-century modernists generally displayed an uncritical, almost devotional, identification with modernity and often (though not always) bypassed discussion of colonialism and imperialism. Progressive understandings of Islam, on the other hand, are almost uniformly critical of colonialism, both in its nineteenth-century manifestation and in its current variety. Progressive Muslims develop a critical and nonapologetic “multiple critique” with respect to both Islam and modernity. That double engagement with the varieties of Islam and modernity,

plus an emphasis on concrete social action and transformation, is the defining characteristic of progressive Islam today.

Unlike their liberal Muslim forefathers (who usually were *forefathers*), progressive Muslims represent a broad coalition of female and male Muslim activists and intellectuals. One of the distinguishing features of the progressive Muslim movement as the vanguard of Islamic (post)modernism has been the high level of female participation and leadership. This is particularly the case in Western countries, where a majority of Muslims who self-identify as progressive are female. The majority of progressive Muslims also highlight women’s rights as part of a broader engagement with human rights.

Progressives measure their success not in developing new and beatific theologies but rather by the amount of change for good on the ground level that they can produce in Muslim and non-Muslim societies. As Safi and a number of other prominent authors noted in the volume *Progressive Muslims: On Justice, Gender, and Pluralism* (2003), this movement is noted by a number of themes: striving to realize a just and pluralistic society through critically engaging Islam, a relentless pursuit of social justice, an emphasis on gender equality as a foundation of human rights, a vision of religious and ethnic pluralism, and a methodology of nonviolent resistance.

Muslim libera(c)tion. Progressive Muslims perceive of themselves as the advocates of human beings all over this world who through no fault of their own live in situations of perpetual poverty, pollution, oppression, and marginalization. A prominent concern of progressive Muslims is the suffering and poverty, as well as the full humanity, of these marginalized and oppressed human beings of all backgrounds who are called *mustad’afūn* in the Qur’anic context. The task of progressives in this context is to give voice to the voiceless, power to the powerless, and confront the “powers that be” who disregard the God-given human dignity of the *mustad’afūn* all over this earth. Muslim progressives draw on the strong tradition of social justice from within Islam from sources as diverse as Qur’an and *ḥadīth* (statements of the Prophet Muḥammad) to more recent spokespersons such as ‘Alī Shari’atī. The Qur’an itself specifically links fighting in the cause of God (*Sabīl Allāh*) to the cause of *mustad’afūn*.

The methodological fluidity of progressive Muslims is apparent in their pluralistic epistemology, which freely and openly draws from sources outside of Islamic tradition, so long as they serve as useful tools in a global pursuit of justice. These external sources include the liberation theology of Leonardo Boff, Gustavo Gutiérrez, and Rebecca Chopp, as well as the secular humanism of Edward Said, Noam Chomsky, and others. Progressive Muslims are likely to combine a Qur’anic call for serving as “witnesses for God in justice” (Qur’an 42:15) with the task of a social critic to “speak truth to the powers.”

As is the case with many feminists and African-American scholar-activists, progressives do not accept the di-

chotomy between intellectual pursuit and activism. Whereas many (though not all) of the previous generations of modernist Muslims were at times defined by a purely academic approach that reflected their elite status, progressive Muslims realize that the social injustices around them are reflected in, connected to, and justified in terms of intellectual discourses. They are, in this respect, fully indebted to the majestic criticism of Edward Said. A progressive commitment implies by necessity the willingness to remain engaged with the issues of social justice as they unfold on the ground level, in the lived realities of Muslim and non-Muslim communities.

Progressive Muslims follow squarely in the footsteps of liberation theologians such as Leonardo Boff, who in his *Introducing Liberation Theology* deemed a purely conceptual criticism of theology devoid of real commitment of the oppressed as “radically irrelevant.” Boff recognized that *liberação* (liberation) links together the concepts of *liber* (“free”) and *ação* (“action”): there is no liberation without action. The aforementioned *Progressive Muslims* (Safi, 2003) volume states: “Vision and activism are both necessary. Activism without vision is doomed from the start. Vision without activism quickly becomes irrelevant” (pp. 6–7).

This informed social activism is visible in the many progressive Muslims organizations and movements, ranging from the work of Chandra Muzaffar with the International Movement for a Just World in Malaysia, the efforts of Farid Esack with HIV-positive Muslims in South Africa, and the work of the 2003 Nobel Peace Prize winner, Shirin Ebadi, with groups such as the Iranian Children’s Rights Society. Progressive Muslims are involved in an astonishing array of peace and social justice movements, grassroots organizations, human rights efforts, and the like.

Toward an Islamic humanism. At the heart of a progressive Muslim interpretation is a simple yet radical idea: every human life, female and male, Muslim and non-Muslim, rich or poor, “northern” or “southern,” has exactly the same intrinsic worth. The essential value of human life is God given and is in no way connected to culture, geography, or privilege. A progressive Muslim agenda is concerned with the ramifications of the premise that all members of humanity have this same intrinsic worth because each member of humanity has the breath of God breathed into them: “And I breathed into humanity of my own spirit” (*wa nafakhtu fihi min rūhī*) (Qur’an 15:29 and 38:72). This identification with the full humanity of all human beings amounts to nothing short of an Islamic humanism. In this global humanistic framework, progressives conceive of a way of being Muslim that engages and affirms the full humanity of all human beings, that actively holds all responsible for a fair and just distribution of God-given natural resources, and that seeks to live in harmony with the natural world.

Engaging tradition. Progressive Muslims insist on a serious engagement with the full spectrum of Islamic thought and practices. There can be no progressive Muslim movement that does not engage the textual and material sources

of the Islamic tradition, even if progressives themselves debate what those sources should be and how they ought to be interpreted. Progressives generally hold that it is imperative to work through inherited traditions of thought and practice: Sunnī, Shī‘ī, Šūfī, juridical, philosophical, theological, mystical, poetical, “folk Islam,” oral traditions, and others all must be engaged. In particular cases they might conclude that certain preexisting interpretations fail to offer Muslims sufficient guidance today. However, they can only faithfully claim that position after—and not before—a serious engagement with the tradition.

Social justice, gender equality, and pluralism. Justice lies at the heart of Islamic social ethics. Time and again the Qur’an talks about providing for the marginalized members of society: the poor, the orphan, the downtrodden, the wayfarer, the hungry, and so forth. Progressive Muslims believe that it is imperative to translate the social ideals in the Qur’an and Islamic teachings in a way that those committed to social justice today can relate to and understand. For all Muslims there is a vibrant memory of the Prophet repeatedly talking about a real believer as one whose neighbor does not go to bed hungry. Progressives hold that in today’s global village, it is time to think of all of humanity as one’s neighbor.

Progressive Muslims begin with a simple yet radical stance: the Muslim community as a whole cannot achieve justice unless justice is guaranteed for Muslim women. In short, there can be no progressive interpretation of Islam without gender justice. Gender justice is crucial, indispensable, and essential. In the long run, any progressive Muslim interpretation will be judged by the amount of change in gender equality it is able to produce in small and large communities. Gender equality is a measuring stick of the broader concerns for social justice and pluralism. As Shirin Ebadi, the 2003 Nobel Peace Prize winner, stated, “Women’s rights *are* human rights.”

Progressive Muslims strive for pluralism both inside and outside of the *ummah*. They seek to open up a wider spectrum of interpretations and practices marked as Muslim and epistemologically follow a pluralistic approach to pursuit of knowledge and truth. In their interactions with other religious and ethnic communities, they seek to transcend the arcane notion of “tolerance” and instead strive for profound engagement through both commonalities and differences.

Progressives and *jihād*. The pervasive discourse of *jihād* has become thoroughly associated with Islam, to the point that one may legitimately ask whether the term can be redeemed. Both Muslim extremist groups such as al-Qā‘idah and Western Islamophobes in fact do use the term to mean a holy war. On the Muslim side, one can point to the public statement of Usāmah bin Lādin: “In compliance with God’s order, we issue the following *fatwa* to all Muslims: The ruling to kill the Americans and their allies—civilians and military—is an individual duty for every Muslim who can do it in any country. . . .” Scholars of Islamic law have been quick to point out that the very parameters of this alleged

“*fatwa*” violate both the letter and the spirit of Islamic law. At the same time, one has to acknowledge that bin Lādin supports his own recourse to violence through the discourse of *jihād*. This same sentiment is reflected on the Western Islamophobic side, where many Christian evangelicals are recasting centuries old polemic against Islam in a new guise.

Progressive Muslims counter both the Muslim extremists’ and the Western Islamophobes’ definition of *jihād*. Instead, they hold firmly to the notion that *jihād* is key, not in the sense of holy war and violence but rather in its root meaning of resistance and struggle. In this regard, progressives in the Muslim community emphasize the responsibility to engage the wider social order by confronting injustice and inequality, while always remembering that one must do so in a nonviolent way. In doing so, they are the heirs of both Muslim visionaries such as the mystic Rūmī (“Washing away blood with blood is impossible, even absurd!”) as well as exemplars of nonviolence such as Gandhi, Martin Luther King Jr., and the Dalai Lama. This new understanding of *jihād*, which seeks to uphold resistance to well-entrenched systems of inequality and injustice through nonviolent means, is one of the key contributions of progressive Muslims. Building on the comments of religious figures such as the Dalai Lama (in his Nobel acceptance speech), they recognize that even terms like “peace” are insufficient when peace is not connected to justice and the well-being of humanity. The goal is not simply peace in the sense of absence of war but rather a peace that is rooted in justice.

Also revealing their indebtedness to American voices of social justice, many progressive Muslims are also inspired by Martin Luther King Jr. For these Muslims, King embodies speaking out for justice from the depth of a religious commitment, from the very midst of a faith community to that community and beyond. Thus, he is a great source of inspiration for many progressive Muslims to be voices of conscience speaking not in the wilderness but in the very midst of society. Progressives thus seek to be voices for global justice speaking firmly and powerfully to the powers that be while perpetually affirming the dignity of all human beings.

AN ISLAMIC REFORMATION? Modernist Muslims are often asked whether their project constitutes an “Islamic reformation.” They answer the question in both the affirmative and the negative. It is undeniably true that there are serious economic, social, and political issues in the Muslim world that need urgent remedying. Much of the Muslim world is bound to a deeply disturbing economic structure in which it provides natural resources such as oil for the global market while at the same time remaining dependent on Western labor, technological know-how, and staple goods. This economic situation is exacerbated in many parts of the modern Muslim world by atrocious human rights situations, crumbling educational systems, and worn-out economies. Most modernist Muslims would readily support the reform of all those institutions.

However, the term *reformation* carries considerably more baggage than that. In speaking of the “Islamic reformation,” many people have in mind the Protestant Reformation. It is this understanding that leaves many Muslims uneasy. Theirs is not a project of developing a “Protestant” Islam distinct from a “Catholic” Islam. Most insist that they are not looking to create a further split within the Muslim community so much as to heal it and to urge it along. For this reason, iconic figures such as Shirin Ebadi eschew the language of “reform” and “reformation,” instead calling for a return to a real, just Islam.

A global phenomenon or a Western Islam? It would be a clear mistake to somehow reduce the emergence of progressive Islam to a new “American/Western Islam.” Progressive Muslims are found everywhere in the global Muslim *ummah*. When it comes to actually implementing a progressive understanding of Islam in Muslim communities, particular communities in Iran, Malaysia, and South Africa *lead*, not follow, the United States. Many American Muslim communities—and much of the leadership represented in groups such as Islamic Circle of North America, the Islamic Society of North America, and the Council on American-Islamic Relations—are far too uncritical of Salafī (if not outright Wahhābī) tendencies that progressives oppose.

Wahhabism is by now a well-known, puritanical reading of Islam that originated in eighteenth-century Saudi Arabia. It was not until the discovery of oil in Saudi Arabia that Wahhabism had the financial resources necessary to import its evangelical mission all over the world, including to the United States. In spite of their exclusivist ideology, Wahhābīs have had a great working relationship first with the British and since the 1930s with the U.S. administration. Lesser known is the Salafī movement, which represents an important school of Islamic revivalism. Salafīs espouse a “return” to the ways of the first few generations of Muslims, the “righteous forefathers.” Central to their methodology has been a recentering of Qurʾān and *sunnah* of Prophet Muḥammad. It would be a mistake to view American Muslim organizations such as ISNA and ICNA as Wahhābī. On the other hand, interpretations of Islam such as Shiism and Sufism are largely absent from these organizations, and the representation of important and contested issues such as gender constructions tends to reflect a conservative, Salafī orientation as well. It is in opposition to both Wahhabism and Salafism that many Muslim progressives define themselves.

One also has to acknowledge that the European and more importantly the North American context has provided a fertile ground for the blossoming of progressive Islam. Many participants in this young movement have found a more hospitable and open environment in the North American milieu than in Muslim-majority areas. Even the contested public world of post-9/11 America still offers great possibilities for conducting public conversations about difficult matters of religion and politics. It would be hard to imagine those critical conversations taking place freely and openly in

many Muslim countries. Also one has to acknowledge the significance of North American educational establishments, as well as many fruitful cross-pollinations with liberal religious institutions, human rights groups, and the like.

Challenges to Islamic modernism. Muslim modernists face a whole host of challenges. Many modernists have profound internal disagreements about issues ranging from hermeneutical approaches to Qurʾān and *ḥadīth*, women's rights, and others. More problematic is the ongoing question of modernity versus the hegemony of the West. Many modernists have wrestled with the question of how to incorporate political institutions, science, and the like from the same Western civilizations that have continued to colonize and exploit much of the Third World, including many Muslim-majority countries.

Some initial phases of Islamic modernism became entangled in apologetic presentations of Islam in which Islam was idealized and imagined as an initially perfect system that had only been sullied through the misogyny and stagnation of later Muslim generations. That presupposition does not enable one to deal constructively with problematic questions in the Qurʾān or the lifetime of the Prophet and the early companions, even as it dismisses useful resources in later developments.

Other challenges are external. Muslim modernists do not have a natural institutional home other than academia and some media outlets. They have continuously struggled to find a home in the *madrasah* systems, although in some places they have achieved a measure of success because of the efforts of Muḥammad ʿAbduh and others. In other cases, they live in exile (Fazlur Rahman and Naṣr Abū Zayd, for example) for having been persecuted in their homeland. Politically they have often come under attack from a number of directions: state authorities who find the modernists' political critiques disturbing; secularists who are puzzled by the modernists' continued involvement with Islam; traditional religious authorities whose own understanding of Islam is undermined by the modernists. In spite of all the above, some modernists such as Fazlur Rahman and Iqbal have the strange designation of being the target of persecution as well as large-scale admiration.

In conclusion, it is clear that Muslims are entering yet another age of critical self-reflection. Given the level of polemics and apologetics, it is extraordinarily difficult to sustain a critical level of subtle discourse. Yet these Muslims today are not merely initiating social transformation, they are reflecting much wider processes at the same time. They are well situated to provide the most balanced and critical synthesis of Islam and modernity.

BIBLIOGRAPHY

There are some classical studies for each phase of Islamic modernism, but to get a sense of the flavor and methodology of mod-

ernists, there is no substitute for actually reading the primary sources.

The finest place to begin a study of Islam in the contemporary world is Carl Ernst, *Following Muhammad: Rethinking Islam in the Contemporary World* (Chapel Hill, N.C., 2003). For an encyclopedic reference, the four-volume *The Oxford Encyclopedia of the Modern Islamic World* (New York, 1995), edited by John L. Esposito, is a useful resource. The often neglected eighteenth-century context can be studied through N. Levtzion and J. Voll's *Eighteenth Century Renewal and Reform in Islam* (Syracuse, N.Y., 1987). For nineteenth-century and early twentieth-century figures, the classic study remains Albert Hourani's masterpiece, *Arabic Thought in a Liberal Age: 1798–1939* (1962; reprint, Oxford, 1983). It can be supplemented with as Ibrahim M. Abu-Rabi's *Intellectual Origins of Islamic Resurgence in the Modern Arab World* (Albany, N.Y., 1996).

For anthologies of primary sources with useful introductions, there is no better source than the two volumes edited by Charles Kurzman. *Liberal Islam: A Sourcebook*. (New York, 1998) deals more or less with twentieth-century figures, and *Modernist Islam 1840–1940: A Sourcebook* (New York, 2002) with slightly earlier intellectuals. Both are worth going through in detail.

For an overview of Muḥammad ʿAbduh, see his *The Theology of Unity* (London, 1955). A good secondary study is Malcolm H. Kerr's *Islamic Reform: The Political and Legal Theories of Muhammad ʿAbduh and Rashid Rida* (Berkeley, Calif., 1966). Muhammad Iqbal's widely influential *The Reconstruction of Religious Thought in Islam* (Lahore, Pakistan, 1951), reprinted numerous times, is a ubiquitous study of modernist Islam. Another master of Islamic modernism, Fazlur Rahman, can best be approached through two of his works, *Islam and Modernity: Transformation of an Intellectual Tradition* (Chicago, 1984) and *Revival and Reform in Islam: A Study of Islamic Fundamentalism*, edited by Ebrahim Moosa (Oxford, 2000).

Important feminist reevaluations of Islamic history and the rise of the women's movement include Leila Ahmed's *Women and Gender in Islam: Historical Roots of a Modern Debate* (New Haven, Conn., 1992). A more positive reading of the possibility of incorporating feminism into Qurʾānic hermeneutics is Amina Wadud's *Qurʾān and Woman* (Oxford, 1989; reprint 1999). For modernist reevaluation of Islamic law, particularly in the area of gender, the classic study is Khaled Abou El Fadl's *Speaking in God's Name: Islamic Law, Authority and Women* (Oxford, 2001).

A critical evaluation of Wahhabism is Hamid Algar's *Wahhabism* (Oneonta, N.Y., 2002). A less polemical study is Ahmad Dallal's "The Origins and Objectives of Islamic Revivalist Thought, 1750–1850," *Journal of the American Oriental Society* 113, no. 3 (1993): 341–359. Also worth consulting is Michael Cook's "On the Origins of Wahhabism," *Journal of the Royal Asiatic Society* 2 (1992): 191–202.

A brilliant anthology of how Neoconservatives, Western Triumphalists, and Christian Evangelicals define Islam as the latest "other" against which the "West" is defined is *The New Crusades: Constructing the Muslim Enemy*, edited by Emran Qureshi and Michael A. Sells, (New York, 2003). The classic study that deconstructs the meta-discourse of "Islam and vio-

lence” is Bruce Lawrence, *Shattering the Myth: Islam beyond Violence* (Princeton, N.J., 2000). A prominent intellectual who argues for the necessity of incorporating a Western identity into Islamic consciousness is Tariq Ramadan, author of *Western Muslims and the Future of Islam* (New York, 2003). A useful study of pluralistic readings of the Qur’an is Abdulaziz Sachedina’s *The Islamic Roots of Democratic Pluralism* (New York, 2001) and Suha Taji-Farouki, ed. *Modern Muslim Intellectuals and the Quran* (Oxford, 2004).

Lastly, Omid Safi’s edited volume, *Progressive Muslims: On Justice, Gender, and Pluralism* (Oxford, 2003), features the writings of fifteen prominent Muslim intellectuals and activists in areas ranging from social justice to religious pluralism and gender equality. The study marks the full turning point from uncritical engagements with modernity in Islamic liberalism and modernism to a progressive understanding that adopts a critical stance vis-à-vis both Islam and modernity.

OMID SAFI (2005)

MODERNISM: CHRISTIAN MODERNISM

The related terms *liberalism* and *modernism*, when occurring in a religious or theological context, are usually no less imprecise than when used with other references. As T. S. Eliot put it: “Liberalism is something which tends to release energy rather than accumulate it, to relax, rather than to fortify. It is a movement not so much defined by its end, as by its starting point; away from, rather than towards, something definite.” Accordingly the content of a set of doctrines or principles described as liberal depends upon that of the “orthodoxy” from which such liberalism diverges, or which it relaxes or qualifies. Much the same applies to *modernism*, which refers not simply to what exists today but to something deemed to be distinctive of today or of the more recent past, and so to be commended as such, in contrast to what represents a settled tradition or a historic inheritance. Defining both terms therefore presents difficulties, and an understanding of what either signifies is best reached by observing how in fact the word has been used, and in particular by recording agreement as to what it at least denotes.

The word *liberalism* was employed early in the nineteenth century to designate “the holding of liberal opinions in politics or theology.” Theologically the word did not at first have a favorable connotation. Thus Edward Irving stated in 1826 that whereas “religion is the very name of obligation . . . liberalism is the very name of want of obligation.” John Henry Newman went further and spoke in 1841 of “the most serious thinkers among us” as regarding “the spirit of liberalism as characteristic of the destined Antichrist.” Liberalism itself he stigmatized in 1864 as “false liberty of thought, or the exercise of thought upon matters in which, from the constitution of the human mind, thought cannot be brought to any successful issue, and therefore is out of place.” More succinctly, Newman condemned it as “the anti-dogmatic principle.”

Gradually, however, this view point changed with the broader adoption by theologians of opinions more or less

critical of received dogma or traditional interpretations of scripture. Employment of the word *liberalist* came instead to be a mark of approval, in opposition to attitudes referred to pejoratively as traditionalist, dogmatist, or even obscurantist. Moreover, liberalism was taken to signify a readiness not only to modify or actually negate certain doctrines or beliefs usually associated with received religious teaching but also to propagate views of a more positive nature, such as the necessity for freedom of inquiry and research and the conviction that new knowledge, when soundly based, will not prove subversive of fundamental religious truth but rather be a light by which to clarify and enhance such truth. Hence to be identified as “liberal” was regarded as a compliment by an increasing number of Protestant thinkers and scholars in the later nineteenth and early twentieth centuries.

At about the same time the term *modernism* gained currency, especially in Anglican circles, as an alternative, and preferable, designation for such theological liberalism. However, *modernism* has long been accepted in a stricter sense as indicating a type of “progressive” theological opinion to be found in the Roman Catholic Church during the pontificates of Leo XIII and Pius X, and many would now consider usage of the word best limited to this latter sense. “Liberal Catholicism” also designates certain tendencies in nineteenth-century Roman Catholicism, notably in France. Its concern, however, was more political and social than theological.

Attitudes that could in some sense be characterized as liberal or modernist have been recurrent throughout the history of Christian thought, but the movements or tendencies that usually carry one of these epithets are of nineteenth- or twentieth-century occurrence, and in the interest of clarity the present entry will observe this restriction.

The immediate intellectual background of theological liberalism was the Enlightenment of the eighteenth century, with its striving for political, social, and cultural liberty. The criterion of “enlightened” judgment was the use of reason, in which the mysteries of religious faith were prone to seem mere relics of the ignorance and superstition of the past. Deism became the widely prevalent expression of this largely negative standpoint. A new era opened with the later philosophy of the century’s greatest thinker, Immanuel Kant, who sought by an analysis of the nature of knowledge itself to offer a rational justification for faith. But the answer he produced in the *Critique of Pure Reason* (1781) was such as to destroy the long-established “natural” theology that most Deist as well as orthodox thinkers regarded as fundamental. In its place he put the witness of the moral consciousness: belief in God was to be seen, philosophically, as a postulate of “practical,” or moral, reason. The scientific understanding could not prove the existence of God, but the will, as the faculty of the moral life, required it. Kant’s own philosophy of religion—or, more correctly, his philosophy of the Christian religion—was embodied in his suitably entitled *Religion within the Limits of Reason Alone*, one of the main sources

from which modern theological liberalism derives. Indeed, Paul Tillich is right in claiming Kant's teaching as "decisive for the theology of the nineteenth century" (*Perspectives on Nineteenth and Twentieth Century Protestant Theology*, London, 1967, p. 64).

The perspective within which Kant views religion appears, on the face of it, narrow. Religion, he maintains, is morality; or at all events morality is of its very substance, albeit construed in terms of divine command. In other words, the religious problem is not a speculative one in which the religious object is validated primarily at the metaphysical level; it is a practical problem, pertaining wholly to man's ethical nature. "The illusion of being able to accomplish anything in the way of justifying ourselves before God through religious acts of worship is *superstition*" (*Religion within the Limits of Reason Alone*, New York, 1960, p. 162). The reductionism that this implies therefore necessitates a critique of traditional beliefs and institutions in anticipation of a more positive statement of what a genuinely rational Christianity must involve. Such insistence on the need for distinguishing between the essential and the nonessential—reason and conscience providing the criteria—was to become the guiding principle of all forms of liberal Christianity, and especially of German nineteenth-century Protestantism.

LIBERAL PROTESTANTISM. Nevertheless, if liberalism is to attain any sort of useful definition, some discrimination has to be made. "Liberal Protestantism," that is to say, is not simply to be equated with "Protestant liberalism." "A moderately orthodox believer," said the French liberal theologian Jean Réville, "may practise liberalism; he will not thereby become a liberal Protestant" (*Liberal Christianity*, London, 1903, p. 17). Protestant liberalism is in fact no more than the conception of Christianity of those who combine a liberal turn of mind with a broadly Protestant type of religious conviction. Such a position is subject, obviously, to many different sources of influence and offers a wide variety of opinion. Liberal Protestantism, on the other hand, is a designation best applied to the kind of theological thinking that, against a generally Lutheran background, developed in Germany during the nineteenth century under the stimulus first of Friedrich Schleiermacher and then of Albrecht Ritschl. Not that it remained confined to Germany: in France, Auguste Sabatier (1839–1901) and Jean Réville (1854–1908) himself, for example, may fairly be classed as liberal Protestants, as are such men as the Presbyterian William Adams Brown in the United States and the Congregationalists T. R. Glover and C. J. Cadoux in Great Britain. Again, Kantian reverberations are as a rule clearly audible in liberal Protestantism, whereas in Protestant liberalism (at all events, in an English and Anglican setting) the prevailing spirit is more that of the seventeenth-century Cambridge Platonists or the latitudinarianism associated with archbishop John Tillotson (1630–1694) than that of Kant or, still less, of Schleiermacher.

Yet to press such distinctions too far would be to obscure the very large amount of common ground that liberals

of all shades of opinion occupy in contrast to traditionalist, let alone "fundamentalist," views. Differences are less of kind than of degree, and they are inevitably marked by national and denominational characteristics. Thus all liberals desire, first, a broad interpretation of dogmatic formularies, where these exist and retain some authority. Second, they are cool toward theological speculation that appears to have no particular ethical relevance. And third, they are especially sensitive to the impact on traditional belief of new knowledge in the sciences, both natural and historical. Indeed, in the more recent phases of liberal religious thought, a determining factor has been the historical criticism of the Bible and the effect that this criticism is bound to have upon the understanding and use of scripture—always for Protestants the ultimate source of Christian doctrine. Hence the varieties of liberalism arise in the main from differing responses on the part of individual religious thinkers to each of these leading considerations.

The starting point for a study of liberal Protestantism is the work of Schleiermacher (1768–1834), "the father of modern theology," as he has fitly been called. Kant, for all his anticipation of subsequent trends of thought, was very much an eighteenth-century figure, in whom the individualist note of ethical rationalism was all-pervasive. Schleiermacher, on the other hand, brought to religious reflection a different spirit. For him religion was primarily a condition of the heart; its essence is feeling (*Gefühl*). Without a deep emotional impulse it cannot be sustained in its true character and becomes either dogmatism or moralism. Authentic religion is, rather, a "submission to be moved by the Whole that stands over against man," a "sense and taste for the Infinite." In his great work on systematic theology, *The Christian Faith* (1821–1822; 2d ed., 1830), Schleiermacher called religion a "feeling of absolute dependence" or, for the Christian specifically, a feeling of absolute dependence upon "God in Christ." Thus in Schleiermacher's religious philosophy a fundamental principle of liberalism is already evident, namely, the appeal to inward experience, and therewith an element of subjectivism from which the liberal standpoint can never be dissociated. In this, indeed, Schleiermacher had been anticipated by Kant; but whereas for Kant the subjective determinant was moral, for Schleiermacher it could best be described as aesthetic. In the subsequent development of liberal Protestantism, the moral factor was consistently the more potent.

This is especially so in the teaching of Ritschl (1822–1889), the most influential German theologian of his era, who for the greater part of his career held the chair of theology at the University of Göttingen. His main literary work was *The Christian Doctrine of Justification and Reconciliation* (1870–1874). Ritschl disliked Schleiermacher's emphasis on feeling, and although his own concern was strongly ethical, he believed also that faith must have an objective basis. Such objectivity, however, he found not in metaphysics, Hellenic or Hegelian (for which, as far as theology was concerned,

Ritschl had no use), but in history, or rather in the unique historical events of the New Testament. In his younger days he had come under the influence of the eminent Tübingen historian of early Christianity, Ferdinand Christian Baur (1792–1860), whose skeptical conclusions in this field had to a large extent been dictated by his Hegelian presuppositions. But by 1856 Ritschl had repudiated the Tübingen position, although he welcomed historical criticism as such since he believed that recourse to the original salvific events would bypass the metaphysical Christology of Catholic dogma, which to the genuinely religious mind had become an impediment. In short, he saw Christianity as essentially a life devoted to action, both Godward and manward, in which the ethical imperative is supreme. The corollary of this was that religious doctrines are not assertions of fact, in the ordinary meaning of the word, but “value judgments” (*Werturteile*) expressive of humanity’s attitude to the world about it and relating to its moral and spiritual ends. For the human claim to moral freedom and the responsibility that this entails is, in Ritschl’s mind, the necessary counterbalance to the determinism of nature as described by modern science, and the primary role of religion is to uphold this claim. To quote Ritschl: “In every religion what is sought, with the help of the supernatural power revered by man, is a solution of the contradiction in which humanity finds itself, as both a part of the world of nature and a spiritual personality claiming to dominate nature” (*Justification and Reconciliation*, Edinburgh, 1874–1900, p. 199).

For Ritschl, the distinctiveness of Christianity lay in the unique clue to an understanding of the divine nature and purposes offered by Jesus, who for the Christian is the sole medium of salvation. And Jesus as the Christ is to be known not through any abstruse theology of his person, but by his work—that is, by his own consciousness of God communicated in turn to us, whereby one experiences forgiveness of sin and restoration of the desire and power to do the will of God. The church, to which Ritschl attached high importance, is the only sphere in which justification and reconciliation are experienced. As such, it is the community of the redeemed.

Ritschlianism, however, includes more than the personal teaching of Ritschl himself and comprises the thinking of a number of theologians prominent in German Protestantism down to at least the outbreak of World War I. It also was not without its representatives in the Anglo-Saxon world. Of the German Ritschlians, the most distinguished were Wilhelm Herrmann (1846–1922), Julius Kaftan (1848–1926), and Adolf von Harnack (1851–1930). Indeed, Herrmann’s *The Communion of the Christian with God* (1886) is perhaps the most typical as well as the most sympathetic expression of the Ritschlian viewpoint one could cite. Its author, who was professor of theology at the University of Marburg, was if anything even more anxious than Ritschl to sunder Christian doctrine from all traffic with metaphysical philosophy. For him, as for Ritschl, the heart of the gos-

pel is an ethical ideal, and confessions of theological belief are altogether secondary. The object of a Christian’s faith is Jesus as he lived. The more radical side of Ritschlianism is represented by Harnack, for many years professor of church history at the University of Berlin. Here again the bedrock of faith is the historical Jesus. In his well-known *What Is Christianity?* (1900), Harnack sets aside the entire Catholic tradition of dogma, hierarchy, and cult; indeed, under the guiding light of modern criticism, he goes far beyond Reformation Protestantism in negating the past. To discover the *Wesen*, the essence, of the Christian religion, the theologian of today must return not merely to the New Testament— theological distortion had already begun with Paul—but to the teaching of Jesus as preserved in the Synoptic Gospels, the heart of which is the principle of the fatherhood of God and the brotherhood of man. The “kingdom” that Jesus preached, shorn of its apocalyptic trappings, must therefore be understood in a purely ethical sense. “The individual is called upon to listen to the glad message of mercy and of God’s Fatherhood, and to make up his mind whether he will be on God’s side as the Eternal’s, or on the side of the world and time.”

The final phase of liberal Protestantism is really post-Ritschlian and centers upon the *religionsgeschichtliche Schule* (history of religions school), typified in the work of Ernst Troeltsch (1865–1923) and Wilhelm Bousset (1865–1920). Troeltsch, at first professor of theology at the University of Heidelberg and afterward professor of the history of philosophy at the University of Berlin, was much influenced by the sociologists Wilhelm Dilthey and Max Weber. The fact, as Troeltsch saw it, that Christianity, like any other cultural phenomenon, must be understood primarily in relation to its attendant historical conditions inevitably posed the problem of the absoluteness of its claims in respect not only to the world’s other religions but to cultural change generally. The proper approach to Christianity appeared to be by way of the history and philosophy of religion; dogmatic theology acquired relevance only within this broader scholarly framework. Not surprisingly, it was an opinion that to the more traditionally minded placed divine revelation at the disposal of a relativistic historicism. This, along with the persistent anthropocentrism of liberal theology, was to lead, by the end of World War I in 1918, to the antiliberalist reaction of Karl Barth, whose *Epistle to the Romans* appeared in the following year, and to the so-called neoorthodox movement generally.

But despite the powerful Barthian influence that lasted for at least four decades into the twentieth century, the liberal aim of communicating the Christian message to modern humanity in terms of its own modernity was not revoked. This aim is evident enough in the work of two of Barth’s most outstanding Protestant contemporaries, Paul Tillich and Rudolf Bultmann, albeit that the associated philosophy here is existentialism rather than post-Hegelian idealism. Moreover, the distinctively humanist tone that since about 1960 has come more or less to pervade virtually all Western

theological thinking is clearly continuous with the older liberalizing attitudes.

In the English-speaking world, liberal Protestantism did not form so clearly defined a force as it did in Germany. At any rate it is more difficult to distinguish between liberal Protestants, in Réville's meaning of the term, and theological liberals in a broader sense. But in this broader sense liberalism is multifarious, depending on varying denominational allegiances, although also to a large extent on individual interests and idiosyncrasies. Classification therefore demands much tact.

The antecedents of English liberalism, particularly within the Anglican context, are to be located in eighteenth-century latitudinarianism, in the "noetic" school at Oxford University in the early nineteenth century—whose chief exponents are Richard Whately (1787–1863), Renn Dickson Hampden (1793–1868), and Thomas Arnold (1795–1842)—and in the midcentury "broad church" as represented by H. H. Milman (1791–1868), A. P. Stanley (1815–1881), and Benjamin Jowett (1817–1893), as indeed by all the authors of *Essays and Reviews* (1860), including Jowett. Frederick Denison Maurice (1805–1872), in some ways the most fertile theological mind of his time in England, eschewed the name "broad church," but his teaching, permeated as it was with the influence of Samuel Taylor Coleridge, had a broadening effect within the Church of England and undoubtedly contributed substantially to the shaping of modern Anglicanism. Maurice himself seems scarcely to have appreciated the unsettling effect on orthodox thinking of the historical criticism of the Bible.

A more self-consciously innovative type of liberalism, however, made its appearance toward the end of the century. It was associated with the names of Percy Gardner (1846–1937), professor of classical archaeology at Oxford University; Hastings Rashdall (1858–1924), dean of Carlisle; W. R. Inge (1860–1954), dean of Saint Paul's, London; H. D. A. Major (1871–1961), principal of Ripon Hall, Oxford; and E. W. Barnes (1874–1953), bishop of Birmingham. All of them were connected with the Modern Churchmen's Union, founded in 1898, and with its organ the *Modern Churchman*. But their "modernism"—to use their own preferred designation—had little theological coherence. Such unity as it possessed stemmed chiefly from a marked opposition to the doctrine and practices of the Anglo-Catholic party within the established church. The Union achieved its highest public notice with its Cambridge conference of 1921 on the general theme of "Christ and the Creeds." Rashdall's paper "Christ as the Logos and Son of God" aroused sharp controversy with such statements as the following: "It is impossible to maintain that God is fully incarnate in Christ, and not incarnate at all in any one else." But by the end of the 1930s Anglican modernism was in decline and is now but the merest wraith of its former self. Indeed, the very name has been virtually abandoned.

A liberalism more akin to continental liberal Protestantism was to be found among the English Nonconformists, or "Free Churchmen," rather than among Anglicans. In the main, however, the Free Church theologians, of whom the most distinguished representatives included P. T. Forsyth and A. E. Garvie (the latter a close student of Ritschlianism), were less inclined to doctrinal novelty than were some of their Anglican contemporaries. The Congregationalist R. J. Campbell (1867–1956), author of *The New Theology* (1907), was an exception. So too was T. R. Glover (1869–1943), a Cambridge classical scholar and author of the popular *Jesus of History* (1917), the thesis of which is much the same as that of Harnack's *What Is Christianity?* Another exception was C. J. Cadoux (1883–1947), whose *Catholicism and Christianity* (1928) propounded a radical critique of Catholic orthodoxy from a liberal angle. The Unitarian tradition, maintained with high repute throughout the nineteenth century by James Martineau (1805–1900)—perhaps the greatest Protestant liberal of his era in England—was also represented, if somewhat journalistically, by L. P. Jacks (1860–1955).

In America the liberal movement in religious thought may be said to have begun with William Ellery Channing (1780–1842). Brought up in the strict ways of New England Calvinism, Channing came to be considered a Unitarian. But critical though he was of traditional doctrines, he believed Christ to have been the perfect revelation of God and the living ideal of humanity. Against Calvinism he set a confident faith in an individual's freedom and inherent capacity for good as a child of God. The leader of the New England Transcendentalist movement, Ralph Waldo Emerson (1803–1882), whom Matthew Arnold, addressing an American audience, described as "your Newman, your man of soul and genius," remains the best-known American religious thinker of the nineteenth century. His religious views are expounded in *Nature* (1836) and the two volumes of *Essays* (1841–1843). The basis of his position was belief in the essential divinity of man; redemption was to be sought in the individual's possession of his or her own soul by original thought and effort. Jesus, he held, was best honored by following his example. A liberal of more orthodox persuasion was Horace Bushnell (1802–1876), who for much of his career was pastor of the North Church at Hartford, Connecticut. His *Discourse on Christian Nurture* (1847) took a mediating line between the old orthodoxy, with its preoccupation with Original Sin and human depravity, and Enlightenment theories of human perfectibility. In *God in Christ* (1849) he applied the moral criterion to dogma, and he insisted that even in scripture the "soul" must be distinguished from the "body."

Nearer the close of the century European influences—and not least Ritschlianism—are discernible in American theology, notably in the writings of H. C. King (1858–1934), president of Oberlin College, Ohio, and William Adams Brown (1865–1943) of Union Theological Semi-

nary, New York, whose work *The Essence of Christianity* appeared in 1902. Among historical scholars of a liberal bent was A. C. McGiffert (1861–1933), also of Union Theological Seminary, who believed religious certitude to be, in the last resort, independent of historical events. Other prominent liberals of the early twentieth century include the well-known New York preacher Harry Emerson Fosdick; Shailer Mathews, whose book *The Faith of Modernism* (1925) is as forthright a statement of liberal ideals as could be wished; and H. N. Wieman, author of *The Wrestle of Religion with Truth* (1927).

ROMAN CATHOLIC MODERNISM. The use of the word *Modernism* in restricted reference (hence the capitalization of its initial letter) to a movement of a theologically “modernizing” or liberalizing character in the Roman Catholic Church at the turn of the twentieth century has already been alluded to. But it should at once be said that to describe Roman Catholic Modernism as a movement at all is somewhat misleading, as it had little cohesion, and those to whom the designation “Modernist” has usually been applied do not in any sense constitute a school. As the most famous of them, Alfred Loisy (1857–1940), expressly stated, they were only “a quite limited number of persons” who individually shared “the desire to adapt the Catholic religion to the intellectual, moral and social needs of the present time.” But the exact determination of their overall aim differed from one writer to another, according to his particular interest. Thus the only satisfactory way of studying Modernism is not to attempt to impose upon it a schematization like that of Pius X, by whose encyclical *Pascendi dominici gregis* it was condemned in 1907, but to examine and assess each author’s contribution to the cause as a whole. The countries where Modernist tendencies were most in evidence were France, Italy, and England. Germany, rather surprisingly, was less affected, and in the United States it had no real following at all.

The task that, in one way or another, the Modernists undertook was that of presenting the world of their day with a defense of Catholicism, in both its doctrinal and institutional aspects, which could be accepted as intellectually plausible. In other words, what Protestant liberals had done for the Reformation tradition they would attempt for the post-Tridentine, and their procedure was often no less radical. Thus Loisy, in *The Gospel and the Church* (1902), approached the whole problem of historical Catholicism—its dogmas, its hierarchy, its cult—along evolutionary lines as a natural growth responsive to spiritual and social needs and determined by the continuously changing cultural environment. A direct reply to Harnack’s *What Is Christianity?*, Loisy’s book denied that the essence of Christianity could be located at any one stage or identified with any single element within its historical life. The entire historical life of Christianity, he maintained, alone provided the data for a true—because empirically grounded—estimate of what the Christian religion is. In this context, Catholicism will be seen to be justified—so Loisy argued—by the sheer fullness and diversity of its content. Similar arguments were used by the

Anglo-Irish Jesuit George Tyrrell (1861–1909), notably in his posthumous work *Christianity at the Cross Roads* (1910).

The peculiar difficulty facing the Modernists lay in seeking to validate a form of Christianity that appeared fatally vulnerable to historical criticism. Indeed, they felt that the main pressure upon faith came from precisely this quarter, and the familiar type of Catholic apologetic, tied as it was to biblical fundamentalism, was incapable of meeting it. Moreover, the question of dogma also raised other issues, of a philosophical order. Catholic philosophy, by official direction, meant Thomism, although more often than not Thomism conceived in a narrow, unhistorical, and scholastic form. A more dynamic religious philosophy was wanted, according to Modernists like the French Oratorian Lucien Laberthonnière (1860–1932), a disciple of Maurice Blondel (1861–1949), as well as to the Bergsonian Édouard Le Roy (1870–1954) and to Ernesto Buonaiuti (1881–1946), protagonist of the Italians and author of *The Program of Modernism* (1907). For a more dynamic philosophy they looked not to Kant, as Pius’s *Pascendi* had alleged, but rather to the voluntarist tradition of much nineteenth-century French thought and even to American pragmatism. Tyrrell and Laberthonnière both stressed the role of the will in belief and were disposed to understand doctrine in terms of an ethical symbolism. Le Roy’s account of dogma (*Dogme et critique*, 1907), in particular, represented it primarily as *une règle de conduite pratique* (“a rule for practical conduct”), without intrinsic speculative content. Thus the doctrine of the divine personality means in effect “Conduct yourself in your relations with God as you would in your relations with a human person.” The vindication of dogma, therefore, will rest on its capacity to induce the experience in which it is itself grounded.

However, the Modernist apologetic, whether historical or philosophical, won no approval at Rome, and the movement was summarily suppressed. In 1910 a specifically anti-Modernist oath was imposed on the clergy, or at least those engaged in teaching. The result of the Vatican’s action was to retard Catholic biblical scholarship, as well as practically all non-Thomist theological thinking, for many years to come.

ASSESSMENT OF LIBERALISM. The strength of liberalism lay in its conviction that the Christian gospel can be offered to modern individuals without affront to their intelligence. It recognized frankly that Christian belief arose, developed, and was formulated in an era and a culture vastly different from that of nineteenth- and twentieth-century Western society, and that both its intellectual presuppositions and the language in which it came to be articulated are inevitably alien and even in large measure unintelligible to this age. Unless therefore one tries to seal oneself off from all contemporary influences, one is bound to reassess the basics of faith in the light of the radically altered ways of thinking that the post-Reformation era has brought about. Especially must Christianity be seen in the perspective of scientific history, even

though this may no longer support forms of belief that have persisted over centuries. Indeed, it is difficult to see how on this score the liberal case can be refuted; the facts speak for themselves, and any modernized version of the Christian religion has to take account of them from the outset.

Nevertheless, liberalism has had its critics from at least the beginning of this century, and not merely among the partisans of a crass traditionalism. To many, its immanentist theology greatly overemphasized the continuity between the world and God and between humanity and God, at the expense of the received belief, on which the whole scheme of redemption turned, that as between finite and infinite, human and divine, there is a qualitative and not merely a quantitative disparity. (The liberal Christology is usually circumscribed by the humanity of Jesus.) In keeping with this, liberalism seemed to its critics if not altogether to minimize sin and evil, yet to interpret these too easily in terms of ignorance, immaturity, and simple maladjustment, while overlooking the sheer heinousness of sin. In fact, liberalism's view of humankind exhibited an optimism stemming from a combination of Enlightenment notions of human perfectibility and the nineteenth-century ideal of progress. Such optimism is encouraged neither by the traditional Christian doctrine of the "natural" human condition as corrupted by the fall nor by the cumulative evidence of sin to that humankind's historical life bears sorry witness. It is also possible to consider as in principle subjective the liberal conception of the church itself: a fellowship of those who share the same or a similar experience, in recognition of which they meet together in worship, hence expressing the social character of religion. Tolerance is applauded because opinions in religious matters inevitably differ. In sum, the values of liberalism, so its critics complain, are essentially those of a bourgeois ethicism having little or nothing of that sense of the eschatological *kairos* ("time") and impending judgment that characterizes the New Testament and persists as a motif in all traditional doctrine.

It was the serious inadequacies of liberalism—as he felt them to be—that led the young Swiss theologian Karl Barth (1886–1968), who had been deeply influenced by Kierkegaard, to protest against the anthropocentrism of liberal theologies in the name of the uncompromising theocentrism of the biblical revelation. The starting point of theology, he urged, must not be subjective "religiousness" but rather God's own self-disclosure through his Word: "God is known by God alone" (*Church Dogmatics* 2.1). Thus neither "religious experience" nor speculative natural theology provides any necessary prolegomena to faith. Instead of the Thomist *analogia entis* ("analogy of being"), Barth offered the *analogia fidei* ("analogy of faith"), that is, the insights of faith based on revelation.

The upshot of the Barthian theological revolution was that all forms of liberalism fell more or less into discredit. This "Barthian captivity," as Reinhold Niebuhr called it, of twentieth-century religious thought persisted for some four

decades, and only in the years immediately preceding Barth's death in 1968 did its end become manifest. The neoorthodox reaction, although it has not ceased to exert its pull on some minds—conservative evangelicalism unquestionably gained heart from it—now appears to have been less a recovery of the old certainties than a temporary *arrêt* in a process that is actually part of modernity itself. In other words, the theological difficulties that liberalism had sought to resolve remain, inasmuch as orthodoxy, if it is to uphold its claim to intellectual respectability, cannot avoid the challenge of criticism, whether philosophical or historical. A serious fault in Barth himself was his evasiveness on the historical authenticity of Christianity. These unresolved difficulties have no doubt influenced theologians' disposition to reconsider the achievements of liberalism in a more sympathetic light.

BIBLIOGRAPHY

- For an understanding of liberalism and modernism, Protestant and Catholic, all the primary works cited in the foregoing article should be studied. Of secondary works, Karl Barth's *Protestant Theology in the Nineteenth Century* (1952; translated by Brian Cozens and John Bowden, Valley Forge, Pa., 1973) offers an account of nineteenth-century German theological thinking in general that is of magisterial weight, although its whole approach to liberalism is critical. H. R. Mackintosh's *Types of Modern Theology* (1937; 2d ed., New York, 1958), Barthian also in its viewpoint, is still useful, as is John Macquarrie's *Twentieth Century Religious Thought* (New York, 1963), which covers much ground but makes only summary presentations of individual thinkers.
- Claude Welch's *Protestant Thought in the Nineteenth Century* (New Haven, 1972) fills in a good deal of the background of the liberal movement, though as yet only the first volume, covering 1790–1870, has appeared. One of my own books, *Liberal Protestantism* (Stanford, Calif., 1968), provides an extended introduction dealing with most aspects of the movement and a selection of texts. *Ritschl: A Reappraisal* (London, 1978), by James Richmond, offers a fairly full study of a writer whom English-speaking readers have always been apt to find difficult, and *Ernst Troeltsch and the Future of Theology* (Cambridge, 1976), edited by John Powell Clayton, treats at length the last great representative of liberal Protestantism.
- Sidney E. Ahlstrom's *Theology in America: The Major Protestant Voices from Puritanism to Neo-Orthodoxy* (Indianapolis, 1967) surveys the American scene. H. D. A. Major's *English Modernism: Its Origin, Methods, Aims* (Cambridge, Mass., 1927), more a manifesto than a history, confines itself principally to Anglicanism. Oliver Chase Quick's *Liberalism, Modernism and Tradition* (London, 1922) discusses the liberal Protestant and Catholic modernist doctrines of Christ in relation to orthodoxy.
- The most authoritative of more recent works on Roman Catholic modernism is Émile Poulat's *Histoire, dogme et critique dans la crise moderniste* (Paris, 1962), although Jean Rivière's *Le modernisme dans l'église* (Paris, 1929), the work of a relatively

“liberal” Roman Catholic, still provides the most comprehensive survey. In *Roman Catholic Modernism* (London, 1970), I have again supplied a longish introduction and a selection of texts, including excerpts from the Vatican documents condemning modernism. Thomas M. Loome’s *Liberal Catholicism, Reform Catholicism, Modernism: A Contribution to a New Orientation in Modernist Research* (Mainz, 1979) is especially valuable for its bibliographical material. Also deserving of mention is Gabriel Daly’s *Transcendence and Immanence: A Study of Catholic Modernism and Integralism* (Oxford and New York, 1980).

BERNARD M. G. REARDON (1987 AND 2005)

MODERNITY. Many factors working together have generated interest in modernity and religion. Among these are an increasing consciousness of the many human societies that now exist, an awareness of previous societies recorded in history, and a recognition of the overwhelming variety of cultures associated with them. The constellation of cultural characteristics associated with the modern period is very different from that normally associated with an isolated tribal culture, a medieval peasant society, or a transitional society of the early modern period. To talk of religion is to identify a particular set of cultural attitudes and activities that point to the deep sources of power in a culture, how humans relate to that power, and the corresponding, codified beliefs and behaviors surrounding it. Each concept is highly complex; to discuss the relationship between them compounds the challenge.

For some time it has been a sophisticated convention to assume that the progressive extension of scientific knowledge sparked the emergence of dynamic Western societies and the extension of their influence. The subsequent triumph of reason and rational behavior over ways of thought and patterns of action associated with traditional cultures was more or less taken for granted. Thus it seemed logical to expect that religious beliefs and behaviors would be forced to the periphery of societies that were becoming modern. By extension it seemed conceivable that religion would disappear altogether. Yet in fact, evidence has suggested that religion, far from disappearing or losing influence, has a prominent place in modern societies. Indeed, religions play many different roles in modern societies, and these societies in turn play back upon religion a wide variety of effects. The term *modernity* refers to the cultural conditions that set the terms for all thought and action in a particular culture. Religious beliefs and behavior cannot be unaffected, even when those who espouse some religion consider themselves untouched by their cultural location. Just as religion remains a cultural reality in modernity, so there can be no escape from modernity, even through a wholehearted appropriation of a comprehensive religious tradition.

DEFINING MODERNITY. *Modern, modernism, modernization, modernity*, and related terms, taken alone, qualified, or compounded, are used every day in the popular media as well as

in specialized journals and technical exchanges. The ubiquity of these terms is due in part to the shifting sets of meaning they carry. To clarify the current discussion, I propose certain distinctions between these terms.

First, *modern* is a correlative term; it implies what is new as opposed to what is ancient, what is innovative as opposed to what is traditional or handed down. However, what is judged modern at a particular time and place in a culture will not necessarily be defined as such either in the future or in some other context. Students of religion, especially, who by definition are interested in cultural patterns viewed in a long-term framework, must not fail to put in perspective changing perceptions of what is “new” and what is “old.” Since a judgment about what is modern is a matter of the perspective of the observer, phenomena that appear similar may in fact vary considerably depending on their context. Thus, “modern architecture” of the mid-twentieth century now has a distinctly dated look. Similarly, nineteenth-century symphonic music must have seemed “modern” to those brought up on the baroque, but outmoded to those brought up on Stravinsky and Hindemith.

Second, the terms *modernism* and *modernization* represent, respectively, cultural and social attitudes or programs dedicated to supporting what is perceived as modern. Modernism entails a kind of explicit and self-conscious commitment to the modern in intellectual and cultural spheres. It involves a commitment to support the tenets of the “new” in the face of critics, opponents, and detractors. In this it parallels the commitment to modernization, a programmatic re-making of the political and economic aspects of society in support of the “new.” This distinction implies that it is more appropriate to speak of modernism in nineteenth-century French Roman Catholicism, or in twentieth-century American Protestantism, or even among those who espouse contemporary versions of ancient Indian traditions, than it is to refer to the “modernization” of a religious tradition. Conversely, it is appropriate to refer to the modernization of a factory plant or its organization of production, or of a tax structure. *Modernism* would normally not be a useful designation with respect to such matters—unless we speak about factory architecture in the one case or art objects as shelters under the tax code in the other.

Thus it is inappropriate to refer to the “modernization” of a religion unless we mean as part of a self-conscious, perhaps largely social and political, program. On the other hand, *modernism* in this context implies a commitment (and usually a cultural program in addition) to render religion compatible with more general commitments in other areas. But is modernism divisible? Attitudes toward art, music, drama, religion, and so forth usually hang together and form a powerful set of interactive commitments. Indeed, such a set of cultural ideals may be related to economic and political change as designated by modernization. The conviction that cultural modernism is often associated with programs for social modernization frequently evolves into a more general be-

lief that secularization is relentlessly supplanting the old with the new. In its extreme form this argument concludes that a process of secularization makes claims upon those involved with it that exhibit a religious character, or that seem like religion in that they are ultimate, unqualified, and beyond review.

Only at this point does the term *modernity* enter our discussion. It explicitly identifies an openness and a commitment to the new as opposed to the old. Our move to the term *modernity* brings us to the consciousness of cultural change. Yet a further move attributes a congruence to the many aspects of a modern culture that makes them appear to be the expression of an entity powerful and coherent in its own right. This third step effectively serves to reify the term *modernity*. To take this step will generally promote confusion in our thinking. It is not helpful to use the term *modernity* as if it referred to a spiritual medium in contemporary life that necessarily rivals religious traditions. It is much more helpful to use it in a prereified or nonreified way as a means of recognizing that cultural change and awareness of that change are pervasive in contemporary societies. What depends upon this distinction between reified and nonreified uses of *modernity*?

One unfortunate consequence of reifying the term *modernity* is that it settles by definition an issue that ought to remain under discussion. To conceive of modernity as a spiritual medium that envelops and interconnects all particular instances of commitment to the modern, whether through modernism or modernization, is to posit an implicitly religious phenomenon, for it assumes that modernity plays the cultural role or roles characteristic of religion. As a consequence, modernity is seen as a rival to traditional or “authentic” religion. An important implication of this view is that religion in a modern society is regarded dichotomously. Either an individual or group is thought to be “for” modernity (and thus against traditional religious commitments) or “for” traditional religion (and thus antipathetic toward modernity in any and all forms). In its most intense version, this dichotomy is characteristic of every period of cultural change known to us and especially of the period we know as the modern one. Under conditions of social and cultural change, and of modernity in particular, one of many responses will be an attempt to reaffirm traditional cultural forms, albeit in highly selective and often strident versions.

CULTURAL CHANGE AND MODERNITY. It is important to explore, at least briefly, the distinction between cultural change and modernism. Stated exactly, the latter is a special case of the former. Cultural change has been a given in human societies throughout every period of which we have knowledge. There have been some periods of more, and others of less, intensive social and cultural change; but certainly no society we know anything about has been altogether free of cultural change. Records of ancient societies and cultures do not permit refined distinctions, but access to more recent historic examples allows some generalizations. Certainly it is possible

to identify characteristic religious responses to periods of intensive cultural change. One is the development of the dichotomous view of the world upon which we have already remarked—“civilized” versus “barbarian,” “believers” versus “heretics,” and so forth. Another response has been the enhancement of orthodoxy, orthopraxy, or tradition in both ancient and recent examples of interaction between cultures as well as within a single culture. A third is the frequently recurring millenarian or apocalyptic response to cultural change. Here change is experienced as so threatening and intense that it is believed a “big change” will necessarily occur.

Cast in this framework, modernity, too, is a special category of social and cultural change. It is, to be precise, social and cultural change embraced self-consciously in the contemporary world. Some characteristic attitudes toward religion mark modernity, but they tend to be special cases of the more general attitudes toward change and not exclusively related to religion. For example, modernity includes a systematic commitment to rationality, that is, a conviction that logically consistent and universalizable principles ought to be the basis for change. Again, modernity tends to undervalue the role of symbols and the subconscious. A third and related attitude is that human life is highly malleable. This set, and the preceding enumeration, is certainly not a full set and is surely a special case of attitudes to social and cultural change. But it is also a special case, because it is self-conscious, of conceivable responses to that larger and more universal phenomenon of social change. Hostility on the part of religious traditions to the modern, especially when cast as a rejection of modernity, is itself as much a characteristic response to social change as its opposite, the enthusiastic acceptance of change by a confirmed modernist. An explicit and positive attitude toward social change is no more directly related to the experience of change than is a negative response. Both are typical attitudes of individuals and groups throughout history who have been religiously sensitive to social and cultural change.

If modernity is not reified as a spiritual entity, and if modernism is recognized as a special and self-conscious case of positive response to social and cultural changes, our proper subject is how religion appears to respond and vary under the conditions of self-conscious social and cultural change in the contemporary world. If we distinguish the fact of cultural change from a postulated, spiritualized, and thus reified modernity as the controlling commitment, we are then in a position to review what seems to happen to religion under the conditions of prolonged change—or at least what has happened in social contexts that have been so characterized. Specifically, in an era that is conscious of the new, are there characteristic changes in religion, especially in relationship to the modern?

THE IMPACT OF MODERNITY ON RELIGION. If we take modernity in this descriptive sense, the decisive commitment to modernization socially and to modernism culturally is first to be observed as a coherent process in the United States. It may be thought that revolutionary France in the last decades

of the eighteenth century or Japan in the late twentieth century represent more thoroughgoing examples of commitment to the “modern.” Certainly, for brief periods other societies may well have manifested an intense and thoroughgoing commitment to change. But over time, at least to date, American society has set about more thoroughly than other societies to overcome traditional ways and self-consciously to replace them with new ones. It is here that the best exhibits are available, and exhibits over time, of the kinds of cultural changes attendant upon the systematic modernization of society. Further, the actual changes we can observe in religion seem to be remarkably heterogeneous, that is, the changes by no means run in one direction only. How can we best summarize what happens to religion under conditions of modernity?

One useful distinction at this point is between responses to modernity that are explicitly keyed to the whole scope of a religious tradition, and those effects that represent the taking on of a coloration from modern society or that are evidence for generalized, nonspecific influence of modernity. It is preferable to consider the latter kind first, since these effects are ubiquitous; this will enable us in turn to review without confusion explicit religious responses to modern life.

Bureaucratization and rationalization. Some of the changes to be observed in religion relating to the modern world clearly derive from the permeation of religious institutions by techniques and procedures developed in other sectors of the society. For example, European-derived (and certainly American-begun) church traditions have adopted much from the business world. These techniques or procedures are inevitably centralizing. This is apparent, for example, in communications: telephone calls have taken the place of pastoral letters, written reports preempt personal visits, revivals and healing services are often televised rather than held locally. Other consequential changes have to do with the liquidity of wealth; even as successful a promoter as the evangelical John Wesley could not have imagined the means available to the contemporary Methodist (or Roman Catholic) church to generate financial resources and shift their allocations throughout a worldwide, well-organized structure.

Adoption of these kinds of management technique potentially strengthens the hands of central religious leaders. But the same modern society also extends to laity the knowledge and ability to challenge such a transfer of power to central authorities. Countervailing trends, then, are at work, leading both to enhanced localism in the parishes and to the creation of extraecclesial religious organizations. Like centralized religious organizations, the latter make use of techniques widely used in the modern world (media appeals, direct mail campaigns) to raise and dispense funds and to exercise influence. These techniques often are used independently of, if not against, more established ecclesiastical authorities whose power is thus countered.

Other kinds of changes characteristic of the modern world also permeate religious behavior. Many have to do

with the high degree of rationality required to function in societies of the scale and complexity characteristic of the contemporary world. One example of this concerns the ordering of time. In the past, traditional religions imposed, or at least sanctioned, a structuring of time to include myriad festivals and feasts. In our society such patterns are in tension with broad social (and especially economic) objectives, so they no longer carry much weight. Thus we can observe certain new constraints or limitations on traditional religion as it impinges on the modern public world. Correspondingly, however, the relevance and influence of religious traditions in the realm of private time and space receive greater emphasis.

These are examples of what we might term the “coloration” through which “new” or modern societies influence all kinds of religious behaviors and beliefs in very basic ways. This “coloration” is thoroughly comparable to the codification of religions in the idioms and through the symbols of particular periods and societies, whether nomadic, pastoral, or urban. The *degree* of penetration by context is different in the contemporary world in some respects, but it is not a different *kind* of penetration. Thus religion is generally affected in the modern era but not solely in terms of conscious response to social and cultural change as represented in modernity.

Religious responses to modernity. There is, however, a contrast between this coloration or permeation of religious traditions and much more explicit religious responses to social change as represented in modern society. Especially as exhibited in American society, these responses may be seen to fall into five categories.

1. One kind of response is the advocacy of new religious ideas or the claim to new insights into ancient religious traditions. This frequently entails embracing the “new” in the name of correctly understanding the old. One dramatic example of this response in North America is the Oneida Community of the nineteenth century. Its founder, John Humphrey Noyes, believed that the spiritual sources for the new modern common life of his community flowed from early Christianity, whose tenets the community claimed to fulfill. Another interesting case is that of Christian Science. Its founder, Mary Baker Eddy, believed that she had correctly interpreted Jesus’ teaching, indeed the essential message of early Christianity, which she thought to yield “modern” insights into healing. Many contemporary religiously innovative groups find their sources not so much in Western traditions as in Eastern lore and ritual. (In these cases, too, the connection with healing is often pronounced.)
2. Another response is self-conscious accommodation of religious traditions to modern society, often in very explicit terms. Indeed, here the term *modernist* is frequently used pejoratively with respect to religion. Into this category fall such well-known adaptations as Protestant liberalism (with European as well as New World ver-

sions), the Jewish Reform tradition (which of course had its origins in accommodation to modern European culture at the time of the Emancipation), and Roman Catholic Americanism in the late nineteenth century (a largely indigenous movement).

3. A third pattern of response is the determined attempt to preserve the continuing tradition, albeit self-consciously within limits posed by the new framework. In many respects this strategy undergirds various churchly responses of the nineteenth and twentieth centuries to modern societies, ranging from the proliferation of mainstream Protestant denominations to the careful and restrained Roman Catholic updating of tradition that became highly visible as a result of the Second Vatican Council and to the self-conscious but limited case of the isolated Mercersburg Movement of antebellum nineteenth-century America.
4. A still different pattern, infrequently recognized as equally a response to modernity, is the strident reassertion of a presumed tradition in a condensed, purified, or even reductionist form. The strands of “fundamentalism” in most of the major religious traditions of the globe are to be interpreted in this light. In this perspective, fundamentalisms, as the simultaneous reduction and enhancement of particular traditions, are no less than modernisms determined by the modern culture that they so stridently reject. Here also American society provides the most fully developed instances of fundamentalism, specifically within denominations with a self-consciously British heritage and especially among Presbyterians and Baptists.
5. A final pattern in the religious response to social change in the modern world is the generation of wholly new traditions. This entails celebration of the modern in often bizarre and idiosyncratic ways, although it may also take the form of recovering pagan traditions or exploiting exotic or esoteric beliefs. These new religions are explicit attempts to reject old traditions rather than to accommodate them. But in the larger sense they are also a response to the intense social and cultural changes experienced by people living in the modern era.

This fivefold pattern is, to be sure, an arbitrary division, for the lines between these five types are always shifting. But it serves to point out that the explicit relationships between modern cultures and religions are not single or of one kind only. They vary greatly. Indeed, the relationships are so plural that respective religious movements responding to perceptions of modernity in different ways may in fact be directly opposed to each other. The classical confrontation between liberalism (or modernism) and fundamentalism in American culture is a prime exhibit of this antagonism between essentially related, though very different, responses to a common cultural experience.

CONCLUSIONS. Modernity has proven to affect religion in heterogeneous ways, both explicit and implicit. The various

explicit religious responses range from a strong and strident reassertion of traditions, frequently on a reduced basis, to outright and uncritical celebration of cultural change. In this the term *modernity* most usefully refers to the kind of intense social, and hence cultural, change that especially characterizes Europe and America, of the nineteenth and twentieth centuries, but that has extended to other cultural areas as well. This period is not unique, however, for in earlier periods something like the same pattern of a range of religious responses to social change has been evident. Religious life within the Roman Empire may be a useful parallel. With respect to the second kind of response—the implicit level of coloration provided by purely technological aspects of contemporary society—it does seem helpful to identify a peculiar cultural configuration exclusively with “modernity.” But this coloration extends as much to the activities of critics of the modern as it does to its partisans. Finally, a significant point is that the modern is not to be seen as itself a spiritual medium, that is to say, a unique religious stance.

When taken together, the concepts of modernity and religion identify the broad range of religious responses to intense and self-conscious social change in the contemporary world. What is uniquely modern is not the particular religious responses to change per se but their variety, intensity, and duration in the contemporary world. Crucial is the insight that religion is not so much threatened by modernity as challenged by it. And the challenge involves an inevitable and implicit coloration of virtually all religious behavior as well as a forcing of responses of many kinds, some direct, some indirect, all to some degree explicit, in the realm of religious belief. In these terms, the concepts of modernity and religion encompass a subject as fascinating as it is complex.

BIBLIOGRAPHY

The subject of modernity has been most fully explored in the social sciences because it has offered a rubric under which scholars can analyze the relentless social change characteristic of the contemporary world. This field looks back to the work of Max Weber, who first gave substantial attention to the relationships between religion and the emergence of modern societies. His *Protestant Ethic and the Spirit of Capitalism*, translated by Talcott Parsons (London, 1930), has continued to provoke strongly positive and negative scholarly responses. The following general discussions of modernity may be particularly useful in the current context: David E. Apter's *The Politics of Modernization* (Chicago, 1965); Cyril E. Black's *The Dynamics of Modernization* (New York, 1966); and Shmuel N. Eisenstadt's *Tradition, Change and Modernity* (New York, 1973). For a different treatment of the question, see *Becoming Modern: Individual Change in Six Developing Countries* (Cambridge, Mass., 1974), by Alex Inkeles and David H. Smith. An interpretation of American history under the same rubric is available as *Modernization: The Transformation of American Life, 1600–1865* (New York, 1976) by Richard D. Brown.

Recent discussions of religion depend heavily on anthropological and sociological perspectives, each of which introduces its own implicitly comparative framework. See the essays (espe-

cially that by Clifford Geertz) in *Anthropological Approaches to the Study of Religion*, edited by Michael Banton (London, 1966). Anthony F. C. Wallace's *Religion: An Anthropological View* (New York, 1966) is also useful.

Peter Berger and Thomas Luckmann collaborated on an influential study, *The Social Construction of Reality* (Garden City, N.Y., 1966), but subsequently have explored somewhat different sociological perspectives on religion in the modern world. Berger's *The Sacred Canopy* (Garden City, N.Y., 1967) and Luckmann's *The Invisible Religion* (New York, 1967) give different estimates of the status of religion in contemporary society. Berger also collaborated with Brigitte Berger and Hansfried Kellner in *The Homeless Mind* (New York, 1973), an explicit consideration of how religion is affected by modernization.

Among studies of particular episodes of religious change in modern societies, William R. Hutchison's *The Modernist Impulse in American Protestantism* (Cambridge, Mass., 1976) is a fine study of liberalism in American culture of the nineteenth and twentieth centuries. On this topic also see Kenneth Caughen's *The Impact of American Religious Liberalism* (New York, 1962). Ernest R. Sandeen's *The Roots of Fundamentalism: British and American Millenarianism, 1800–1930* (Chicago, 1970), sharply focuses on the question of sources. George M. Marsden's *Fundamentalism and American Culture* (New York, 1980) is a superb study that suggests the broader sources of this movement and its implications.

Whitney R. Cross's *The Burned-Over District* (Ithaca, N.Y., 1950), an older case study of religious responses to the extreme social change of upper New York State in the early nineteenth century, suggests how religious movements as diverse as revivalism, Mormonism, and the Oneida Community could originate under the same social conditions. See also Paul E. Johnson's *A Shopkeeper's Millennium* (New York, 1978), a case study of the Rochester Revivals, for one model that explicitly relates religion to rapid social change. *Religious Movements in Contemporary America*, edited by Irving I. Zaretsky and Mark P. Leone (Princeton, 1974), is a compendium of essays on new religious movements.

On the expectation of "big changes" induced in a society whose culture is threatened, see Kenelm Burridge's *New Heaven, New Earth* (New York, 1969). *Millennial Dreams in Action*, edited by Sylvia L. Thrupp (New York, 1970), a broader discussion of millenarianism, suggests additional perspectives on this phenomenon.

Revised Bibliography

MOGGALIPUTTATIṢṢA, Buddhist elder and *arahant* leader of the monastic order (*saṃgha*) in India during the reign of Aśoka (274–232 BCE). According to the chronicles of the Theravāda tradition (*Mahāvamsa* and *Dīpavamsa*), he was the chief Buddhist adviser to Aśoka. After Aśoka became a generous supporter of Buddhism, he asked Moggaliputtatissa whether anyone had ever been a greater kinsman of the Buddha's religion. Moggaliputtatissa responded that a true kinsman of the Buddha must let his son or daughter enter the *saṃgha*. As a result, Aśoka encouraged one of his sons, Mahinda, to become a monk and one of his daughters, Saṃghamitta, to become a nun. Moggaliputtatissa subsequently became Mahinda's teacher in the *saṃgha*.

The primary work of Moggaliputtatissa is reported to have been the purification of the *saṃgha* and the organization of the Third Buddhist Council. Because Aśoka supported the *saṃgha* with lavish patronage, the *saṃgha* became corrupt and filled with undisciplined monks. When Aśoka's ministers, sent to ascertain what was wrong within the *saṃgha*, rashly executed some of the monks, Aśoka feared that the blame for the sin would accrue to him. Moggaliputtatissa, however, reassured Aśoka that he was not to blame for the act. Then, seated beside Aśoka, Moggaliputtatissa questioned all the monks and purged the *saṃgha* of those who did not subscribe to the Vibhajjavāda interpretation of the teachings. The chronicles relate that he then chose a thousand *arahants* and held the Third Council, at which the Tipiṭaka was recited and committed to memory in its complete and final form. Moggaliputtatissa himself recited the *Kathāvathuppakaraṇa* at this council.

Moggaliputtatissa also arranged for Buddhist monks to be sent as missionaries to other countries. The most notable of these missionaries was Mahinda, who is credited with the introduction of Buddhism to Sri Lanka.

MOHENJO-DARO SEE INDUS VALLEY RELIGION

MOHILEVER, SHEMU'EL (1824–1898), a leader of the proto-Zionist movement *Ḥibbat Tsiyyon*. Born in Lithuania, Mohilever served as rabbi in various communities in Lithuania and Poland. In the 1860s and 1870s, he wrote articles in the religious periodical *Ha-Levanon*, in which he advocated cooperation between the Orthodox and the *maskilim*, the followers of the Jewish Enlightenment. Relations between these two groups were extremely bitter, and Mohilever's attempt to create a bridge between them remained ahead of its time.

Like some of the *maskilim*, Mohilever was attracted to the idea of settlement of Jews in the Land of Israel even before the pogroms of 1881. Following the pogroms and the beginnings of mass emigration, he joined with others in creating the *Ḥibbat Tsiyyon* movement to divert the emigrants to Palestine. Mohilever was the honorary president of the Kattowitz conference of 1884, and his closing speech became a classic Zionist sermon. *Ḥibbat Tsiyyon* was torn from the outset by tensions between its religious and secular members, and these ultimately led to a withdrawal of support by many Orthodox Jews who had initially favored the movement. True to his belief in working with the *maskilim*, Mohilever remained in *Ḥibbat Tsiyyon*. However, in order to further religious interests in the movement, Mohilever suggested establishment of a "spiritual center" (*merkaz ruḥani*) which, following his death in 1898, became the foundation for Mizraḥi, the religious Zionist faction within Theodor Herzl's Zionist movement.

Mohilever worked intensively on developing Jewish colonies in Palestine and influenced Baron Edmond de Rothschild to contribute money toward this end. He also headed a tour of agricultural colonies in 1890. These settlement activities, although small and often failures, laid the groundwork for the later Zionist settlement.

Mohilever joined Herzl's World Zionist Organization when it was founded in 1897, but because of his infirm condition, he played no role in its activities. Nonetheless, he made an important contribution to the later Zionist movement with his insistence on an alliance between religious and secular Jewish nationalism.

DAVID BIALE (1987)
Revised Bibliography

MÖHLER, JOHANN ADAM (1796–1838), German Roman Catholic theologian. Möhler was born on May 6 in Igersheim, Germany, near Mergetheim, about fifty miles from Stuttgart. Having determined to become a priest, he entered the seminary at Ellwangen, which seminary was incorporated by the government of Württemberg into the University of Tübingen in 1817. Möhler was ordained in 1819, and after a year in parish work he returned to Tübingen, to continue his studies in classical philology. Because the seminary authorities experienced continuing difficulty finding a suitable instructor in church history, Möhler found himself appointed privatdocent in church history in 1822 and instructed to prepare himself as best he could. He was given leave in 1822–1823 to travel to various German universities, the high point of his trip being brief contacts with Johann August Wilhelm Neander, Philipp Marheineke, and Friedrich Schleiermacher in Berlin. In the summer of 1823, Möhler began to teach church history, patristics, and canon law at Tübingen. He also contributed articles and reviews to the *Tübinger theologische Quartalschrift*, founded in 1819 by his principal mentor, Johann Sebastian Drey.

Möhler's first major work appeared in 1825: *Einheit in der Kirche, oder Das Prinzip des Katholizismus, dar-gestellt im Geiste der Kirchenväter der drei ersten Jahrhunderte* (Unity in the Church, or the principle of Catholicism, as presented in the spirit of the fathers of the first three centuries). Following the path of Drey's interest in, but by no means full acceptance of, the views of Schleiermacher and Schelling, Möhler in effect locates the Romantic concern for the organic unity of man with man and man with God in the writers of the first Christian centuries. This unity is traceable to the working of the inner spirit of the church, although, like Drey, Möhler retains a clear distinction between the divine and the human. (It should be noted that throughout his theological career Möhler tended to a somewhat Jansenistic view of the anticipatory, or initiating, role of divine grace.) Möhler differed with what later in the century would be standard Roman Catholic teaching in his conception of the church: the outward forms of Christianity are simply produced, as needed, by the spirit, with no assurance that the forms thus produced will always be the same. He wrote, for example, that "the Church is the body belonging to the spirit of the faithful, a spirit that forms itself from inward out." This and similar expressions earned Möhler the mistrust of those German Catholics who lived under Prussian rule, frustrating his attempt to move to one of the Prussian universities. Later some Catholic commentators, such as Edmond Vermeil, saw in Möhler a progenitor of modernism. In 1827 Möhler's *Athanasius der Grosse und die Kirche seiner Zeit* (Athanasius

the Great and the church of his time) appeared, in which he criticizes Schleiermacher's Sabellianism and his tendency to blur the God-man distinction. In the following year Möhler was made *professor ordinarius* and doctor of theology.

With Marheineke's *Institutiones symbolicae* as his apparent model, and answering to the renewed German interest in the doctrinal differences arising from the Reformation, Möhler published in 1832 the first of five editions of *Symbolik, oder Darstellung der dogmatischen Gegensätze der Katholiken und Protestanten* (Symbolics, or presentation of the dogmatic differences of Catholics and Protestants). The title refers not to religious symbols but to the Latin *symbolum*, that is, creedal statement. His characterization of Protestant churches drew a number of sharp replies from that quarter, the most significant being the work of his university colleague (on the Protestant theological faculty) Ferdinand Christian Baur, *Der Gegensatz des Katholicismus und Protestantismus . . . mit besonderer Rücksicht auf Herrn Dr. Möhlers Symbolik*. Besides these two works in their various editions, Möhler and Baur each addressed an additional book-length reply to the other, Möhler's *Neue Untersuchungen* and Baur's *Erwiederung auf . . . Möhlers neueste Polemik*. It would appear that the controversy upset both the peace of the university and Möhler's health, with the result that Möhler moved to Munich, where he began teaching in the university in 1835 and where he died on April 12, 1838. His lectures on church history, patristics, and Paul's *Letter to the Romans* were published posthumously.

Möhler's *Symbolik* is divided into two books. After an introduction, book 1 compares Roman Catholic with Lutheran and Reformed teaching in the areas of original sin, justification, the sacraments and the church, and eschatology. Book 2 takes up "the smaller Protestant sects," namely, those of the radical Reformers, Quakers, Pietists, Methodists, Swedenborgians, Socinians, and Arminians. Möhler's conception of comparative dogmatics goes far beyond merely recording divergent views. It is necessary, he writes, "to decompose a dogma into the elements out of which it has been formed and to reduce it to the ultimate principles whereby its author had been determined." On the other hand, it is also necessary that all "parts of the system be viewed in their relation to the whole, . . . to the fundamental and all-pervading idea." Whereas the spirit of the church led Catholicism, as a collectivity, to produce Catholic dogma, the teachings of the reformers were their individual productions. In Luther's mind and teaching, remarks Möhler, there was only "the inordinate pretension of an individuality which wished to constitute itself the arbitrary centre round which all should gather." In this apotheosis of the human, Schleiermacher is "the only genuine disciple of the Reformers." (Interestingly, Baur basically accepted Möhler's assessment of Protestantism. What he objected to was Möhler's denial of Protestantism's right to doctrinal development.) Paradoxically, the germ of Luther's error lay in his theological anthropology, in his understanding of original sin, wherein the total

loss of human freedom leads to the affirmation of universal divine necessitation. Viewed systematically, Protestantism displays the fatal flaw of the disappearance of the merely finite human. By 1832 Möhler had sufficiently mastered church history to recognize and accept fundamental theses of the Council of Trent: synergism in justification and good works, and the positive, outward role of Jesus Christ in the institution of the church and the seven sacraments.

In its immediate effect Möhler's work was a noteworthy contribution to increased self-respect and intellectual respectability among mid-nineteenth-century German Catholics. The long-term effect of Möhler's work arose less from his polemical thrusts than from his essentially Romantic vision of the place of Christ in the church. If the whole life of Jesus Christ is "one mighty action," then "the Church is the living figure of Christ manifesting himself and working through all ages. . . . He is eternally living in his Church, and in the sacrament of the altar he has manifested this in a sensible manner to creatures endowed with sense." Möhler's interest in the organic nature of reality and in the dignity of the human as a finite symbol of the divine can be traced, for example, in M. J. Scheeben's *The Mysteries of Christianity* (1865) and Henri de Lubac's ecclesiological studies—and ultimately in papal and conciliar documents, namely, Pius XII's *Mediator Dei* and *Mystici corporis* and the Constitution on the Liturgy of Vatican II.

JOSEPH FITZER (1987)

MOKOSH is the life-giving goddess in ancient Slavic mythology, inherited from the pre-Indo-European pantheon and debased during the early Christian era. She is the only female deity mentioned in the Kievan pantheon established by Vladimir I in 980 CE. In northern Russia, she has survived as a house spirit, Mokysa or Mokusha; a tall woman with a large head and long arms, she shears sheep at night and spins flax and wool. Her name is connected with spinning and plaiting (Lithuanian *meksti*, *makstyti*, “to plait,” and *mākas*, “shirt”; Russian *meshok*, “sack, bag,” *moshna*, “pouch”) and with moisture (**mok-* or **mokr-*, “wet, moist”). These associations suggest her ties with the life-giving and life-taking goddess of Old Europe—that is, with Fate, the spinner of the thread of life and the dispenser of the water of life. Menhirs (*kamennye baby*), venerated in some Slavic areas into the twentieth century (and some now called *Maria*), seem to be connected with this ancient goddess, who possessed healing powers. Paralytics, the blind, and the deaf offered flax, wool, and sheep to these stones.

In the Christian era, Mokosh was superseded by Paraskeva-Piatnitsa (“Friday, fifth day”) or Lianitsa (“linen washer”). In the Russian Orthodox tradition she is identified as Saint Paraskeviia (from the Greek *paraskevi*, “Friday”). Friday was a day sacred to the goddess and was characterized by taboos on women’s work. In Carnival processions, the saint’s image was that of a woman adorned with flax, her hair hanging loose and her hands extended. Legends speak of the miraculous powers of healing springs or river sources associated with Paraskeva-Piatnitsa. In the Russian ritual called *mokrida* (from *mokr-*, “wet”), a sacrifice to her consisted of flax, wool, thread, or woven articles such as towels and shirts. Her most important holiday fell on October 28, a day within the annual period of flax preparation. Women may not work on this day. Disregard of this rule may bring on blindness or some other malady, or may even result in death. Piatnitsa may transform intransigent women into frogs. Posts and shrines in her honor were built at crossroads, and wooden images of her were erected as late as the twentieth century.

In northern Russia, old icons testify to the continuing importance of this pre-Indo-European goddess in Christian guise. In them, Saint Paraskeviia, who replaced Mokosh, is shown as one of a saintly triad, along with Saint Elijah (Il’ia), who replaced the Indo-European deity Perun, and Saint Blasius (Vlasii), who replaced the Indo-European deity Veles-Volos.

MARIJA GIMBUTAS (1987)
Revised Bibliography

MOKṢA. The term *mokṣa*, a Sanskrit masculine substantive, and its feminine synonym *mukti*, are derived from the linguistic etymon *muc*, meaning “release.” Both terms have always been employed in an exclusively religious sense, denoting release from the tedious and painful cycle of transmigration (*saṃsāra*). Such a notion first appears in Indian thought with the oldest Upaniṣad, as well as in early Buddhism.

The notion of *mokṣa* is found neither in old Vedic literature, nor in the Saṃhitās (“collections”), nor in the Brāhmaṇas, the commentaries referring to sacrificial rites. Indeed, the oldest known Vedic texts are concerned with enjoyment (*bhukti*) of the earthly world, not with release from it. The metaphysical, moral, and soteriological associations of the concept of *mokṣa* are based on a religious sensibility that places absolute priority on the experience of being liberated from those very structures and patterns.

It was not until the sixth century BCE that texts began to give evidence of what would come to be the main concern of Indian religious thought, that is, release from the cycle of rebirth or *saṃsāra*, which is generated by the weight of actions (*karman*) fulfilled during the present life or during previous ones. Such a preoccupation arose at the same time in Brahmanism and Buddhism, and eventually extended throughout the Indian subcontinent. It lies at the very base not only of the Upaniṣads but of the teachings of the Buddha and of his contemporary, the other great religious reformer, Mahāvīra.

The concept of *mokṣa* becomes more elaborately developed in both the *Mahābhārata* and the *Laws of Manu*. The idea also appears in the early Upaniṣads, but is expressed with the synonymous term *mukti*. When *mokṣa* appears, it is under its compound *vimokṣa*, but with the same meaning. Early Buddhism employs the Pali form *mokkha*.

The *Bhagavadgītā*, which very likely constitutes one of the earlier parts of the *Mahābhārata*, does not yet employ the word *mokṣa*, but the etymon *muc* provides substitutes to specify those who have a mind to gain release (4.4); the one who is released is referred to with the adjective form *mukta* (5.28) and, as in the *Chāndogya Upaniṣad*, which predates the *Gītā* by three centuries, the substantive form appears only as *vimokṣa* (16.5) or *nirvimokṣa*, with the same meaning.

Often, where *mokṣa* might be expected, other words are substituted for it. A word derived from Vedism, *amṛta*, is used to introduce the notion of immortality; in that case, however, it takes on a particular significance, putting the stress on the fact that *mokṣa* results in a privileged position, the major effect of which is to avoid rebirth. The essential point is that *mokṣa* is liberation from the ties of action (*karman*) and from *saṃsāra*, the endless chain with no beginning.

By using a different vocabulary, the later systems derived from Brahmanic thought give a different coloration to their conception of release. For instance, the Yoga system proposes *apavarga*, which emphasizes escape from the cycle of rebirths; the Sāṃkhya chooses the word *kaivalya*, that state of being in which one regains primitive unity. However, in spite of a different wording, the aim remains the same, that is, the liberation of the *jīva*, or the individual soul.

In the Vedānta texts of the Middle Ages, composed by the commentators on the *Brahma Sūtra*, it is the substantive term *mokṣa* that is preferred. The most influential of these commentators are Śaṅkara (eighth century CE), Rāmānuja (c. eleventh to twelfth century), Nimbārka (thirteenth century), Madhva (fourteenth century), and Vallabha (fifteenth century). Following them, modern Indian philosophers of the nineteenth century as well as contemporary thinkers adhered to the same term.

Mokṣa is a perennial word in the Indian religious vocabulary; the notion it conveys in every case is the assurance that the practitioner is never to come back to this world again. Various ascetic traditions throughout Indian history have taught that the release from the world can actually take place before one's physical death. Such traditions speak then of the *jīvanmukta*, that person who is "released while still alive."

Writings colored by Tantric influences, particularly those connected to the Vaiṣṇava Pāñcarātra, mention three ways to liberation. The first is based on a full differentiation between the god and his worshiper. The second is based on a theory of union between the two of them: Self and self make one; God and soul are one. The third way to liberation consists of an attempt to reintegrate the Supreme Self through complete identification with it. In Tantric Vaiṣṇavism, that expectation is named inmost union, or *sayujya*.

The *Bhagavadgītā* delineates three paths of self-discipline leading to freedom: through action (*karmayoga*), through knowledge (*jñānayoga*), and through devotion (*bhaktiyoga*). In the first, one is deemed bound by each good or evil deed yet can win appropriate reincarnation through actions or deeds. On the face of it, it seems impossible to place *karman* and *mokṣa* together; good deeds may only be valued as preliminary steps to liberation. But we must consider here the particular context of *karman* in its primitive significance as a ritual act, an act specially consecrated. The word *karman* is, of course, basically related to action. However, one will not be tied up by one's actions if one bears in

mind the all-important rule not to expect a reward in this world or later on. Only acts with no self-concern may open the kingdom of the *brahman*.

The main characteristic of *jñānayoga* is the cognition that *ātman* and *brahman* are identical. It is cognition or insight that grants man real freedom, for the individual soul is considered free but fails to recognize it.

The *Bhagavadgītā*, together with all of the theistic systems, also espouses a third way to reach emancipation, that is, through *bhakti*, or devotion. Originating in Vaiṣṇavism, *bhakti* spread forth into other religious traditions of India, and became particularly important in Tantric Śaivism.

With regard to cognition or meditation as a path to *mokṣa*, both the Upaniṣads and Śaṅkara hold that there is a procedure of mind bound to an intuitive recognition between the *ātman* and the *brahman*, that is, the identity of the self within the Self, or the Primary Energy from whom all energies proceed. Through mere concentration of mind one should seize that identification content as the intuitive recognition of the famous *tat tvam asi*: "that thou art."

In the theistic systems, the meditation process, rather than relying upon abstractions, rests on a personification of the Ultimate. Meditation is achieved by concentrating on the god's performances such as they are reported in the sacred texts. The gods are invoked through prayer formulations known as mantras, which are expected to be impregnated by the very energy of the One invoked. The foundations of a relationship with the Lord are built on love and confidence. In return, the Lord, through his benevolence, grants his worshiper the deliverance others achieve only through the course of multiple lifetimes. Sometimes, *mokṣa* appears as a favor granted by the god, owing nothing at all to human effort. The notion of delivery is conceived of quite differently by theistic and nontheistic systems. If such a quest is evident in the Indian current of thought, it is out of a theistic conception that it acquires its full religious significance.

Indian writings with a political tendency often mention the three traditionally recognized objects (*vargas*) of earthly life: *dharma* (moral duty or law), *kāma* (enjoyment), and *artha* (material wealth). In a combined philosophical and religious context, a fourth object, *mokṣa*, is added. Philosophically, it is recognized as the most important, for it expresses the human being's supreme object, his return to the primary cause, the Ultimate.

In the Upaniṣadic context, *mokṣa* is the cause of little mythological elaboration. It is from traditions where *mokṣa* is won by worshiping a personified god that the myth takes strength in literature as well as in iconography. From the epic poems (i.e., the *Mahābhārata* and the *Rāmāyaṇa*) onward, the notion of liberation is given a mythological context. One of the most striking examples is provided by Kṛṣṇaism. In the separate forms of a child, a warrior, and a lover, the hero Kṛṣṇa is a permanent actor in the quest for salvation of his worshippers.

The Vedānta circles that issued from Rāmānuja and Nimbārka, and later from Vallabha, emphasized the combined worship of Kṛṣṇa and of his favorite shepherdess, Rādhā, for the predominance of love over any other feeling may in itself lead to emancipation. Because every iconic image keeps a fragment of divinity after ritual ceremonies have been practiced, worshiping images is a definite step in adoration; more potent than the rite itself are the images, charged with a salvific power. The Śaiva tradition also recognizes the efficacy of worshiping the images of the god (Śiva) and the goddess (Devī or Kālī or the Great Goddess).

When people beg for material valuables, the one “who knows,” as it is said in the Upaniṣads, is aware that only through the benevolence of God may he reach the Ultimate, which is the way out of the cycle of rebirths.

MONASTERY. [*This entry discusses the architecture of Christian monasteries. For discussion of monasteries in Asian religions, see Temple, articles on Buddhist Temple Compounds, Daoist Temple Compounds, and Confucian Temple Compounds. For further discussion of the monastic way of life, see Religious Communities.*]

A monastery is a building or group of buildings arranged for the members of a religious order to live as a community apart from the world in work, study, and prayer dedicated to God. The term *monastery* will be broadly used here to mean not only the houses of monks but also the houses of nuns (convents) and friars (friaries); the term *monk* will be used to mean both male and female residents of monasteries.

The practice of Christian monasticism has its origins in Egypt where, beginning in the late third century, men with-

drew to the deserts and mountains to meditate and fast in solitude. Soon these hermits (Lat., *eremites*) formed groups of cells adjacent to a small oratory or church (*laura*). Pachomius (c. 292–346) was the first to organize hermits into a cenobitic community (*coenobium*), where each monk lived alone in a room or a cell but joined with the other monks for prayer and meals. Nothing is known about the physical appearance of these monasteries except that the informally disposed buildings were surrounded by a wall, and the monks grouped according to skills or crafts. In Asia Minor, Basil the Great (c. 329–379) added charitable works such as establishing orphanages, hospitals, and workshops to the monks’ activities. Some monastic communities included buildings for travelers and pilgrims.

By the fifth century, the cenobitic system had spread throughout the Mediterranean world and north through Europe. The organization of the buildings varied from monastery to monastery, according to what activities were performed and at what times of the day and night. A coherent and logical architectural scheme was worked out only after the monks’ day was strictly regulated.

In 529, Benedict of Nursia (c. 480–547) established a community at Monte Cassino, in Italy, where he composed a rule to govern its life. The rule demanded a blend of liturgy, study, meditation, and manual labor under the close direction of an abbot (*abbas*). While not prescribing the physical features of the monastery, the rule profoundly influenced its design by touching on all aspects of monastic activity, including the monastery’s services to society.

THE BENEDICTINE SCHEMA. By the late eighth century, Benedict’s rule was the accepted code for western European monasteries. The first monastic plan is known as the Plan of Saint Gall—it is extant and now resides in Saint Gall, Switzerland. This plan is a copy from about 820 of a lost scheme for an ideal monastic complex formulated during the reform synods of Aachen in the years 816 and 817. The plan did not designate a specific monastery and was never built as such; rather, it was a statement of policy showing what buildings should make up an ideal monastery and the relationship of these buildings to one another. The Plan of Saint Gall provided a model for later monasteries where the rule of Saint Benedict could be lived in the most rational manner.

Designed to accommodate 110 monks and 150 to 170 serfs and workmen, the Saint Gall plan clearly defines the different activities of the monastic community within separate buildings. Broadly described, these buildings comprise the church; the cloister and its buildings for the monks; the buildings for the sick, the elderly, and the novices; the buildings for the monastery’s secular responsibilities; and the domestic buildings serving the community. Each building on the plan is labeled, and these labels are sometimes complemented by a reference to the spiritual significance of the building. The order and logic of the plan both served and reflected the order of the monks’ lives as prescribed by Benedict’s rule—a perfect life required a perfect monastery.

COMPONENTS. The monastery, a self-contained and self-sustaining community within the larger community of empire, kingdom, or nation, was enclosed by a high wall with only one means of access. Its physical and spiritual heart was the church. Whereas in the eastern Mediterranean, the centralized, or cross, plan was more popular, in the West, as the Saint Gall plan shows, the basilical plan was preferred. East or West, the church was always the most resplendent building in the monastery, invariably constructed of stone or brick and richly ornamented. The church served the local parish, pilgrims, and guests as well as the monastic community. The lay community and visitors were restricted to the western end of the church, located closest to the monastery's entrance.

The monks, housed in their own group of buildings, were isolated from serfs and workmen and from the secular activities of the monastery. Located alongside the eastern half of the church, the monks' quarters consisted of three ranges of large, often double-storied buildings tightly locked around a square or rectangular courtyard that was the cloister. This cloistral complex was usually sited on the south side of the church in cooler northern climates and on the north side in southern climates; site constraints also influenced its location.

A continuous covered arcade surrounded the open court and so gave direct access to all the buildings. The walk closest to the church often was used for reading or study and from the fifteenth century contained recesses or carrels to hold the monks' desks. The origin of the cloister as an architectural unit is still unclear, but the square-shaped cloister surrounded by the monks' quarters was an invention of the Carolingian age; its development was dependent on the adoption of the highly controlled and ordered life prescribed by Benedict.

On the eastern side of the cloister, the dormitory was placed at right angles to the church and, joined to it at the transept, provided direct access for the monks during night services. Monks slept communally in the early Benedictine monasteries, although the dormitory often was divided into separate cubicles by wooden partitions. After Pope Martin V conceded single cells to the Benedictines in 1419, the common dormitory became rare. Taking up a greater area than a dormitory, single cells probably led to the two-story cloister composed of cells on all three sides of the upper floor. On the Saint Gall plan, the dormitory was raised above the monks' warming, or day, room. Located near the dormitory was the reredorter, or latrine, which was linked by a covered passage to protect the monks in inclement weather.

The refectory was placed at right angles to the dormitory, parallel to the church, with the vestiary, or wardrobe, above. While most refectories were at ground level, some were raised on undercrofts, which were used for food storage. Like the dormitory, the refectory had to be large enough to accommodate all the monks at one time. Monks ate at long tables while listening to scriptural readings given from a pulpit. A fountain or basin for the monks to wash in before eat-

ing was located near the refectory, often in the south walk of the cloister. From the twelfth century, the fountain was commonly an independent structure projecting into the cloister opposite the refectory. The kitchen was located near the refectory but usually outside the cloister.

On the west side, for easy access to the outer world, was the cellar, located on the ground floor, with a larder above. Between the cellar and the church, the sole formal exit from the cloistral area was through the monks' parlor, where monks, when permitted, met guests. Except for the time they spent working, the monks spent their entire lives in the cloistral complex. This complex, an architecturally conceived whole, provided a self-contained world for the monks within an already separate world.

From the eleventh century, one other building or room not included on the Saint Gall plan became a standard feature of the cloistral area: the chapter house. Used for business matters of the monastery and as a burial place for the abbots, the chapter house was located either next to the church or under the dormitory. In England, it was sometimes a separate circular or polygonal building.

The other buildings that made up a typical medieval monastery, as shown on the Saint Gall plan, were sited and grouped according to their function and their relationship with the secular world. Attached to the north side of the church were rooms for the porter and visiting monks. Flanking the apse was the scriptorium, where selected monks copied and illuminated manuscripts, with the library above it. By the twelfth century, the library frequently was located under the dormitory, alongside the chapter house. Also on the north side of the church, but freestanding, were the buildings that served the monastery's obligations of hospitality and education. These included the house and kitchen for visitors of rank; a school for children of the local nobility; and a house and kitchen for the abbot, whose social responsibilities included such secular activities as entertaining guests. The inscription on the Saint Gall plan notes that the ideal abbot's house is constructed of stone; in many monasteries, except for the church, the abbot's house was the most splendid building.

Isolated to the northeast of the church was the infirmary. This infirmary, also used as a nursing home for aged monks, often was designed as a monastery in miniature, with its own refectory, dormitory, bath house, and chapel arranged around a cloister. Completing this unit was the doctor's house, the house for bloodletting, and a medicinal herb garden. Nearby was the cemetery, which in the Saint Gall plan doubled as an orchard. The novitiate, also planned as a monastery in miniature, was to the south of the infirmary.

The L-shaped tract of land on the south and west was occupied by the service buildings. These included chicken and goose houses, a granary, a mortar and mill, workshops, houses for livestock and their keepers, and facilities for visiting pilgrims, paupers, and servants of distinguished guests.

Careful attention was paid to sanitation. In the Saint Gall plan, most of the latrines were placed on the perimeter. Whenever possible, monasteries were located near flowing water, which was channeled both to provide fresh water and to carry away waste. The importance of the water supply and drainage in medieval monasteries is attested to by a plan, drawn up around 1160, for the installation of a new water system at the Canterbury Cathedral monastery.

There is a coherent and logical organizing principle underlying the plan of Saint Gall. The hierarchical division and separation of buildings by function that is integral to the plan is clearly realized in all later monasteries. The plan provided a highly generalized statement adaptable to highly particularized site conditions, needs, and size. The clarity and unity of the plan served the monastery at a symbolic as well as a practical level, reflecting the order of the Benedictine rule and, by extension, the divine order and rule. For many centuries, the scheme of Saint Gall remained the guiding principle for the layout of a monastery, easily adapted to meet the requirements of orders other than the Benedictine.

OTHER DEVELOPMENTS. The monasteries of the Carthusian order are a variation on the carefully conceived scheme of Saint Gall. In 1084, Bruno of Cologne (c. 1030–1101) fused the eremitic life with the cenobitic in one complex at Chartreuse, France, soon called La Grande Chartreuse. It was designed to house twelve monks and a prior, with each living alone in a cell and working alone in the private garden attached to his cell. The only communal activities in these Carthusian monasteries were mass, matins, vespers, and occasional meals. To ensure the monks' solitude, the cells and gardens were arranged around a large cloister and separated from the ancillary activities of the monastery by the church, refectory, chapter house, library, and prior's cell, all of which were organized around a second and smaller cloister. The quarters for the lay brothers (*conversi*), who ministered to the needs of the monks, and for the guests were arranged around a separate cloister. Because their tasks required more frequent contact with the outside world, lay brothers inhabited either the western range of the cloister or a duplicate cloistral complex to the west. The Certosa di Pavia, the charter house in Pavia, Italy, founded in 1396, is typical of the layout and, like many Carthusian monasteries, housed twice the ideal number of twelve monks. Despite the adoption of single cells and private gardens, there was no substantive alteration in the ideal monastic scheme since there was no fundamental change in the monk's world of prayer, study, and work.

The Cistercians, founded in 1098 by Stephen Harding, dedicated themselves to restoring the original concept of Benedict's rule—self-sustaining communities based on a life of hard manual labor and prayer. They built their first monastery at Cîteaux, France, but it was later, under the leadership of Bernard of Clairvaux (1090–1153), that the order grew rapidly. Uniformity of activities and liturgy within the order resulted in uniformity in plan and design. For example, all the early churches followed the so-called Bernardine plan

of a long nave and a rectangular apse in imitation of the church at Clairvaux. The Abbey of Maulbronn, Germany, founded in 1139, exemplifies Cistercian planning as a whole as well as the early design of the church. Located in secluded valleys, Cistercian monasteries possessed small guest quarters and no outer school. The lay brothers, in the western range of the cloister, were physically separated from the cloister by a walk known as the lane. The monks' refectory was usually at right angles rather than parallel to the church, probably to provide space for the kitchen between the refectory and the quarters of the lay brothers. Extensive and often distant land exploitation required granges consisting of living quarters, a chapel, and barns.

Over the centuries, Benedictine monasteries increasingly were adorned with figural sculpture and painting intended to instruct the faithful in Christian doctrine. For Bernard, this architectural ornament achieved an aesthetic and emotional power inappropriate for monks. Cistercian architecture was without figural sculpture and was minimally embellished, but the unplastered stone buildings achieved an austere monumentality reflective of Cistercian ideals. Cistercian monasteries were structurally innovative and influential in the dissemination of the pointed arch and vault throughout Europe.

The Franciscans (founded by Francis of Assisi, c. 1181–1226), the Dominicans (founded by Dominic of Osma, c. 1170–1221), and the Augustinians (late eleventh century) adapted the Benedictine schema to serve their synthesis of the contemplative life and active ministry. Located in cities and towns, their churches were large and spacious to serve better the new emphasis on preaching. From the 1520s, these three orders played a crucial role in the colonization and conversion of the Americas. In Mexico alone, nearly sixty monasteries were built in the sixteenth century. The early monasteries consisted of a church, often of single nave, and accommodations for the friars grouped around a cloister. For the enormous number of converts, the friars built a large walled courtyard that was attached to a side or corner of the church; this served as a temporary outdoor nave for the huge congregations. A typical courtyard consisted of a vaulted structure with a triple-arched façade to house the Sacrament on the side opposite the entrance and small square structures known as *posas* (Span., *posar*) at the corners. Pauses were made at the *posas* during liturgical processions around the courtyard, and they were used by the friars when teaching separate groups in the corners. The Dominican Monastery of Tepotzlan, Mexico, built in the sixteenth century, shows this ensemble. Both the open court and the *posas* appear to be an original architectural solution, probably invented by the Franciscans, for the particular spatial needs of the early Mexican monasteries. By the mid-sixteenth century, it was normal for these nontraditional open courtyards to be roofed, using traditional European techniques.

As early as the seventh century, and as formalized in the Saint Gall plan, many monasteries served the dual needs of

both the monks and the larger community. In England, for example, in ten of the seventeen dioceses, the bishop's residence was in a monastery, and the monastery church also served as the cathedral church. Built within cities, the monks' buildings were set apart by a high wall. The church formed a physical and spiritual link between the conventual buildings and the bishop's palace, court, and administrative buildings outside.

The alliance of secular power with the monastery was demonstrated most influentially in the Escorial palace-monastery in Madrid, built between 1563 and 1584. It was conceived and endowed by Philip II as a retreat for himself and as a mausoleum for his father, Charles V; the monks, in this case of the Hieronymite order, performed daily rituals of commemoration for dead and living royalty. The Escorial was built on a plan of axial symmetry, with the church and crypt at the center and the monastic community housed around five cloisters on the south side of the church and its forecourt. To the north were the palace, a college and seminary, and lodgings for guests. A radical innovation was the king's apartment wrapped around the sanctuary of the church; its location simultaneously stated the power of the monarchy and affirmed monarchical piety. The absolute order of the design of the Escorial, where even the cruciform church echoes the overall grid, reiterates this union of church and monarchy.

The union of religion and state achieved its greatest architectural grandeur in the eighteenth-century Baroque monasteries, especially in central Europe. Adopting a symmetrical and axial plan in emulation of the Escorial, both monastic and secular precincts also were built around their own cloisters. Imperial apartments usually possessed a monumental, ceremonial staircase leading to the imperial hall, a large library to assert the monastery's role as a center of learning, and often a theater. These colossal and ostentatious monastery-palaces had magnificent façades and, sometimes, vast forecourts.

From the beginning, Byzantine and Russian monasteries showed less uniformity of plan than did those in the West. Although the church was normally in the center of the complex, the support buildings were variously arranged. But in the Baroque period, many newly founded monasteries followed the symmetrically planned and sumptuously appointed models of central Europe.

MODERN TIMES. Following the Protestant Reformation of the sixteenth century and the French Revolution of 1789, many monasteries were dissolved or suppressed, and the buildings were destroyed. A monastic revival in mid-nineteenth-century Europe, coupled with colonization and increased missionary activity, saw the establishment of monasteries in Africa, the United States, and, by the end of the century, Japan. In the twentieth century, and especially after World War II, many monastic communities launched extensive building programs, often selecting internationally renowned architects. Emphasis was on mission and on hospi-

tal and educational work, including higher education. Some monasteries extended the concept of hospitality to serve as temporary retreats for the laity. As before, the church acted as the spiritual unifier and the physical separator; the cloistral area was located on the side farthest from the visitor's area, and the school and other buildings were on the other.

Even before the Second Vatican Council of 1965, monastic churches were designed to emphasize the unity of monks and laity. The Benedictine Abbey of Saint John in Collegeville, Minnesota, founded in 1856 and redesigned by Marcel Breuer in 1953, preserves traditional plan organization while epitomizing the new trends. The entire complex of conventual buildings, a seminary, a university, and a high school, center on and revolve around the church. Scholastic zones are grouped to the north and west, and the conventional buildings are to the south. But the bell-shaped church has a centrally located altar, which allows the monks' choir to be visible to the laity, and new materials and structural forms directly express contemporary technology and ideas.

The monastery provides a physical environment to serve the contemplative and active dimensions of the monk's life and has, therefore, a continuity in overall planning concepts and building type irrespective of the circumstances of time and place. At the same time, within the type, monastic architecture shows the persistent experimentation and variation necessary for the particular requirements of the different orders.

AN OVERVIEW
BUDDHIST MONASTICISM
CHRISTIAN MONASTICISM

MONASTICISM: AN OVERVIEW

The Greek word *monos*, from which *monasticism* and all its cognates derive, means “one, alone.” According to this etymology, therefore, the basic monastic person may be a hermit, a wandering ascetic, or simply someone who is not married or a member of a household. However, the term *monastic* normally refers to people living in community and thus embraces the cenobitic as well as the eremitic and peripatetic lifestyles. In Western societies, the definition of *monasticism* has often been restricted to its classic manifestations, especially the Benedictine tradition. By this definition clergy who adopt some aspects of monastic life and rule (canons regular or regular clerks), mendicant orders (Franciscan, Dominican, and like associations), and other religious orders are not properly called “monastic.” Furthermore, within the classic definition one might be able to include some kinds of non-Christian monasticism—that is, those with goals and life patterns fairly similar to the Benedictines—but not others.

Nevertheless, many religious traditions feature (with varying degrees of formal institutionalization) a recognizable type of social structure for which *monasticism* is an appropriate name. The Buddhist *sangha*, the Christian religious and monastic orders, Jain monasticism, and Hindu *sādhus* or *saṃnyāsins* provide the most obvious examples. Daoist associations and Muslim Šūfī orders share many of the essential features of monasticism, although they also have some atypical aspects. Among primitive peoples something like monasticism exists in the phenomenon of secret societies. Other traditions, for example, Judaism and Protestant Christianity, have little expression of this religious possibility. Even within these religions, however, there have been associations much like monastic communities: among the Essenes, for example, and various sixteenth-century Lutheran groups, through the deaconess movement, to a current interest, most notably in the community at Taizé, France.

With all these examples in mind, in the following paragraphs I shall attempt to develop a comprehensive analysis of the monastic phenomenon. In order to avoid the gender specificity of *monk* and *nun*, persons who exhibit and represent the monastic phenomenon will be called “monastics.”

DEFINING FEATURES. First and most prominent of the essential features of monasticism is the monastic’s distinctive social status and pattern of social relationships. The monastic person is identified as one whose self-perception and public role include membership in a special religious category of persons, a status which is deliberate and extraordinary. In some cases the monastic lives with other monastics, but in other cases participation in a communal life may only be sporadic. Most monastics are at least theoretically members of a group, but they may not live with that group for most of their monastic existence. The monastic status can involve either a new home or homelessness.

The second defining feature of the monastic situation is a specific program or discipline of life. The most obvious examples of formal regulations for the monastic life are the Vinaya of Buddhism and the Benedictine rule, but even less clearly defined categories set up expectations concerning appropriate behavior and activities for monastics. Monastic life, in contrast to the rest of human life, is entirely oriented toward a personal religious goal. Hence, the monastic adopts special patterns of living in order to achieve that goal.

Monastic status is differentiated from other religious roles, offices, and functions in that it is not primarily based on performing some service to others in the religious tradition or to the larger society but on the more private cultivation of a path of transformation. A minister, priest, shaman, or similar expert in sacred procedures exhibits a kind of religious leadership dependent on a community to which sacred values are transmitted. Certainly these roles can be merged: some religious professionals also live like monastics. Likewise the monastic person or community can take on many and varied tasks of service, only some of which may be obviously connected to the pursuit of the personal religious goal. Nevertheless, the essential element in any monastic situation is the longterm focus of the monastic life: separation from normal human existence in the pursuit of individual aspirations.

Third, monastic status is celebrated and publicized in various ways. A process of initiation marked by ceremony is very important to public perception as well as to monastic self-consciousness. Monastic status is also often indicated by distinctive clothing, modifications of the body (such as tonsure), and symbolic accoutrements (for example, the Buddhist staff and begging bowl). In many traditions the monastic leaves the arena of family, clan, or similar “natural” grouping and lives in a deserted place. The difference between monastics and others can be expressed through such factors as a different daily schedule: many monastic rules call for interrupted sleep or early rising. A specific diet may be prescribed. In all cases the monastic status represents a new

or added identity expressed by specific behaviors, signs, and patterns of relationship to others.

Finally, it is important to note the presence of a larger religious tradition and set of institutions within which the monastic phenomenon takes place. We do not call those institutions “monastic” when the religious community in question is the whole legitimate religious tradition. The Shakers, for example, had many of the patterns of monastic life but constituted a whole church in and of themselves. This is the phenomenon that is more often termed a “sect” or “cult.” Monasticism, by contrast, exists as an option within a wider grouping or identity; it is a special possibility that not everyone in that religious group adopts or is expected to adopt.

The optional monastic identity may be central or peripheral to the larger tradition. Christianity can exist without monasticism because, in the “secular” priesthood and episcopal office, it has a social structure and forms of leadership independent of monastic patterns. Such patterns are less central in Islam, where much of the tradition disowns monasticism completely. By contrast, monasticism is central to Buddhism and Jainism; indeed, the monastic is sometimes thought to be the only true representative of these traditions and the lay community no more than a subordinate support group. Jainism and Buddhism began with monasticism, whereas Christianity manifested this pattern clearly only after a few centuries of existence.

The basic, common features of monasticism, therefore, can be reduced to these four: special status; dedication of monastics to the practice of personal religious disciplines; ritual entry and ongoing identification marked by special appearance; the role of monasticism as an option for some persons within a larger tradition and community. In addition to these features, however, there are many other frequent characteristics of the monastic situation that are not found in all examples.

FREQUENT CHARACTERISTICS. Even though the most careful definition of *monasticism* could not include communal life as a necessary factor, there can be no doubt that monastic existence is rarely completely solitary. Even wandering or hermit monks assemble periodically. These assemblies and the buildings constructed for longterm residence constitute the most visible aspects of monasticism and therefore might assume a larger place in one’s perception of the phenomenon than they should. Much that is important to monastic life is personal, private, mental, or otherwise difficult for outsiders to gain access to. It is often only in public ceremonies or visible features such as the monastery itself that the outsider observes the monastic phenomenon. However, any adequate comprehension of monasticism requires a knowledge of the lives, conversations, and writings of monastics.

Sometimes monastic status is lifelong; this would seem to be the normal implication of the initiation into a higher realm. In some situations, however, temporary affiliation with a permanent community or temporary communities is

a possibility. In Thailand many young men enter the preliminary stages of monastic life with no intention of persevering. A few months of monastic existence is better than none from their point of view. The Hindu phenomenon of the ashram is also deliberately temporary yet has many of the characteristics of a monastic community. The ashram may be thought of as the stage of life through which a pious Hindu man proceeds on his way from being a householder with a family to becoming a *sannyāsin*, a wandering, homeless, holy man. The ashram may also be thought of purely in terms of a forest dwelling place of such a man and the community that may gather around him.

Christian religious orders often have some arrangement whereby laypeople can become affiliated with the order without becoming full members. The third order of the Franciscan tradition and the Benedictine oblates are two such orders. In some instances a residential oblate may live just like the other members of the community or order. Certain Sūfīs live a kind of monastic existence in addition to being married, and several contemporary Christian religious communities are experimenting with such an arrangement.

Another frequent feature of monastic life and a major dynamic in its communal form is the phenomenon of discipleship and obedience. Monastic aspirants gather around a spiritual master, *guru*, or initiator who becomes their model and guide. The starets in the Russian Orthodox Christian tradition, the *shaykh* or *murshid* in Sufism, and the Zen Buddhist master are prominent examples. The relationship of master and disciple also can be found in nonmonastic situations. In all examples this type of association is much more intense and personal than that normally experienced between teacher and pupil. The master embodies the lesson and mediates transcendent power; radical obedience is an important discipline in the attainment of the monastic goal. Monastics sometimes validate their doctrine and practice by reference to their masters and their masters’ masters, forming lineages back to the founders of their traditions.

Another important aspect of much monasticism, yet one not essential to it, is poverty or simplicity of lifestyle. The constitutive factors of distinction from normal or prevailing forms of life and the adoption of a specific rule and discipline are often expressed in the rejection of comforts or luxuries enjoyed by the rest of society. It is ironic that, despite the attempt to be ascetic or plain, monasteries often become quite wealthy. In order to participate in the holiness of the monastic community, the surrounding community characteristically bestows its valuables on the monastery, hoping to exchange them for the treasures of merit, wisdom, and piety cultivated by the monastics. Also the industry and discipline of monastic work has occasionally produced significant wealth. Such accumulation of wealth, as well as other factors that may lead to a change in the character of a monastic community’s life over a period of time, have produced successive reforms within long monastic traditions. Benedictine history is a story of reforms: the first notable one took

place under the aegis of Benedict of Aniane about three hundred years after Benedict of Nursia founded the order. This was followed by the reform programs of Cluny, the Cistercians, the Trappists, and so on.

Monastic clothing has had great significance in some traditions. In many cases the origin of such clothing was merely an extension of the emphasis on simplicity—the garments of the poor were adopted. *Šūfis* are so called because of their affirmation of simple wool (*šūf*) in contrast to the silks of the rich. The ocher robe in India and the various colors of the Christian communities have been important means of identification. There has also been a “romance of the cowl.” The monastic garment itself has had a fascination and religious significance, for example in the desire to be buried in a cowl through deathbed profession. In Jain monastic practice we find the unusual phenomenon of nakedness as monastic “clothing.” The Digambara Jain monks are thus “sky-clad” as a precaution against harming even a body louse and as an ascetic discipline, and at the same time to signify their monastic status by departing from the normal way of dressing.

According to one interpretation, monasticism can be understood basically in terms of asceticism; self-denial and the acceptance of pain are the basic reasons for the existence of the institution, from this point of view. Insofar as “asceticism” can refer to any kind of discipline, one cannot argue with this approach. “Asceticism,” however, is usually associated with painful and rigorous disciplines, and not all monastic systems prescribe difficult or unusually painful practices. The range is very broad between mild ascetic disciplines and self-denial on a heroic scale, although it is rare that a monastic is not self-conscious about avoiding and rejecting many human potentials and comforts. At the least sleep and eating are usually regulated and reduced. Silence is kept for extended periods. However, ascetic practice is also always a matter of perspective and degree: what seems like suffering to one person might not disturb the comfort of another. If a monastic thinks that suffering must be cultivated in order to achieve a religious goal, many and various techniques may be used. In other situations what might seem like asceticism to the outsider may be understood and experienced more as simplicity and the reorganization of life.

Most monastics in the history of world monasticism have been men; indeed, the founders of monastic orders, including the Buddha, have allowed women to be monastics only reluctantly. This probably has been due more to surrounding cultural factors than to anything intrinsic to monasticism. The avoidance of sexual activity and arousal, however, has been an important aspect of much monastic asceticism. Some monks apparently have thought of women primarily as temptresses, and their literature sounds misogynist. The Orthodox Christian monastic center on Mount Athos, in Greece, forbids entrance to women. By contrast, there is greater interest today in mixed communities and in lessening the isolation of monastics from the rest of society.

MONASTIC ACTIVITY. The program, rule, or discipline that is so important in monastic life varies widely between traditions and monasteries. Some monastics spend their time in liturgical activities, others in devotional or yogic exercises, and many in work that does not seem to be religious at all. The monastic performs any task with its religious effects in mind no matter what its other benefits. The basic monastic purpose is to achieve a religious goal, even if the activities performed by monastics may seem somewhat incidental to such a goal. Apparently irrelevant activity often looms large in specific situations and may provide much motivation for the monastic and support from the larger community. The list of monastic disciplines and activities contains none that are absolutely unique to monasticism but many that have been especially prominent and perhaps easier to pursue within a monastic context.

Meditation and prayer, in their various forms, have been the most important activities in most monasteries: meditation may be discursive, ecstatic, yogic; prayer can be spontaneous, formal, communal, solitary. However, all kinds of religious practice are cultivated in monastic situations. Formal liturgical ceremonies (monastic profession or initiation, sacrifices, and sacred dramas) are frequent and conspicuous aspects of monastic life. Monasteries are known for their communal chanting of sacred texts, as certain *Šūfī* orders are known for their dancing rites; other arts are also developed by monastics in the interests of their religious application. Some monastic traditions have been suspicious of particular art forms, associating them with the luxuries of the world or seeing them as distractions; but even simplicity has artistic intention and power. The stark beauty of a Zen garden or a Cistercian church exemplifies a use of the arts in the service of monasticism as much as more ornate and elaborate artistic expressions.

A special kind of meditation or reflection is important to the monastic endeavor in many places and ways. This is the attention given to every detail of life, both physical and mental. Not only are monastics intent on orienting everything in their lives toward the achievement of religious transformation; their heightened consciousness about the motions and thoughts of everyday life becomes itself a transforming mental discipline. They argue that too much human life is lived unconsciously and thus without purpose or organization. By consciously acknowledging and reflecting on such commonplace activities as breathing, walking, or thinking, the monastic gains a new perspective on the human phenomenon. The smallest building blocks of life may be used to evoke ever-deeper awareness and ultimately enlightenment.

The whole of cenobitic monastic life is choreographed by the rules of the order. Times of sleeping, eating, praying, meditating, and working are all prescribed, and these actions are performed by the monastics in unison. The sounds of bells and other signals punctuate the day and coordinate the many lives of the monastics into a single harmonious program. This attempt to blend individual lives into a larger so-

cial unity has been influential as a model for utopian theorists and represents to many lay people an attractive aspect of monastic existence. Religious symbols of unity, harmony, and peace are reinforced by the living of the monastic pattern.

It is not difficult to recognize prayer, meditation, and rituals, which are important in any religious situation, as being important as well in the monastic pursuit of religious transformation. However, monastics also do other works that are not so obviously religious. Many monastic rules demand that the monastic perform menial, common chores, not only because work of that sort must be done by someone in any community of human beings but also because of the meaning that is attached to it within the monastic framework: menial labor may give a form to humility, its rhythms may be seen as an aid in meditation, its performance may be an act of service and obedience to the master, and so on. An emphasis on self-sufficiency and isolation has led monastics and monasteries to be pioneers in foreign and remote areas, performing a service in civilizing or proselytizing. Monasteries have also functioned as hotels and hospitals in remote places.

Some monastic work involves intellectual activity. Benedict's rule emphasizes reading (*lectio divina*) as a major component of the monastic life along with prayer and work. The path to perfection or religious transformation is often an intellectual path that requires a new understanding of the self and the world. Reading and study in the monastic context is a means of salvation, a technique for the reconstruction of one's worldview. Also, because the rule, religious texts, and other written guides to meditation, prayer, and discipline must be available to monastics, much of their effort has been put to copying, studying, and teaching these materials. Their educational task starts with that monastic necessity, easily comes to include other religious scholarship, and may extend to more "secular" knowledge as well. Wisdom and religious insight may be cultivated for their role in religious transformation, but here, as elsewhere, there is the potential for great benefit to the rest of society incidental to the main goal. The role of Christian monasteries in preserving classical Greek and Latin writings is a famous example of the intellectual by-products of monasticism. Buddhist *vihāras* in India and elsewhere have been important centers of learning.

In some situations charitable acts are held to be more important for the monastic than more individual disciplines. A distinction is made within Christian communities between contemplative orders, where activities like those mentioned above predominate, and active orders, where emphasis is placed on work with beneficial effects for others. In the active monastic styles the way to attain deeper or higher religious status is associated with the merit and value of meeting people's needs, in addition to or instead of the cultivation of private pieties. Thus a monastic belonging to an active order may be a teacher, nurse, priest, or support person in some beneficial institution, but with an interest or investment in

the work that is beyond that of nonmonastic colleagues. For the monastic such work is part of a discipline or rule, a means toward a religious goal.

The services of monasteries to society as schools, hospitals, and places of hospitality to travelers have been mentioned. Monastics have often provided priestly or pastoral services for their larger communities. Monasteries have also served as orphanages, places of burial, research institutes, and pilgrimage centers. They have provided places of reflection and restoration for individual and communal visits and retreats. It may also be important to people preoccupied with daily, practical concerns that monasteries simply exist; the knowledge that somewhere people are praying and meditating can in itself be beneficial.

A number of answers can be given to the question "Why do people become monastics?" Some of these answers might be given by the monastics themselves; others could be provided by students of human behavior attempting to see beneath and beyond the self-consciousness of participants in a social phenomenon. Some of these responses might seem pejorative or critical of the monastic endeavor, while others would be admiring and adulatory. Some answers are psychological and personal, others more social or historical in focus, and most are complex and ambiguous.

Many people have associated the monastic with words like *escape* and *retreat*. This manner of speaking reflects a perception of the monastic world as a realm dominated by an inability or unwillingness to cope with normal life or "the world." This view might lead one to a conception of monastic life as a refuge for the weak or the scrupulous. Insofar as one understands the world and "normal life" to be diabolical or illusory, however, the monastic retreat is the more courageous and realistic option, calling for extraordinary strength and dedication. Monasticism has also been significant as a preserver of culture and civilization in eras when the political structures of the world were weak. Certainly during the disintegration of the Roman Empire monasteries provided islands of tranquillity and an opportunity for the pursuit of intellectual activity that was unavailable in the surrounding society.

The adoption of a markedly different way of living cannot but imply some criticism of the alternatives. Thus some observers have emphasized the role of monastic life as a protest against the prevailing patterns of the world or of the religious tradition. Even without a specific aim of reforming or transforming their traditions, monastics have offered an alternative set of ideals to their coreligionists and in so doing have often, perhaps unwittingly, inspired change.

The meaning of monastic life in specifically religious or theological terms goes beyond the analysis presented above. By means of symbols and doctrines the visible rites and practices of monastic life are understood to be much more significant than is apparent to the outside observer. The theme of death, for example, is prominent in various ways. Through

profession or initiation the monastic technically attains a status comparable to that of the dead. Indeed, the death and rebirth symbolism in these rites is often quite clear. Through the transformation of joining the monastic community or adopting monastic status, one enters the realm of being of the angels, the ancestors, or those who have achieved enlightenment. Furthermore, it has been noted that Christian monasticism began when martyrdom ceased, indicating that it took over as the arena of ultimate commitment, the new form in which one could die to the world for one's faith. Buddhist monasticism is also a way of death in that the *dharma* provides a program for eliminating all attachment to the world as well as any desire to be reborn.

When ascetic activities are stressed in a monastic life they may be understood as penance and sacrifice to atone for sinfulness. Suffering can be thought beneficial to oneself or to others, the latter leading to the possibility of merit and its transfer in the thought of the monastics or their surrounding community. Ascetic practice may be seen as a means of gaining power, not only over oneself but also over others, even the gods, for example in the ideas associated with *tapas* in Hinduism.

Monastics as well as scholars have understood monastic life primarily as a pursuit of mystical experience. The *tariqah* in Sūfī monasteries can be seen both as a rule and as a method for attaining advanced spiritual life. Many monastics praise and cultivate special states of mind and body, states in which enlightenment, ecstasy, or union with the divine is said to be reached. No matter how advanced the person or the community, however, such states are bound to be rare. Thus, much that is monastic is at best only oriented toward those rare moments, and perhaps quite irrelevant to them. Furthermore, the broad definition and description of monasticism developed in this article includes possibilities for the orientation of monastic existence in other directions. In other words, many monastics may have a conception of the ideal spiritual state that does not center on mystical experiences or realizations, but could instead be focused on charitable, liturgical, or scholarly work to the neglect or exclusion of private mysticism.

One of the criticisms of monasticism has been that it is selfish, that it is in essence a private, individualistic religiosity. That assertion may be true in some instances, but there is much to counter it. Monastic works of charity offer one kind of counterevidence. The social environment of the monastery represents another. Few, if any, monastics have ever been unknown to at least some other people in their environment, and the very fact of their existence has been influential on others. Even if monasticism is centered on the self and its transformation, there has rarely been a monastic for whom the Dominican motto has not been true: "Contemplata aliis tradere" ("To give to others the fruits of contemplation").

CONTEMPORARY MONASTICISM. In recent decades monastics from various religious traditions have become more

aware of each other. Toward the end of his life the famous Trappist monk Thomas Merton wrote and spoke of the many similarities among the world's monastic systems. Roman Catholic monasteries in traditionally non-Christian areas have been interested in this consanguinity and have produced some writing on monasticism as an interreligious phenomenon. Since 1960 an organization known as Aide Inter-Monastères has encouraged dialogue between monastics of various religions. Some Christian monastics and monasteries now practice techniques borrowed from Hinduism and Buddhism.

In the United States many experimental as well as traditional new religious communities have been established. A monastic impulse seems to have been a part of the "counterculture" revolution of the sixties and seventies. Monasticism apparently continues to be a persistent and beneficial social and religious structure. In the seriousness with which the monastic reexamines life and its goals, in the rigor with which a discipline of life is pursued, the monastic phenomenon offers an alternative way of life and view of the world to the rest of society.

BIBLIOGRAPHY

Studies of monasticism that take into consideration more than one religious tradition are a fairly recent phenomenon. The best book of this kind is *Blessed Simplicity: The Monk as Universal Archetype* by Raimundo Panikkar and others (New York, 1982). For an informal comparative survey of religious communities, see Charles A. Fracchia's *Living Together Alone: The New American Monasticism* (San Francisco, 1979).

A careful analysis of the theology and practice of Christian monasticism is provided by Louis Bouyer in *The Meaning of the Monastic Life* (London, 1955). The standard teaching and reflection of Christian monks is presented by Claude J. Peifer in *Monastic Spirituality* (New York, 1966). Good books on Christian monasticism and religious orders abound; see especially David Knowles's *The Monastic Order in England*, 2d ed. (Cambridge, 1963), and *The Religious Orders in England*, 3 vols. (Cambridge, 1948–1959). A critical view of medieval monasticism is presented in George G. Coulton's *Five Centuries of Religion*, 4 vols. (Cambridge, 1923–1950). The Benedictine rule, along with indexes and informative articles, is available in *RB 1980: The Rule of St. Benedict in Latin and English, with Notes*, edited by Timothy Fry and others (Collegeville, Minn., 1981).

Hindu monasticism is covered by G. S. Ghurye in *Indian Sadhus*, 2d ed. (Bombay, 1964). Sukumar Dutt's *Buddhist Monks and Monasteries of India* (London, 1962) is the best source on Buddhist monasticism in India. For Chinese Buddhism, see Holmes Welch's *The Practice of Chinese Buddhism, 1900–1950* (Cambridge, Mass., 1967). The Buddhist monastic rule is treated in Charles S. Prebish's *Buddhist Monastic Discipline: The Sanskrit Prātimokṣa Sūtras of the Mahāsāṃghikas and Mūlasarvāstivādins* (University Park, Pa., 1975).

On monasticism in Islam, see J. Spencer Trimingham's *The Sufi Orders in Islam* (New York, 1971). An older standard reference is John K. Birge's study of a Sūfī order in Turkey, *The Bektashi Order of Dervishes* (1937; New York, 1982). An abridged translation of a Sūfī rule is found in Menahem Milson's *A Sufi Rule for Novices* (Cambridge, Mass., 1975).

On Protestant monasticism, see François Biot's *The Rise of Protestant Monasticism* (Baltimore, 1963). Peter F. Anson surveys Anglican communities in his *The Call of the Cloister*, 4th ed., rev. (London, 1964).

MONASTICISM: BUDDHIST MONASTICISM

The myth of the historical Buddha's life provides the basic model for Buddhist monasticism. Prince Siddhārtha Gautama went, in Buddhist language, on the "Middle Way," a life of moderate asceticism, between lay life and extreme asceticism. His practices were based on the belief in the existence and attainability of a transcendent reality, enlightenment more profoundly real, powerful, and blissful than the world as experienced in a nonenlightened state. The exercise of meditation, learning, ethical conduct, and progress on the path to liberation were thought to be best managed in solitude, or at least in single-gender communities that did not engage society in traditionally accepted, lay-oriented ways.

Buddhists believe that the best way to follow the path to enlightenment is to live a disciplined lifestyle, one conducive to generating awareness of one's mental states and the causally produced nature of all elements of existence. Sexual relations, marriage, procreation, family life, career, and personal concerns are distractions from religious concerns and thus rejected as preconditions for admission to the Buddhist monastic communities. Buddhists monks and nuns who take vows are, in canonical terms, "pleased" (*prasāḍita*) by their vows. Joining the monastic order has a tempering or "cool-

ing" (*śītala*) effect on the passions, anger, and delusions of monks and nuns. According to Buddhist doctrine, to be rid of the bonds of habitual thought and behavior is a happy and pleasing thing; monastic life is not supposed to be oppressive or restrictive.

In the monastic literature, whenever the Buddha prohibited an action and instituted a rule, he did so to please his disciples. Buddhist monastic life is considered a liberation from mental and physical bondage and conducive to religious development. In the monastic literary corpus there are many examples of the advantages of monastic life. In one episode from the Pali Vinaya, translated by Isaline B. Horner in *The Book of the Discipline*, the parents of a young man named Upāli were confused about how to educate, care for, and provide for the best interests of their beloved son:

"By what means could Upāli, after our demise, live at ease and not be in want?" Then it occurred to Upāli's parents: "If Upāli should learn writing . . . his fingers will become painful. If Upāli should learn calculation . . . his breast will become painful. If Upāli should learn money-changing . . . his eyes will become painful. . . . Now if Upāli should go forth among the recluses, the sons of the Śākyaans, so would Upāli, after our demise, live at ease and not be in want." (Horner, 1938–1966, vol. 3, pp. 10–11)

When Upāli heard of his parents' plan, he was delighted and encouraged his friends to join him in the Buddhist order. Entry into the monastic order was socially acceptable and advantageous, not a punishment or life-denying exile. Commitment to, or at least proximity to, religious mysteries brought social and political status, and for this reason monks and nuns gained prestige and power in their support communities.

Fully developed Buddhist monasticism likely did not originate during the historical Buddha's lifetime. Still, Buddhist monks and nuns use the example of the Buddha's life story as a behavioral model. Through Buddhist history, in communities of celibate Buddhist men and women there were two ideal modes of behavior, reflecting the origins and historical developments preserved in the Buddha's story. The two are eremitic asceticism, likely taken from the earliest years of the order, and cenobitic community life, in which monks and nuns are engaged with monastic brethren and lay society. Some monks continued the practice of strictly renunciative solitary retreats in sometimes remote areas, affirming the ancient eremitic roots of Buddhism, while others, often from the same monastery, were concerned with active monastery affairs, community academic studies, and ritual practices—a cenobitic lifestyle. Similarly, solitary or group pilgrimage to sacred sites, for example, was an accepted practice for Buddhist monks, as long as the monks stayed within the ethical and behavioral parameters. Both modes of behavior were validated by the life story of the Buddha: the renunciative mode by Siddhārtha leaving his home, family, and birthright; and the active mode of behavior by his activi-

ties after his enlightenment, when he returned to public life as a teacher and monastic community developer. This apparent duality of active behavior and renunciative behavior, even in the context of settled monastic life, is one of the characteristics of Buddhist monastic behavior that continues throughout the history of the institution in many if not all its manifestations.

THE SPREAD OF BUDDHIST MONASTICISM. One of the important factors in the spread and growth of Buddhist monasticism was its adaptability. As long as monks and nuns preserved the basic teachings and social behavior patterns, Buddhism could be translated into any language or culture. That is, as long as monks obeyed the monastic laws and engaged in the ritual and meditative practices, Buddhism could and did appear in manifold forms through history. This flexibility served the Buddhist “conquest” of Asia well and stimulated the growth of a massive religious institution with broad sociological diversity, extensive literature, philosophy, ritual, and considerable political power. Indeed, in addition to places for meditation and worship, monasteries were centers for the study and practice of medicine, for writing and building library collections, for Buddhist arts, for adjudicating community disputes, and in general for serving the needs of host communities. Buddhism was and remains an international religion and was intended for transmission into different languages and cultures.

The first example of Buddhism’s adaptability to its cultural environment is in India itself. Buddhism was a new innovation that adapted as India grew and developed. The early Buddhist Vinaya collections record the growth and evolution in an Indian cultural context. In the first years of Buddhism, like their Upaniṣad-motivated brethren, Buddha’s followers were strictly eremitic, following an extreme ascetic lifestyle. The Vinaya monastic literature records that early monks and nuns wandered from place to place, even through the rainy season. These Buddhist wandering mendicants practiced firm renunciation of worldly concerns. With the success of Buddha’s system, however, problems developed because of the sheer numbers of converts. Farmers began to complain about crops destroyed by Buddhists wandering in the monsoon, poorly nourished and weak monks and nuns began to develop illnesses, and the large numbers were difficult to manage. Buddha therefore instructed his communities to set up shelters and temporary residences (*ārāma*) for the duration of the monsoon season. Two sections of the Vinaya deal with the realities of feeding, housing, and occupying itinerant Buddhist monks and nuns during the four-month Indian monsoon season.

The new residences soon increased in size, quantity, and quality, thanks in part to continuing donations of buildings and land by the lay populations and political authorities. Buddhist authorities were soon faced with the problems of retreat conduct, and they needed an effective method to propagate the teachings during the retreat time, when monks and nuns did not wander. The earliest solutions for the com-

munities were the *Posadha* (the twice-monthly rules [*prātimokṣa*] recitation ceremony) and, eventually, regular collective meetings for group rituals, practice, and instruction. The recitation meetings were not a Buddhist innovation; other Indian religious groups kept the ancient Vedic tradition of meeting on the days of the full and new moon, a practice common to religions of that era, Buddhist and non-Buddhist. It was nonetheless one of the significant steps in the development of collective Buddhist monastic practice and a demonstration of the order’s adaptability to local conditions.

The corpus of Indian Buddhist ritual practices and philosophies grew as the order spread and encountered different environments, languages, and social structures. Buddhist monasteries maintained the fundamental teachings and moderate ascetic lifestyle, but Buddhists soon elaborated on the basic doctrines and accommodated new ritual practices current in its own and in new host cultures. Buddhist monasteries became centers for the production of an extensive literary corpus that was often translated into new host languages and subsequently expanded. Though restricted at various times by adverse sociological, economic, and political conditions, Buddhist monasteries were centers for teaching and learning, for medical study and practice, and for elaboration of Buddhist doctrines and associated rituals.

With regional developments in India and gradually elsewhere, first in tropical Śrī Lāṅkā and Southeast Asia and later in high-altitude Northwest India, disputes over points of doctrine and monastic discipline arose. These controversies and resolutions were sometimes recorded in detail and sometimes not, with the result that there is a huge body of often fragmented information about early Buddhist monasticism recorded and transmitted out of its original contexts. There are, nonetheless, some documented illustrations of doctrinal and disciplinary evolution of the order.

The process of institutional development can be seen in recorded events. After Buddha’s death in the fourth century BCE, his disciples held a meeting at Rājagṛha, which is historically regarded as the First Council. It is plausible that the faithful would hold a meeting after the death of Buddha to formalize the doctrines and the ethical rules and to eulogize the late Buddha. According to the tradition, after the death of the great teacher the disciples gathered to collect and preserve his teachings. Other meetings followed the First Council. The number of these councils is, however, uncertain, and it is probable that there were many more such meetings than are recorded in the standard histories. The point is that there were general meetings at which the doctrinal and disciplinary teachings were reviewed, codified, and sometimes modified to meet the exigencies of changing conditions. While there were obviously developments of major significance resulting in schisms in the community and the development of historical sects, little of the data in the accounts of the early Buddhist conventions and institutions can be confirmed. All of the specifics of the First, Second, and later Councils—the

dates, the places, the topics, the resolutions, the participants—are subject to questions. The interest in the councils lie in what philosophical, ethical, and social questions they raised and how those were resolved to support the evolution of the doctrine and spread of the community.

After the first meeting on the occasion of Buddha's death, there were councils at Vaiśālī and later at Pāṭaliputra (Patna). There was eventually a division in the Buddhist monastic order (between Mahāsāṃghika and Sthavira), but the divisive issues are not well understood. These meetings were either concerned with ten points of monastic discipline or with five points of doctrine attributed to one Mahādeva. The list of ten points includes rather trivial matters, and it is probable that these were in themselves indicators of larger issues.

Indeed, a probable cause of the early schism in Buddhism was a controversy between the majority Mahāsāṃghikas and the Sthaviras over expansion of the Vinaya. The Sthaviras evidently saw a need to expand the Vinaya to meet changing conditions. The Mahāsāṃghikas disagreed and were accused of laxity in discipline, which led to the sectarian dispute.

The early schism in Buddhist monasticism is alternatively attributed to five issues of doctrine called the “heresies of Mahādeva.” The five points, which may have been issues of the Third Council, clearly involve points of doctrine, including the status of an enlightened being (*arhat*), but their importance and any significant outcomes are unclear. The sequence, chronology, specific philosophical positions, and importance of the specific points are uncertain, but nonetheless the matters involved monastic life. Later sectarian disputes and divisions likewise were over matters of the inviolability of received scriptures, doctrine, and discipline. The main point is that, as Buddhist monasticism developed, there were disruptive forces in the community. These, however, did not impede the growth of Buddhism; they instead signal how Buddhism adapted to different conditions and ideologies and grew larger as a result.

The early councils and schisms were followed by modifications in later times and other places. Mahāyāna Buddhism developed soon after the early schisms, and new theories, rituals, literature, and engagement with lay society were accommodated by and institutionalized in Buddhist monasteries. Monasticism flourished in Northwest India under the Kūṣāṇa kings, and as time went on Buddhist monasticism spread along the central Asian trade routes into China, Korea, Japan, Southeast Asia, and Tibet. Through all of its manifestations it adapted to local cultures and environments and at the same time preserved its basic doctrinal message and its moderate ascetic lifestyle.

BUDDHIST MONASTICISM AND POLITICS. A key factor in the historical success of the Buddhist monastic institution was its ability to function together with political authorities. Even though monks and monasteries were outside of temporal society and did not recognize conventional social and po-

litical authority structures, relationships between monasteries and governments were often symbiotic. Buddhist monasteries enjoyed the extensive support and protection of political authorities, and in turn monasteries offered religious services, education, and public legitimization. Monasteries were often civic institutions and served the needs of local communities, generating considerable political influence. It was in a government's best interest to support and be validated by these institutions, and many of the most famous monasteries were built during the major dynastic periods throughout Asia.

The monastic literature includes accounts of imperial support for Indian Buddhist monasteries even during the Buddha's lifetime. The story of Anāthapiṇḍika tells of support by wealthy merchants and kings, King Bimbisāra in particular, who donated the Jeta Grove near Rājagṛha in Māgadha to the Buddha and his community of followers. In her translation of the Vinaya, Horner reports that “[t]he householder Anāthapiṇḍika had dwelling places made, he had cells made, porches, attendance halls, fire halls, huts for what is allowable, privies, places for pacing, wells, halls at the wells, bathing halls, lotus ponds, etc. . . . [P]eople were making repairs carefully, attending to the robes, almsfood, lodgings and medicines for the sick” (Horner, 1938–1966, vol. 5, pp. 222–223). Such lavish support brought merit to the wealthy and royal classes. Royal support also brought the kings legitimacy and provided lay and monastic communities education, medical and hospice care, and religious services.

Royal and wealthy lay political support is evident throughout Buddhist history. Monasteries spread with official support in Māgadha, Bihar, Śrī Laṅkā, and Southeast Asia in the early years after Buddha's death. India was experiencing new growth and had close contacts with Persia and Bactria, Central Asia, and locales even further. In India monasticism survived and grew with local political support, especially under the Mauryan king Aśoka (c. 269–236 BCE). According to the legend, this king was particularly aggressive in his conquest of the Indian subcontinent and subsequently converted to Buddhism. After his conversion he was an avid supporter of religion, especially Buddhist monastic institutions. Buddhism, and specifically the interests of Buddhist monasteries, became factors in national policymaking. As a result, monasteries grew in number and in strength in India, in the far northwest as far as the Greek colonies, to the north in the Himalayas, and in Southeast Asia.

After the fall of the Mauryas, Buddhism continued to develop with government support from central Asian kingdoms. There was a succession of kings, including the Buddhist supporter King Milinda (r. 160–140 BCE). The short-lived Śuṅga (187–151 BCE) and Kāṇva (151–106 BCE) dynasties sponsored a great deal of construction of stupas, temples, and Buddhist institutions. The Kūṣāṇa dynasty was the next major dynasty to officially endorse and sponsor Buddhist institutions. The first of the major transmissions of Buddhist monasticism to China began during the Kūṣāṇa

dynasty. Their kings sponsored Buddhist monasteries that stretched from Afghanistan into Samarkand and through modern Pakistan. The kingdom included all of northern India and was influential in Khotan, Yarkand, Kashgar, and further east. Kaniska, the best known of the Kūṣāṇa kings, supported Buddhist monasticism. In these times there was extensive growth of Buddhist ritual, Mahāyāna philosophy, sūtra literature, and institutional expansion.

During the Gupta dynasty (320–580 CE), Buddhist monasticism was supported by the royal courts and by craft guilds. Monasteries were well endowed and became centers of learning and religious practice, and often of community life. Some of the most famous monastic scholars lived in the Gupta period, and monasteries were built throughout India on a grand scale with much political and social support. Religion and politics became so closely related in this period that kings who sponsored building projects often took on nearly divine status. Monasteries also increased their wealth and political power. Some of the most renowned Buddhist monasteries in history were built in the Gupta period. Nālandā Monastery in Bihar, for example, was known throughout classical Asia and was a source of doctrine and monasticism for important Southeast Asian communities.

During the division of India into small kingdoms in the Pāla era (650–1250), Buddhist monasteries consolidated into larger monastic institutions because of a lack of pan-Indian institutionalized support structures and because of the destruction of major Gupta monastic centers by invading armies. Nonetheless, monasticism became the vehicle for the transmission of Buddhism to Tibet, China, and Japan, and to new monastic sites in Cambodia, Pagan, Burma, Java, and elsewhere. Pāla era kings especially established and legitimized their imperial rule by resorting to Buddhist religious models and extensive support of Buddhist monasteries. The practice of religiously legitimizing kingship continued in Tibet and Southeast Asia, notably in the Qing dynasty (1644–1911) during the reign of the Qianlong emperor in the late eighteenth century. As a result, monastic institutions increased, for example, in Tibet and Mongolia, where thousands of new Buddhist monasteries were built in the seventeenth to nineteenth centuries.

Because Buddhist monasteries enjoyed popular support and often wielded political power, Buddhism was sometimes criticized and even persecuted or regulated by lay authorities. In Tang China (618–907); Buddhism was persecuted, powerful Buddhist monasteries were secularized in Meiji Japan (1868–1912); and monasteries were targeted in Tibet in the modern period under Chinese rule. Monasteries often accumulated so much influence that they threatened the integrity and credibility of lay governments and were thus a threat to established lay political authority.

Monasticism, and its special relationship with political authority, was present in all of its support cultures. The Buddhist community's moderate asceticism and Middle Way doctrines were transmitted intact into an enormous variety

of cultures, preserving monasticism as the constant, the vehicle and foundation necessary to reestablish itself in a foreign environment. Its survival and prosperity often depended on local political authorities, and it did indeed survive and prosper.

BUDDHIST MONASTICISM AND ECONOMICS. The Buddhist order was founded and based on metaphysical principles, but its functions were based on the truth of conventional operations in the world. Accordingly, Buddhist monks and monasteries accepted donations of cash, land, and material of all kinds, and they sometimes became rich and powerful. In spite of the injunctions against individual monks owning money, the monastic literature allows the collective ownership of donated and community wealth. Some monks managed their own finances, and in some places a special lay office was established at monasteries to handle donations and finances for monks. Permanent endowments of land and tax rights; endowments of properties with guaranteed long-term agricultural, pastoral, or other income; rights to impose corvée; and constant donations from the lay communities made some monks and monasteries extremely wealthy.

Monasteries were given land, buildings, novice sponsorship, and donations by political authorities and wealthy businesspersons as a matter of routine. Wealthy persons often willed their properties to monasteries or individual monks further increasing monastic holdings. Local laypeople offered food and materials appropriate to their means. Monasteries and monks had other sources of income, depending on the wealth and circumstances of their support communities. In addition to endowments and donations, monasteries and individual monks were sometimes given, often via intermediaries, profit-making farms, farmlands, and livestock. In Tibet and elsewhere, for example, monasteries received regular payments from profits and percentages of commodities produced or sold. Some monasteries lent money and land rights, receiving interest income and payment in kind. The understanding or basic principal at work here was that monastic income, donated and entrepreneurial, was to be used for religious purposes, even if personal and institutional interests coincided. Scholarship has shown that the monastery and individual monks were involved in a broad range of economic activities and that some monasteries and monks became wealthy.

MONASTICISM AND LAW. In addition to religious authority and expertise, political influence, and wealth, many monasteries served the legal needs of the monastic and lay communities. The Buddhist order had a fully developed internal legal system. The monastic law codes divide offenses according to severity and include detailed definitions and case examples for what constitutes each kind of transgression. In addition to internal monastic law codes, Buddhist canonical law was often a validating instrument for lay law. For example, Burmese monastic leaders produced, implemented, and preserved a fully developed lay legal system based on Buddhist law. Monastic law codes were a source of law and legal au-

thority in Southeast Asian cultures and elsewhere, affirming the Buddhist monastic commitment to engagement in worldly matters. Direct involvement in lay legal matters on all social levels shows further that monasteries and lay political, social, economic, and legal institutions interacted closely in symbiotic relationships.

As time went on, Buddhist monasticism was fully integrated into societies in Southeast Asia and in Tang and, especially, Song China. Chinese monasteries interacted closely with government and influenced legal guidelines in politics, business, and lay life. In Tibet, monasteries were often seats of religious and lay power. The Tibetan practice of combining religious and lay authority put political and legal power in the hands of monastic leaders. There are many examples of religious authorities adjudicating lay disputes over civil and criminal law in addition to laws for monastic behavior.

WOMEN IN BUDDHIST MONASTICISM. The history of women in Buddhist monasticism is varied. Patriarchal societies and gender values took their toll on women's institutions. Though according to mainstream doctrine women can be enlightened, in the canonical versions of Buddhist monastic literature women are often cast in unflattering roles. The number of vows nuns must keep is larger than that for men, and there are specific rules that establish the subordinate status of nuns. There are some early literary collections, the *Therīgāthā* hymns, and later writings, but there were few women writers. Women most often did not have access to monastic education. In many countries, moreover, women's ordination lineages did not survive. In modern Tibet and in parts of Southeast Asia, for example, there are no unbroken lineages of full ordination from nun to nun, and nuns are able to take only a brief list of vows.

However, it is also true that women in Asian Buddhist cultures had extensive and important roles in local communities in addition to positive, historical human and divine role models. The status of women varied, depending on specific cultural contexts, economies, and historical periods. There were successes for Buddhist women, including women's ordination lineages. For example, modern scholarship gives evidence of well-established and well-endowed nunneries in India in the Gupta dynasty, though these went into decline in the following centuries. In China, women's ordination lineages were preserved intact.

When women's monasteries were in decline, women re-established monastic life as they were able. In Tibet, for example, where there was no lineage for full ordination, there were nonetheless many nunneries. Women did not have the educational opportunities that were available for men, but they were able to engage in Buddhist meditations and rituals in celibate monastic institutions. In Tibet there were traditions of women pilgrims, ascetics, and even community leaders and teachers who were recognized by the community at large. Thus, whereas women's monasticism was not preserved in Tibet according to ancient Indian models, there were still vibrant women's communities throughout Tibetan

history. Educational standards and facilities were not as developed as in men's monasteries, but women built and maintained strong traditions of meditation, ritual, and community solidarity. Indeed, in twentieth-century Amdo, Northeast Tibet (modern Gansu province), the greater Labrang Monastery community supported women's monasteries even without full ordination.

MONASTICISM: CHRISTIAN MONASTICISM

Christian monasticism does not differ from monasticism in other world religions in its most basic motivation: to allow those who consider themselves capable of practicing a form of religious life that is beyond the means of ordinary believers to do so. The goal and purpose of such extraordinary achievements in Christianity derive from the evangelical counsels of fasting, chastity, and the renunciation of property. With the renunciation of secular attachments, the nun or monk begins a journey of continuous self-mortification with the goal of contemplative unity with God through prayer. Such renunciation has to be practiced and trained for, which requires both abstention and continuous exercise. Abstention is core to the term *monachos*, which means a single, independent, or solitary person. Continuous refinement of practice is core to the term *askesis*, which means training or exercise. Yet whereas singularity through ascetic abstention can highlight the status of religious virtuosi, it may also marginalize them and signify a precarious, even heretical, existence. As such, the salience and permanency of ascetic religious-virtuoso status depends on the reactions of the community and ecclesiastical and political authorities.

BEGINNINGS OF MONASTICISM AND THE “AGE OF THE DESERT” (C. 200–C. 500 CE). Recent research has shown that at the beginning of monasticism, Christian monastic ascetics were only a part of a larger ascetic landscape that was populated by a variety of holy men from different religious traditions in the Roman Empire. It also has become increasingly clear that Christian monasticism does not have a single beginning, but originated in a variety of communities in different areas. Structural heterogeneity spans the familiar forms of anchorites, who live alone, and cenobites, who live in a stable community, but also the Syrian wandering beggar-ascetics and small communal groups within existing inhabited zones in Egypt; moreover, domestic forms of early monasticism existed that were particularly common among women, which shall be addressed further below. It appears, in fact, that the long-held model of the emergence of Christian monasticism out of the prototypical Egyptian recluse must be abandoned. Egyptian Christian monasticism, in its earliest ascetic forms, was located in urban spaces, and it did not inspire, or was not an apparent model for, monastic developments in the Christian world. Monasticism in Palestine, too, was not about eremitical withdrawal into remote desert regions but rather an integral part of Christian life there from early on. One of the main sources of the traditional view of the eremitical/desert beginnings of monasticism,

Athanasius’s *Life of Antony*, which portrayed Anthony of Egypt (c. 251–356) as an exemplary Christian person who perfected his sanctity through solitary life in the desert, is now understood as a discursive strategy with the purpose (and result) of homogenizing different forms of monasticism and consolidating them into a type that could be more easily demarcated from other forms that were, in the eyes of ecclesiastical authorities, less desirable. The common characterization of this monastic era as the “Age of the Desert” is therefore questionable at best.

The cenobitic form of monasticism can be traced back to Pachomius of Egypt (c. 290–346). It was based on the consideration that the ascetics’ heroic virtue could be bolstered and more easily sustained if they lived in a communal setting, allowing them to create a Christian community of love (*koinōnia*, hence “cenobitic”). This community required both stability in a fixed abode (claustration) and governing principles and guidelines, or a *rule*, which became the hallmarks of monasticism. Neither as removed from society nor as regimented and strictly disciplined as it was once believed they were, Pachomian communities spread in the fourth century and were the precursors to later cenobitic forms of monasticism in the monastic age.

THE WESTERN MONASTIC ERA (C. 500–C. 1200). After the turbulences of the fifth century associated with the onslaught of the barbarian tribes, which ended the Age of the Desert, monastic establishments in Western Christianity were given a normative foundation by the sixth-century Rule of St. Benedict. Named after Benedict of Nursia (c. 480–c. 547) and likely based in part on the earlier *Rule of the Master*, the Rule of St. Benedict emphasized stability, peacefulness, order, and collective self-sufficiency. Confronted with often unstable political conditions and a yet largely untamed natural environment, monks and nuns achieved stability by living in a permanent setting that offered shelter from these conditions. Removed from an outside world of violence and warfare, these “athletes of God” fought a more peaceful, spiritual battle instead. This task necessitated order and a structured, methodical way of life.

The prologue to the Rule calls on monks and nuns to “establish a school for the Lord’s service” (Fry, 1981, p. 165), which offered training in the virtues of obedience and discipline. Obedience meant subservience to the abess or abbot, who had authority over monastic communities’ secular and spiritual matters yet was an elected leader and governed by precise mandates of conduct. Discipline both reflected and facilitated commitment to a principled, methodical way of life, which was, because “idleness is the enemy of the soul” (Fry, 1981, p. 249), precisely structured with daily routines. For the most part, these routines focused on collective prayer, *lectio* (the study of texts and private meditation), and work. Collective prayer was organized around a daily round of divine service, the *Opus Dei*. It was complemented by *lectio*, which led to the emergence of Benedictine monasteries as perhaps the foremost centers of learn-

ing, scholarship, and literary production from about the eighth century until at least the eleventh century.

Work was also considered one of the constitutive elements of the monastic profession: “When they live by the labor of their hands, as our fathers and the apostles did, then they are really monks” (Fry, 1981, pp. 249, 251). The valorization of work came out of a tradition that viewed labor both as a means of subsistence and charity and as a way to combat the temptation of *acedia*, or sloth and lethargy brought on by idleness. It enabled the members of a monastic community to aid the poor and sick, prevented them from falling into idleness, and contributed to their material self-sufficiency.

The Rule stated that because for members of monastic communities it was “not all good for their souls” to leave the stable and disciplined environment of the monastery, “the monastery should, if possible, be so constructed that within it all necessities, such as water, mill and garden are contained, and the various crafts are practiced” (Fry, 1981, p. 289). The combination of advancing education and craft skills with improving technologies for cultivating land enabled the monastic communities to achieve a high degree of self-sufficiency.

Monastic houses commonly followed a mixed rule, or a combination of observations taken from different rules, until the Rule of St. Benedict ascended to dominance in the early eighth century. Local customs and conventions continued to be accommodated through so-called customaries.

Cluniac and Cistercian monasticism. The term *Cluniac monasticism* denotes a movement to revive and restore Benedictine monastic life after the decline of the Carolingians and the plundering and pillaging of monasteries by the Vikings and Saracens. The tenth-century reforms that emanated from Cluny and a large number of affiliated or similar reform-minded monastic houses such as Gorze, Hirsau, and Bec led to a ceremonialization of the monastic life and much closer affiliation with nobility. Whereas the Rule of St. Benedict prescribed about three and a half hours a day of prayer and recitation of psalms, Cluniac monastic communities engaged in such activities to a much greater extent. As the number of recited psalms increased from 15 to 170, most of the day was spent in the choir, and the celebration of private and commemorative masses further added to the liturgical demands on the monks.

At the same time, Cluniac monasticism represented a closer affinity with the upper, noble strata of society, in that monks performed religious services for nobles in return for material endowments and protection. The Cluniacs’ link to the nobility was further strengthened by the fact that many nuns and monks came from noble families and that the higher ranks of the Cluniac organization were populated by men of aristocratic origins. For members of the nobility, the endowment of a monastery in land was thought to secure the donor’s temporal and eternal welfare, and noble patronage of monasteries continued to provide privileges and means of influence on the administration of monastic life even after

the Gregorian reform movement and canon law curtailed lay proprietorship of cloisters. In part, this was a utilitarian *do ut des* transaction within an economy dominated by gift and barter, a transaction by which secular wealth and status were traded for spiritual assistance in this life and what was to follow thereafter; in part, however, gift transactions and transfers, as newer historical studies have shown, also served to establish, affirm, and deepen lasting social commitments and moral bonds between donors, donees, mediating agents, and their surrounding communities, thereby integrating these parties into a network of relations and encompassing the realms of both the sacred and the profane.

A different, less feudalized and ceremonialized type of spirituality was embraced by the Cistercians. In reaction to changes within the larger society, such as political consolidation and the expansion of commercial markets, they developed a spiritual program that strongly stressed simplicity, poverty, manual labor, and charity. These goals were to be achieved by rejecting worldly entanglements and restoring a strict, literal adherence of the Rule of St. Benedict. Within 150 years the Cistercians expanded from the “new monastery” formed by two dozen monks around Robert of Molesme (c. 1027–1110) and guided by the charismatic Bernard of Clairvaux (d. 1153) to an organization with perhaps over twenty thousand members by the mid-thirteenth century.

The Cistercians’ economic achievements are well known. They include opening up uncultivated frontiers, converting rural hinterlands into flourishing farmlands, and enhancing the agricultural productivity of already developed estates. Frugality and a distinct economic organization were at the root of their success in transforming the rural economy. The Cistercians emphasized simplicity and austerity, reflected in a comparatively brief and modest liturgy, plain architecture, and the absence of ornaments in their churches. Intrinsic to Cistercian austerity was an emphasis on manual work, to be performed with vehemence and regularity and viewed as the principal means for supporting a monastic community—an approach in stark contrast to the dominant practices in Benedictine monasticism at the time. This religious attitude was complemented by the rationalized economic organization of Cistercian *granges*—or estates composed of contiguous fields and farms obtained through a combination of gifts, leases, pawns, and purchases. Organized into a single unit for agricultural production, a grange allowed a much more methodical estate management than did the previously fragmented patches of land. Granges were exempt from ecclesiastical tithes and other agricultural taxes, and local markets in the countryside and urban settings (if available) provided a ready outlet for their agricultural and pastoral products.

Having few outlets for expenditure beyond charity and subsistence, the Cistercians could re-invest their wealth in the acquisition of monastic estates, and thus further the basis of their economic success. But in the second part of the thir-

teenth century, Cistercian land acquisition came to a halt. The peasantry had fewer material incentives to join the order, with serfdom disappearing, markets for agricultural products expanding, and cultivation methods improving by the late twelfth century. Burghers and knights, too, found other spiritual avenues, and the burghers of the cities were differently served by the urban mendicant orders. By the thirteenth century the “new monastery,” a highly aristocratic order, in some ways looked like the monastery of old.

THE MENDICANT ERA (C. 1200–C. 1500). During the twelfth century, monasticism was both revived and altered, developments which occurred in the context of rapid social change. An expanding commercial economy, the revival of the cities, a newly found individualism, and increasing levels of lay literacy altered established social traditions—and with them religious life.

In Italy and France an early response to this change came in the form of religious hermits. Drawing on traditions of eremitical poverty in early Christian monasticism, charismatic hermits such as Romuald of Ravenna (950–1027) or Norbert of Xanten (1080–1134) rejected the stability of the monastery and lived their lives as wandering ascetics. Committed to austerity and noninvolvement with a commercializing, more individualist society, the hermits ushered in a new type of religious eremiticism by not seeking a life of solitude but rather associating with loose groups of followers and supporters. Many of these groups disbanded after the death of their leader, while others assimilated into monastic groups where they continued their serene eremitical life.

A different response came in the form of lay religious movements, which also embraced apostolic poverty but lived in small communities seeking to emulate the life of early Christian communities. Groups such as the Italian Humiliati and the early French and Italian Waldensians rejected the monastic traditions of concentrating on spiritual labor and withdrawing from the world. Combining preaching with itinerancy and austerity, they formed the model for a revival of Christian monasticism in the form of the mendicant orders.

The mendicants. The Franciscans and Dominicans responded to changing socioeconomic conditions by radically breaking with received monastic traditions. They did not question the contemplative life as the ultimate form of Christian perfection, or prayer as the pivotal means to achieve it. They dispensed, however, with the life in a stable, enclosed residence that had been the hallmark of traditional monasticism, and they were governed by ecclesiastical rules whose explicit *raison d'être* was preaching to the populace. As popular preachers admonishing the laity to repent and to seek inner conversion, they left the seclusion of the cloister for the busy streets of the city, voluntarily renouncing all forms of property, be it personal, as their monastic predecessors had done, or corporate. Instead of collective stability and withdrawal from society, they chose individual mobility and participation in secular affairs.

With this turn, monastic spirituality opened itself to the world. The mendicants rejected the legacy of world flight in monasticism and recentered the meaning of asceticism on notions of strict poverty and active ministry. The attraction of the mendicants was extraordinary: in the first one hundred years they grew from a few men around Francis of Assisi (1181/82–1226) and Domingo de Guzmán (c. 1170–1221), the two founders of the major mendicant orders, to a total of about twenty-eight thousand Franciscans and about twelve thousand Dominicans.

Rapid organizational growth, however, brought about significant changes in mendicant spirituality within the first fifty years, during which some of their early ideals were significantly changed or even abandoned. In the case of the Franciscans, the first friars who joined Francis of Assisi shared his ideal of imitating the simple, austere life of the apostles. Much like other religious charismatics at the time, Francis renounced the vanities of the world, which in his case meant the comfortable lifestyle of a wealthy merchant's son, for the transient existence of an itinerant preacher. Money was not even to be touched, and academic studies were not encouraged. Yet whereas the early Franciscans were expected to support themselves by working and begging, within a span of less than forty years the Franciscans' commitment to manual labor changed, together with their views on the futility of learnedness and absolute avoidance of money. Manual labor was abandoned, as growth in numbers and the inevitable routinization of Franciscan charisma necessitated changes in the order's structure and some of its defining spiritual characteristics. The precarious existence of itinerant beggars and laborers was difficult to reconcile with the need for some institutional and economic stability. It became necessary to impose organizational structures onto the order and to regulate the avenues of admission and advancement, as well as to adopt a less unworldly stance toward money. Furthermore, a great number of priests joined the order, and heresy continued to be viewed as a primary threat. The rustic views of Francis on learning and the unresolved relation of the friars-priests to the secular clergy were at odds with the view shared by many clerics and more-learned members of the order that active ministry required a trained, professional apostolate and the definition of rights and duties *vis-à-vis* the parish priests. By about the mid-thirteenth century, the Friars Minor were a highly clericalized and learned order, steeped in university life. Earlier notions of absolute poverty gave way to the permission for corporate use, if not ownership, of property, and full control over it.

The other major mendicant order, the Dominicans, did not experience the same organizational dilemmas and shifts in spiritual orientation or emphasis. From the beginning it was conceived to be a priestly order devoted to preaching. The meaning and extent of poverty, while important, was not as contested as among the Franciscans, and intellectual training was considered paramount for an active apostolate. For the professional pastors and preachers who stood at the

forefront of the defense of the church as inquisitors and who attended to the spiritual needs of the laity, a solid foundation in theology and the art of preaching was essential. Because the nature of the order was clerical and its orientation priestly, there was no place for work. In the daily routine, manual toil and meditative reading—two of the pillars of the Rule of St. Benedict—gave way to a brief liturgy and the occupations of preaching, studying, and teaching. In both orders, therefore, asceticism was channeled toward the methodical training of the intellect and endured in corporeal and social renunciations such as chastity and penury.

In the later Middle Ages the monasticization of the mendicants and persistent debates over the role of wealth were indicative of significant challenges to religious life. Such challenges were also obvious in traditional religious orders, where abuses and discipline problems as well as declining numbers reflected a crisis in monastic life.

THE REFORMATION, PROTESTANTISM, AND THE ENLIGHTENMENT. Laxity in spiritual discipline in religious life was one of the issues that prompted the Augustinian friar Martin Luther (1483–1546) to question the foundations of monastic life. Luther, as well as other reformers, ushered in a period in which Protestant authorities disbanded existing houses and disallowed the establishment of new ones. Monastic property was seized and distributed into secular channels.

Ever since the Reformation, the notion of the priesthood of the believer, which exalts each believer to the status of religious virtuoso, has remained one of the pillars of Protestantism. This notion mitigates against the establishment of religious orders whose members enjoy a fundamentally different religious status from that of other members of the church.

A second challenge to monastic life after the Reformation came in the form of the Enlightenment. Enlightenment thinkers tended to equate monastic rituals and traditions with unenlightened superstition and tied them to the society of old. In the wake of the French Revolution and Napoleon Bonaparte's rule, most monastic communities were disbanded or destroyed.

THE APOSTOLIC ORDERS AND TEACHING CONGREGATIONS. Reform in the Catholic Church took its own shape in its reformations of religious life in the sixteenth century. One of more than a dozen new apostolic orders that emerged and prospered in that period, the Jesuits represented a new form of order that replaced the emphases in traditional monasticism on contemplation and in the mendicant orders on poverty with a stress on ministry, discipline, and commitment to furthering the church's causes. Founded by Ignatius Loyola (1491–1556), the order grew rapidly. Within a hundred years of their papal approval in 1540, they represented an organization of over 15,000 members. A precipitous decline occurred in the late eighteenth century, however. This decline affected them as well as the traditional monastic groups and the friars. Within a period of fifty years after Pope Clement XIV disbanded the order in 1773, the number

of male monks, friars, and members of apostolic orders has been estimated to have dropped to only 70,000, and only about forty of more than one thousand monasteries of the traditional monastic communities survived.

A reversal of such decline was made possible through the revival of traditional monasticism's appeal in the nineteenth century, which led to a revival of Benedictine and Cistercian communities. Numerically more significant, however, was the emergence of hundreds of new religious communities, particularly religious congregations that substituted an active charitable agenda for the traditional contemplative orientation. In practice, this often involved teaching, nursing, and social services. These brothers and sisters in congregations contributed tremendously to the renewal of Catholic religious orders up to the second part of the twentieth century.

THE CHALLENGES OF SECULARIZATION. In an attempt to bring about the *aggiornamento* modernization of Catholic faith, the Second Vatican Council (1962–1965) initiated various changes in the Catholic Church. This occurred at a time when theologians presumed that modern societies underwent a process of secularization that required religious communities to evolve in order to better meet the demands of modern life. Distinctions between laity and priesthood were reduced, and the leveling of status also affected the religious vocation of a member of a monastic community. A steep decline in the number of Catholics entering religious communities ensued. In the United States, by 1990 the annual number of women who entered a religious order was about one-seventh of what it had been three decades earlier, and the number of men in a religious order had been reduced to less than half. Whereas Canada and western European countries experienced a similar decline (with concomitant financial exigencies and geriatrification of membership), the opposite is true for sub-Saharan Africa and South Asia. Catholic religious communities in those areas have grown significantly, to the extent that for some orders these countries produce a very significant portion of novices. So far, no reversal of these trends is in sight for the twenty-first century.

MONASTICISM AND GENDER. The role of women in Christian monasticism has undergone many changes. The predominance of teaching congregations over contemplative communities since the second part of the nineteenth century is a reflection of one of the most fundamental changes in monasticism, the increasing involvement of women, as women have joined active congregations in much greater numbers than their male counterparts. When Catholic religious communities reached their numerical peak in the United States in 1965, sisters outnumbered brothers by a ratio of about five to one. Worldwide, the vast majority of Catholic religious today are women.

Women, however, have not always been so strongly represented in Christian monasticism, nor has the cloistered life always been encouraged for female religious. In early monasticism, female religious virtuosity was related to the celibacy of virgins and widows. For women, separation from the

world often did not mean withdrawal from the community and living a life of self-mortification in the desert or wilderness (although for some women, it did), but rather a selective abstention from worldly life (sex, marriage, and food) within a family, house, and community. The structure of early female Christian asceticism was heterogeneous: some women lived in informal ascetic groups, others lived an anchorite life, while most remained in their families and communities or joined a household with a clergyman. By the fifth century the claustration of women in cenobitic communities was under way and set the stage for the institutionalization of women under the Rule of St. Benedict.

Following a period of expansion and the flowering of new monastic foundations for women in the seventh century, especially in the form of double monasteries, the proportion of houses dedicated to women declined steadily until the end of the eleventh century. The first Cluniac cloister for women was not founded until about a century and a half after the foundation of Cluny itself. Similarly, while recent scholarship no longer contends that there were no Cistercian establishments for women, the early Cistercians did anything but welcome women with open arms. Further, when women joined they had to maintain strict lifelong enclosure. Nevertheless, half of the about 850 nunneries that were founded for women in France and England between 410 and 1350 appear to have been founded in the period between the late eleventh century and the late twelfth century, including women-centered monastic communities such as Fontevraud and the Gilbertines.

The tradition of claustration continued among the Franciscans and the Dominicans in the later Middle Ages. In 1206, some nine years before the first male Dominican community was founded, Dominic established a cloister for women at Prouille—as an imitation of Cathar houses for women—with the purpose of winning over converts from the Cathars. Unlike Francis, who remained reserved toward the idea of women affiliating with his order, Dominic appears to have been open to women's wishes to join the religious life. The establishment of other monasteries for Dominican nuns followed, and their numbers increased significantly, even though a quota system was put in place to regulate demand. Franciscan convents, inspired by the saintly example of Clare of Assisi (1194–1253), proliferated as well. Yet the nuns lived a religious life quite different from that of the friars. Most importantly, they continued the monastic tradition of strict enclosure for women. Their claustration prevented them from preaching and begging, and no provisions were made for organized study. It required considerable pressure from the papacy to ensure that communities of women were properly integrated into the mendicant orders, if only in thoroughly regulated and well-defined terms. The restrictions on women's access to the apostolic life and on the ways in which they were allowed to live it led them to focus on contemplation. Medieval nuns contributed greatly to the mystical and devotional literature of the later Middle Ages.

In the apostolic era, apostolic orders for women flourished. This was the case for both cloistered and unclaustrated communities, even though the latter often had difficulty with ecclesiastical authorities when insisting on performing charitable work for the poor. It was not until the decline of apostolic orders in the late eighteenth century and the revival of monastic communities in the teaching and nursing congregations that active worldly services would become a predominant focus of women religious.

CHRISTIAN MONASTICISM IN COMPARATIVE PERSPECTIVE.

With the exception of Max Weber, few scholars have attempted a comparative study of monasticism in different religious traditions. Weber's writings in the sociology of religion, which focused on the economic ethics of the world religions, revealed that monastic groups generally attracted followers of religious traditions who were best suited for, and most committed to, stringent ascetic practices. The stringency and direction of such ascetic practices varies, however. Compared to its counterparts in Confucianism, Daoism, Hinduism, and Buddhism, Weber argued, Christian monasticism is comparatively unique in two aspects: (1) its relatively modest ascetic requirements, and (2) its stronger inner-worldly focus. Even though Christian monasticism knew of extremely demanding ascetic practices, such as those displayed by the stylites (fifth- and sixth-century Syrian ascetics who solitarily dwelled on a pillar for up to several decades, themselves influenced by Eastern precedents), its practices never quite equaled those required of Hindu ascetics, who may have produced some of the most extraordinary religious forms of world renunciation and bodily abnegation known to humankind. In contrast, Western Christian monasticism, especially as it became guided by the Benedictine rule, aimed for consistency, not supererogatory achievements possible only for a very select few. The emphasis on consistency contributed to Western monasticism's methodical character, and its less stringent ascetic demands coincided with a stronger inner-worldly focus. In other words, Christian monastics were not expected to leave the world behind in contemplation nearly as much as Hindu or Buddhist monks were, but rather embraced manual labor as an ascetic practice.

In practice, the tension between contemplative and ascetic practices proved difficult to resolve. On the one hand, tedious practices of manual labor tended to be given over to monastic affiliates of lesser status to free the monks and nuns proper to engage in contemplative practices, which lessened monasticism's inner-worldly focus. For example, in Cluniac and Cistercian monasticism, most of the manual chores fell on the *conversi*, or lay brothers. On the other hand, reformations of monastic life periodically restored manual labor's status and contributed to important technological advances, such as the use of the watermill and the rationalization of agriculture (particularly on Cistercian estates), or moved it close to the center of monastic spirituality, as happened in the early Franciscan groups. While all forms of monasticism in the world's major religions were much more concerned with transcending the secular spheres than with mastering or

rationalizing them, the tension between the two directions appears to have been more pronounced in Christian monasticism; attempts to resolve it brought about a variegated monastic landscape over time.

More recent scholarship has broadened this perspective and led to significant revisions. For example, Mayeul de Dreuille's overview of the monastic traditions in Hinduism, Buddhism, Judaism, and Egyptian religions provides a much-needed newer comparative perspective and reminds the reader of the possible influences of these traditions on Western monasticism. Ilana Friedrich Silber's comparative study of Theravāda Buddhism and medieval Catholicism points to patterns of lay support and interaction with laity as well as to political patronage as factors shaping monasticism's societal impact and the direction of its spirituality—thus indicating a more dynamic relationship between monasticism and society than is suggested by Weber. In spite of these newer studies, research on comparative monasticism and asceticism remains in its infancy.

BIBLIOGRAPHY

For a general overview of Western Christian monasticism, the best studies are Peter King's *Western Monasticism: A History of the Monastic Movement in the Latin Church* (Kalamazoo, Mich., 1999) and, with a focus on the Middle Ages, C. H. Lawrence's *Medieval Monasticism: Forms of Religious Life in Western Europe in the Middle Ages* (3d ed., New York, 2001).

Important new studies on early monasticism include James E. Goehring's *Ascetics, Society, and the Desert: Studies in Early Egyptian Monasticism* (Harrisburg, Pa., 1999) and Daniel Caner's *Wandering, Begging Monks: Spiritual Authority and the Promotion of Monasticism in Late Antiquity* (Berkeley, Calif., 2002). The varieties of monasticism in Palestine are addressed in John Binns's *Ascetics and Ambassadors of Christ: The Monasteries of Palestine, 314–631* (Oxford, 1995). On Athanasius and Pachomius and their ecclesiastical position and interpretation, see David Brakke's *Athanasius and the Politics of Asceticism* (Oxford, 1996) and Philip Rousseau's *Pachomius: The Making of a Community in Fourth-Century Egypt* (Berkeley, Calif., 1985).

The Rule of St. Benedict is contained in *R[egula] B[enedicti] 1980: The Rule of St. Benedict*, edited by Timothy Fry, OSB (Collegeville, Minn., 1981). For monastic customaries, see Kassis Hallinger's "Consuetudo: Begriff, Formen, Forschungsgeschichte, Inhalt," in *Untersuchungen zu Kloster und Stift*, edited by the Max-Planck-Institut für Geschichte (Göttingen, Germany, 1980), pp. 140–166. For Cluniac monasticism, see Barbara H. Rosenwein's *Rhinoceros Bound: Cluny in the Tenth Century* (Philadelphia, 1982); for the Cistercians, Louis J. Lekai's *The Cistercians: Ideals and Reality* (Kent, Ohio, 1977). For the moral character of and extensive social relationships entailed by noble donations in the case of Cluny, see Barbara H. Rosenwein's *To Be the Neighbor of Saint Peter: The Social Meaning of Cluny's Property, 909–1049* (Ithaca, N.Y., 1989).

The new eremitical groups in the twelfth centuries are discussed in Henrietta Leyser's *Hermits and the New Monasticism: A*

Study of Religious Communities in Western Europe, 1000–1150 (New York, 1984). Lester K. Little discusses changes in social conditions and their effects on religious life in *Religious Poverty and the Profit Economy in Medieval Europe* (Ithaca, N.Y., 1978).

For a history of the Franciscans and Dominicans, see John Moorman's *The History of the Franciscan Order* (Oxford, 1968) and William A. Hinnebusch's *The History of the Dominican Order* (Staten Island, N.Y., 1966–1973).

A very readable, up-to-date account of changes and directions in Catholic religious orders since the Reformation is provided by Patricia Wittberg's *The Rise and Fall of Catholic Religious Orders: A Social Movement Perspective* (Albany, N.Y., 1994). Steve Bruce's *God Is Dead: Secularization in the West* (Oxford, 2002) addresses causes and consequences of secularization from a comparative perspective.

The best study of women in monasticism is Jo Ann McNamara's *Sisters in Arms: Catholic Nuns through Two Millennia* (Cambridge, Mass., 1996). Susanna Elms's *Virgins of God: The Making of Asceticism in Late Antiquity* (Oxford, 1993) addresses early monasticism and women. Helen Rose Ebaugh's *Women in the Vanishing Cloister: Organizational Decline in Catholic Religious Orders in the United States* (New Brunswick, N.J., 1993) focuses on current transformations among American female religious.

Max Weber's thoughts on monasticism in the world religions are scattered throughout his *Gesammelte Aufsätze zur Religionssoziologie*, vols. 1–3 (Tübingen, Germany, 1920–1921). Newer scholarship on this topic includes Mayeul de Dreuille, OSB, *From East to West: A History of Monasticism* (New York, 1999), and Ilana F. Silber, *Virtuosity, Charisma, and Social Order: A Comparative Sociological Study of Monasticism in Theravada Buddhism and Medieval Catholicism* (Cambridge, UK, 1995). The role of asceticism in different religious traditions is discussed in *Asceticism*, edited by Vincent L. Wimbush and Richard Valantasis (Oxford, 1995).

Differing strains of asceticism in medieval monasticism are addressed in Lutz Kaelber's *Schools of Asceticism: Ideology and Organization in Medieval Religious Communities* (University Park, Pa., 1998), chapter 2, which contains an earlier version of sections of this article, as well as a more extensive discussion of some issues raised here.

LUTZ KAELEBER (2005)

MONEY. In examining the significance of money in the history of religions, one must begin by making a distinction between the commercial use of money in societies that have developed a market economy and the uses of money in societies with nonmarket economies. In the former, money is used primarily as a medium of exchange and standard of value in the marketplace, and its value lies in its abstractness, in its ability to mediate the exchange of goods between all persons who desire to engage in exchange, regardless of their social status and regardless of the nature of the goods involved. In this context money plays a major role in the economy, and the economic sphere is relatively independent of

the social and religious spheres. When money is used in the context of a nonmarket economy, on the other hand, its use is more intimately connected with social and religious institutions. Whereas in a market economy money is used primarily for the commercial exchange of essential goods, in nonmarket economies such exchanges are often accomplished through nonmonetary means (such as barter or redistribution by a political authority), and money is reserved for a more exclusive set of exchanges that are at once social and religious in significance. This article will accordingly focus on the social and religious significance of money in communities with nonmarket economies.

Marcel Mauss (1914) was one of the first scholars to call attention to the religious significance of money in so-called primitive and archaic societies. In 1914 Mauss noted the use of objects like shells and precious metals as means of exchange and payment by peoples who were without a system of coinage. Drawing on evidence from Africa, Oceania, and North America, he insisted, against the anthropologist Bronislaw Malinowski, that such objects are rightly described as money, but he added that they are to be distinguished from modern money in being used only in specific social contexts and in being endowed with numinous or sacred value over and above their economic worth.

One of the most famous examples of such money is provided by the *kula* ring of the Trobriand Islanders, studied by Malinowski and discussed as well by Mauss. The *kula* ring is a complex system of exchange by which armbands and necklaces made of shells, collectively called *vaygu'a*, are traded around a large ring of islands just east of New Guinea. The armbands and necklaces, items of high value but of little practical use (they are seldom used even as ornaments), are traded in opposite directions around the circle by various sets of trading partners who make periodic voyages between their respective islands. The complex system of gifts and counter-gifts that develops is closely connected with the social order. The higher a person's social status, the more trading partners that person is liable to have, and the more generous he or she may be expected to be in gift giving. Not only is status an important factor in the giver, but the *vaygu'a* themselves develop a kind of status. The more a particular necklace or armband is traded, the more valuable it becomes, receiving a name and personal history and taking on a certain numinous quality. This trade in *vaygu'a* forms the heart of a more extensive trade between the islands that includes trade in ordinary commodities as well as in the valuable shell ornaments. Furthermore, the *vaygu'a* themselves can be given a definite price, in terms of baskets of yams, and in some specific circumstances can serve as a means of payment for services. Mauss argued that they could therefore be considered as a form of money, although clearly not the impersonal medium of exchange normally intended by that word. The *kula* ring thus provides a good example of money in a nonmarket economy, where it is an integral part of the economic system and yet still has a definite social and magico-religious value.

The use of shells as money goes far beyond the Trobriand Islands. The commonest form of shell money is the cowrie shell, which is found in China, India, the Near East, Africa, Europe, and the Americas. This small, attractive shell is well suited to serve as money because of its portability, countability, and immunity to counterfeiting. However, the use of the cowrie as money was originally motivated by more than its practicality. Mircea Eliade (1969) has pointed out the rich symbolism of shells in general, and the cowrie is no exception. It has been used widely as a talisman and is commonly viewed as a symbol of fertility, while among certain Indian tribes of North America it was treated as a sacred object. Like gold and jade, both rich in symbolism, cowries were also quite commonly buried with the dead. In China, cowries were placed in the mouth of the dead person, perhaps as a kind of passage money, similar to the obol for Charon in ancient Greece. The association of cowries with gold is evidenced by the fact that cowries actually made of gold have been found in Egypt and Cyprus. The popularity of the cowrie as a form of money is thus also due to its intrinsic symbolic properties.

Another widespread form of money is the glass bead. These seem to have been particularly common in Africa, where they were believed to grow naturally in the ground and thus to partake of the sacrality of the earth. Like the cowrie, they provided a convenient form of currency that was also endowed with numinous and magical properties. They were used not only as money but also in various rituals. Among some African peoples they were ground up, mixed with water, and rubbed on children to aid their growth. Again like the cowrie, they are often found in graves.

Not only were many types of primitive or archaic money endowed with an intrinsic numinous quality; some were also used as the specified means of payment for various religious services. This is seen clearly in ancient India, where the *Śatapatha Brāhmaṇa* enjoins that the payment (*dakṣina*) of the priests officiating at a sacrifice be made in gold, cattle, clothing, or horses. With the possible exception of clothing, all these objects are laden with religious symbolic significance. Their value was at least partly intrinsic, and it was this intrinsic worth and not their raw economic value that made them fit for the remuneration of priests. Their economic value was located within a broader context of social and religious value.

A particularly interesting case of an exclusively religious use of money is the Chinese custom of making offerings of paper money to gods, ghosts, and ancestors. Four centuries before paper money began to be used for commercial exchange in China, it was already being used as a sacrificial offering. The money itself consisted of pieces of paper in varying sizes and colors, decorated with designs, depictions of gods, or Chinese characters. A small piece of tin foil was sometimes attached to the center of the paper in order to represent silver or, when dabbed with yellow tint, gold. Obviously this paper money had little real economic value, but

this was in fact intentional, because it was believed that what was a mere imitation in this world would become, when transformed by the sacrificial fire, a genuine treasure in heaven. There it would be added to the Celestial Treasury for the benefit of the person making the offering. This paper money is still in use in Taiwan, where four principal types are found: “gold” paper money, offered to the gods; “silver” money, offered to ghosts and ancestors; “treasure money” for repaying the “debt of life”; and “money for the resolving of crisis,” used primarily in rites of exorcism.

It goes without saying that gold and silver have been favorite forms of money from earliest times. Long before they came to be used for commercial exchange, however, they were used for gift exchange and as a standard of value among various political, social, and religious elites. Exchanges of articles made of these precious metals were a primary means of asserting and maintaining one’s status. The cups, tripods, bowls, and arms exchanged among the ruling elite of Homeric society, for instance, were often made of precious metals and were endowed with the numinous quality that is associated with these metals more generally. A king’s treasury could express not only his political sovereignty and personal wealth but also an intrinsic sacred power that could come to the aid of his kingdom in times of crisis.

The close association of gold and silver with royalty, on the one hand, and with religious values, on the other, did not cease when these metals eventually began to be used in the manufacture of coins. Although it has been customary in textbooks on economics to attribute the introduction of coinage or “real” money to a merchant class seeking to overcome an awkward system of barter, this hypothetical reconstruction contains little historical truth. In fact, as illustrated above, the use of money cannot be equated with the use of currency in a market. Furthermore, the transition from a nonmarket to a market economy is a gradual one that is not identical with the introduction of coinage. According to Édouard Will (1954), who builds upon the earlier work of Bernhard Laum (1924), the introduction of coinage in ancient Greece must be understood in the context of the social and legal reforms of the time of Solon (c. 630–560 BCE). Far from being intended to facilitate trade (which was in fact not a Greek but a Phoenician concern), coinage was introduced by the state in order to provide a new standard for an older system of exchange that had become decadent and unjust, and to provide a standard means for payments made to the state such as taxes, fines, port fees, and the like. The introduction of coinage was thus the initiative of the same group with which gold and silver were already associated, namely, the royalty.

The religious significance of the earliest coins must be seen in this larger political context. Although it was argued in the nineteenth century, in particular by Thomas Burgon and Ernst Curtius, that early Greek coinage had a direct religious origin, it seems more likely today that the numerous religious symbols found on these coins are to be understood

both as symbols of the issuing city-state and as symbols of the divine sanction behind a specific issuing body and hence behind the value of its coinage as well. This is not to deny that religious representations have been favorite themes on coins throughout history; but these representations are to be understood as expressing the religious values of the issuing body and not necessarily as implying an intrinsic value in the material coin itself.

With the introduction of coinage, therefore, a gradual movement began away from the more archaic pattern of attributing sacral value directly to the material objects used as money and toward the highly abstract forms of money used today, which are valued purely on the basis of their usefulness as indirect media of exchange in commercial markets.

With the introduction of fully monetized market economies, one begins to encounter a reversal in religious attitudes toward money. Whereas the earliest forms of money had a positive numinous quality for many archaic peoples, the disruptive effects that moneys and markets can have on the social structure of previously nonmarket societies can lead to negative evaluations of money as an evil. This can be seen clearly in the medieval West, where the introduction of markets and the increased use of money from the eleventh century onward led to a variety of religious protests. Money was increasingly represented as demonic. Feelings of awe before the numinous qualities of gold and silver were transformed into feelings of disgust for gold and silver coins, which were increasingly compared to excrement. By the end of the thirteenth century, depictions of apes defecating coins begin to appear in the margins of manuscripts. One also finds a picture of the head of a monster vomiting gold coins into a golden bowl. In less extreme forms this religious suspicion of the role of money in a market economy has persisted into the modern era.

BIBLIOGRAPHY

A good introduction to money considered in its social contexts is provided in Walter C. Neale’s *Monies in Societies* (San Francisco, 1976). Numerous studies of money in nonmarket economies, including two of Malinowski’s essays on the Trobriand Islanders, have been collected by George Dalton in *Tribal and Peasant Economies: Readings in Economic Anthropology* (Garden City, N.Y., 1967). Both Neale and Dalton are students of Karl Polanyi, some of whose more important essays have been edited by Dalton in *Primitive, Archaic, and Modern Economies: Essays of Karl Polanyi* (Garden City, N.Y., 1968). The two standard studies of “primitive money” are Paul Einzig’s *Primitive Money*, 2d rev. ed. (Oxford, 1966), and A. Hingston Quiggin’s *A Survey of Primitive Money* (London, 1949). These two books are mines of information but need to be supplemented by the more theoretical works listed above.

The symbolism of shells has been studied in Mircea Eliade’s “Observations on the Symbolism of Shells,” chapter 4 of his *Im-*

ages and Symbols: Studies in Religious Symbolism (New York, 1969), pp. 125–150. Chinese paper money has been studied recently in Hou Jinglang's *Monnaies d'offrande et la notion de trésorerie dans la religion chinoise* (Paris, 1975). On the origins of Greek coinage, see both Ernst Curtius's "On the Religious Character of Greek Coins," *Numismatic Chronicle* 10 (1870): 91–111, and Édouard Will's "De l'aspect éthique des origines grecques de la monnaie," *Revue historique* 212 (July–September 1954): 209–231. The classic work on the origins of Greek money remains Bernhard Laum's *Heiliges Geld: Eine historische Untersuchung über den sakralen Ursprung des Geldes* (Tübingen, 1924). Marcel Mauss's groundbreaking article, "Les origines de la notion de monnaie," first published in 1914, has been reprinted in his *Ceuvres*, vol. 2, edited by Victor Karady (Paris, 1969), pp. 106–112. Also to be consulted is his classic study *The Gift: Forms and Functions of Exchange in Archaic Societies* (1954; New York, 1967).

DAVID CARPENTER (1987)

MONGKUT (1804–1868), Thai Buddhist reformer and later king of Thailand. A son of the second king of the Cakkri dynasty (1782–), Mongkut was heir apparent to the throne. However, when his father (later known as Rama II) died before Mongkut had reached his twentieth birthday, his claims were passed over in favor of those of his uncle (Rama III). Having entered the Buddhist monastic order for a temporary stay only two weeks prior to his father's death, he decided to remain a monk. Mongkut's monastic career did not end until more than a quarter of a century later when, following his uncle's death in 1851, he was chosen to succeed to the throne. At that point he left the order, became king (Rama IV), and began a reign that continued until his death.

Mongkut began his monastic career at Wat Samorai, a forest monastery near Bangkok that was renowned for its emphasis on ascetic practice and meditation. After a year of apprenticeship there he became increasingly dissatisfied because no adequate intellectual grounding or justification was being provided for the practices in which he was engaged. For this reason he left to become associated with a monastery in Bangkok, Wat Mahāthāt, which emphasized the study of the sacred texts written in the Pali language. There he quickly demonstrated his intellectual ability, becoming a leading expert in Pali studies.

Despite his increasing erudition, however, Mongkut remained skeptical about the authenticity of the tradition in which he was participating. At a certain moment during his stay at Wat Mahāthāt he reached a point of spiritual crisis (so the story goes) and vowed that if his doubts were not resolved within the week he would give up the struggle and leave the order. Before Mongkut's self-imposed time limit had expired, the answer that he was seeking came to him during an encounter with a Mon monk. (The Mon were an ethnic group with a long and venerable history in both Thailand and Burma.) This teacher was able to convince Mongkut that the Theravāda tradition as preserved and practiced by

the Mons was the authentic tradition, the one remaining truly faithful to the teachings of the Buddha and to the testimony of the Pali scriptures (the Tipiṭaka). The obvious corollary was that the Thai version of the Theravāda tradition was inauthentic, misguided, and in need of reform.

Soon after his encounter with the Mon monk, Mongkut returned to Wat Samorai, where he launched his reform movement. Having initiated his own program of Pali studies at this forest monastery, he soon "discovered" that the boundary stones that established and set off the sacred precincts (*sīmā*) were not in accord with the requirements set forth in the Vinaya (the portion of the Pali Tipiṭaka that deals with the behavior of monks and the proper ordering of monastic life). Thus, he concluded, the ordinations that had taken place at this monastery, which for many years had been an ordination center for the Thai *sangha* as a whole, were invalid. In order to rectify the situation Mongkut arranged for the proper consecration of the sacred precincts at the Wat, and for his own reordination by monks who had been ordained in the Mon tradition. Through these formal ecclesiastical acts Mongkut made an irrevocable break with the traditionally oriented community of Thai monks (the Mahanikai; Pali, Mahānikāya) and established a new, reformist Thai lineage that later came to be known as the Thammayut (Dhammayuttika) Nikāya.

During Mongkut's remaining years in the order, he gradually built the new lineage into a small but distinctive and distinguished community. This community came to include within its ranks a number of serious and intellectually creative young monks, most of them from high-ranking families in the kingdom. It gained the support of many laymen and laywomen, including prestigious and influential members of the nobility. It also gained widespread popular recognition through an active program of teaching, not only in the capital city but also in the countryside.

Like many reformers who have emerged in traditions that have preserved sacred scriptures from the distant past, Mongkut appealed to the authority of those scriptures in order to purge supposed accretions that had, from his perspective, come to compromise the purity of the original tradition. He also combined his emphasis on scripturalist reform with an openness to the new modes of scientific rationality (and the accompanying rejection of inherited "superstitions") that were then being introduced from the West. The effect of these reforms on religious practice was the adherence, by the monks, to more canonical forms of monastic discipline and ritual. Doctrinally, the reforms resulted in a new modernist form of Buddhist teaching that emphasized the humanity of the Buddha and highlighted the ethical and humanitarian aspects of his message.

When, at the age of forty-seven, Mongkut left the order and became king, he assumed the traditional royal responsibility for the support of the *sangha* as a whole. In this new role he provided patronage and protection for the older and much larger Mahanikai lineage, but he clearly favored the re-

form-minded Thammayut lineage that he himself had founded.

By the time of Mongkut's death in 1868 the reform movement that he had originated was well established. During his long career as a monk he had provided the intellectual and organizational leadership that had enabled the new Thammayut lineage to become a coherent community with its own distinctive emphases and goals. Subsequently, during his seventeen years as king, he fostered both the religious and intellectual atmosphere and the institutional ecclesiastical adjustments that enabled the new movement to consolidate its position and extend its influence. In so doing, Mongkut has contributed, more than any other individual of his era, to the establishment of the gradual but pervasive process of modernist reform that characterized the development of Thai Buddhism during the late nineteenth and early twentieth centuries.

FRANK E. REYNOLDS (1987)
Revised Bibliography

MONGOL RELIGIONS. If stereotypical reports from early times are taken into account, the religious forms

of the Mongols have been influenced by the religions professed by all ethnic groups who have lived in what later was to become Mongolian territory prior to the emergence of the Mongols. The oldest of these religious forms was shamanism, which was the religion of the Liao empire of the Kitan (907–1125) and their usurping successors, the Jurchen (1115–1234). There have been accounts of Buddhist influences in the steppes since the Chinese Han period (206 BCE–220 CE), while Iranian influences are attested among the Turkic peoples of the region. Nestorian Christianity is reported as early as the twelfth century among the Turkic neighbors and later compatriots of the Mongols, the Kereit, Naiman, and Önggüt. This nourished contemporary Western beliefs that located the realm of the fabulous Prester John in their territory. Later conversions of Mongols by Catholics even led to the foundation of a bishopric in Khanbaliq (Beijing), but this development was short-lived. Renewed Christian missionary attempts in the nineteenth and twentieth centuries have again failed to leave recognizable traces in Mongol popular religions.

In addition to the influences of Nestorianism, Manichaeism, with its dualistic ideas of light and darkness and good and evil, also played a role in the religious history of the region. It had strong footholds in the oasis towns of the Uighurs, which were incorporated into the Mongol Empire under Chinggis Khan (1162–1227). The Zoroastrian deity Ahura Mazda was an Iranian import who in Mongol popular religion became Khormusta Tengri, with a retinue of thirty-three heavenly beings (*tengri*). All these professions have been of temporary influence, however, while shamanism has remained the perennial dominant religious practice of the Mongols.

In contrast to the abundance of studies on the shamanism of the Siberian ethnic groups and of the Buriats, shamanism in Mongolia has not yet received the scientific treatment needed to form a well-founded opinion of this religious manifestation. Following the trends of research on Siberian shamanism, the emphasis of investigation has been placed on such external paraphernalia as drums, ceremonial dresses, and idols. But unlike the Yakut and Buriat shaman songs, both of which show important Mongolian components, only a very small number of invocations from Mongolia proper have been published; an even smaller number of these incantations have been translated. Recently published materials, however, show shamanism still in existence in the northwestern parts of the Mongolian People's Republic and in eastern Mongolia. A number of invocations gathered in 1982 in the eastern part of Inner Mongolia and among the Daghurs of northwestern Manchuria also testify to the continued existence of shamanism. Some studies on these forms of shamanism have been published.

Mongol shamanism developed into its current state in various phases. In the original phase, fear of natural powers that were thought to be caused by evil forces led to the worship of the spirits of ancestors. One of the few remaining

chronicles about the origin of shamanism, a text from the Chahar region, states that the living “made offerings of one wooden bowl of tea, one wooden bowl of water, and one bowl of milk brandy on the first, seventh, and ninth days of each new moon; saluted; and worshiped,” attempting thereby to obtain the protection of the ancestral spirits. Through these actions one would combine forces with the masters of places and the waters, thus becoming powerful enough to fight the detrimental forces. The shamans (male, *böge*; female, *idughan/ludaghan*), however, by their worship and incantations became the mediators and the means of communication with the forces to which all life was exposed. In addition to the spirits of ancestors, the spirits of unfortunate people who had not found a natural end, having been killed by accident, murder, or suicide, were thought of as possessing particular powers. They were added to the group of helpful powers that were manifest in the venerated idols called *ongons*. Because personal *ongons* were transferred into a greater unit through the merger of smaller ethnic groups or through marriage, the number of *ongons* of the individual shaman increased. (A shaman who marries obtains the *ongons* of his wife’s clan.) The more *ongons* a shaman possesses, the greater is his power. This explains the diversity of incantations and the varying names of the invoked spirits and *ongons*. The functions of shamanism, as explained by the shamans themselves, are to invoke the *ongons*, to shamanize with their help, to intercede on behalf of ill persons, to exorcise evil and the powers creating calamities and illness, to expel these into effigies that are then destroyed, and to pronounce charms and prognostications by scapulimancy and other divinatory methods.

Shamanism thus appears to have developed out of the needs of a primitive economic society for the preservation and protection of the means of subsistence (health, fire, food, game, and livestock, as well as human labor, i.e., children), all of which were obtained through the help of the ancestors. People seek shamanic assistance for immediate concerns; there is no belief in its efficacy for retaliation or reward in another world or in a future life. Shamanism, lacking any moral incentive, is a matter of this world, using combinations of natural means to achieve supernatural results. The culmination of all shamanic practice is the ecstasy the shaman experiences when the protective spirit enters his body. The shaman then acts in the spirit’s power and speaks in its voice. The ecstatic state is achieved in part by self-hypnosis, and in part by constant turning around in circles, inhaling burning juniper, and gulping large doses of alcohol; no other use of drugs and stimulants is traceable among Mongol shamans. In this state the shaman travels into another world, searching for the soul of the ill person, fighting with evil powers for it, and trying to win back the victim’s health. The fate of the person in whose behalf the shaman acts is uttered by the protective genius through the mouth of the shaman.

The shaman’s drum serves as the vehicle of this spiritual journey, having the function of a horse or a boat. Some

Mongol shamans explain the streamers on their vestments as feathers enabling them to fly on the spiritual journey. Others call these streamers snakes. To transport themselves to the spirit world, certain shamans from Inner Mongolian tribes use wooden or iron staffs, each crowned with a horsehead and terminated with a carved hoof, and adorned with rattling iron rings and little stirrups. Beating the drum and shouting and singing loudly with the assistance of helpers is part of the shaman’s ritual; these actions are intended to frighten and scare away the evil spirits and demons. Such an aim is already attested for the Kitan shamans of the tenth and eleventh centuries. Once exorcised, the evil originators of the illness are banished into effigies that are burned or buried.

To become a shaman a person must have the calling. The mental instability, resulting in a long period of initiatory illness, that is often reported for the Siberian and northern Eurasian shamans is rarely mentioned in Mongolia. Such a nervous and feeble condition would not accord with the historical fact that until the time of Chinggis Khan, the shaman (*bögel/bägi*) often was the head of the clan and therefore was not only its spiritual leader but also its political and military leader. Mongol shamans seem to be perfectly healthy individuals. The prospective shaman is singled out by an old shaman who becomes his teacher (*bagši*). From the *bagši* the student learns the names of all the ancestral spirits, which eventually are all bequeathed to him. The young shaman thus becomes a link in an age-old chain of religious and ethnic tradition. The continued existence and activity of the *bagši* is still being reported. One famous *bagši* died as recently as 1970 in the Bulghan district of northern Mongolia; in 1983 the incantations of a sixty-one-year-old *bagši* and his pupil (*šabi böge*) were recorded in eastern Mongolia. The costumes of Mongol shamans furthermore lack any of the female symbols and emblems reportedly common among Siberian and Central Asian shamans.

In the thirteenth century Mongol shamanism was influenced by administrative measures when the first Mongol emperor in China, Khubilai Khan (r. 1260–1294), established by imperial decree the office of the state shamans. These shamans were responsible for offerings in memory of Chinggis Khan and his house as well as for the worship of fire. According to the *Yuanshi*, the official Chinese history of the Yüan dynasty, these shamans pronounced their prayers and invocations in the Mongolian language. Judged by the evident longevity of the Mongolian oral tradition and its extraordinary reliability, it seems certain that some of the prayers still used today at the so-called Eight White Yurts, the center of worship of the deified Chinggis Khan in the Ordos territory, contain remnants of these early shamanic prayers and supplications. Tradition has outlived the destructive influences of the fratricidal warfare of the Mongols in the fifteenth and sixteenth centuries as well as more recent attempts at annihilation. The faithful handing down of the clan-bound names of the ancestral spirits from one generation of shamans to the next is proof of the age of the many different extant samples

of shaman invocations and poetry. The Yuan government's early administrative measures regulating religious affairs may also account for a certain conformity of expression in the shamanic supplications. The mention in invocations of Chinggis Khan's son, Čagadai, and Čangqulang, one of Čagadai's spouses, testifies to the continued inclusion of historical personages of the Mongol imperial line in the realm of the powerful ancestral spirits and *ongons*. The same holds true for the mention of members of the Mongol imperial family among the persons lauded in the fire prayers for having brought the flame to life by striking sparks from flint and steel.

The ephemeral contacts of Buddhism with the ruling strata of the Mongol nobility during the twelfth and thirteenth centuries and later did not lead to any decisive intrusion of Buddhist notions into the religious conceptions of the bulk of the Mongol populations. Shamanism remained dominant. Only when Buddhist missionary work began among the Mongols in the sixteenth century did shamanism come under heavy attacks. Biographies of Buddhist missionaries such as Neyiči Toyin (1557–1653), who converted the eastern Mongol tribes; the lamas who were active in the southern part of Mongolia ruled by Altan Khan of the Tümet (1507–1583); and the western Mongol Zaya Paṇḍita (1599–1622), who spread Lamaism among the northwestern Mongol groups, show clearly the methods of conversion. All of these missionaries had recourse to the persecution of shamanism and the shamans and to the sequestration and destruction of their idols, vestments, and paraphernalia, using ruthless force, persuasion, and bribes. The conversion aimed particularly at prohibiting bloody offerings of animals and the worship of the *ongot*, the collective term for *ongon* figurines. Princes and overlords sustained the missionaries by donating horses and cows to converts while burning the confiscated shamanic idols in iconoclastic purges. Thousands of the idols were destroyed in this period, and the shamans had to renounce their profession and faith. Many fled during the sixteenth century into more remote regions, even as far as the territory inhabited by the Buriats.

Considered by both the Lamaist clergy and most princes to be a meritorious deed that would further the spread of Buddhism, such persecution has been repeated again and again up to the beginning of the twentieth century. Cases of rounding up, mistreating, and burning shamans were reported among the eastern Khalkha Mongols in the nineteenth century and in the remote northwest of Mongolia in 1904. Yet shamanism and related forms of popular religious worship have not been totally subdued. Forced during the periods of worst suppression into some camouflaged forms, it found a new, more syncretic expression by adding and adapting objects and forms of Buddhist veneration. The old, true forms of "black" and "white" shamanism were supplemented by a third, "yellow" shamanism or semi-shamanism that included praying to Buddhist and shamanic numinous representations. In addition to the traditional objects of veneration (the *ongons*; the sun and moon; Köke Mōngke Tengri,

the "eternal blue sky"; Khormusta and his thirty-three *tengri*; and the lords of the places, mountains, and waters), a new pantheon was worshiped.

While shamanism calls itself a "faith without scriptures," there exist a great number of written prayers and invocations for this other group of venerated numinous images. Most of these are directed toward obtaining help, blessings, and consecration through the instrument of incense offerings (*sang*). The structure of the *sang* follows the pattern of Buddhist incense offerings, but, shrouded in some Buddhist phrases and verses, contains ancient pre-Buddhist conceptions. This development was due to the necessity of creating a prayer that would appear to be a genuine work of Buddhist liturgy, a practice engaged in by both famous Buddhist ritualists and stout shamanic believers. The former intended to use these new scriptures to expel shamanic ideas completely, while the latter hoped to preserve essential parts of the old belief under the veneer of the new Buddhist religion. The Buriat scholar Dorzi Banzarov, the first to study the popular religion of the Mongols, described this practice: "The Lamas collected prayers which survived on the lips of the people, added to them new ones more in conformity with the new religion, and again distributed them among the people" (Banzarov, 1891, p. 2). In the sixteenth century a process thus began that resulted in the creation of numerous prayers and hymns of semi-Buddhist character, which became an inexhaustible mine of information concerning the conceptions of old Mongol religion. The Hungarian scholar Alice Sárközi has aptly stated the importance of these texts for the history of religions: "Every new text, or even new variants of already known texts can enlarge our knowledge of popular native beliefs and can shed a light on details which up to now have not been quite intelligible" (Sárközi, 1984). Analysis of such materials has yielded insights into the rather complex figure of a fire goddess who developed out of one of the oldest rituals into the worship of mountains and heights (*obogha*) and into the existence of a triad or pentad of gods of fate, headed by Mōngke Tengri and Atagha Tengri, all considered to be "a late hypostasis of Eternal Heaven," as Sergei Iu. Nekliudov phrased it (Nekliudov, 1982, p. 500).

These divine representations, as well as those of Chinggis Khan and Geser Khan, the hero of a widely known epic, present an iconography related to the Tibetan "enemy gods" (*gra lha*), wearing the armor of Central Asian warriors of the first millennium CE and mounted on horses of varying color. All of these equestrian deities have protective functions. In addition to Köke Mōngke Tengri, Čaghan Ebügen ("white old man") is venerated as the personified creative power, the lord of all earth and water, protector of animals and guarantor of longevity. He is certainly one of the oldest deities of the Mongol pantheon. Prayers to him refer to a legendary meeting between the White Old Man and the Buddha in which the Buddha confirmed him in his functions, testifying to this deity's pre-Buddhist origins. All requests addressed to

these numinous representations of the popular religion are requisite to the nomadic/seminomadic pastoral way of life and its additional economics. The prayers ask for the same things as the shamanic invocations do: health; fertility and children; multiplication of livestock; protection against evil, dangers, war, and robbers; prevention of droughts, inundations, and blizzards; and safe roads, journeys, and caravan travel. In regions of additional or expanding agriculture, requests for augmentation and protection of crops are added, but the formulas of the prayer remain the same.

In more recent times the healing activities of the shamans have been more and more predominant, the shaman personnel being divided into real shamans (*bögeludaghan*) and non-shamanic healers and singers. The method of healing employed tends toward a kind of group therapeutic treatment of psychic illness (*andai*), which consists of shamans, helpers, and a crowd of laymen singing and arguing with the patient as a means of restoring him to his normal psychic state. In eastern Mongolia this singing therapy has been practiced since at least the mid-nineteenth century.

Revised Bibliography

MONISM is a term applied to a group of thinkers or to philosophical systems that emphasize the oneness or unity of reality. Thinkers ordinarily regarded as monists do not themselves use this label, and do not refer to an agreed-upon monistic model. Unlike philosophical systems such as Platonism or Daoism, however, examples of monism cannot be identified by means of an accepted source or criterion. Moreover, in contrast to philosophical schools of thought such as pragmatism or existentialism, monism lacks an identifiable point of origin and a historical framework. In this respect, monism is a conceptual label, like idealism, realism, or determinism. It might be more appropriate to use only the adjectival form: thus, rather than regard a philosophical system as an example of monism, we should understand that, in a variety of ways, philosophical and religious systems are more or less monistic. In view of the arguable character of monism, perhaps the most useful task of the present essay would be to establish one or more definite examples of a monistic system and to abstract from such examples the specific features that render them monistic.

Philosophies frequently regarded as monistic are found in both Asian and Western traditions and are rather evenly distributed among ancient, modern, and contemporary systems. Many philosophical systems ordinarily regarded as monistic are influenced by mystical experience. Even though there are monistic systems that are not mystical, as well as mystical systems that are nonmonistic, there is a close affinity between monistic and mystical systems of thought. Most of the systems referred to in this article exhibit a mystical as much as a monistic emphasis. The decided influence of mysticism on monistic systems, as well as the considerable frequency with which mystical experience is expressed in a monistic system, would seem to be due to the unitive quality of the mystical experience itself. The great mystics, especially those of the Indian and Christian traditions, emphasize that their blissful experience of oneness with or in the divine renders all particulars insignificant, and in some cases, relatively unreal and illusory. This tendency of monistic thinking to favor unity and oneness at the expense of the particular has confined monism per se to a minority position in philosophy

and religion, both Asian and Western. Even in India, ordinarily regarded as uniformly monistic in philosophic and religious outlook, the monistic system of Śaṅkara (traditional dates 788–820) is but one of several competing interpretations of the Hindu scriptures. Similarly, in the Western tradition, philosophical thinkers such as Plotinus (204–270) and Spinoza (1632–1677), and others who espouse an unabashed monism, have proven unable to gain a dominant position in the tradition. Despite significant differences, Śaṅkara, Plotinus, and Spinoza individually and collectively show the essential strength as well as the typical weaknesses of monism as a philosophical position.

ASIAN TRADITIONS. Perhaps of all claimants to the label “monist,” the paradigmatic system is that of the ninth-century mystic philosopher Śaṅkara, who stands in the Indian tradition as the foremost interpreter of the ancient scriptures and the creator of an original philosophy of *brahman*, the Absolute, “one without a second.” Śaṅkara’s *advaita* (nondual) system is one of several alternatives within Vedānta, the religious-philosophical tradition consisting in systematic exposition and speculation based on the Vedas (c. 800–400 BCE) and the Upaniṣads (c. 800–400 BCE), mystical and quasi-philosophical texts in the Sanskrit of the *ṛṣis* (seers) of ancient India.

The dialectic between Śaṅkara and his competitors, both Vedāntins and proponents of other Indian philosophical schools, has helped to establish Śaṅkara’s system as a model of monistic thinking. Because his sources are evident, because his arguments on behalf of an absolute oneness of reality are systematic, ingenious, and influential, and because his interpreters and opponents have shown his position to be committed to an unambiguous epistemological and metaphysical monism, Śaṅkara serves, in Wittgenstein’s terminology, as a “home base” for the “family resemblances” that monistic systems would seem to share. Whatever else monistic systems have in common, they all seem committed to a conception of reality that resembles Śaṅkara’s idea of *brahman* in its oneness and in its contrast to the unreal or less real particulars of the spatial and temporal world, all of which are, according to Śaṅkara, ordinarily and erroneously experienced as separate from *brahman*.

Of the thirteen Upaniṣads that have survived and have been commented upon by sages such as Śaṅkara, Rāmānuja, and Madhva, some tend toward theism, but most contain passages that have placed a definite monistic stamp on the Indian philosophical tradition. The *Bṛhadāraṇyaka* and *Chāndogya* Upaniṣads offer some of the strongest texts for the monistic position:

Brahman indeed was this in the beginning. It knew itself only as “I am Brahman.” Therefore it became all. Whoever among the gods became awakened to this, he, indeed, became that. . . . Whoever knows thus, “I am Brahman,” becomes this all. (*Bṛhadāraṇyaka Upaniṣad* 1.4.10)

Verily, this whole world is Brahman, from which he comes forth, without which he will be dissolved and in which he breathes. (*Chāndogya Upaniṣad* 14.1.1)

According to Śaṅkara, the concept of *brahman* in the Upaniṣads teaches that all particulars of the spatial or temporal world—all objects, thoughts, spirits, and gods (since gods are temporal, they are less than *brahman*)—are real only with respect to, only by virtue of being one with, *brahman*. Particulars that appear real to the observer independent of *brahman* do so because of an all-pervasive ignorance (*avidyā*). Although the universal self and God (in whatever form, by whatever name) is *brahman*, the ignorant perceiver, or believer, habitually regards these and lesser entities, or appearances, as independent realities.

Śaṅkara follows the Upaniṣads in distinguishing two aspects of *brahman*, namely, *nirguṇa* (indeterminate) and *saguṇa* (determinate), and identifies Īvara (God) as the personification of *saguṇa brahman*. In itself, (*nirguṇa*) *brahman* is beyond qualities—not only beyond description, but beyond any specificity, including the temporal nature of God. *Saguṇa brahman*, which includes everything that is not *brahman* per se—from the most ephemeral entity or musing to the most perfect concept of God—issues from *brahman*, has its reality by virtue of *brahman*, and in the end is gathered into *brahman*. Or rather, *saguṇa brahman* in all of its multiplicity is finally—or once again—realized as the one indivisible (*nirguṇa*) *brahman*, which it never ceased to be even though it most assuredly appeared to be separate from (*nirguṇa*) *brahman*. That is, *saguṇa brahman* appeared real as *saguṇa* (having qualities, particularized, pluralized) even while its true identity as *nirguṇa brahman* (“one without a second”) was hidden not only from human consciousness but, presumably, even from higher beings and perhaps from God as well. Obviously, the terrible burden (or flaw) of a system that is so strongly on the side of oneness is to establish a degree of reality for particulars, which range from fleeting moments to God the creator of the universe.

The most effective alternative interpretation to Śaṅkara was provided by the South Indian philosopher-saint Rāmānuja (c. 1017–1137), who argued that the level below *brahman* must also be counted as real. Rāmānuja’s position is within Vedānta, but it is closer to traditional theism as developed in the Jewish, Christian, and Muslim traditions. Rāmānuja’s criticism of Śaṅkara’s *advaitist* (nondual) conception of *brahman*, however, does not lead him to deny either the *nirguṇa brahman* or Śaṅkara’s contention that the reality of *saguṇa brahman* is entirely dependent on *nirguṇa brahman*. In this respect, Rāmānuja’s position is closer to that of a theist who affirms, in addition to a God involved in the world, a conception of God or godhead that is beyond and ultimately unaffected by the temporal experiences of God and humanity.

The twentieth-century philosopher-statesman Sarvepalli Radhakrishnan (1888–1975) tried to combine the merits of Śaṅkara’s absolute nondualism and Rāmānuja’s qualified

nondualism by attempting to reconcile, in a polar relationship, the two natures of *brahman*—absolutely one and beyond, on the one side, and pluralistic and particular on the other. It must be admitted that Radhakrishnan's view is very close to that of Śaṅkara except that he forcefully affirms the reality of the world. As he notes in his semiautobiographical essay *The Religion of the Spirit and the World's Need: Fragments of a Confession* (1952), his intent is to “save the world and give it a real meaning”; it is *brahman* that gives the world its true meaning, but only if *brahman* is understood in a positive relation to the world.

Radhakrishnan's metaphysics shows the influence of both Plotinus's description of the One/Intellect (*nous*)/Soul/World and Whitehead's conception of the divine in process:

[The *Taittirīya Upaniṣad*] affirms that Brahman on which all else depends, to which all existences aspire, Brahman which is sufficient to itself, aspiring to no other, without any need, is the source of all other beings, the intellectual principle, the perceiving mind, life and body. It is the principle which unifies the world of the physicist, the biologist, the psychologist, the logician, the moralist and the artist. (Radhakrishnan, 1953, p. 59)

We have (1) the Absolute, (2) God as a Creative power, (3) God immanent in this world. These are not to be regarded as separate entities. They are arranged in this order because there is a logical priority. The Absolute must be there with all its possibilities before the Divine Creativity can choose one. The divine choice must be there before there can be the Divine immanent in this world. This is a logical succession and not a temporal one. The world-spirit must be there before there can be the world. We thus get the four poises or statuses of reality, (1) the Absolute, Brahman, (2) the Creative Spirit, *Īśvara*, (3) the World-Spirit, *Hiranyagarbha*, and (4) the World. This is the way in which the Hindu thinkers interpret the integral nature of the Supreme Reality. (ibid., p. 65)

In his attempt to articulate the integral nature of the Supreme Reality, Radhakrishnan argues that *brahman* includes *Īśvara*, and *Īśvara* is the concrete manifestation of *brahman*: “There is nothing else than the Absolute which is the presupposition of all else. The central mystery is that of Being itself. We should not think that emphasis on Being overlooks the fact of Becoming” (intro. *The Brahma Sutra*, New York, 1960, p. 119). This fact of becoming is none other than *saḡuṇa brahman* or *Isvara*: “The Absolute is a living reality with a creative urge. When this aspect is stressed, the Absolute becomes a Personal God, *Īśvara*” (ibid., p. 126). *Īśvara* is not something other than or in addition to *brahman*; *Īśvara* is *brahman* itself: “The creative thought ‘let me be many’ belongs to Brahman. It is not simply imagined in him. The energy that manifests itself in Brahman is one with and different from Brahman” (ibid., p. 142).

Despite Radhakrishnan's determination to reconcile Śaṅkara's conception of the *brahman* with the reality and

value of the world, he nevertheless admits, with the Upaniṣads and Śaṅkara, that the absolute oneness of (*nirguṇa*) *brahman* is unaffected by God and creation:

So far as the Absolute is concerned, the creation of the world makes no difference to it. It cannot add anything to or take anything from the Absolute. All the sources of its being are found within itself. The world of change does not disturb the perfection of the Absolute. (Radhakrishnan, in Muirhead, 1958, p. 502)

It is possible to find in some of the Buddhist schools metaphysical and epistemological teachings that seem to be examples of monism, though if one keeps in mind the aim of all Buddhist teaching—to attain enlightenment, *nirvāṇa* (eternal peace), or Buddhahood—such teachings will be seen to be only incidentally and superficially monistic. The concept of *śūnya* or *śūnyatā* as developed by Nāgārjuna (second or third century BCE) offers a vivid example of the way in which Buddhist teaching can be, though perhaps should not be, interpreted monistically. Zen Buddhism (or, in Chinese, Chan Buddhism) offers a second, equally ambiguous example of apparent monism. In both cases, as in the Buddhist tradition generally—to the extent that any generalization can be made accurately for the full variety of Buddhist teachings—the monism affirmed is intended primarily as a mere philosophical or conceptual stage on the way to an enlightenment experience concerning which no statements can be stable or adequate. According to Nāgārjuna, absolute reality can be positively experienced but only negatively expressed: “There is no death, no birth, no destruction, no persistence, no oneness, no manyness, no coming, no departing” (*Mādhyamakakārikā* 1).

D. T. Suzuki (1870–1966), the prolific interpreter of Mahāyāna Buddhism and exponent of Zen Buddhism in the West, offers a more explicit account of the paradoxical character of the extent to which Zen may—and may not—be regarded as monistic:

We may say that Christianity is monotheistic, and the Vedānta [the dominant school of Indian philosophy, based on the Upaniṣads] pantheistic; but we cannot make a similar assertion about Zen. Zen is neither monotheistic nor pantheistic; Zen defies all such designations. Hence there is no object upon which to fix the thought. Zen is a wafting cloud in the sky. No screw fastens it, no string holds it; it moves as it lists. *No amount of meditation will help Zen in one place.* Meditation is not Zen. Neither pantheism nor monotheism provides Zen with its subjects of concentration. . . . Zen wants to have one's mind free and unobstructed; even the idea of oneness or allness is a stumbling block and a strangling snare which threatens the original freedom of the spirit. (Suzuki, 1974, p. 40)

The Mādhyamika (Middle Way) of Nāgārjuna and Zen Buddhism share with monistic philosophies a systematic and highly effective assault on the apparent self-sufficiency and presumed reality of all particulars, but as expressions of Buddhist spiritual wisdom, they move beyond the monistic consequence of this assault to the silence of enlightenment.

In the Chinese tradition, particularly in the writings of Laozi (traditionally, sixth century BCE?) and Zhuangzi (latter fourth to early third century BCE), the illusive but uniquely formative concept of the Dao performs a function similar to the concept of *śūnyatā* in Mādhyamika Buddhism. According to the *Dao de jing* (*The Way and Its Power*), the poetic-philosophical text attributed to Laozi but in actuality compiled by his followers in approximately the early fourth century BCE, the Dao is the unity and the creative principle underlying all particulars. In contrast to an absolute monism such as defended by Śaṅkara, the Daoism of Laozi and Zhuangzi does not threaten, and in fact celebrates, the reality and value of particulars. Space and time, persons and nature, life and death, and all shades of being and becoming arise in and return to the Dao. But the Dao is not a principle or concept to be thought; it is a mysterious, ineffable reality to be experienced—and to the extent experienced, expressed only indirectly and inadequately. The Dao cannot be grasped or defined, but it can be received and hinted at by artful, seemingly effortless, action. The Dao is above concepts, above either being or nonbeing, and yet it runs through all realities named by concepts. It is the One behind the many—but not the One that can be named, thought, or delineated. Like the butterfly, which ceases to be itself when caught and mounted, human attempts to catch the Dao can catch expressions of the Dao, but not the Dao itself.

WESTERN TRADITION. There are perhaps a dozen thinkers spread throughout the history of Western thought who would likely be included in any survey of monistic systems. Among the ancient Greeks, probable candidates include Parmenides for his enigmatic but highly influential definition of reality as One. If monism were to be regarded as a theory of one kind of reality (as distinct from the more usual conception of monism as defining reality as singular), Democritus would be included for his definition of reality as consisting in atoms. Plotinus, the Neoplatonic mystic of the third century, articulated a philosophy of the One that stands as an obvious model of monistic thinking in the history of Western philosophy. The Christian period is steadfastly theistic—that is, maintaining a real separation between creator and creation—with the notable exceptions of the nineteenth-century Irish theologian John Scottus Eriugena and the fourteenth-century Rhineland mystic Meister Eckhart.

In Judaic and Muslim thought, orthodox theism and its attendant resistance to monism proved effective except for Ibn ʿArabī, the thirteenth-century Spanish Ṣūfī Muslim, who taught that God, or reality, is absolutely singular, and that the human soul is indistinguishable from God. It is important for anyone unfamiliar with Islamic thought to understand that the Muslim thinkers of the Middle Ages were using the same philosophical sources—primarily Plato and the Neoplatonists—as were medieval Jewish and Christian thinkers. Obviously, thinkers in each of these three religious and cultural traditions also drew from—and in turn influenced—their respective religious traditions. In the case of Ibn ʿArabī, his Muslim experience took the form of mysti-

cism known as Ṣūfism. As R. C. Zaehner notes: “The introduction of Neoplatonic ideas into Ṣūfism from philosophy was, of course, made much of by Ibn al ʿArabī who systematized them into something very like Śaṅkara’s version of the Vedānta” (*Hindu and Muslim Mysticism*, New York, 1969, p. 174). Although Ibn ʿArabī’s system is generally regarded as heretical by orthodox Muslims, his writings—perhaps because of his vast erudition and manifest saintliness—were influential on subsequent Muslim and Christian thinkers.

In the modern period the two most important monistic philosophers have been the seventeenth-century Sefardic Jew Barukh Spinoza, who defines reality as one substance, calling it either God or Nature, and the nineteenth-century German idealist G. W. F. Hegel, whose concept of the Absolute continues to hold its place in the modern West as the dominant monistic philosophical system. Within the present century there are at least four philosophers, all American or British, who have extended the Hegelian, or absolute idealist, variety of monistic philosophy: Josiah Royce and F. H. Bradley, who wrote at the turn of the century, and W. T. Stace and J. N. Findlay, both Hegel scholars and metaphysicians who wrote at midcentury.

Virtually all of these philosophers, religious thinkers, and mystics, as well as others who could be added to the list, can be understood as a variation or subset of one of the following five influential figures: Plotinus, Eriugena, Eckhart, Spinoza, and Hegel.

Plotinus (c. 205–270), the last great thinker of antiquity, combined a profound knowledge of Plato, Aristotle, and the Stoics with an equally profound mystical experience of absolute oneness. Although Plotinus thought that he was faithfully interpreting the philosophy of Plato, he is rightly credited with founding a new school of philosophy, that is, Neoplatonism. Moreover, although Plotinus’s writings, and therefore the tenets of Neoplatonism of which he was the first and greatest exponent, were neither influenced by Christian teachings nor read by medieval Christian theologians, nevertheless they exercised a significant influence on Christian thinking indirectly through Augustine (354–430) and Dionysius the Areopagite (fl. c. 500). By the time Plotinus’s *Enneads* were rediscovered by Marsilio Ficino, the fifteenth-century head of the Platonic Academy of Florence, Meister Eckhart (1260–1327?) had articulated a novel monistic system, fashioned equally by Neoplatonism and by his spiritual life and thought as a German Dominican monk. The Neoplatonic—or Plotinian—cast of Eckhart’s mystical monism accounts for its distinctiveness and for his difficulties with defenders of orthodox Christian theism. A close look at Plotinus’s idea of the One will show both its affinities and its ultimate incompatibility with Christian doctrine; not surprisingly, Eckhart’s use of Neoplatonic monism led his writings to be censored as heretical.

Plotinus’s concept of the One is comparable to, and in part derived from, the absolute One of Parmenides, the Good of Plato’s *Republic*, Aristotle’s First Cause, and the im-

manent God of the Stoics. In affirming the absoluteness and transcendence of the One, however, Plotinus is speaking from a compelling mystical experience of Unity. Throughout the *Enneads*, which Plotinus's student Porphyry arranged in six sets of nine treatises each (Gr., *ennea*, "nine"), all of his references to the One, particularly those in the final tractate (6.9), "On the Good, or the One," emphasize that the One cannot be described or characterized, but can only be pointed to as the ineffable source and goal of mystical experience. In terms comparable to the Upaniṣadic concept of *brahman*—though with a greater affirmation of the value and beauty of the individual soul and the physical world—Plotinus conceives of the One as the absolute unity and harmony underlying all particularity and all polarities. The One is the source of the other two principles, or levels, of reality, both of which exist within the One and share completely in its divinity. But the One is not less absolute for their existence. Since the second and third principles, Mind or Intellect (*nous*) and Soul, are also real (though not absolute in their own right), it is not easy, as Plotinus admits, to state in what the One, or the Unity, consists. Unity can be experienced, but not described. Plotinus tells us:

We are in search of unity; we are to come to know the principle of all, the Good and First; therefore we may not stand away from the realm of Firsts and lie prostrate among the lasts: we must strike for those Firsts, rising from things of sense which are the lasts. Cleared of all evil in our intention towards The Good, we must ascend to the Principle within ourselves; from many, we must become one; only so do we attain to knowledge of that which is Principle and Unity. . . . The Unity, then, is not Intellectual-Principle but something higher still: Intellectual-Principle is still a being but that First is no being but precedent to all Being; it cannot be a being, for a being has what we may call the shape of its reality but The Unity is without shape, even shape Intellectual. (*Enneads* 6.9.3)

In this tractate, Plotinus continues with a series of negative definitions: the One is not merely the Good, nor merely Mind, nor Soul, but is the indivisible source and perfect goal of all of these limited realities. While all characterizations of the One must be negative, experience of the One cannot but be overwhelmingly positive. This experience is more than an intuition or a vision; it is "a unity apprehended":

The man formed by this mingling with the Supreme must—if he only remember—carry its image impressed upon him: he is become the Unity, nothing within him or without inducing any diversity; no movement now, no passion, no outlooking desire, once this ascent is achieved; reasoning is in abeyance and all Intellection and even, to dare the word, the very self: caught away, filled with God, he has in perfect stillness attained isolation; all the being calmed, he turns neither to this side nor to that, not even inwards to himself; utterly resting he has become very rest. (*ibid.*, 6.9.11)

As this passage shows, it is difficult to separate the mystical from the philosophical assertions in Plotinus's philosophy,

and in this respect, although he was not a Christian, Plotinus stands at the head of a line of Christian mystical philosopher-theologians for whom the concept of God, or the Absolute, is equally the object of mystical experience and philosophical reflection.

In his work *On the Division of Nature*, for example, the Irish theologian John Scottus Eriugena (810–877) affirmed and extended several Plotinian tenets: the absolute ineffability of God—a concept expressed in Christian theological language almost identical to descriptions of the One of Plotinus; a dual process of emanation from, and return to, the One of lower stages of reality—stages that also resemble those articulated in the *Enneads*. At the same time, Eriugena also used Christian ideas as developed by Dionysius the Areopagite and Gregory of Nyssa, both of whose works he translated from Greek to Latin. For Eriugena as for Plotinus, God or the One is not only beyond human thought, but equally beyond his own thought: God is incomprehensible even to himself because in his oneness he does not think at all. In fact, the reason for creation, which is accomplished through his ideas (*nous* in Plotinus's system, the divine attributes in Eriugena's), is to manifest the otherwise absolute and eternally hidden nature of God. Thus, the God of Eriugena is virtually identical to the One of Plotinus in that he (or it, in view of its absolute and transpersonal nature) is the source of being and knowledge but absolutely transcends both.

Meister Eckhart (1260–1327?) drew from Eriugena, and through him from Plotinus and early Neoplatonic Christian thinkers. He developed a concept of the Absolute, or God, that he called godhead, from the two points of view developed by Plotinus and Eriugena and comparable to the unqualified (*nirguṇa*) and qualified (*saguṇa*) dual conception of *brahman* in Advaita Vedānta. According to Eckhart, God is Being per se, or all that is, but is also inexplicably above and beyond Being, totally other and absolutely one. Existence or Being can be seen from two points of view, as the mysterious source of being and as being (or creation) itself, but ultimately there is only one existence. This affirmation of absolute unity of being, on the one hand, and on the other, the idea that all beings, including the human soul, are none other than God or Being from the perspective of creation, shows why Eckhart's teaching was regarded as too monist not to be at odds with orthodox Christianity. Eckhart's conception of the unity of God follows Eriugena's negative characterization of God and resembles Nāgārjuna's conception of the ultimate as *śūnyatā*, emptiness or nonbeing. Clearly, there is a point in the monist position at which the absolute fullness and the absolute emptiness of being appear to be indistinguishable—they are equally true and equally inadequate ways of expressing the absolute otherness of the One, the ultimate ineffable source of all particularity.

The same need to see the Absolute from two perspectives—as it is in itself and as it is from the perspective of creation—recurs in the metaphysical system of Barukh Spinoza (1632–1677), according to which the Absolute is referred to

as Substance, God, or Nature. These three terms are declared to be perfectly synonymous, infinite, and absolutely necessary: “God, or substance, consisting of infinite attributes, of which each expresses eternal and infinite essentiality, necessarily exists” (Proposition 11). God (or Substance or Nature) manifests itself through an infinity of attributes, two of which, thought and extension (or ideas and bodies), are intelligible to man and constitutive of his experience. These two attributes, which are capable of infinite combinations, are related to each other (in contradistinction to Descartes’s dualism of mind and body) through their common source in one divine Substance. Spinoza’s solution to the Cartesian dualism, however, generates the same problem that attends all monistic systems—the difficulty in establishing the reality of particulars, which Spinoza refers to as modes, within the one indivisible Substance. Although Spinoza may be thought to have generated his metaphysics from a religious or mystical impulse, his conception of the divine as impersonal and absolutely necessary was clearly not influenced (except perhaps negatively) by either Jewish or Christian theological orthodoxy.

In conceiving of the world as God’s manifestation of himself within his inviolable unity, Spinoza is in general agreement with other absolute monists like Advaita Vedānta (of the Upaniṣads and Śāṅkara), Plotinus, Eriugena, and Eckhart, but he is unique in attributing absolute determinism to the divine substance. On this point Spinoza is rigorously consistent even if his terminology gives the impression of inconsistency or paradox: he refers to the necessity of the divine Substance as both freedom and determinism because God is free to do what is required by his nature. God is free because of what he is—or because of the necessity which is the essential character of his existence. Since only God must be, and must be what He is, only God is free. Further, all of God’s attributes and modes are what they are necessarily as part of God’s essence. Without violating its unity and necessity, one can conceive of God, or Nature in polar terms, as the creator, or *natura naturans* (“Nature naturing”), and as creation, *natura naturata* (“Nature natured”), which consists in the infinite combinations of attributes and modes of the one divine Substance, God, or Nature. Within this Substance, all things that exist do so, and do so in the way that they do, because they are not other than God, and God’s nature is absolutely necessary.

In the conclusion of *Ethics* Spinoza asserts that this Substance—which, it must be remembered, is the one and only reality regardless of how plural and diverse it appears to a human perspective—can be known by the third or highest form of knowledge, the intellectual love of God. This love, which is knowledge of a particular in relation to its divine cause (or divine nature), is in effect a direct knowledge of God, or Nature, in its infinity, eternity, and necessity. In this discussion of the intellectual love of God, which occurs in part 5 of *Ethics*, “Of Human Freedom,” Spinoza’s monistic conception of Substance (God or Nature) reveals a rever-

ence and a personal experiential depth that would appear to be mystical even if not religious in the usual sense. While the overall force of *Ethics* would seem to represent an atheistic monism that allows no room for the God of Western religion, the profoundly mystical love of divine necessity, which is the goal and perhaps the source of Spinoza’s entire system, would seem to justify Novalis’s often-quoted reference to him as “a God-intoxicated man.” W. T. Stace holds to both of these interpretations and suggests that Spinoza “exhibited in himself the living paradox of being a God-intoxicated atheist” (*Mysticism and Philosophy*, p. 217).

In that his philosophy of the absolute Spirit is the result of philosophical reflection rather than the product of his own mystical experience, G. W. F. Hegel is closer to Spinoza than to Plotinus or Eckhart. Hegel would also seem to resemble Spinoza in that his philosophy of the Absolute is an expression, however partial and indirect, of the experience and understanding of absolute Unity for which the great mystics, of both Asia and the West, are the primary source. In explaining the relation between mysticism and philosophy in Hegel, Frederick Copleston wisely remarks that Hegel was not a mystic and did not look to mysticism to solve the problems of philosophy, but rather “he saw in mysticism the intuitive grasp of a truth which it was the business of philosophy to understand and exhibit in a systematic manner” (*Religion and the One*, p. 135).

While Hegel’s conception of the Absolute combines elements of many predecessors, including Plotinus, Eriugena, Eckhart, and Spinoza, in his original synthesis he introduces novel conceptions so as to create a uniquely profound and modern monistic philosophy. In terms similar to the conception of God in Eriugena or Eckhart, Hegel conceives of the absolute Spirit as revealing itself through spatial and temporal creation. For Hegel, however, the Absolute is neither empty nor so totally transcendent as to be characterized as nonbeing. Rather, the absolute Spirit of Hegel more closely resembles Spinoza’s conception of Substance in that it is intelligible to human consciousness. In fact, it is through human rationality that the Absolute has its being: the Absolute exists through its self-knowing, which is none other than its being known through speculative philosophy. In this respect, Hegel’s conception of absolute Spirit may be said to exhibit a radical temporality characteristic of process philosophy and other modern philosophical systems influenced by the theory of evolution. Spirit itself evolves through human consciousness, without which it cannot be said to be intelligible—or real, which comes to the same, according to Hegel’s identification of the rational and the real.

Is Hegel’s system, then, monistic? In what does his principle of unity, or oneness, consist? Since Hegel’s system precludes univocal summations, two responses may fittingly be offered: in that the absolute Idea is single, rational, and the sole reality, Hegel’s system clearly resembles monistic systems such as those of Plotinus, Eriugena, Eckhart, and Spinoza; since, however, the absolute Idea cannot be thought

to exist in its own right as a full or finished reality separable from the process of human consciousness by which it knows itself, there is a sense in which the One in question, the absolute Idea, is equally plural and temporal. Absolute Spirit is there in the beginning, and without it, there would be no beginning—but it is equally the case that it comes to be, or comes into being, by being thought—as all human reflection is advancing, or making real, the actual content of the divine Idea. In Hegel's view, his *Phenomenology of Spirit* was itself a significant contribution toward the self-realization of absolute Spirit.

Delineating the relationship between these two perspectives—absolute Spirit as the one source of all and as the temporal-spatial process—required thousands of torturous pages by Hegel and continues to produce countless volumes of interpretation by his followers and critics. While it might be possible to solve the problem of the one and the many in contemporary terms without recourse to Hegel, most of the important work on this problem in the present century is demonstrably traceable to one or another interpretation of the Hegelian system. The most promising effort would seem to be that of J. N. Findlay, whose Gifford Lectures, *The Discipline of the Cave* and *The Transcendence of the Cave*, given from 1964 to 1966, represent a reformulation, by phenomenological and dialectical methods, of problems first set forth by Plotinus and Hegel.

CONCLUSION. A survey of monistic systems ranges from the uncompromising Advaita (“nondual”) Vedānta of Śaṅkara to those thinkers, such as Radhakrishnan and Hegel, who have attempted to affirm the unity or oneness of reality without jeopardizing the reality or value of the many. In this regard, Radhakrishnan's response to, and restatement of, Śaṅkara's conception of *brahman* “so as to save the world and give it a real meaning” would seem to be a telling critique of the absolute monist position: the stronger the affirmation of oneness, the more difficult it is to affirm particulars in their own right. Within the context of absolute unity, all particulars are relegated to a quasi reality. If all is *brahman*—or Being, or the Absolute, or the One by any other name—then sticks and stones, civilizations and planets, ideas and gods must all share, and perhaps lose, their distinctive reality within the all-inclusive (or all-consuming) reality of the One.

Given the extent to which a monistic system jeopardizes the reality of the ordinary world, it is perhaps not surprising that it typically has drawn its inspiration from, and in turn lends its formulations to, mystical experience. The three most formidable monistic systems—those of Śaṅkara, Plotinus, and Spinoza—are all dependent on mystical awareness, however rational may be their respective processes of articulation. In view of the monistic tendency to devalue the full range of particulars, it is understandable that throughout the history of Western thought, monism has been countered not only by orthodox theologies (of Judaism, Christianity, and Islam) but equally by dominant philosophies. In Asia, and particularly in India, monism may appear to have enjoyed

greater success historically, but most Asian thought systems—for example, Confucianism in China, theism and Yoga in India, and various forms of Buddhism throughout Asia—have not been monistic. Further, the remarkable influence of Advaita Vedānta in India may be due as much to its apparent mystical source and hermeneutical power as to its philosophical argumentation. The monist affirmation of the One (in whatever terminology) may well be truer than the myriad religious and philosophical positions that hold to the reality of the many, but while the vast majority of religious thinkers and philosophers fall short of mystical insight, it seems probable that in the future of philosophy and religion monism will continue to be a strongly opposed minority position.

BIBLIOGRAPHY

The most useful survey of monistic philosophies is Frederick Copleston's Gifford Lectures, 1980, published as *Religion and the One: Philosophies East and West* (New York, 1982). Although it is less focused on monism, Karl Jaspers's brilliant interpretive study, *The Great Philosophers*, 2 vols. (New York, 1962–1966), treats virtually all of the philosophical contributors to the monist position. Volume 2 is especially recommended for its chapters on Laozi and Nāgārjuna, Heraclitus and Parmenides, Plotinus, Nicholas of Cusa and Spinoza. W. T. Stace's *Mysticism and Philosophy* (Philadelphia, 1960) is a study of the implications of mysticism for philosophy, particularly monistic philosophies. Nine articles on the philosophy of mysticism are collected in *The Monist* 59 (October 1976). Surveys on monism and pantheism are to be found in *The Encyclopedia of Philosophy* (New York, 1967) and *Encyclopaedia Britannica* (Chicago, 1968).

There are several virtually indistinguishable editions of the Upaniṣads, one of which is *The Principal Upaniṣads*, edited and translated by Sarvepalli Radhakrishnan (New York, 1953). Radhakrishnan's metaphysics is most fully articulated in *An Idealist View of Life*, 2d ed. (London, 1957); see also his “Spirit in Man,” in *Contemporary Indian Philosophy*, edited by J. J. Muirhead (London, 1958). For a contemporary exposition and defense of Śaṅkara's nondualist system, see Eliot Deutsch's *Advaita Vedānta: A Philosophical Reconstruction* (Honolulu, 1969). For Nāgārjuna and early (or Indian) Mahāyāna Buddhism, see especially *Emptiness: A Study in Religious Meaning* (New York, 1967), by Frederick J. Streng, and *Nagarjuna: A Translation of His Mūlamadhyamakakārikā with an Introductory Essay*, translated and edited by Kenneth K. Inada (Tokyo, 1970). D. T. Suzuki's *Introduction to Zen Buddhism* (New York, 1974) is one of the many introductions and surveys he has written that are relevant for the paradoxically monistic character of Zen Buddhism; *Zen Buddhism: Selected Writings of D. T. Suzuki*, edited by William Barrett (Garden City, N.Y., 1956), is particularly useful. There are numerous translations of Laozi's *Dao de jing* and of the writings of Zhuangzi, including Wing-tsit Chan's *The Way of Lao Tzu* (Indianapolis, 1963), Burton Watson's *Chuang-tzu: Basic Writings* (New York, 1964), and Raymond M. Smullyan's *The Dao Is Silent* (New York, 1977).

The best translation of Plotinus's *Enneads* remains Stephan MacKenna's *The Enneads*, 3d ed. (New York, 1957). Selections from John Scottus Eriugena's *De divisione naturae* are reprinted in *Selections from Medieval Philosophers*, edited by Richard McKeon, vol. 1 (New York, 1930); in *Medieval Philosophy*, edited by Herman Shapiro (New York, 1964); and in *Medieval Philosophy*, edited by John F. Wippel and Allan B. Wolter (New York, 1969). There are several English-language translations of Meister Eckhart: James M. Clark and John V. Skinner's *Meister Eckhart: Selected Treatises and Sermons* (London, 1958); Raymond B. Blakney's *Meister Eckhart: A Modern Translation* (New York, 1941); Matthew Fox's *Breakthrough: Meister Eckhart's Creation Spirituality* (New York, 1980), with introduction and commentary; and a brilliant philosophical interpretation, Reiner Schürmann's *Meister Eckhart, Mystic and Philosopher* (Bloomington, Ind., 1978). The most scholarly and substantial interpretation of Ibn 'Arabī is Henry Corbin's *Creative Imagination in the Sūfism of Ibn 'Arabī* (Princeton, 1969).

Spinoza's metaphysics is fully articulated in one volume, *Ethics*, volume 2 of *The Chief Works of Benedict de Spinoza*, translated by R. H. M. Elwes (New York, 1951). For Hegel, the indispensable—and famously difficult—volume is *The Phenomenology of Mind*. The translation by J. B. Baillie (1910; rev. ed., New York, 1949) has been superseded by a far more readable edition: *Phenomenology of Spirit*, translated by A. V. Miller, with foreword and textual analysis by J. N. Findlay (Oxford, 1977). There are three important restatements of the Hegelian Absolute: Josiah Royce's *The World and the Individual*, 2 vols. (New York, 1901–1902), the Gifford Lectures, 1900–1901; Francis H. Bradley's *Appearance and Reality: A Metaphysical Essay* (1893; 2d rev. ed., Oxford, 1930); and J. N. Findlay's Gifford Lectures, 1964–1966, published in two volumes: *The Discipline of the Cave* (London, 1966) and *The Transcendence of the Cave* (London, 1967). Findlay's neo-Hegelianism, or (in his term) Neo-neo-Platonism, is further developed in his *Ascent to the Absolute: Metaphysical Papers and Lectures* (London, 1970) and is given a precise summation in Douglas P. Lackey's "An Examination of Findlay's Neoplatonism," *The Monist* 59 (October 1976): 563–573.

Revised Bibliography

MONKEYS. Monkeys have played a complex and ambiguous role in the religion and folklore of diverse cultures. Although deities in monkey form have occasionally been venerated as psychopomps, tricksters, or intercessors, simians have more commonly been viewed as comical or degenerate simulacra of human beings. Both responses suggest a perception of these animals as challenging boundaries and categories, a theme that in the modern world remains implicit in much visual representation and fictional and scientific narrative. Despite a tendency among premodern authors and artists to be vague and generic about nonhuman primates (a confusion that persists in nontechnical discourse conflating, for example, tailed "monkeys" and tailless "apes"), human responses to simians, especially in regions in which the latter abound, have often been species-specific, reflecting characteristic features or behaviors of particular primate groups.

Perhaps the most widely attested response to anthropoid primates has been the notion that they are degraded or fallen humans, whose bestial status reflects punishment for a transgression. Thus a Jewish legend holds that the men who contrived to place idols atop the tower of Babel were turned by God into apes, and in a Greco-Roman tale a diminutive race of humans who attempted to deceive Hercules were punished by the gods by becoming "tailed ones" (*cercopes*). A Muslim story holds that apes originated when a group of Jews were cursed for violating the Sabbath, and an Algerian tradition traces them to a human group deprived of speech by divine wrath. According to a medieval European legend, when God visited Adam and Eve after the fall, Eve concealed some of her numerous progeny out of shame over her sexual activity, and, as punishment, God transformed the hidden children into monkeys. Although such tales reflect the anthropocentric prejudices of monotheist religions, they are not confined to Europe and the Middle East. The motif of transgression and metamorphosis into a simian is preserved in the Mayan *Popol Vuh*, and it also occurs in Southeast Asia, in the tale of a wicked couple who are tricked by a god into squatting on red-hot bricks; when their backsides are burned red, they flee in shame into the forest. Similar stories, often involving punishment for sexual license, are the commonest explanations of simian origins among tribal groups in India, and cast doubt on the frequent assertion that Hinduism's now-robust cult of Hanumān derives from a hoary and indigenous tradition of "monkey worship." Comparable tales have been reported concerning the orangutans of Indonesia and the chimpanzees of the Ivory Coast. Japanese folktales involve many instances of cross-species transformation, yet those involving monkeys nearly always feature the one-way

metamorphosis of a human who has incurred divine punishment. Even in the case of Hanumān, a sense of transgression of divine powers and of being “marked” as simian in punishment is found in the tale of his jaw (Sanskrit, *hanu*) being disfigured by Indra’s thunderbolt. The abundance of such stories confirms Horst Janson’s assertion that, when faced with the discomfort aroused by the similitude of simians, humans in general have tended to become “Darwinists in reverse” (Janson, 1952, p. 13).

Veneration of monkeys has been more sporadic. The earliest attested instance, in ancient Egypt, was directed toward a single species of baboon known to Greco-Roman authors as *cynocephalus* or “dog-head” because of its canine facial appearance. In contrast to other monkeys who appear in Egyptian art as leashed pets or performing grotesques, this animal was considered sacred and associated with both sun and moon. Images of seated male baboons, hands raised in adoration of the rising sun, adorn the columns of several temples, and mummified animals were commonly interred in a seated posture. Sculpted baboon images often display erect penises—a mark of lasciviousness in the view of later observers—that probably indicated the connection of both the sun and the animal with fertility. Yet the baboon was also associated with the moon and sacred to the moon god Thoth, a healer and magician, scribe of the gods, and guide of deceased souls. In some myths, the baboon taught hieroglyphics to Thoth and wore his lunar orb on its head. Its image regularly appeared atop scales, signifying postmortem judgment, over which Thoth presided. The god himself was sometimes depicted in the form, or with the head, of a baboon. The humanlike menstrual cycle of the female cynocephalus, which further linked the animal to cosmic rhythms, was noted by some ancient writers, as were temples where troops of semidomesticated baboons were fed by priests.

Elements of Thoth worship were transposed onto the Greco-Roman mystery cult of Hermes Trismegistos—who was likewise a magician, healer, and psychopomp—and gemstone rings carved with images of ithyphallic baboons enjoyed a vogue in the late Roman Empire, possibly as aphrodisiac charms. But the more common response to the Egyptian baboon-deity in classical Mediterranean cultures was scorn and ridicule. A minor decorative motif in Greek art, monkeys appear to have had no sacral significance; rather, they commonly represented ugliness, sycophancy, and immorality. Aristotle’s brief observation that anthropoid primates constitute a morphological category situated between humans and quadruped animals would later definitively establish the “link” occupied by these animals in the medieval “great chain of being.” The Romans sometimes kept monkeys as pets, but held the sight of one in a dream to be an evil omen. Roman writings, including Galen’s accounts of his dissections of Barbary apes (a nearly tailless macaque native to North Africa and Gibraltar, and the best-known monkey in the ancient West), reveal discomfort with their likeness to men, exemplified in the punning aphorism of the

second century BCE poet Ennius: “The ape, that vile beast, so similar to us” (*Simia quam similis turpissima bestia nobis*).

Simian semblance took on ominous implications for religions whose scriptures declared the human form to be the “image of God.” The stump-tailed posterior of the Barbary macaque was especially problematic, for God had declared in *Leviticus* 22:23 that all animals were to have tails. A Jewish legend declared that Adam himself was created with a tail, which God later removed as a sign of exaltation over bestial creation. The macaque was hence viewed as a duplicitous beast trying to “ape” human rank. A variant on the story claimed that God himself had cut off the ape’s tail as punishment for its presumption, leaving “scars” on its backside—the ischial callosities, or “sitting pads,” common to Old World monkeys. The Patristic writings of early Christianity are strident in their denunciation of “idoltrous” Egyptian religion and often focus on “ape worship” as its most loathsome practice. In medieval sources, the devil was called “God’s ape” (*simia Dei*) because he tried unsuccessfully to imitate God’s creative acts, and the monkey in turn was labeled “likeness of the devil” (*figura diaboli*). Renaissance paintings of the “fall of man” sometimes feature an ape slyly munching one of the forbidden apples; the gullible Eve points to the beast in order to sway her consort’s resolve to uphold God’s commandment—one instance of a common patriarchal tendency to associate women (as less-than-men) with monkeys.

In time, the Christian morphological preoccupation with monstrous *similitudines* and “hybrid races” that threatened to erase the boundary between the human self and the feral “other” would influence the response of Europeans to newly discovered primates and people in other parts of the world, contributing both to the racism of the colonial era and to the pseudoscience of eugenics that arose in the wake of Darwin’s *On the Origin of Species* (1859). The association of simians with the “primitive” and “savage” as well as with the infantile and feminine, and the caricaturing of subject peoples and human enemies as “monkeys,” has long persisted in Western discourse, as has the whimsical portrayal of simians as human surrogates in visual art. A recurrent theme in popular culture (reflected in such works as the Danish Baron Hollberg’s eighteenth-century novel *Nicolai Climii iter subterraneum*, and the twentieth-century American *Planet of the Apes* films) has been the discovery of a realm in which simians and humans trade places and confront the contingency of species roles. Late-twentieth-century scholarship has also critiqued the burgeoning scientific literature of primatology as (in feminist Donna Haraway’s phrase) “simian orientalism,” and asserted that its ostensibly “objective” discourse contains numerous elements of disguised mythos (Haraway, 1989, p. 10).

The rich traditions of monkey gods and heroes found in South, Southeast, and East Asia all appear indebted, to varying degrees, to the ancient Indian epic *Rāmāyaṇa* (c. fourth century BCE), in which a race of magical, talking monkeys

befriend the human hero Rāma and assist him in recovering his kidnapped wife, Sītā. This tale probably penetrated much of Asia in the early centuries of the common era and may have become interwoven with local monkey lore. In many Southeast Asian Buddhist versions of the story, Rāma's principal helper, Hanumān, here identified as a magical White Monkey, is portrayed as a resourceful but lascivious trickster whose amorous and martial adventures sometimes eclipse those of his human master. The tale of his liaison with the Fish Queen, resulting in a marvelous hybrid son, remains a favorite in the dance theater traditions of Thailand and Cambodia and in the visual art of Malaysia.

In Japan's indigenous Shintō tradition, a "monkey deity" (*saru kami*) named Saruta Biko is attested in texts dating to the eighth century. He belongs to the category of gods associated with liminal spaces such as village boundaries, functions as a messenger between the heavenly and earthly worlds, and serves as mediator between humans and the *kami*, or spirits, particularly the powerful Mountain Deity. He has a special connection with horses and is used in rites intended to protect them from disease. In later Japanese lore, the monkey is primarily portrayed as a trickster and clown, and is associated with human "outcasts" who, like him, mediate between people and gods, yet serve as bearers of pollution. Today, a highly adaptive local species of macaque is considered the "national monkey" of Japan and is said to be the only animal referred to with the honorific *san*, otherwise reserved for humans. The work of twentieth-century Japanese primatologists has been cited for its more emotional and sympathetic response to these animals, exemplified by the monkey funerals sometimes held at research labs.

In China, the popular "monkey king" Sun Wukong of Daoist and Buddhist legend, Ming-period fiction, and modern Beijing opera, probably combines elements of the *Rāmāyaṇa* and of Southeast Asian White Monkey tales with indigenous lore concerning gibbons and macaques. As the most endearing character in the hundred-chapter novel *Xiyōu Ji* (Record of the westward journey, 1592), Monkey aids a Buddhist monk in a perilous pilgrimage to India in quest of scriptures, displaying the supernatural powers he acquired by stealing peaches and pills of immortality from the Jade Emperor of the Daoist heaven. Plucky and exuberant, he represents both the Buddhist concept of the restive "monkey mind" that must be tamed to achieve enlightenment and the pragmatism and resourcefulness of a homegrown Chinese culture hero. Despite the centuries-long effort of the literati to suppress non-elite lore and the postrevolutionary crackdown on religious expression, a folk Daoist cult of Monkey survives on Taiwan and in Singapore, where he is revered as a trickster, esoteric preceptor, and healer (especially of children and horses), and as an exorcist sometimes invoked through rites of possession.

The origins of the immensely popular Hindu monkey-god Hanumān, also known as Māruti and Āñjaneya, are obscure. Ceramic monkey figurines from Indus Valley sites and

a single Vedic hymn featuring a "virile monkey" have led to speculation that an earthy folk deity (*yakṣa*) in simian form may have preceded Hanumān's literary debut in Vālmīki's *Rāmāyaṇa*. Born of the union of the wind god Vāyu with a celestial nymph who was cursed to assume monkey form, the epic's Hanumān has a rambunctious childhood in which he nearly devours the sun and is wounded and then blessed by the gods. He matures into a sagacious and powerful ally of Rāma who leaps across the ocean carrying his master's ring and message to the captive Sītā, burns the demon city of Lanka with his flaming tail, fetches a Himalayan summit covered with healing herbs to save Rāma's wounded brother during the climactic battle, and ultimately receives the boon of physical immortality as well as Rāma's boundless gratitude. His role expanded in later vernacular retellings of the story, and his independent worship, well attested from roughly the tenth century CE, has undergone dramatic growth in modern times.

Though understood as a devotee of Viṣṇu in the Rāma-incarnation, Hanumān is also regarded as an avatar of Śiva, especially in the latter's awesome and destructive persona as Rudra, and is sometimes paired with local mother goddesses as a guardian or familiar. His propitiation by villagers as a boundary protector, by Śaiva ascetics as an immortal yogi, by the mentally afflicted as a shamanlike exorcist, and by wrestlers as the patron of martial arts may reflect ancient practices only marginally associated with the Rāma narrative. His shrines are ubiquitous in many regions of India and draw huge crowds, especially on Tuesday and Saturday, when worshippers seek his protection from malefic planetary influences. Although Hanumān's visual representation spans the gamut from fully simian to humanlike (though invariably tailed) icons, the deity's celibacy and sagacity pointedly contradict the normal Indian perception of simians, and earthly monkeys, especially the black-faced "hanuman langur" and (less commonly) the reddish rhesus macaque, receive only wary respect and occasional protection as his somewhat debased relatives. A god who is said to combine self-assertive *śakti* (power) and self-effacing *bhakti* (devotion), Hanumān may be read, especially in the discourse of Hindu nationalism, as a subaltern enforcer of traditional high-caste authority, yet he has more typically expressed the upwardly mobile aspirations of lower- and middle-status groups. At once comic and cosmic, subhuman and supernatural, aggressive and contemplative, earthy and divine, Hanumān exemplifies and theologically transfigures the boundary-challenging role that simians have so often played for human cultures.

PHILIP LUTGENDORF (2005)

MONKS SEE MONASTICISM; RELIGIOUS COMMUNITIES

MONOLATRY SEE HENOTHEISM; MONOTHEISM

MONOPHYSITISM, meaning "one nature" and referring to the person of Jesus Christ, is the name given to the rift that gradually developed in Eastern Christendom after the Council of Chalcedon in 451. While the definition agreed upon at the council laid down that Christ should be acknowledged "in two natures," human and divine, the properties of each nature retaining their identity, the Monophysites held that after the incarnation the two natures became one, so that all the thoughts and acts of the Savior were those of a single unitary being, God in Christ.

The germ of Monophysitism may be found in the *logos-sarx* (Word-flesh) theology of the Alexandrian church. The question of how Christ's personality should be acknowledged could not be avoided, however, once the Creed of Nicaea (325) confessed that he was "of one substance with the Father." If this was so, how was Christ to be considered of one substance with man? Fifty years later, the answer was given uncompromisingly by Apollinaris, bishop of Laodicea in Syria, a friend of Athanasius and an Alexandrian-trained theologian. Scripture, he maintained, emphasized that Christ was "one." In *De fide et incarnatione* he wrote, "There is no distinction in Holy Scripture between the Word and His flesh; He is one energy, one person, one *hypostasis* [individuality], at once wholly God and wholly man." This exactly summed up what was to become the Monophysite position: Christ was "out of two natures," one.

Apollinaris's opinions aroused the opposition of the Cappadocian fathers and were condemned at the Council of Constantinople in 381, but his works circulated widely under the names of orthodox personalities, and as such they influenced profoundly the theology of Cyril of Alexandria (412–444). Cyril, however, was willing to admit at least the mystical reality of the two natures after the incarnation. His successor as patriarch of Alexandria, Dioscorus (444–451), less subtle and more impetuously ambitious for his see, made an uncompromising one-nature Christology the basis of his theology, and enunciated it in his vindication of the archimandrite Eutyches at the Second Council of Ephesus in August 449 (the "Robber Council"). The Council of Chalcedon reversed this situation, and Dioscorus himself was condemned (though for indiscipline rather than for heresy) and exiled. However, a large proportion of Eastern Christians, especially in Egypt, showed that they supported the one-nature Christology and rejected Chalcedon.

Dioscorus died in exile at Gangra in Paphlagonia in 454. Three years later his supplanter, the former archpriest Proterius, who had been consecrated by Egyptian bishops at Chalcedon, was lynched. Another former presbyter of Cyril, Timothy Ailuros (d. 477), was consecrated bishop by the anti-Chalcedonians. Although Timothy was also exiled, until 482 the Church of Alexandria was divided between an anti-Chalcedon majority and a Chalcedonian minority.

Schism, in the sense of establishing a rival church with its own hierarchy, was far from the minds of Timothy and his supporters. They were entirely loyal to the empire politically, but they aimed at persuading the emperor and his advisers to abandon the *Tome* of Leo and the Council of Chalcedon in favor of their one-nature interpretation of the theology of Cyril. Timothy opposed Eutyches' belief that Christ's human nature was not the same as that of ordinary man. In 475 the anti-Chalcedonians came near to success when the usurper Basiliscus, who had forced the legitimate emperor Zeno (474–491) into exile, issued an edict declaring his adherence to the councils of Nicaea and Constantinople and *both* councils of Ephesus, and declaring as anathema the

Tome of Leo and “all that was said and done at Chalcedon in innovation of the holy symbol of Nicaea.”

In 476 Basiliscus fell, largely because of the support given to Zeno by the patriarch of Constantinople, Acacius, who was determined to protect the prerogatives of his see against possible renewal of threats from Alexandria. On July 28, 482, in an attempt to reunite the church in Egypt and reconcile it to communion with Constantinople, Zeno issued a circular letter, known as the *Henotikon*, to the “bishops, monks, and laity of Alexandria, Egypt, and Cyrenaica.” This letter, drafted on Acacius’s advice, reaffirmed the creedal statements of Nicaea, Constantinople, and the first council at Ephesus (431), condemned Nestorius and Eutyches, accepted the Twelve Anathemas of Cyril (which tended toward one-nature Christology), and proclaimed that Jesus Christ, consubstantial with both God and man, and “incarnate from the Holy Spirit and the Virgin Mary and *Theotokos* is one and not two.” Anyone who thought differently was anathema. The *Henotikon* avoided denouncing Chalcedon as such, which would have removed from Constantinople its legal superiority, grounded in Canon 28 of that council, over the other sees in the East; but the letter went just far enough to secure the uneasy agreement of Alexandria, Antioch, and Jerusalem. The popes, however, refused to accept the *Henotikon* and denounced the restoration of communion between Acacius and Peter Mongus, patriarch of Alexandria (482–490), as “double-dealing.”

The Acacian Schism lasted from 484 to 519. During this time Monophysite opinions hardened in Egypt and Syria, while the emperor Anastasius (491–518) personally favored them. The Monophysites found a spokesman in Severus, a monk from a noble ecclesiastical family in Pisidia who in November 512 was promoted to be patriarch of Antioch. During his six years of rule he evolved a theology based almost entirely on Cyril’s teachings. Severus’s Christological beliefs, expressed repeatedly in tracts and a massive correspondence (of which four thousand letters and fragments have survived), might be summed up as follows: “The Fathers have taught us that God, the Word, the Unique One begotten by his Father without beginning, eternally, impassably, and incorporeally, did in the last times for our salvation take flesh of the Holy Spirit and of the holy *Theotokos* and ever-virgin Mary, flesh consubstantial with us, animated by an intelligent and reasoning soul.” Christ was both God and man, of one single nature; the ideas of Eutyches and Dioscorus, and the *Tome* of Leo and the definition of Chalcedon, were alike repudiated. In the last years of Anastasius’s reign, the empire was moving rapidly toward Monophysitism. Communion between the four Eastern patriarchates was maintained, at the expense of communion with Rome.

The death of Anastasius in July and the succession of the Latin-speaking and pro-Chalcedonian Justin I (518–527) brought about an immediate change. Communion between Rome and Constantinople was restored in 519. Severus was exiled, along with his chief supporter, Philoxenus,

bishop of Hierapolis (Mabbug) in Mesopotamia, and some fifty-five other bishops. Gradually it became clear that if the Monophysite congregations were to survive, a hierarchy would have to be created to administer sacraments to them. Severus, in exile in Alexandria, reluctantly assented to the ordination of presbyters and deacons in 529/30. Great numbers of volunteers came forward. The schism between the Monophysites and Byzantine orthodoxy may be said to date from that moment.

During the reign of Justinian (527–565), the Monophysite movement assumed the form it was to retain through the centuries. In 532 the emperor tried to settle the controversy through a conference aimed at agreeing upon a statement of doctrine based on the Theopaschite interpretation of Christology, that is, that “one of the Trinity suffered in the flesh and was God.” Although this came near to the Monophysite position, the emperor’s insistence on the canonical status of Chalcedon wrecked the possibility of agreement. Between that time and the death of Theodora in 548, however, the Monophysites had a firm ally in the empress. At the end of 534, Severus was invited to the capital by the emperor, and the following year Theodora secured the election of a new Monophysite patriarch of Alexandria, Theodosius (535–566), and a pro-Monophysite patriarch of Constantinople, Anthimus, bishop of Trebizend (535–536). This was too much for the emperor, the pope, and the Chalcedonians. Anthimus was replaced, and Severus was condemned by a powerful synod held at Constantinople on June 10, 536; the condemnation was confirmed by edict on August 6.

Severus died at Alexandria in February 538. By that time, Justinian, urged on by the papacy, had restored the Chalcedonian line of patriarchs in Alexandria, a factor that more than any other associated the Monophysite patriarch with the Coptic Christians as a national representative of the Egyptians. Though their patriarch, Theodosius, was ordered to Constantinople at the end of 537, the Monophysites, thanks to Theodora, were not without means of reply. A mission under the presbyter Julian was fitted out by the empress and arrived in the kingdom of Nubia (Nubia) to convert the royal court to Monophysite Christianity. Even more effective was the series of missions carried out by Jacob Baradaï (Burd’ana), who had been consecrated bishop of Edessa by Patriarch Theodosius. Between 542 and his death in 578 he crossed and recrossed the whole area between the Bosphorus and the Persian frontier, establishing congregations and a Monophysite hierarchy to govern them. The eventual tally of twenty-seven metropolitans and 100,000 clergy all over the eastern part of the Roman Empire given by Baradaï’s contemporary John of Ephesus (d. 585) may be exaggerated, but clearly Baradaï’s missions established the Monophysite church on a permanent footing. Not for nothing did the Syrian Monophysites take the name Jacobites, which they have retained to this day.

On the emperor’s side, the Fifth General Council held at Constantinople during 553 may be reckoned as another

effort to placate the Monophysites, through its condemnation of the Three Chapters (treatises criticizing Cyril's theology by the Antiochene theologians Theodore of Mopsuestia and Ibas of Edessa). In 573 Justin II (565–578) issued a second *Henotikon*, which again stressed the oneness of Christ, without, however, repudiating Chalcedon. Under Heraclius (610–641), what proved to be the final, though at first the most promising, effort to find a settlement failed. Intrinsically the Monophysites could accept the formula proposed to them by the emperor: that there was one will and one energizing activity in Christ, even if two natures were confessed. For three years following the restoration of the True Cross in Jerusalem in 630, it looked as though this compromise doctrine, known as monoenergism, was providing common ground between Monophysites and Chalcedonians. But once more, suspicion of any formulas that left a shred of authority to Chalcedon, Egyptian distrust of Cyrus "the Caucasian," the emperor's nominee as patriarch of Alexandria, and cleverly orchestrated opposition to monoenergism by Sophronius, patriarch of Jerusalem (634–638), brought the plan to nought. When, within a few years, Egypt, Palestine, and Syria were lost to the Arabs, the Monophysites saw the hand of God in their success against the Byzantines.

By this time, Monophysitism was a missionary faith that had assumed many forms. On the one hand, it rejected outright any idea that the flesh of Christ was liable to suffering—preached by the followers of Julian of Halicarnassus (fl. 520–530)—that is, acceptance of the views of Eutyches; on the other, it accepted the theology of Cyril of Alexandria combined with rejection of the Council of Chalcedon as incompatible with it—represented by the Armenian and Ethiopian churches. The Coptic church and what is known of the Nubian church followed Severus of Antioch more closely and seemed to have been more hostile to Chalcedon and the two-nature Christology enunciated in the *Tome* of Leo. The Syrian church looked back to its great protagonist, Jacob Baradaï. Rejection of Chalcedon, on the one hand, and of the two-nature Christology held in the West and by the Nestorians, on the other, has formed the common ground between various national and regional churches known to other traditions as the Monophysite churches. Reluctantly, these have remained separate from the Eastern Orthodox churches and from the West to form one of the four main divisions of Christianity that have survived to our day.

Revised Bibliography

MONOTHEISM. Derived from the Greek *mono* ("single") and *theos* ("God"), the term *monotheism* refers to the religious experience and the philosophical perception that emphasize God as one, perfect, immutable, creator of the world from nothing, distinct from the world, all-powerfully involved in the world, personal, and worthy of being worshiped by all creatures. Some forms of monotheism, however, differ about the notions of God as distinct from the world and as personal.

The term *monotheism* has generally been used theologically rather than for philosophical or cross-cultural descriptions of religion. Philosophers have used the term *theism* with the same meaning as *monotheism*, and cross-cultural descriptions find categories like *monotheism* and *polytheism* to be inappropriate in describing some religious traditions. The term *monotheism* presupposes the idea of *theos*—a divine being with mind and will, fully personal, conceivable in images drawn from human life, and approachable through prayer. In this respect monotheism differs from deism and from the various forms of monism. It also presupposes the unity of the divine and raises one *theos* exclusively to absolute supremacy and power, producing and governing everything according to the divine will. In this respect monotheism differs from those views that accept a plurality of divine beings. In the strict sense, *monotheism* best describes the idea of God in Judaism, Christianity, and Islam, and in the philosophical systems based on these traditions. But one may extend the term to include conceptions of deity in certain other traditions such as Zoroastrianism, Sikhism, and some forms of Hinduism and Buddhism, even though these traditions include somewhat different conceptions, such as the existence of evil forces alongside God, the nonpersonal nature of God, God's complete immanence in the world, or the fundamental unreality of the world. In this article, the basic requirement for a religious tradition to be considered monotheistic is that it emphasize both *theos* and *monos*.

MONOTHEISM IN RELIGIOUS HISTORY. Whereas monotheism is most often associated with the Jewish, Christian, and Islamic religions and philosophies, tendencies contributing toward a monotheistic outlook have long been present in human religious history. Monotheism is like a river with many springs and many tributaries. The course of the river is difficult to map, for monotheistic beliefs are often put forward in protest against other beliefs and practices.

Obscure as they are, springs of monotheism can be discerned at the very earliest levels of known human cultural life, in the primordial high god of the archaic hunters. The theory of *Urmonotheismus* ("original monotheism") as put forth by Wilhelm Schmidt and others held that a primordial monotheism was the earliest form of human perception of deity, and that the plurality of gods and spirits found in most primal religions was a degeneration from this original perception. While that theory cannot be substantiated in the history of religions, research in recent years has made it clear that a great many primal or archaic peoples have conceptions of a high god who is creator of the world, has supreme authority over other gods and spirits, and presides over human morality. Some of the most archaic peoples, such as certain groups in Africa, Australian Aborigines, and the nomadic hunters of Tierra del Fuego, have definite conceptions of a supreme god associated with the sky who is changeless, invisible, and all-powerful and who gives morality. The supreme high god characteristically is a remote god (*deus otiosus*), too distant, all-powerful, good, and just to need worship or to be intimately involved in ordinary existence; there are lesser

gods and spirits who play a much more active role in the lives of the people.

The streams of the monotheistic vision run dimly through the fertile valleys of archaic agricultural religions with their pluralistic experience of the forces of nature centered on Mother Earth. Here the high god tends to become head of the divine pantheon; pushed into the background by earth gods of fecundity, the high god could hardly be the focus of a unifying perception of deity. But a few high gods developed with supreme sovereignty and autonomy, as sources of fecundating power and guarantors of the order and norms of the world and of human society. For example, Zeus and Jupiter were ruling high gods fashioned in accord with the Greek and Roman notions of norm and law. In India, Varuṇa was sovereign guardian of *ṛta*, cosmic order, a role taken over later by the great gods Viṣṇu and Śiva. Yahveh, the high god of the ancient Hebrews, was known as all-powerful creator, absolute sovereign, and author of all norms and laws by which the earth functions. Belief in these high gods did not necessarily exclude lesser divine forces, but it did provide the opportunity for reflections on the unity of divine reality, as will be seen in the following examples from ancient Greece, Hinduism, and Buddhism.

Greek religion. Among Greek thinkers, ideas of a unitary divine reality were expressed as a means of showing the order and reasonableness of the world. Already in pre-Socratic times, it seems, philosophers like Xenophanes depicted the spiritual unity of the whole world in the notion of the All-One, uncreated, unchangeable, and immanent in all things. Plato stressed the unity of the Good and identified God with that: God must be perfectly good, changeless, and the maker of the best possible world. Aristotle also made the idea of goodness central to his concept of God, the causal principle of all. The unicity of the supreme First Mover follows from the unity of the physical world: God is one, eternal, and immutable. God is defined as pure mind (*nous*), who always thinks one and the same subject, namely himself—and thus this view is not really theism. Later in the Hellenistic religions, the sense of God's unicity was expressed by raising one god or goddess to supremacy, encompassing all others. For example, Apuleius described Isis as the one Great Mother of all, by whatever name she may be called in different areas (*Metamorphoses* 11).

Hinduism. Hinduism is characterized by monistic (*advaita*, or nondualistic) thought, which merges the divine reality with the world in a unity called *brahman*. Here the unifying principle is strong, but the theistic quality of the unified divine reality is of lesser importance. There have always been theistic tendencies in Hinduism, but these have been associated with a variety of divine beings. Yet intense concerns of *bhakti* (devotion to a god) have sometimes led Hindus to raise up one god as supreme ruler, or to see the various gods as manifestations of one God. "They call it Indra, Mitra, Varuṇa, and Agni . . .; but the real is one, although the sages give different names" (*Rgveda* 1.169).

Among Vaiṣṇavas, Viṣṇu tends to become all, and the same is true of Śiva among Śaivas. Kṛṣṇa, *avatāra* of Viṣṇu, can be put forth as the supreme God behind all names: “Many are the paths people follow, but they all in the end come to me” (*Bhagavadgītā* 4.11). One theistic strand in Hinduism identifies ultimate reality with Devī, the Great Goddess, in one of her many forms. Thus Hinduism does recognize the oneness of the divine, and it includes theistic forms of worship, even worship of one God exclusively, without denying the reality of other gods.

Buddhism. Buddhism, like Hinduism, is based on monistic or nondualistic thought and posits only an inferior role for those born at the level of gods, trapped as they are like all living beings in the cycles of rebirth. But in Mahāyāna Buddhism, the idea has arisen that beings who have realized their Buddhahood (that is, Buddhas and *bodhisattvas*) can function similarly to gods in theistic religions. Generally Mahāyāna Buddhism holds to the multiplicity of these powerful beings, but in certain schools one such Buddha becomes supreme and is worshiped exclusively. Such is the case with Amitābha (Jpn., Amida) Buddha in Pure Land Buddhism, a soteriological monolatry offering the one hope of salvation for this degenerate age. Esoteric (Vajrayāna) Buddhism has developed a unified cosmotheism, according to which the whole universe is the body of Mahāvairocana, the Great Sun Buddha, with all Buddhas and *bodhisattvas*—and thus all reality—united in this supreme Buddha-reality.

Egyptian religion. One of the earliest forms of exclusive monotheism apparently developed in ancient Egypt. Within the elaborate and complicated polytheism of Egyptian religion there had long been rationalistic tendencies toward seeing various gods as different forms of one particular God, with an emphasis on the supremacy of the Sun God, who tended to absorb other gods. Around 1375 BCE Pharaoh Amunhotep IV repudiated the authority of the old gods and their priests and devoted himself exclusively to Aton, the god appearing as the sun disk. He proclaimed himself the son of Aton, taking the name *Akhenaton* (“devoted to Aton”), and he imposed this worship on others. By royal decree Aton became the only God who exists, king not only of Egypt but of the whole world, embodying in his character and essence all the attributes of the other gods. Akhenaton even had the names of the other gods effaced from inscriptions and replaced with the name of Aton. Akhenaton’s monotheism was related to protest against abuses in the cults of the gods, but it does not appear to have led to new ethical standards. Within twenty-five years Akhenaton was gone, and his successors restored the old cults.

Zoroastrianism. Growing from the ancient Indo-Iranian polytheistic religion, Zoroastrianism unified all divine reality in the high god Ahura Mazdā. Zarathushtra (Zoroaster), who probably lived sometime between 1700 and 1000 BCE, was a priest who turned against some of the traditional cultic rituals and proclaimed the overthrow of polytheism. In his teaching, Ahura Mazdā (Pahl., Ohrmazd) is the

one God who, to implement the divine will in the world, associates with the six Amesha Spentas (“holy immortals”), spirits or angels that represent moral attitudes and principles. Ahura Mazdā, the Wise Lord, is good, just, and moral, one who creates only good things and gives only blessings to worshippers. The one God is sovereign over history, working out the divine plan for the world. Humans are to assist God through upright deeds, and there will be a final judgment in which every soul will be judged to see if it is worthy of entering Paradise. Conflict is accounted for as the hostility of two primordial spirits: Spenta Mainyu, the good spirit, and Angra Mainyu (Pahl., Ahriman), the evil spirit. Ahura Mazdā apparently fathered these two spirits; the struggle between them has been going on since the beginning of time, when they chose between good and evil. It appears, then, that Ahura Mazdā cannot be called omnipotent, for the realm of evil is beyond his control; in that sense it may be said that this is not a complete monotheism. Yet there is no doubt that Zoroastrianism considers the realm of Ahura Mazdā to be ultimately victorious. Further, in this eschatological religion the conflict between good and evil is understood not so much metaphysically as ethically, involving the free choice of humans either for the rule of the Wise Lord or for that of Angra Mainyu. It is true that later Zoroastrianism brought some of the other gods back into the picture again. But in the teaching of Zarathushtra in the *Gāthās* is found a unique type of monotheism with an ethico-dualistic accent and an eschatological monotheistic fulfillment.

Judaism, Christianity, and Islam. The three religions that generally are held to be the full expressions of monotheism, Judaism, Christianity, and Islam, also arose against the background of the polytheism of the ancient Near East. These three religions are closely related in that they grew from the Semitic cultural background and the foundations of the religion of ancient Israel.

Although it was the fountainhead of this type of monotheism, the religion of ancient Israel was not actually monotheistic in early times. Stories of the patriarch Abraham show that he worshiped the Canaanite high god ʾEl in a variety of forms in addition to the god of the clan, and when the people of Israel entered into a covenant with the high god Yahveh they did not exclude the existence of other gods. One might call early Israelite religion henotheistic or monolatrous in the sense that exclusive loyalty was to be given to Yahveh, but Yahveh’s power was limited because other nations had their own gods. Some Israelites lived with a polytheistic vision, giving loyalty to Yahveh as the god of the covenant but also worshipping Baʾal and the other gods of fecundity as they settled in Canaan and became agriculturalists. But the covenant relationship with Yahveh contained the seeds of monotheism; the Israelites experienced Yahveh as personal, being revealed in historical events and demanding exclusive loyalty and ethical behavior according to the covenant law. Prophets arose who challenged the polytheistic notion that various gods controlled the functions of nature. Elijah and Hosea,

for example, held that it is only Yahveh who has power in all areas of existence, as the creator of all and the one God who sends corn at the harvest and wine at the vintage. Just as polytheistic ideas were overcome, the prophets also struggled to overcome the limitations of a henotheistic view of God. At one time it was accepted that one could not worship Yahveh outside the land of Israel. But Amos insisted that the one God, Yahveh, had not only brought Israel out of Egypt, but had also brought the Philistines from Caphtor and the Arameans from Kir (*Amos* 9:7). And Second Isaiah, the prophet of the Babylonian exile, went so far as to describe Cyrus II, the mighty king of the Medes and Persians, as “the anointed one of Yahveh” whom Yahveh had taken by the hand (*Is.* 45:1). In the vision of these prophets, Yahveh is no tribal god sharing power with other nations’ gods but is in fact the universal creator of all and the director of the history of all peoples, according to Yahveh’s own design.

Jews, Christians, and Muslims drew on the fundamental monotheistic vision of ancient Israel, each group filling out the picture of God with colorings and shapes drawn from its own particular culture. The dimensions of the Jewish, Christian, and Muslim type of monotheism will be discussed at more length below.

Sikhism. One more expression of monotheism should be mentioned in this religio-historical survey: Sikhism. Starting with Gurū Nānak (1469–1539 CE), an Indian type of monotheism developed that synthesizes the mystical monotheistic tendency found in Hinduism and the ethical, personal monotheism brought into India by Islam. In Gurū Nānak’s teaching, there is only one God, who is immortal, unborn, self-existent, creator of all the universe, omniscient, formless, just, and loving. God is both transcendent as pure potentiality and immanent as world-embodiment. Thus God is contained in everything. God is personal but is beyond complete knowledge, to be worshiped mainly in rituals of repeating his name. Revelation comes through *gurūs* who speak the divine word. Humans attain heaven or hell at the end of a lifetime, although they are involved in many rounds of births and deaths. Final salvation for humans is *nirvāna*, absorption into God’s being like water blending with water.

Summing up this cross-cultural religio-historical survey, it is clear that monotheism has arisen in a number of ways. In some areas it came through rationalization, seeing the logic of unified divine power. In other traditions, mystical experience of everything as one and unified with the divine gave rise to monotheistic expressions. In still other traditions, historical experiences of one powerful, personal God led toward formulations of monotheistic belief.

MONOTHEISM IN CONTRAST TO NONMONOTHEISTIC VIEWS. Monotheism often arises in opposition to other views of divine reality. One of the most obvious contexts against which monotheism defines itself is a plurality of divine beings or forces, which is commonly called polytheism. Central to polytheism is the notion of *theoi*, personal divine beings within nature and society. These gods have personal wills,

control specific spheres, and interact with one another to make up a functioning organism. The functioning of nature is seen as the operation of a plurality of divine wills, and this plurality and conflict are extended to human life and society. Typically there is a head of the pantheon, but this high god is limited in power and authority and often is thought of as old or impotent.

Monotheism distinguishes itself from the various forms of polytheism in that the whole realm of divine power is unified, with no conflicting wills or limitations. God has unlimited authority and power but still is *theos*, possessing personal will and relationship to the world. The plural forces are seen as qualities and attributes of God or as subservient beings of the created world. In the monotheistic view, God transcends the world of nature and human society; the world is not the locus of divine power, for God is the universal creator of everything out of nothing (*ex nihilo*). Humans find value and integration of meaning by realizing their common creaturehood and serving this one universal God. Revelation from God is the source of unified, universal meaning.

Related to polytheism is what F. Max Müller called henotheism and what others have called monolatry: worshiping one god at a time or raising up one most powerful God as the only one to be worshiped. The other gods, while real, are downgraded before this supreme God. Monolatry means one God is worshiped as supreme, though the lesser gods of other peoples are recognized. Henotheism (kathenotheism) would be the view that different gods can be worshiped as the supreme God one at a time without implying that the other gods do not exist.

In contrast to monolatry and henotheism, monotheism universalizes the power and authority of the one God exclusively, for even sharing power with lesser gods would be a limitation that cannot apply. Monotheism is intrinsically universal, transcending tribal or nationalistic limitations; the one God has authority and power over all peoples, friends and enemies alike. And monotheism refuses the henotheistic idea that one god can be worshiped as supreme at one time and another at another time, although it does allow for the experience of various aspects of the one God at different times.

A form of thought close to monotheism but still related to polytheism and henotheism is theistic dualism. Typically, this experience of the divine reality separates out the hurtful or evil elements and associates these with another divine power, thus setting up a divine struggle with echoes in human life. One unified supreme God is posited as the good divine force, and the source of evil can be thought of as many beings or as one evil being.

Strictly speaking, monotheism does not allow the one God to be limited even by the causes of destruction and evil; these causes cannot be divine forces outside the will of the one God. Ultimately the one God must be the source of all reality and all events, including those that humans experi-

ence as evil and destructive. Some forms of monotheistic thought do allow for evil beings as creatures of God, permitted to cause destruction and evil for various purposes within the overall authority of the one God. But these demons, devils, and satans are only part of the panorama of human existence, and they cannot limit or act against God's power, authority, and will.

Monism in the history of religions refers to a broad category of thought and experience that emphasizes the oneness or unity of all reality, so that no ontological separation exists between the divine and the world itself. All reality, including humans, share in the divine nature. Hindus and Buddhists have preferred the term nondualism, emphasizing that multiplicity arises from a single basis, and that there is no ultimate duality between self and other. Monism and nondualism tend to be nontheistic, for qualities of personal will and otherness from the world do not fit this perception of the divine. The world is not what it appears to be in the multiplicity of one's perceptions. Rather, either the world is in essence one divine reality, or it is fundamentally an illusion, or it consists of forms and expressions that emanate from the one divine source. Further, monism and nondualism tend to be nonhistorical, in the sense that a cyclical rhythm of time expresses the experience of the one divine reality. The religious path is one of mystical discipline and meditation, bringing progressively higher stages of knowledge and ultimate liberation in union with the one divine reality. Of course, provision is made for theistic practices at the lower levels of spiritual perfection.

Monotheism distinguishes itself from the various forms of monism and nondualism by positing a definite separation between the one divine reality and the world that God brought into existence. In this sense there is a dualistic emphasis in monotheism, for there are two distinct realms of reality, the divine and the created world. Only God is eternal and transcendent, having created the world out of nothing (*ex nihilo*). At the same time, most forms of monotheism hold God not only as transcendent but also as immanent in the world: God's presence, power, and operation are immediately present in human experience. The world is a creature, real and good as part of God's design. Revelation from God is important as guidance; prophetic and devotional emphases predominate over the mystical and meditative ones. God is a personal *theos* who confronts one in historical existence as an Other, to whom one relates through obedience and service. And God works in the history of the world, directing events toward an eschaton in which there will be evaluation and judgment. History has a beginning and an end, and God transcends it all.

DIMENSIONS OF MONOTHEISTIC BELIEF AND PRACTICE. In setting up a typology of monotheism to show the ideal types toward which the various monotheistic religious traditions seem to point, it is important to realize that even within one tradition there will be different experiences and philosophies of monotheism. Thus, while a tradition may be dominated

by a certain type, its particular coloration may be affected by hues drawn from other types. Further, monotheistic thought focuses especially on the theoretical or verbal dimension of religious experience. In moving to the practical and the social spheres one encounters a variety of phenomena that at times may not be distinctively monotheistic. Worship, law, customs, and social forms may show striking parallels in different religions without regard to the theoretical stance on monotheism, polytheism, or monism. For example, visual images of the divine reality are used in Christianity as well as in Hinduism, but not in Islam or Judaism—and also not in polytheistic Shintō. Some Muslim mosques are as bare and simple as Buddhist meditation centers, while some Christian churches gleam with golden brocade, candles, images, and saints that rival Hindu or Daoist temples. Orders of priests, monks, and nuns bring some Christian groups close to Buddhism, while the rabbi and imam of Jews and Muslims resemble more the learned teacher of a Hindu ashram. The veneration of saints in some sectors of Islam and Christianity appears similar to the veneration of spiritual beings in traditional African religions, but other sectors of Islam and Christianity strongly reject these practices. Thus care needs to be taken in setting up a monotheistic typology, so that religious traditions are not fitted in too tightly, doing damage to the integrity and richness of the particular religion.

The following typology of dominant emphases in the monotheistic religions includes elements from some religious traditions that may not be fully monotheistic, yet they all put forth the two essential ingredients of monotheism: *monos* and *theos*.

Monarchic monotheism. Monarchic monotheism, the belief in one God who rules over many gods, is close to polytheism and grows out of a cosmic religious context. One high God rises to supreme authority and unlimited power, forcing the other powers to total submission. Akhenaton's monotheistic movement in ancient Egypt was of this type; and Yahvism in early Israel displays this form, with Yahveh pictured as "a great king above all the gods" (*Ps.* 95:3). The attitude that subjugates other religions and imposes a monolithic system on all may be a result of this type of monotheism.

A subtype of monarchic monotheism would be dualistic monotheism: one God opposed against evil forces. In this view there is one ruler God, all-good and all-just, who tends to become distant, watching over the struggle within existence in which evil divine forces play a part. The distinctive quality of this type of monotheism is that it takes evil away from the being of the one God, accounting for it through demons or devils. Zoroastrianism is a classic example of dualistic monotheism: although the one God, Ahura Mazda, is supreme, the evil spirit Angra Mainyu struggles throughout the history of the world, to be overcome only at the end. Popular forms of Judaism, Christianity, and Islam have sometimes approached this type of dualistic monotheism with ideas of Satan or the devil defying God's will, although

generally these religions see the evil one as a creature permitted by the one God to perform evil within creation. The struggle between God and evil forces can be seen as a cosmic struggle, as in the Hindu Purāṇas, in which demonic powers arise anew in each new age and Viṣṇu is incarnated anew in an *avatāra* to do battle and realign the cosmic order. Some traditions in Judaism and Christianity describe God's struggle with Satan or the Antichrist as taking place on a trans-historical, cosmic plane. More commonly, however, dualistic monotheism has strong ties to the historical plane of human existence and provides an ethical dimension for human involvement in God's struggle against evil.

Emanational mystical monotheism. Emanational mystical monotheism may be divided into two subtypes: the worship of one God through many gods, or the worship of one God as the world soul. The first subtype, congenial especially to a monistic context, recognizes many gods but sees them as emanations of the one divine source, which is conceived of in theistic terms. Some ancient Greeks rationalized the plurality of the gods in relation to a particular supreme high god in this way. Hindu theistic cults sometimes offer this explanation of the relation of the many gods to the one great god worshiped in that cult. Viṣṇu, for example, can also be worshiped in many *avatāras* and with many different names. Another example would be Esoteric (Vajrayāna) Buddhism, in which all Buddhas and *bodhisattvas* can be seen as emanations of the Great Sun Buddha, Mahāvairocana.

Another type of monotheism related to the monistic worldview is the mystical view of the one God as the world soul. This type of monotheism holds that there is one personal *theos* who is not sharply separate from the world but rather is the creative divine force in everything. Again, the great theistic cults of Hinduism and Buddhism often show this type. For example, Rāmānuja's "Qualified Nondualism" holds Viṣṇu to be the absolute, supreme God to whom the worshiper relates in *bhakti* as qualitatively different from the worshiper himself; yet Viṣṇu and the worshiper are united as soul and body are united. In the theistic Kṛṣṇa cults, Kṛṣṇa as the supreme personality of God can be experienced as different from the world, yet in the highest mystical experiences these differences fade away and Kṛṣṇa becomes all, as expressed in Arjuna's vision (*Bhagavadgītā*, chap. 11). Sikhism is a monotheism that emphasizes God as absolute creator, self-sufficient and unchanging; yet God is embodied in the world, and the believer who finally reaches *nirvāna* becomes absorbed in God. Sikh monotheism, like Hindu monotheistic forms, tends to be nonhistorical, looking on existence as a countless series of cycles until finally the separation is overcome and the worshiper achieves complete union with the one God. Certain mystical movements within Judaism, Christianity, and Islam have also approached this type of monotheism without displaying the ahistorical feature. For example, the "pantheism" ("everything is in God") of Sūfī mystics like Ibn al-'Arabī (1165–1240 CE) or of medieval Jewish mystics tended to see the whole universe as an emana-

tion of God's own being, a reflection of the divine, while maintaining a view of God as distinct from the world.

Historical ethical monotheism. Historical ethical monotheism, the belief in one God guiding the historical design, characteristically describes God as personal, having a will for the historical design of the world, guiding all events as the creator, separate from the world yet immanently involved in human history as the God whose law governs all, who gives value to all and holds all accountable at the end of history, and who is revealed through pivotal prophets, events, and scriptures. Humans are expected to follow God's design by establishing goodness and justice in human society. God makes total demands, controls political history, is intolerant of other gods or other ultimate commitments, and is to be worshiped by all exclusively.

Zoroastrianism contains most of these monotheistic features, although it makes the dualism of good and evil central to the conception of the divine and thereby assigns some limits to the power of God. Sikhism also contains many of the features of ethical monotheism, but it gives central place to a cyclical view of existence and the goal of mystical absorption into God.

The family of religions made up of Judaism, Christianity, and Islam most fully expresses this type of monotheism and places it at the center of religious thought and practice. Each of these three traditions also adds its particular hue to the universal monotheistic vision. Judaism places a strong emphasis on the personal character of God, encountered in an "I-Thou" relationship and providing an ethical design for life as spelled out in the Torah and Talmud. The universal character of the one God is seen as turned toward humankind, especially in the very specific form of the covenant relationship with the Jews as "chosen people." The particular nature of this covenant and its demands does not negate God's universality, in the Jewish view. God's design for the world is to be fulfilled especially through the covenant with the Jews and thus a great responsibility is placed on them. Further, all non-Jews who fulfill in their lives the basic human principles known as the "seven commandments of the children of Noah" will have a share in the life of the world to come. Thus the religion of Judaism expresses a universal monotheism that focuses on God's particular relationship to humans through the covenant with the Jews.

Christians have modulated historical ethical monotheism into concrete, existential terms by emphasizing the personal character of the one God revealed in human history. Resisting tendencies of *tritheism*, Christian tradition has worked out a *trinity* that makes God concretely immanent in this world as Father, Son, and Holy Spirit. Central to this vision is the incarnation of God in the person of Jesus Christ, a historical particularization of the universal God that provides a pivot for all of human history and points to the fulfillment of God's whole design in the eschaton. Christians insist that their Christology is monotheistic; Christ is one substance (*homoousios*) with God the Father. Jews and Muslims,

of course, find this doctrine of the incarnation of God in Christ to be out of line with their understanding of monotheism.

Muslims have made the unity (*tawhīd*) of God the central statement of their confession of faith: “There is no god but God.” Islam puts forth a very radical monotheism in insisting on the utter transcendence and sovereignty of God, all-powerful in every aspect of the universe, to be likened to nothing. The greatest sin is *shirk*, associating anything else with God. The universal God is particularized in Islam by making the Qurʾān the concrete revelation by which God relates to all humans and gives them guidance. While the final revelation came through the prophet Muḥammad, it is intended for all humans in all ages as their guide to the ethical life and to the blessings that God intends for faithful creatures.

CURRENT REFLECTIONS ON MONOTHEISM. Monotheism is the long-established religious tradition in the cultures informed by Judaism, Christianity, and Islam, but still a considerable amount of searching and rethinking goes on. Philosophers and theologians continue to draw out the implications of the monotheistic vision for thought and society. For example, an influential work by H. Richard Niebuhr, *Radical Monotheism and Western Culture* (New York, 1960), argues that modern society tends toward henotheism, making one particular society into the center of value and the object of loyalty; in contrast, radical monotheism has as its reference the One, beyond all the many, from whom all reality receives its value. Contemporary Jewish and Muslim writers have also stressed radical monotheism as a critique of the polytheistic or henotheistic tendencies of modern society.

Modern thinkers have also been wrestling with some of the central characteristics of traditional monotheism that seem to be problematic. Difficulties revolve around issues such as God’s personality, God’s immutability, God’s strict separation from the world, the theocratic overtones of monotheism, its patriarchal associations, its seeming suppression of human freedom, and its supposed tendency toward exclusion and violence toward others. Recent critiques of traditional monotheism have come particularly from analyses of the type of ideology and society associated with monotheism. In 1935 Erik Peterson, in an treatise called *Der Monotheismus als politisches Problem* (Leipzig, 1935), described monotheism as a political ideology linked with the notion of divine kingship and leading to totalitarianism, and this line of criticism has recently been renewed. For example, Regina M. Schwartz in *The Curse of Cain: The Violent Legacy of Monotheism* provides a strong indictment of traditional monotheism for the way it has supported various forms of oppression and violence. Feminist thinkers, especially in the Christian and Jewish traditions, have criticized monotheism as a model of the highest form of patriarchal power and authority; in monotheism, God is imaged as male, omnipotent with unilateral power and authority over the world, separate and autonomous, exclusive, and opposed to everything related to

change, sensuality, nature, feeling, and femininity. Disillusioned by the effects of secularism, thinkers such as Alain de Benoist and Manuel de Diéguez blame monotheistic ideology for suppressing human freedom and forcing people to adopt atheism as the only alternative. They seek a neopagan resurgence as a new location of the sacred in the plurality and freedom of human life rather than in the monolithic totalitarian rule of monotheism. David Miller likewise has suggested that monotheism can no longer sustain and provide creativity for modern culture, calling for a return to the creative sources of polytheism.

Without surveying all the recent reinterpretations of the idea of monotheism among philosophers and theologians, several lines of thought may be mentioned here. In general, theologians and other thinkers have attempted to be more careful in the use of conventional dualisms like monotheism-polytheism, personal-impersonal, and transcendent-immanent, recognizing that religious traditions, including those labeled monotheistic, are complex and embody elements from both sides of these conceptual dualities. For example, feeling that the traditional view of God as personal tends to make God another being in addition to those known in the world, John Macquarrie and Paul Tillich speak of the divine reality as “Being” or the “Ground of Being,” avoiding pantheism but holding God to be not one being but the *source* of all being.

The movement known as process philosophy or theology has attempted to move to a *via media* between an untenable unipolar theism in which God is immutable and completely separate from the world, and an equally untenable pantheism. Alfred North Whitehead and Charles Hartshorne maintain that God includes and penetrates the world, while still being distinct from the being of the world. This bipolar view sees God as infinite personal existence and thus independent of the actual world in abstract identity but including the actual world in concrete existence. God is the source of love and the cause of nature’s order and has an overall design for the world. Since God is personal, change and growth take place in God as well as in the world.

Many Christian theologians, like Jürgen Moltmann and Colin Gunton, recognizing the problems with a monarchical, patriarchal monotheism, stress God’s liberating relation to humans by reemphasizing the trinitarian conception—though such emphasis widens the gulf between Christian thought and that of Judaism and Islam. Feminist thinkers have produced far-reaching reinterpretations of monotheism, making extensive use of feminine experiences and symbols. For example, Elizabeth Johnson re-envisioned the patriarchal God and the attendant hierarchical world order by a theology “from below,” drawing on women’s life experiences and focusing on the biblical Sophia (Wisdom) tradition as a way of bringing out feminine aspects and qualities of God.

Some scholars continue to defend the value of the traditional monotheistic perspective. For example, Bernard-Henri Lévy turns to the Jewish tradition to show that the

monotheistic ideal of eternal, universal law actually has a liberating function, safeguarding against totalitarianism and all the idols of nature, ideology, and the state. In contrast to the criticism that monotheism represses human freedom and creativity, Lenn Goodman draws on Jewish and Islamic philosophy to bring out the interplay of human values and the idea of monotheism, arguing that the monotheistic idea of God illuminates one's social, moral, cultural, and aesthetic life and guides one toward a genuinely humanistic philosophy.

This ongoing discussion makes it clear that monotheistic thought, while often challenged by and in tension with alternate and modified religious understandings, is still central to most of the Western world and will continue to be a dominant mode of experiencing and expressing the divine reality.

BIBLIOGRAPHY

The classic study that marshaled much evidence for an *Urmonotheismus* among archaic peoples is Wilhelm Schmidt's *Der Ursprung der Gottesidee: Eine historisch-kritische und positive Studie*, 12 vols. (Münster, 1912–1955); although Schmidt's theory is no longer accepted, much of the material is still useful. John S. Mbiti gathers and synthesizes concepts about the unity of the high god from all over Africa in *Concepts of God in Africa* (New York, 1970). Arvind Sharma, *Classical Hindu Thought: An Introduction* (New Delhi, 2000), discusses the tendencies toward monotheism alongside monism in Hindu thought and practice; and Tracy Pintchman, *The Rise of the Goddess in the Hindu Tradition* (Albany, N. Y., 1994), shows that various forms of the great Goddess often become a unifying focus in the theistic traditions. Paul Williams, *Mahāyāna Buddhism: The Doctrinal Foundations* (London, 1989), describes tendencies in Mahāyāna Buddhism to raise one or another form of the Buddha to supreme status. Rajinder Kaur Rohi, *Semitic and Sikh Monotheism: A Comparative Study* (Patiala, 1999), explores monotheism in the Sikh tradition.

Erik Hornung, *Akhenaten and the Religion of Light* (translated by David Lorton; Ithaca, N. Y., 1999), examines Akhenaten's brief monotheistic era in ancient Egypt. Tendencies toward a monotheistic view in Greece, Rome, and the Near East are described in *Pagan Monotheism in Late Antiquity*, edited by Polymnia Athanassiadi and Maichael Frede (Oxford, 1999); and John Peter Kenney, *Mystical Monotheism: A Study in Ancient Platonic Theology* (Hanover, N. H. 1991). Peter Clark, *Zoroastrianism: An Introduction to an Ancient Faith* (Brighton, U. K., 1998), discusses the unique interplay of dualistic and monotheistic ideas within Zoroastrianism.

William F. Albright's *From the Stone Age to Christianity: Monotheism and the Historical Process*, 2d ed. (Garden City, N. Y., 1957), is a well-known study of the development of monotheism in ancient Israel viewed against the background of ancient Near Eastern cultures. Two studies emphasizing that the development of monotheism in Israel was a long and complex process are Stanley Rosenbaum, *Understanding Bib-*

lical Israel: A Reexamination of the Origins of Monotheism (Atlanta, 2002); and Robert Karl Gnuse, *No Other Gods: Emergent Monotheism in Israel* (Sheffield, 1997). The Jewish rabbinic conception of the oneness of God is presented by Louis Jacobs in *A Jewish Theology* (New York, 1973). A forceful exposition of monotheism in the Jewish view is found in Abraham Heschel's *Man Is Not Alone: A Philosophy of Religion* (New York, 1951). Paul Tillich presents a monotheistic theology related to his view of God as the "Ground of Being" in his *Systematic Theology*, vol. 1 (Chicago, 1951). *Radical Monotheism and Western Civilization* (New York, 1960) by H. Richard Niebuhr has been very influential in discussing the relevance of monotheism for Christian societal ideals. The central importance of the unity of God in Islam is presented by Muḥammad 'Abduh in *The Theology of Unity* (London, 1966). The articles in *Islamic Spirituality: Foundations*, edited by Seyyed Hossein Nasr (New York, 1987), look at the oneness of God in relation to many other aspects of Muslim spiritual experience. A rich sampling of philosophical ideas about God, with a typology of theistic views, is found in Charles Hartshorne and William L. Reese's *Philosophers Speak of God* (Chicago, 1953). H. P. Owen surveys the various philosophical approaches to God as he defends traditional theism in *Concepts of Deity* (New York, 1971).

Among many critical views of traditional monotheism, Regina M. Schwartz, *The Curse of Cain: The Violent Legacy of Monotheism* (Chicago, 1997), presents a strong discussion of the relationship of monotheism to various forms of violence and oppression. Material on feminist critiques of traditional theistic concepts can be found in Rosemary R. Ruether's *Sexism and God Talk: Toward a Feminist Theology* (Boston, 1983), and in Judith Plaskow, *Standing Again at Sinai: Judaism from a Feminist Perspective* (New York, 1990). Thinkers as different as Alain de Benoist, *Comment peut-on être païen?* (Paris, 1981), and David L. Miller, *The New Polytheism: Rebirth of the Gods and Goddesses* (New York, 1974, revised ed. 1981), suggest that monotheism fails to provide freedom and religious creativity for the modern age and a return to polytheism is needed. Jan Assmann, in *Moses the Egyptian: The Memory of Egypt in Western Monotheism* (Cambridge, 1997), shows how the idea of monotheism fostered the dichotomy of true religion and false religion in Western intellectual history, while alternate forms of cultural memory more favorable to ancient Egypt continued to persist. And Rodney Stark, in his *One True God: Historical Consequences of Monotheism* (Princeton, N. J., 2001), presents a far-ranging discussion of the historical and sociological repercussions, both negative and positive, that monotheism has had in Western culture.

Presenting monotheism in a positive view, Bernard-Henri Lévy in *Le testament de Dieu* (Paris, 1979) attempts to show that the monotheistic ideal of a universal moral law can be a liberating safeguard against all forms of totalitarianism. *Monotheism*, edited by Claude Geffré and Jean-Pierre Jossua (Edinburgh, 1985), is devoted to the theological discussion of the criticisms of monotheism and the need to rethink and renew this theological concept. Jürgen Moltmann counters oppressive monarchical monotheism with a liberating trinitarian model of God in *The Trinity and the Kingdom: The Doctrine of God* (London, 1981); and Colin E. Gunton, *The One, the Three and the Many: God, Creation and the Culture of Moder-*

nity (Cambridge, 1993), argues that both trinitarian and monotheistic perspectives are necessary for upholding human freedom. Elizabeth A. Johnson, in *She Who Is: The Mystery of God in Feminist Theological Discourse* (New York, 1992), is representative of many feminist scholars as she reinterprets the “one living God” with metaphors and images suggesting relationship and communion. Drawing on extensive studies in Jewish and Islamic philosophy, Lenn E. Goodman presents philosophical investigations of monotheism with respect to ethics and human values, notably in *Monotheism: A Philosophical Inquiry into the Foundations of Theology and Ethics* (Totowa, N. J., 1981); and also in *God of Abraham* (Oxford, 1996).

THEODORE M. LUDWIG (1987 AND 2005)

MONSTERS. Strictly speaking, a monster is a mythical being and may be human or animal or a combination of both; it may be huge, misshapen, or grotesque, malevolent, savage, or terrifying. Such creatures have been a feature of popular lore and religious cult in all parts of the world from earliest times. The term is applied also to human “freaks,” or “monstrous births,” that is, persons with more or less than the normal number of limbs or organs, Siamese twins, hermaphrodites, and even albinos.

In popular legend, monsters are commonly portrayed as both stupid and gluttonous. What they have in brawn, they lack in brain, and when they devour their victims, it is not because they are innately hostile to the human race but because they possess insatiable appetites. It is often their obtuseness and greed that prove their undoing.

One kind of mythical monster is the dragon, the embodiment of primordial chaos, who is believed to have been subdued in battle by a leading god before the world order could be established. The Sumerians of Mesopotamia spoke of such a combat between the monster Azag (“demon”) and the god Ninurta; the Babylonians, of the defeat of the rebellious Tiamat by their supreme god Marduk; the Hittites, of the defeat of a sea serpent named Illuyankas by the combined efforts of the goddess Inaras and a mortal hero; the Hebrews, of Yahveh’s rout of Leviathan; the Hindus, of Indra’s subjugation of Vṛtra; the Iranians, of the dispatch of the serpentine Azhi Dahaka; and the Greeks, of the triumph of Zeus over the contumacious Typhon.

The primordial monster appears not only in myth but also in ritual. It is a widespread custom to inaugurate a new year or season by staging a mimetic combat between two antagonists who represent respectively the old year and the new, winter and summer, drought and rainfall, and the like—a combat that survives, albeit in distorted form, in the English Mummers’ Play and similar seasonal performances elsewhere. What thus inaugurates each separate year or season is thought to have inaugurated the entire procession of years and seasons in any given era and to be destined to happen again before a further era can begin. The defeat of the

monster is therefore retrojected into cosmogony and projected into eschatology: Leviathan, Vṛtra, Azhi Dahaka, and Fenrisúlfr of Norse mythology, for instance, are said to be imprisoned but not slain and will eventually burst their bonds and have to be subdued again.

In several myths, the monster personifies the swollen rivers or winter squalls that threaten to inundate the earth unless properly channeled. In Chinese folklore, the subjugation of raging streams is called “caging the dragon.” Conversely, however, the monster sometimes personifies a malevolent power who impounds the subterranean waters that have to be released in order to prevent drought.

Adverse natural phenomena are also personified as monsters, though it is sometimes difficult to determine whether these represent the phenomena themselves or the demonic powers that are believed to cause them. One such monster is the gigantic North American deity called the Thunderbird, the flapping of whose wings is believed to cause storms. The ancient Sumerians spoke likewise of a gigantic bird named Heavy Wind (Im Dugud) who caused storms; the Teutons spoke of Hraesvelgr. Analogous figures appear in the folklore of such diverse peoples as the Chinese, the Burmese, and several American Indian tribes.

Hurricanes are often attributed to the rampages of monsters. In the Mesopotamian creation epic *Enuma elish*, the rebellious Tiamat is accompanied into battle by a cohort of gruesome monsters that includes Stormwind, Cyclone, and the like. The Seneca Indians saw in hurricanes the activity of a monstrous bear named Ya-o-gah. According to some scholars, the English word for this phenomenon derives ultimately from *Hurucán*, the name of a monstrous wind god of the Quiché Indians of Central America.

Equally widespread is the belief that eclipses are caused by a monster’s swallowing and then disgorging the sun or moon. The Hindus spoke of a dragon called Svarbhanu; analogous figures appear almost universally. In the language of the Turkic-speaking Chuvash and of Estonian folklore, a verbal form translated into English as “eaten” is used to describe an eclipse. Drums and gongs are beaten, bells rung, and trumpets blown in many parts of the world to scare away the dire adversary. A variant of this notion asserts that the sun is pursued nightly by a voracious monster—in ancient Egypt by the serpent Apopis and in Norse mythology by the wolf Skoll.

Another natural phenomenon personified as a monster is the whirlpool, which is said by some scholars to be the original referent of the word *gargoyle* (from the Latin *gurgēs*). In Arabic a waterspout is popularly termed *tinnīn* (“dragon”); in the Old Testament the sea monster Leviathan is sometimes referred to by the term *tannin*. So, too, Edmund Spenser describes a whirlpool as a whale.

Not only natural phenomena but also human situations and infirmities are personified as monsters or are attributed to their activities. In Babylonian magical incantations, epi-

lepsy and palsy are represented as a demonic monster with a bird's head and human hands and feet, and impotence as one with a lion's mouth, a dragon's teeth, and an eagle's talons. In Jewish folklore, noontime sunstroke and dizziness are attributed to an ogre who has the head of a calf with a revolving horn in the center, one eye in its breast, and a body covered with scales, hair, and eyes.

Sexual dreams are commonly represented in popular lore as due to the assaults of monsters who consort with sleeping men and women. Those that assail men are known as succubi; however monstrous their activities, they are usually portrayed not as grotesque harridans but as voluptuous sylphs or *femmes fatales*. Those that assail women are known as incubi. Belief in such creatures was widespread especially in the Middle Ages and was held even by such noted churchmen as Augustine. They were thought to be the demon lovers of witches, and intercourse with them was said to produce "monstrous births," deformed persons, hermaphrodites, and sometimes albinos. Indeed, according to many medieval commentators the "sons of God," who are said in the *Book of Genesis* (6:1–4) to have consorted with mortal women and thus engendered a race of giants, were in fact incubi.

Fairly universal is the belief in a monstrous beldam who seizes and strangles newborn babes and kills their mothers or drains the mothers' milk. In ancient Mesopotamia, she was known as Lamashtu and was portrayed with a lion's head, a woman's body, and bird's feet. She held serpents in both hands and suckled a black hound and a pig at her breasts. The Hittites knew her as Wesurya ("strangler"); known among the Greeks as Gello, Lamia, or Strix, she could take the form of a screech owl or bat. The Arabs saw her as a goggle-eyed hag whose one foot was that of an ass and the other that of an ostrich. In German folklore, she is a sharp-nosed, scrawny harridan. Superstitious Jews identify her with Lilith, the legendary first wife of Adam, who was expelled childless from Eden for her rebellious behavior and who is therefore envious of all new mothers. In many parts of the world plaques and amulets are hung up to ward her off.

Not only diseases and human infirmities but also death and the netherworld are portrayed as monsters. In several passages of the Old Testament (*Is.* 5:14, *Hb.* 2:5, *Prv.* 1:12) hell is depicted as a being with jaws agape, a portrayal frequent in medieval art, for example, in the east window of York Minster. Supay, the Peruvian deity of the nether regions, is similarly characterized.

There are also animal monsters, creatures that combine the parts of several different beasts or of beasts and human beings. Not all of them are regarded as harmful; some, despite their grotesque forms, represent beneficent spirits or deities. Many of these monsters acquired acceptance through descriptions of them in medieval and later bestiaries, which in turn derive largely from a book about animals known as the *Physiologus*, compiled (probably in Greek) between the third and fifth centuries CE by an unidentified writer and subsequently translated into many European and Oriental

languages. Under the hands of Christian redactors, symbolic and allegorical meanings were given to the fabulous beasts, and they were thus incorporated into heraldry (e.g., the lion and the unicorn of British heraldry). Prominent among such creatures are the unicorn, the phoenix, the griffin, and the manticore.

The unicorn is first mentioned by the Greek writer Ctesias (third century BCE) as native to India and akin to the rhinoceros. It was later portrayed in art and literature as a white horse with a single horn protruding from the middle of its forehead. It is identified by some early translators of the Old Testament with the *re'em*, a beast mentioned in several passages, and on the basis of this identification it became prominent in Christian symbolism. The *re'em*, however, is said explicitly to have more than one horn (*Dt.* 33:17, *Ps.* 22:21) probably it is the now extinct aurochs. Legend asserted that the unicorn could be caught only if it leapt into the lap of a virgin sent into the woods to entice it.

The phoenix, a red bird variously identified as an egret or flamingo, is said to be native to Arabia. It was believed to live for five hundred years and then to burn itself in its nest. Out of the ashes arose a new phoenix. Modern scholars believe that this is simply a Greek transmogrification of the Egyptian mythical *bennu* bird, who represented the resurgent sun and rose daily from a flaming tree at Heliopolis.

The griffin is a creature with a lion's head and the wings of an eagle who, in Greek mythology, guarded the gold in the north. It is probably to be identified (even in name) with the biblical *cherub* (Babylonian *karūbu*), who was not an angel, as is commonly supposed, but a monster who guarded the entrance of ancient Mesopotamian palaces and who is also related to the legendary dragon who guards the pot of gold.

The manticore is a hybrid monster described in the bestiaries as possessing a lion's face, a man's body, and a tail with a serpent's head and a scorpion's sting. It has gleaming eyes and can leap prodigious lengths. It is said to be native to the Far East but may in fact derive from the fabulous Indian monster *makara*.

In general, harmful demons are often portrayed as monstrous beasts. A representative example is the Russian Zmei Gorynych, a snake that typifies all evil and is prone to run off with mortal girls.

One example of a beneficent animal monster is the Iranian Senmurv, part dog, part bird, and sometimes part reptile, who gave mankind seeds scattered from a tree in which it lived. Another is the Chinese Qilin, a spirit of good luck who has a deer's body, a bushy tail, cloven hoofs, and horns.

Besides these individual theriomorphic monsters there are also classes of such beings, for example, centaurs, Gorgons, and harpies. Centaurs are most commonly described in Greek literature and portrayed in Greek art as half human and half horse. It should be observed, however, that this is but one variety of them, for their human parts are said to be

combined alternatively with those of asses and other beasts. It has therefore been suggested by some modern scholars that centaurs are really the mythical counterpart of the bands of wild men who are said to rampage in animal pelts and perform ritual dances at certain seasons in Balkan countries and who find their congeners in the hobbyhorse performers of English folk custom. The Gorgons are, in Greek mythology, three horrendous sisters whose glance petrifies the beholder. Their hair consists of serpents, and they possess golden wings, brazen claws, and huge teeth. One of them, Medusa, is mortal. Harpies (“snatchers”) are filthy winged monsters, part woman and part bird, who defile whatever they encounter and who, according to Hesiod, also carry off newborn babies. In the latter capacity, they have their counterpart in Canaanite lore. Hesiod calls two of them by the names *Aello* (“stormwind”) and *Ocypete* (“swift flier”). These names are included to this day in the Jewish amuletic plaques mentioned above as a device for averting the child-stealing beldam.

Human “monsters” or freaks are popularly attributed to the union of mortal women (especially witches) with incubi, or demons. Included among them are misshapen children and adults, androgynes, and persons with extra limbs and organs. An outstanding example is the Pig-faced Lady, Tanakin Skinner, who appeared in London in the early seventeenth century. An otherwise gracious person, she was said to have the head of a sow and to eat from a trough. Her grotesque form was attributed to divine vengeance on her mother, who had refused alms to a poor woman begging for the sustenance of her child. Another example is the Elephant Man, the subject of a well-known play by Bernard Pomerance. Albinos too fall into this class, although the popular attitude toward them is ambivalent. In Senegal, for instance, they are regarded as ominous; in Gabon they are killed at birth, whereas in New Guinea they are deemed holy.

Remote, “outlandish” peoples are often depicted as monsters in traveler’s yarns, medieval romances, and the writings of various ancient authors. Herodotus (485?–425 BCE) and Pliny the Elder (23–79 BCE), for example, mention a legendary people of the far North named the Arimaspeans, who have no heads but have eyes in their stomachs. Japanese legend tells of Jon-li, a remote island inhabited by people whose bodies are half human and half dog. Marco Polo says that the inhabitants of the Andaman Islands are dog-headed, and other writers similarly describe the Karen of Burma. The Jewish traveler Binyamin of Tudela (twelfth century) reports that men who live in the Turkish steppes have no noses, although this may refer to flat-nosed Mongolians. In the same vein, Jean Struys (1650) asserts that tailed men are to be found on the southern side of Formosa, and a similar statement is made by later writers about an allegedly cannibal race called the Nuam-ni’aros who lived between the Gulf of Benin and Ethiopia. Jews during the Middle Ages were also commonly accused of cannibalism.

Some monsters are not objects of actual belief but are deliberately invented to scare unruly children. The outstand-

ing monster of this type is the Greek figure Mormo (“bogey”), also called Mormolukeyon (“bogeywolf”), who survived in British nurseries as late as the nineteenth century. Similar creatures are the beldam Bebau in central France and the *windigo* of the Ojibwa Indians of North America.

The conquest of a draconic monster who ravages a country or holds a princess or other fair maiden captive is a standard motif in heroic legend. One is the Chimera, a fire-breathing monster, part lion, part dragon, and part goat, who ravaged Lycia and the neighboring lands but was slain by the hero Bellerophon mounted on the winged horse Pegasus. Typhon, a hundred-headed, fiery being, challenged the sovereignty of Zeus but was destroyed by a thunderbolt and buried under Mount Etna. The Minotaur, half bull and half man, was kept in a labyrinth by King Minos of Crete to devour the youths and maidens demanded of Athens as periodic tribute. He was eventually defeated by the hero Theseus with the aid of the princess Ariadne. (The exaction of periodic tribute by water spirits as the price of averting inundation is a not uncommon theme in world folklore.) The Hydra was a hundred-headed monster of the Peloponnese who was slain by Herakles as one of his twelve labors. Whenever one head was severed two grew in its place, but the hero eventually scorched the growth with a firebrand. Geryon was a monster with three heads or three bodies whose herds near Gades (Cadiz) Herakles carried off as his tenth labor, slaying their guardians, the giant Eurytion and the two-headed hound Orthros, as well as the Geryon itself. Fenrisúlfr (Fenriswolf) was the monstrous offspring of Loki in Norse mythology. The gods eventually bound him with a fetter made by dwarfs from the sound of a cat’s footfall, the breath of a fish, and the spittle of a bird, and then imprisoned him in the depths of the earth. He will break forth, however, at the final twilight of the gods (Ragnarök) and slay Óðinn (Odin), only to be himself slain by Óðinn’s son Víðarr. Battles against monstrous dragons are familiar also from the legends of Perseus, Beowulf, Saint George, and many other heroes.

From time to time—especially in the present century—reports have circulated of gigantic prehistoric monsters sighted in various parts of the world. These are commonly termed “monsters,” but that designation is misleading, for a monster is essentially abnormal, whereas these creatures are supposedly surviving specimens of mammoths, mastodons, and the like. To this class belongs especially the celebrated Loch Ness monster of Scotland, said to have been seen sporadically throughout the ages, but a subject of public interest only since 1933. It is reputed to have been seen since then by no fewer than four thousand witnesses, and several scientific expeditions have attempted to photograph and identify it. A group of sonar and photographic images obtained in 1973 by the Academy of Applied Science has, for some, lent credence to its existence. It is usually described as being dark gray or brownish black in color, about fifteen to twenty feet long, with a thin neck, small head, long tail, four paddles or fins, and several humps. Another such alleged prehistoric

monster is the Yeti, or Abominable Snowman, said to have been sighted or to have left gigantic footprints in remote areas of the Himalayas. He is described as resembling an ape, standing nearly six feet tall, shaggy in appearance, with huge teeth in a large mouth, and a head tapering to a point. However, native Sherpas declare that he is far smaller and has red or black tufts of hair and the face of a monkey. He has no tail and apparently walks on two legs.

Cousin to the Yeti is Sasquatch, or Bigfoot, a hypothetical species of primates said, since 1840, to have been sighted in the mountains of the Pacific Northwest. This creature is reported to be between seven and nine feet in height and to weigh from six hundred to nine hundred pounds. He is not ferocious. He looks like a furry ape, walks upright, and leaves footprints sixteen inches long and six inches wide. Sasquatch plays a role in the folklore of the Northwest Coast Indians and in turn has a cousin in the Mono Grande of the Andes. It has been suggested that the Abominable Snowman, Sasquatch, and Mono Grande may be surviving specimens of a prehistoric ape-man known as *Gigantopithecus*, fossils of which have been discovered in China and other parts of Asia.

Monsters and ogres survive also in popular lore in such figures as Frankenstein's monster, King Kong, and the like—staples of horror movies, television, and comic strips. An interesting development in this respect is the circulation of stories about visitors from outer space allegedly seen emerging from flying saucers. Significantly, many of these stories come from rapporteurs of Irish descent, and the creatures are described as having a form closely resembling that of the leprechauns of Irish folklore.

Finally, it may be observed that monsters also appear as figures of political propaganda. An outstanding instance is the portrayal of the Japanese in World War II as “monkeys”—a tendentious revival of the old practice (mentioned above) of so characterizing remote, unfamiliar peoples. Similarly, barbaric historical personages are commonly designated “monsters,” for example, Attila and, in our own day, Adolf Hitler and Joseph Mengele. In such characterizations, the essential nature of a monster is effectively expressed; huge, savage, and hostile, he is the direct opposite of the diminutive dwarf, elf, or gremlin, who, albeit mischievous, is essentially benevolent.

THEODOR H. GASTER (1987)
Revised Bibliography

MONTAGU, LILY (1873–1963), founder of the Liberal Jewish movement in England. Born in London on December 22, 1873, Lily H. Montagu was the sixth child of Ellen Cohen Montagu and Samuel Montagu. Her father was a wealthy banker and leading member of the Orthodox Anglo-Jewish community. Convinced that Orthodoxy offered her, and other women, little room for religious self-expression, she found in the works of Claude Montefiore a vision of Judaism that mirrored her own understanding of true religion as personal in nature, universal in outlook, and best revealed through daily conduct.

In the January 1899 issue of the *Jewish Quarterly Review*, Montagu published “The Spiritual Possibilities of Judaism Today,” an essay in which she asked all religiously committed Jews to help her form an association aimed at strengthening the religious life of the Anglo-Jewish community through the propagation of Liberal Jewish teachings. Membership would not necessarily demonstrate allegiance to what Montefiore identified as Liberal Judaism but simply would demonstrate the recognition of its ability to awaken within many Jews a sense of spirituality and personal responsibility to God. The Jewish Religious Union (JRU), established by Lily Montagu in February 1902, instituted Sabbath afternoon worship services conducted along Liberal Jewish lines and propaganda meetings, led by Montagu, to clarify and spread its teachings. Though Montefiore agreed to serve as the group's official leader, Montagu assumed responsibility for its major activities and daily affairs.

By 1909, acknowledging the failure of its initial, all-inclusive vision, the union declared itself to be a movement specifically committed to the advancement of Liberal Judaism. During the next few decades, Lily Montagu helped form Liberal Jewish synagogues throughout Great Britain, frequently serving as their chairman or president, and became lay minister of the West Central Liberal Jewish Congregation in 1928, a position to which she was formally inducted in November, 1944. Following Montefiore's death, in 1938, she assumed the presidency of the JRU, later renamed the Union of Liberal and Progressive Synagogues. Having conceived of the idea for an international JRU as early as 1925, Montagu also helped found and eventually became president of the World Union for Progressive Judaism.

Montagu was the author of eleven books, including *Thoughts on Judaism*, a theological treatise published in 1902, and her autobiography, *The Faith of a Jewish Woman*, published in 1943.

BIBLIOGRAPHY

Little has been written either on the history of the Liberal Jewish movement in England or on Lily Montagu herself. The only critical study of Montagu's life and thought published to date is my book *Lily Montagu and the Advancement of Liberal Judaism: From Vision to Vocation* (Lewiston, N.Y., 1983). A second volume, *Lily Montagu: Sermons, Addresses, Letters and Prayers*, edited and with introductions by me (Lewiston, N.Y., 1985), includes a fully annotated selection of her unpublished writings. Finally, for a more detailed account of Montagu's contribution to the development of Liberal Judaism, see my essay "The Origins of Liberal Judaism in England: The Contribution of Lily H. Montagu," *Hebrew Union College Annual* 55 (1984): 309–322.

Revised Bibliography

MONTANISM. Although there are various reports (e.g., Hippolytus, *Refutatio* 8.19.1; Eusebius, *Church History* 6.20.3) that the leaders of Montanism composed many writings, none of these has come down to us. As a result, special importance attaches to the approximately twenty-five surviving fragments of their prophecies and oracles (see new edition in *Kirchengeschichtliche Entwürfe*, 1960) and a few inscriptions, as well as to the writings from Tertullian's Montanist period, although the latter reflect essentially the later development of Montanism. Even the writings of the adversaries of Montanism have disappeared and are known to us only from citations by the fathers of the church. Especially important are Eusebius's account in his *Church History* and the *Panarion* of Epiphanius of Salamis, both of which are based on numerous sources. By contrast, what we know

of Montanism from Jerome and Augustine has significantly less value as a source.

According to the sources, Montanism arose in Asia Minor in 156/7 CE and was centered there, at least in its first period. Its founder was Montanus, but he was evidently accompanied from an early date by prophetesses, among whom Priscilla (or Prisca) and especially Maximilla were particularly important. After they had first attracted attention by speaking in tongues, Montanus and his associates made use of intelligible oracles and prophecies to proclaim the final revelation and the will of the Holy Spirit. The Spirit was calling for an intensified expectation of the end, since the Parousia (the second coming of Christ) was imminent. The thousand-year reign would descend to earth at Pepuza (and Tymion?) in Phrygia, and the faithful were to travel there in order to share in it as soon as it appeared. They were to prepare themselves by intensified asceticism.

Glossolalia and the claim of a communication of the Spirit were at this time just as suspect to the official church in Asia Minor as was the expectation of an imminent end. The bishops endeavored in vain through exorcisms to resist the "new prophecy," as the apparently tightly organized movement was called, and they tried to coordinate their activity against the "Cataphrygians" (so called after their place of origin) at the first provincial synods. Despite these efforts, Montanism spread far beyond Asia Minor. Only with great difficulty was its recognition by the bishop of Rome prevented, and approximately in the year 207 in North Africa it made a convert of Tertullian, who became a passionate proselytizer for Montanism.

The fight against the movement was difficult because early Montanism was orthodox in its doctrine and exemplary in its ethics. Its characteristic traits—a heightened expectation of an imminent Parousia and a resultant intense asceticism (to the point of seeking martyrdom)—were basic elements of early Christianity, as were speaking in tongues and the claim to immediate revelation from the Holy Spirit. Montanus claimed that in him the Paraclete had made his appearance. After all, the coming of the Spirit was expressly announced in the *Gospel of John*. In addition, millenarianism found justification in the *Revelation to John* and was especially widespread in Asia Minor, and this even in the subsequent period. The *Revelation to John* and the *Gospel of John* were evidently among the spiritual sources from which Montanism was derived.

By the second half of the second century the official church and its theology had moved beyond the expectation of an imminent Parousia and had made room for the idea of postponement of the end. The *Second Letter of Peter* and the *Shepherd of Hermas* are clear proof of this. In the community at large, however, the expectation of an imminent end was still alive, at least in a latent form, and was given new life by Montanism. It was this expectation that made it possible for the movement to spread so quickly and so widely. The church's opposition to Montanism began to be effective only

when the predicted return of the Lord did not occur and the prophetic energies of the movement fell off. Maximilla's oracle, "After me there will be no further prophet but only the end" (Epiphanius, *Panarion* 48.12.4), gave the church a weapon that became all the more effective as time passed after the death of Maximilla and neither the predicted end nor even the disturbances and wars preceding the end came to pass. During the second half of the second century, Montanism underwent the same kind of development that official Christianity had experienced: there was a withering of the prophetic element, cessation of glossolalia, and a decline in ethical standards.

It was the ethical rigorism of Montanism that converted Tertullian. When he became a Montanist in about 207, he evidently had been in conflict with the official church, which in his opinion was too lax, for some time. The gift of prophecy was still alive in Montanism at that time, as was eschatological expectation, though this was no longer as intense as in the beginning. The gift of tongues had disappeared, and the Lord's thousand-year reign was expected to come no longer in Asia Minor but in Jerusalem.

It is not possible to say for certain to what extent Montanism had spread in the West and how long it persisted there. Modern writers often rely too much on the lists of heresies, in which Montanism soon acquired its fixed place, as proof that the movement actually existed in a given area. Although Augustine wrote of "Tertullianists" in Africa, it is uncertain to what extent they are to be identified with Montanism. On the other hand, in the East the laws against heretics give the impression down to the beginning of the fifth century that Montanism was still a living reality there.

The attempt (by Wilhelm E. Schepeleern and, later, B. W. Goree Jr., for example) to explain Montanism in terms of the paganism of Asia Minor and especially the cult of Cybele is not a promising one in view of the state of the sources. What these writers view as a tradition peculiar to Asia Minor (e.g., emphasis on ecstasy, the special place of women, intense asceticism) was in fact the common possession of early Christianity.

BIBLIOGRAPHY

My contributions to *Kirchengeschichtliche Entwürfe* (Gütersloh, 1960) expand on themes treated above: "Bemerkungen zum Montanismus und zur frühchristlichen Eschatologie" (pp. 105–148) and "Augustin und der Montanismus" (pp. 149–164). See also Heinrich Kraft's "Die altkirchliche Prophetie und die Entstehung des Montanismus," *Theologische Zeitschrift* 11 (1955): 249–271; Douglas Powell's "Tertullianists and Cataphrygians," *Vigiliae Christianae* 29 (1975): 33–54; W. E. Schepeleern's *Der Montanismus und die phrygischen Kulte: Eine religionsgeschichtliche Untersuchung* (Tübingen, 1929); and B. W. Goree Jr.'s "The Cultural Bases of Montanism" (Ph. D. diss., Baylor University, 1980). Pierre de Labriolle's *Les sources de l'histoire du montanisme*

(Paris, 1913) is still fundamental, even though the editions used are largely outdated.

KURT ALAND (1987)

Translated from German by Matthew J. O'Connell

MONTANUS, second-century Christian schismatic. For information on the life of Montanus we are dependent on statements made by the Christian controversialists of the time, as transmitted by the fathers of the church. Only a few utterances of Montanus himself have come down to us: "I am the Father and I am the Son and I am the Paraclete," as in the *Dialogue between a Montanist and an Orthodox Christian* (J. Ficker, 1905, pp. 447ff.) and according to Didymus of Alexandria (*De Trinitate* 3.41) and Epiphanius (*Panarion* 48.11.1). "The Paraclete" is sometimes replaced by "the Spirit" or "the Holy Spirit" or some expanded form of this. Man is like a lyre, and Montanus is described as the plectrum that sweeps across the strings. Extraordinary promises are made to the faithful, but no concrete indications are given of Montanus's teaching or ethical demands in any of the extant sources concerning him.

Montanus reportedly first attracted notice in the time of the proconsulate of Gratus (Quadratus?), in Ardabau (on the Phrygian border of Mysia), as promulgator of the "new prophecy." When combined with data provided by Eusebius and Epiphanius of Salamis, this information suggests the date 156/157 as the approximate beginning of this movement. Montanus is also reported to have been a recent convert to Christianity (in Eusebius's *Church History* 5.16.17) and to have previously been a priest of Apollo (this designation appears in the *Dialogue*) or, more generally, a priest of idols (in the *Dialogue* and in Didymus's *De Trinitate* 3.41). Jerome speaks of him (*Letters* 41, to Marcella) as *abscisum et semivirum* (castrated and half a man), that is, a priest of Cybele. Montanus is reported to have hanged himself (*Church History* 5.16.13). Since the same story is told of Maximilla, the prophetess and close associate of Montanus, the report is evidently a piece of antiheretical polemic, passed on by an anonymous writer simply as a rumor (cited in *Church History* 5.16.15). We cannot say for certain whether the report is true that Montanus was originally a pagan priest, but the contradictory claims suggest that early Christian polemics played a role in the report, especially since there is no reference to this pagan background of Montanus among the writings of the anti-Montanists of the second century.

Augustine (*De haeresibus liber* 26) reports that Montanus celebrated the Lord's Supper with bread that had been prepared using the blood of a one-year-old infant. The blood had been extracted by means of countless tiny punctures. The same story is told by numerous church fathers (Epiphanius, Filastrius, Cyril of Jerusalem, Jerome), but it represents nothing more than the acceptance into antiheretical Christian polemics of the pagan legend of the orthodox Christian Lord's Supper as involving the ritualistic sacrifice

of an infant. This story was told at the end of the second century (cf. Minucius Felix, *Octavius* 9.5). Because they did not recognize this, some scholars saw the story as reflecting the influence of an orgiastic culture in Asia Minor and considered it as justification for looking into the matter further. Montanus's contemporary adversaries knew nothing about the story, or they gladly would have used it in arguments against him. Also, Eusebius, who summarizes virtually everything of the anti-Montanist writings, would undoubtedly have passed the story on.

There was nothing about Montanism that could not have been found, at least in the form of tendencies, in the early Christian church. Montanism was a movement of renewal that sought to revive, in the second half of the second century, certain elements of worship, doctrine, and ethics that had gradually died out in the church at large during the first half of the century. Montanism itself eventually underwent the same kind of development that official Christianity had experienced (cessation of glossolalia, withering of the prophetic element, nonfulfillment of the expectation of the second coming of Christ, decline in ethical standards), so that in the third century Montanism's internal energies were gradually exhausted and nothing was left but a sect that, from the fourth century on, was exposed to ecclesiastical and civil persecution and was doomed to extinction.

KURT ALAND (1987)

Translated from German by Matthew J. O'Connell

MOODY, DWIGHT L. (1837–1899), American revivalist preacher. Dwight Lyman Moody was born in Northfield, Massachusetts. Like many Americans of his era, he left home as a teenager for the city—first Boston, then Chicago. In each city he quickly established a reputation as an aggressive boot and shoe salesman, but in Chicago he soon turned his organizational talents to religious endeavors, especially those of the local YMCA. During the nearly two decades he lived in Chicago, Moody moved from volunteer to full-time religious work, developed his techniques as an urban evangelist, and began to establish a national reputation as a leader in church circles. After several tentative, exploratory trips overseas, Moody in 1873 launched a career in England as a full-time revivalist. Within two years he had established himself as a highly effective revivalist, able to stir religious feelings in large numbers of people during lengthy revival "campaigns" conducted in the principal cities of England and Scotland.

Moody parlayed his fame overseas into even greater public acclaim in the United States. Beginning in 1875 he conducted a series of lengthy revivals, carefully planned and orchestrated, in most major American cities. True religious sentiment and feeling were to be found in these revivals, even though Moody's activism, efficient organization, and rough-hewn appearance seemed also to exemplify the emerging materialism of industrial America.

By 1880 Moody had established a permanent residence at his birthplace, Northfield, Massachusetts. This act, combined with the evangelist's continuing round of annual urban revivals, exemplified the tension many late nineteenth-century Americans felt in living between the two worlds of small-town origins and big city realities. Moody broadened his concerns beyond mass revivalism in the 1880s. Shifting part of his energy and interest into education, he founded Mount Hermon and Northfield academies in his hometown, and the Moody Bible Institute, for training urban evangelists, in Chicago.

In the last years of Moody's life, growing divisions between liberals and conservatives in American Protestantism somewhat undermined his leadership. His personal integrity and his irenic temperament, however, made it possible for him to bridge the gap between these divergent groups, and only after his death in 1899 did tensions grow so great that open conflict erupted.

In numerous ways Moody epitomized popular American Protestantism in the second half of the nineteenth century. His family life and personal values reflected evangelical Protestant ideals of personal piety and morality. In the public realm, also, Moody embodied key characteristics of the evangelical world. He had transformed that world by adapting the revival tradition to the new urban, industrial context of late nineteenth-century America. His public activities in his later years also offer fascinating glimpses of the breakup of the cultural synthesis evangelism had provided in the nineteenth century. To the end of his life, Moody remained one of the best representatives and reflectors of popular Protestant culture and practice in the United States.

JAMES F. FINDLAY (1987)

MOON. To observers on earth, the moon appears to be the most changeable of celestial phenomena. In earlier times the appearance of the new crescent was often greeted with joy as a return of the moon from the dead; the full moon was considered an occasion for celebration, the waning a time of anxiety, and the eclipse a cause for dread. In religion and mythology the moon plays a variety of roles. It is personified as a male or female divinity, or, like the sun, thought to be an object thrown up into the sky by some supernatural being. It may be thought of as kindly or malicious, male or female, pursued or pursuer, a god of destruction or of birth and growth.

An early recognition of a connection with menstruation gave rise to the conception of the moon as the guardian of the female cycle and of birth or, alternatively, as a male god who monthly defiles women. In connection with dew, rain, or tides, the moon may promote the growth of vegetation or bring disastrous floods.

The moon has been a measure of time from early times, especially for hunting societies. In tropical climates, where the sun is cruel, the moon is considered beneficent, especially by nomads and caravan drivers. As a male god the moon appears as the Strong Bull of Heaven who cares for his cows, the stars; or as the sacrificed god, the son or lover of the mother goddess.

As a goddess, the moon brings cures and eases childbirth or, on the other hand, helps to rot corpses and receives the dead. The waxing and waning of the moon led to the idea that it dies and is reborn, and thus the moon became a part of funeral ceremonies and rites of resurrection. The discovery that the moon is the closest celestial body to the earth led to the idea that the moon was the “abode of souls,” a way station to immortality.

The phases of the moon seem to echo the life cycles of women and therefore connect the moon with the Triple Goddess who presided over birth, initiation, and death. The Moon became part of a triad with Hekate, goddess of the underworld, and with Artemis, the divine huntress, whose hounds were the stars. Sometimes even the Egyptian goddess Isis joined the grouping. In this connection the qualities of the moon are fertility, moisture, change, darkness, and magic. In the ancient Chinese division of the universe into *yang* (hot, dry, strong, male) and *yin* (cool, moist, weak, female) the moon is considered *yin*.

Usually the waxing moon is a fortunate omen and waning moon a dangerous one. In the Andaman Islands the waxing moon is male and the waning moon female. The dark of the moon is the time for gathering herbs to be used in spells and curses. The new or full moon is the time for white magic. In some systems, however, the moon rushes to conjunction with the sun to be refreshed by his light.

In poetry, the dying god, who is related to the divine powers of the plant world, is often compared to the moon. Intoxicating liquors used in many religious ceremonies are

said to drip forth from the moon. As spider, spinner, and weaver, the moon is likened to the three Fates, who spin and weave man’s destiny.

The moon is often paired with the sun, as either father, son, wife, sister, or daughter. Sometimes the moon and sun are twins, and the weaker one, usually the moon, is doomed to live in the underworld, while the other rides on high. Frequently both are thought of as boats riding through the ether as on the ocean. Often, the sun rides in a chariot pulled by four white horses. The moon is pulled by two white horses, or by a bull, a stag, or a cock.

The moon’s animal is often the bull, because of the crescent shape formed by its horns, or the hare, because of its fertility or because the “man in the moon” is thought to resemble a hare. The bear is also associated with the moon, because its hibernation and waking are like death and resurrection; the snail, because it retreats and reappears; or the frog, because it is an aquatic creature.

THE MOON AS A MEASURE OF TIME. Aside from night and day, the moon is the most obvious natural measure of time. The Indo-European root is the same for the *moon*, *month*, and *measure*. There exist what may be notations of the moon’s phases in Paleolithic caves in Spain from 7000 BCE. Stonehenge in Great Britain (c. 3000 BCE) may have been used to measure the movements of the moon as well as those of the sun. There are still primitive peoples who use only the moon to measure time. Before the arrival of Europeans, American Indians counted the lunations as “war month,” “month of flowers,” and so forth. The dark of the moon was the “naked time”; its first appearance, the “coming to life.”

Agricultural people, however, needed to have their times of planting and reaping coincide with the seasons—that is, with the sun. Thus began the long effort to correlate twelve lunations (too few) or thirteen lunations (too many) with the solar year. Accounts from republican Rome show the problems associated with this effort. We are told that from earliest times a *pontifex minor* would watch for the new moon from the Capitoline Hill, and when it was sighted, call out to Juno, the queen of the gods. The first of the month was called the calends from the verb “to call out.” Juno is in this way identified with the new moon, as her husband, Jupiter, is with the ides, or full moon. The priest then announced the series of festivals for the coming month and whether the nones (the half-moon) would fall on the fifth or the seventh. The festivals, sponsored by the state, were instituted as a means of keeping the agricultural, military, and civil activities in order. It was necessary for all farmers to come into the city to learn on what days they could not work but must keep festival. On calendars that have come down to us, festival days are marked *nefas*, meaning that no work could be done; 109 out of the 355 days of the year were designated *nefas*.

The priesthoods, like the early magistracies, were in the hands of the patricians. The inconvenience of not knowing the feast days was one of the problems that led to the “strug-

gle of the orders.” Eventually the *fasti* (calendars) were published, in 304 BCE. The year began in March, and any time that had to be intercalated to bring the months into line with the seasons was added in February, after the Terminalia (a festival of boundaries and the year’s end, celebrated on February 23).

Until the end of the republic the work of intercalation was the duty of the pontifices, who were often inefficient or corrupt. For instance, the date of court cases could be shifted by altering the intercalations. By the end of the republic, the whole calendar was out of harmony with both the sun and the moon. Cicero, writing to his friend Atticus, says he is not sure whether or not there will be an intercalation. There was a clause in contracts that read “si intercalat” (“in case of an intercalation”).

Julius Caesar, aided by his Egyptian astronomer, made a clean sweep of the quasi-lunar calendar, extended the year 45 BCE from 355 to 445 days, and started anew on January 1, 45 BCE, with a cycle of 365 days, adding another day on the fourth year, after the Terminalia. This, with a few adjustments, is the solar calendar under which we live.

The ancient Greeks sent out criers to announce the sighting of the new moon. At some unknown point in history, the Greeks had limited the length of the year to twelve lunations of “full” or “hollow” months (comprised of thirty and twenty-nine days respectively), with an intercalary month every two years. We learn from Geminus that “they sought for a period which should, as to years agree with the Sun, as to months, with the Moon.” The first period they constructed was an eight-year cycle called the *octaeteris*.

A nineteen-year cycle was suggested by the astronomer Meton in 432 BCE but was apparently not accepted by the cities, which went their own way, creating their own calendars and even inventing their own names for the months. In *The Clouds* of Aristophanes, the Moon complains, “You subvert the calendar and fail to observe her days. When the sacred days are unobserved, the gods go hungry, and it is the Moon they threaten.” In this confusion, many citizens returned to direct personal observation of the rising moon. Beginning in the second century BCE, two sets of dates were recorded, “according to the state and according to the deity [Selene].”

In Mesopotamia the month began with the sighting of the new moon. A letter to the Assyrian king Esarhaddon (r. 680–669 BCE) states, “On the thirtieth I saw the moon. It was in a high position. The king should wait for the report from the city of Assur and then may determine the first day of the month.” There are indications that in some cities months alternated between thirty and twenty-nine days in a nineteen-year cycle with regular intercalations. By the time of the Seleucids (third century BCE), it was possible to calculate the appearance of the new moon and to predict eclipses.

In India, religious festivals are still regulated by the lunar calendar, as are such domestic events as marriages. The moon

festivals—two days for the new moon, one for the full moon—are considered important, even by Buddhists. The present names of the months are derived from the *nakshatras* (“lunar mansions”), twenty-seven or twenty-eight conspicuous stars along the ecliptic through which the moon passes.

The early Hebrews celebrated the new moon with a feast, which was a family gathering at which animals were sacrificed. The months were identified by the agricultural activity taking place at the time. The beginning of the month, after being attested to by observers, was announced to various communities by fire signals at first, and later by messengers. Since messengers could not always reach the outlying groups in a day, festivals often went on for two days. Since Passover, celebrated at the full moon, was originally a feast of the first fruits, it had to occur after the reaping of the grain. Thus it became necessary to add another month after Adar (approximately March). After the exile the calendar followed the Babylonian system, using Babylonian names for the months, counting the days from the evening, and intercalating an extra month on a regular basis. After the third century there was increasing dependence on calculation of the beginning of the month, though some sects from time to time insisted on reverting to direct observation.

The lunar year to which Muslims adhere was not established until 631 CE, when Muhammad made his last pilgrimage to Mecca. There he proclaimed that the year should consist of twelve lunar months and that intercalation should be forbidden. As Arabs before that time had probably had a combination lunar and solar calendar, it is likely that Muhammad intended to discourage old pagan festivals. His system won acceptance by the Arabs, who since ancient times held the moon in special reverence. The festivals now run through the whole year and come back to the same solar season in about thirty-three years. The new month begins when two trustworthy Muslims notify the authorities that they have observed the new moon from a mountaintop or from an open field. The crescent motif (the *hilal*) has been much used throughout the centuries in Islamic art and in the last two hundred years has appeared on the standard of Islam.

Early Christians attached importance to celebrating Easter at the time of the Jewish Passover but agreed that Easter should fall on a Sunday. In the third century Christians began to frame lunar calculations for themselves. The Easter controversy raged in the early church and still exists between the Western and Eastern churches. The final conditions arrived at in the West are that Easter must be kept on the Sunday after the paschal moon (the calendar moon whose fourteenth day falls on or after the vernal equinox), reckoned from the day of the new moon inclusive.

THE MOON AS DEITY. Only once, so far as is known, did the moon as divinity command political power and an influential priesthood, but it did so for about three thousand years, through changes of race, language, and regime. The place was the area between the Tigris and Euphrates rivers, known as Mesopotamia (“between the rivers”), and the cult

spread or grew independently in Syria, Palestine, Arabia, and Anatolia.

In the southern part of the Land between the Rivers there appeared around 5000 BCE the first urban civilization—a group of cities in which trade, division of labor, metalworking, organized religion, and writing were developed by a people whom history knows as Sumerians. Each of the cities was under the protection of a high god and in the beginning was probably ruled by the priesthood of the god. By the time the first records appear, these gods are all related. An is the creator-sky god. His son, Enlil, the Air, carries on most of the business of controlling the other gods and resides in the holy city of Nippur. The first son of Enlil is Nanna, the Moon, patron of the important city of Ur. His wife is Ningal, daughter of the Lady of the Reeds, a moisture goddess from the marshes. The children of Enlil and Ningal are Utu, the Sun, and Inanna, warrior goddess of love and the Evening Star. The trio of Moon, Sun, and Evening Star are often found together on royal stelae down through Babylonian times.

The Semitic-speaking peoples who succeeded the Sumerians—Akkadians, Assyrians, and Babylonians—took over most of their inventions and adopted the Sumerian pantheon, giving the gods Semitic names. Nanna became Sin; Utu, Shamash; and Inanna, Ishtar.

C. Leonard Woolley, excavating at Ur in 1922–1934, found the famous royal tombs, containing the bodies of mass suicides, royal ladies (who Woolley surmised might have been priestesses of the Moon), and a harp with a bull's head and a lapis lazuli beard, the Strong Bull of Nanna. He also describes the ziggurat of Ur, dedicated to the Moon, the best preserved of its kind in the Near East. At the top of the ziggurat, a high staged tower terraced with trees, was a shrine where the god rested, gave dream oracles, or took part in a sacred marriage. This last is suggested by a hymn in which Ningal addresses Nanna, "In your house on high I will come to you, Nanna. In your perfumed cedar mountain, in your mansion of Ur, I will come to live."

At the base of the ziggurat was a large temple, the real home of the god, where he was fed and clothed daily. Probably the people saw the god only when he was paraded at each phase of the moon—on the first, seventh, and fifteenth days of the month. The temple was a huge complex of storehouses, kitchens, and rooms for priests and slaves. It was a landowner and received rent in kind, which was used for sacrifices and for feeding the enormous staff. Slaves were employed in smelting, weaving, and preparing goods for sale. The high priestess of Nanna was traditionally a king's daughter.

A text describes how Nanna made a pilgrimage to visit his father Enlil at the holy city of Nippur, taking agricultural products and receiving in return Enlil's blessing. Enlil confirmed his son in power as Nanna, the king of Ur. It is likely that the king acted out the life of the god. During the dark

days of the moon, called the "days of lying down," the queen conducted the rituals.

The temple complex at Ur was destroyed and reconstructed many times over the centuries, by Assyrians, Babylonians, even by alien Kassites, and finally by Cyrus, the Persian invader. The complex was rebuilt not to conciliate the people but to preserve good relations with the god.

The Assyrians, who took over from the Sumerians the worship of the moon under the name of Sin, built another moon city, Haran, on the Euphrates. The Assyrian kings came to Haran to "take the hand" of Sin after they had been confirmed by their own god, Ashur. In the sanctuary at Haran was a dream oracle, where Esarhaddon (r. 680–669 BCE) was told to proceed to the conquest of Egypt, which he did. Moon worship continued at Haran well into Islamic times when it was the center for a planet-worshipping people called the Sabaeans. The emperor Julian worshiped the moon at the temple in Haran in 365 CE.

In the early sixth century BCE, Babylon was the area's greatest city. Its founder, Nebuchadnezzar, set about rebuilding Ur. His successor, Nabonidus, was an antiquarian and a devoted worshiper of the moon. His mother (or grandmother) had been governor of Haran, and he was perhaps partly of West Semitic origin. In records of Ur, Nabonidus found the inscription of Ur-Namma, founder of the third dynasty of Ur (2100 BCE), whom he called "a king before me." Upon the ancient foundation he rebuilt the ziggurat "as in old times." He also rebuilt the temple at Haran and one in the Arabian city of Tema, where he remained for eleven years. Many critics in Babylon claimed he was putting his god Sin above Marduk.

The name of the moon in Canaan was Yarih. A Canaanite text tells of his wedding to Nikkal (related to Ningal, wife of the Sumerian moon god): "I shall make her field into vineyards, the field of their love an orchard" (Samuel Noah Kramer, *Ugaritic Manual*, 1955, no. 77). There is no doubt that the golden calf worshiped in *Genesis* was a figure of the moon and that Mount Sinai was his home.

Throughout Anatolia there are depictions of and inscriptions to the Anatolian moon god, called Men, from the Indo-European root for *moon* and *measure*. He was known as Menotyranus ("lord of the moon"), Men Ouranios ("lord of the sky"), or Katachionios ("lord of the underworld"), suggesting that he was a god of death and rebirth. We cannot be sure whether he arrived along the trade routes from the Near East or was an indigenous deity. Later Men became confused with the "dying and rising god" Attis, the castrated follower, son, or lover of the Great Mother of Phrygia, Cybele, as well as with Dionysos and Sabazios of Thrace, two other dying and rising gods.

THE MOON IN MYTHOLOGY. In ancient India, Soma was the deification of a sacred plant that, when pressed, strained, and mixed with milk and barley, became an intoxicating drink for men and gods. The whole ninth book of the *R̥gveda* is

devoted to the praise of the yellow drink, which it identifies with the yellow moon. There is a marriage hymn in which the god Soma is married to the Sun, Sūrya, and has his head in the laps of the Nakṣatras (“lunar mansions”). Soma is celestial and bright, dispelling darkness and dwelling in the waters. In a later hymn, Soma is said to have married all twenty-seven Nakṣatras, daughters of the creator god, but he prefers one, Rohiṇī (possibly identified with the evening star). The other wives complain to their father, who afflicts the moon with a wasting sickness, causing his waning and disappearance. The Moon promises to reform and then grows back again, but always he relapses. In this problem the Moon is aided by Śiva, like Soma an ancient god of change, fertility, and destruction. Śiva wears the Moon’s crest on his head; Soma is known as the “crest of Śiva.” In a wheeled chariot drawn by a horse or an antelope, Soma leaves the sky to visit the earth at the new moon to revitalize plants and animals. *Soma* as an intoxicating drink has been compared to the wine of the Greek Dionysos, which the playwright Euripides described as “a drink that is poured out, a god for a god.”

In Iran there is also a ritual of the sacred drink, there called *haoma*, which is not identified with the moon. In one hymn, the Moon is one of a triad of divinities, the lowest one being the sacred ox, who is sacrificed. The seed of the ox enters the Moon, where it is purified and divides into all the species of plants and animals. Iranians dedicated the right eye of every sacrificed animal to the Moon. They believed that when all things were put in motion by Angra Mainyu, or Evil, the Moon created time, which will run until Angra Mainyu is overthrown.

The ancient Greeks had only one myth concerning the moon, there called Selene, “the bright one.” It is the story of how she fell in love with Endymion, a prince of Elis, while he was sleeping on Mount Latmos in Asia Minor. She begged Zeus to give Endymion eternal sleep so that she could visit him every night. In this way she managed to have fifty children by him, the number of the lunations between Olympic games, or equal to one-half of the eight-year cycle. Though there are almost no rituals associated with the moon in Greece, there are traces of moon worship from earlier times and in outlying regions. The Endymion myth connects Asia Minor with western Greece. According to Plato, mothers and nurses in ancient times taught children to bow down to the new moon. Torchlight parades for Selene are mentioned. A dream oracle in the Peloponnese, frequented by ephors from Sparta, was dedicated to Helios (the Sun) and to Pasiphae (the name, meaning “shining on all,” is an epithet of the Moon). There was a queen named Pasiphae in Crete, where there are many traces of bull worship. In the myth, this Pasiphae fell in love with a white bull and from their union produced the Minotaur, who was half man and half bull. Another bull brought Europa (whose name, meaning “broad-faced,” is another epithet for the Moon) from Phoenicia to Crete.

In Baltic mythology the sun is feminine and the moon masculine. The Balts say that the Sun was once married to

the Moon, but he left her for the Morning Star. This so enraged the storm god, the most important Baltic god, that he beat the Moon with his sword, thus reducing the latter’s size. The Sun and Moon have many children, the stars, but the Morning Star is a product of a union of the Sun with the storm god himself. The Moon, in shame and anger, avoids his wife, and they never appear together.

In Japan, the Sun, the most important divinity, is feminine; the Moon, her brother, plays only a minor role. Once the Sun ordered the Moon to go down to earth to find out what the goddess of food was doing. When the Moon arrived on earth, the goddess of food, meaning to please him, turned her face toward the land and from her mouth poured out boiled rice; toward the sea, all kinds of fish; and toward the mountains, all kinds of game. The Moon, instead of being pleased, was so enraged that she had offered him things from her mouth that he killed her. Out of her corpse were born the horse, the cow, and the silkworm. Back in Heaven the Sun, angry with her brother for what he had done, said, “I’ll see you no more,” and so they never meet.

Another myth of plant discovery is told by the Machiganga of Peru. It relates that the Moon gave mortals cultivated plants, giving instructions about them to a mortal girl whom he eventually married. He caused his wife to be fertilized by a fish, and she produced four sons: the daytime Sun, the planet Venus, the Sun Under the Earth (i.e., the sun at night), and the nocturnal Sun, invisible to all but shedding its light on the stars. This fourth child was so hot that he scorched his mother’s womb, and she died. The Moon’s mother-in-law reproached him, saying that there was nothing left for him to do but to eat the corpse. His wife, disgusted with life on earth, had left her body there and taken her soul to the underworld. The Moon was distressed but obeyed his mother-in-law. Thus the Moon became an eater of corpses and decided to move far away from the earth.

All types of creation myths explain the origin of the moon, usually together with the sun. The cosmic egg motif occurs in the Finnish epic *Kalevala*: the egg falls from heaven onto the knee of the creator goddess as she floats in the cosmic waters, and from it emerge all the aspects of the universe. The sun was made out of the yellow of the egg and the moon out of the white. In Greenland, the Sun and Moon are a mortal pair, sister and brother. In a house with no light they lay together. When the sister discovered that she had committed incest, she tore off her breasts and threw them at her brother; the holes they left became sunspots. Then she flew away and he after her, both carrying torches. The sister’s torch burned brighter so she became the sun, and her brother, the moon.

To the type of myth in which the world is created out of the body of a primal being belongs the Huron story of At-aentsic. She was a creation mother goddess who was thrown down from heaven through the hole in the sky she had made by tearing up the world tree. Landing on earth, she gave birth to twins, one good and one evil. The evil son killed her, but

the good one made the sun from her face and the moon from her breasts.

In the Aztec pantheon, Huitzilopochtli is a warrior god, culture hero, and the sun. When Mother Earth became pregnant with him (her last child), her other children, the stars, were angry and pursued her to kill her. But one, called Golden Bells, ran ahead to warn her mother. The sun god sprang fully armed from the womb and beheaded Golden Bells. Learning that she had meant well, in compensation he put her head in the sky as the moon, but he chased the other stars away, as the sun does at rising.

The Greek Hesiod (seventh century BCE) describes all creation as the result of sexual union. From the original parents, Earth and Sky, were born twelve Titans, who paired off and produced most of the natural objects as well as the gods. One pair, Theia and Hyperion, become the parents of the Sun (Helios), the Moon (Selene), and the Dawn (Eos). Another pair of Titans became the grandparents of Hekate, goddess of the underworld, and of Artemis, the huntress. Hekate and Artemis later became identified with the moon. In the Homeric *Hymn to the Moon* (sixth century BCE), the Moon has a daughter, Pandia, by Zeus. There was a festival at Athens called the Pandia where round moon cakes were sold and eaten.

In one of the emergence myths characteristic of the southwestern United States, the Pueblo tell how mortals came up in several stages to the surface of the earth. Finding it in darkness, they tossed into the sky the moon and sun, which they had brought with them. A variant of the emergence myth is found in Oceania, in which mankind or the gods are originally enclosed in a shell that they have to pry open. In a Micronesian story, the creator god, Ancient Spider, encased in such a shell, found two snails; after he opened the shell he used the smaller for the moon and the larger for the sun.

In Queensland, the Sun is a woman made by the Moon; although she has two legs, she has a number of arms, which can be seen as the sun's rays. Among the Aranda (Arunta) of Australia, a man of the Opossum totem carried the Moon around with him in a shield, keeping it hidden in a cleft of the rocks all day. One day a man of another totem saw the Moon shining and ran away with it. The Opossum man, unable to catch the thief, called out to the Moon to rise into the sky and shed light on everyone. This it did, and it has remained in the sky ever since.

According to the Pima Indians of North America, the Sun and Moon are parents of Coyote, the famous trickster figure in mythology. In another story, it is Coyote who invents the Sun and Moon. Some Altaic-speaking peoples of Siberia believe that in the beginning there was no sun or moon, but people themselves flew around in the air and gave out light. A high god sent a spirit to help them. Stirring the primeval waters, he found two mirrors, which he set up in the sky as the sun and the moon. Mirrors are often used in

rituals by Siberian shamans, and in their out-of-body travels they frequently reach the moon.

THE MOON AND DEATH. Because of its monthly disappearance and return, the moon is often connected with the idea of mortal death and rebirth. In the Caroline Islands it is believed that in the beginning men rose from the dead, as did the moon. Every month they fell into a deep sleep when the moon became dark and awoke when the moon returned. An evil spirit disapproved of this and arranged for men to stay dead. In New Zealand, in a similar story, it is the culture hero Maui who wished men to live forever, but the moon said, "No, let them die and become like the soil."

In western Ceram, an island westward of New Guinea, a divine maiden was desired in marriage by the sun god. When her parents, disapproving, put a dead pig in her marriage bed as a substitute for her (perhaps a vestige of a changeover from human to animal sacrifice), the Sun caused her to sink into the ground. The girl called out to her parents, "Slaughter a pig and make a feast. In three days, look into the sky where I will be shining like a light." Thus the feast of the dead was instituted, and mortals for the first time saw the moon rising.

To the Siberian Inuit (Eskimo), death is conceived as loss of one's soul, which travels up to the moon and finally to the sun. This upward flight of the soul through the planets and stars is a widespread motif, found earliest among the Sumerians. It turns up again in Plato's *Republic* and in Cicero's *Somnium scipionis*, where the younger Scipio Africanus dreams he visits his grandfather in the heavens and looks down on all the celestial spheres. Below the moon, his grandfather tells him, all is chaos, but up here all is pure and serene.

The fullest account of the moon as the "abode of souls" is found in the essay *De facie lunae* by Plutarch (second century CE). Pythagorean philosophers had already taught that the Elysian Fields, the Greek isles of the dead, were situated on the sun and moon. In his essay Plutarch describes mortals as consisting of three parts: body, soul, and reason. In death the body is dissolved by Demeter, who stands for Mother Earth. The soul, together with reason, floats upward and, if pure, reaches the moon. If corrupt, it must wander between the earth and the moon until it is purified. The moon is ruled by Persephone, the Greek queen of the underworld, now transferred to the upper spheres. The souls who remain on the moon become beneficent spirits who return to earth to give oracles and help mortals in other ways. Gradually they are dissolved into pure reason and reach the sun.

In one of the earliest Indian Upanisads we are told that there are two roads open to souls after death: the road of flame and the road of smoke. The road of flame leads to the sun and the gods; the road of smoke to the moon, the ancestors, and reincarnation.

In the teaching of Mani, founder of the Manichaeans, the souls of those who have learned the truth during their

lives are taken up to the wheel of the sun, where they are purified and passed on to the moon, here described as the superior station. Both of the luminaries are pictured as boats sailing to and fro in the upper atmosphere. When the moon becomes full of souls, it ferries them toward the East to the "aeons of light," who place them in the "pillar of glory," their final resting place. Then the moon, greatly reduced in size, returns for another load of souls.

THE MOON AND THE OCCULT. Witches' meetings are held at the full moon, but the dark of the moon is the time for black sorcery. A practice known as "drawing down the moon" is pictured on Greek vases. In the *Voyage of the Argo* (Apollonius Rhodius, third century BCE), Medea, the priestess of Hekate, is gathering herbs when the Moon addresses her, saying "How often have you disorbed me, making the nights moonless so you might practice your incantations." In this case the Moon would seem to be guiltless in the magic rites.

The lucky rabbit's foot must be taken in the dark of the moon, perhaps because the hare is one of the Moon's animals and she might protect it. According to Aelianos, a Greek writer of the third century CE, the moon causes epilepsy, which may be cured by a special kind of peony that, like the mandrake root, cannot be seen by day but must be gathered at night by tying to it a dog who pulls up the root and then dies (*On Animals* 24). This plant also cures afflictions of the eyes "in which moisture congeals and robs the eyes of their sight." Spells to reunite lovers are especially effective when cast by moonlight. In Theocritus (third century BCE) a lovesick girl calls on the moon for help in her enchantment. The Roman poet Catullus (first century BCE), in his hymn to Diana, calls her Trivia, Lady of the Crossroads (i.e., Hekate), and the "moon with counterfeit light." In the Middle Ages Diana was considered the ruler of witches, together with the "horned god." Pope John XII (tenth century) accused witches of "riding with Diana."

In dream divination, according to Artemidorus (*Interpretation of Dreams*, second century CE), "Intercourse with the Moon is entirely auspicious for shipmasters, pilots, merchants, astronomers, vagabonds and people fond of traveling. But for others it means dropsy. . . . Selene the Moon represents both the wife and mother of the dreamer. She also represents prosperity, business ventures and navigation."

Thoth, the Egyptian god of measure and writing, was appointed by the sun god Re to take his place in the underworld as the moon. Thoth is also the god of magic and spells, like the Greek Hermes. In the Hellenistic period, the two were combined as authors of a series of magico-mystical writings under the name of Hermes Trismegistos.

In the astrology that took form in Alexandria around the second century BCE as a combination of Near Eastern star lore and Greek mathematics, the moon, "when at its northern or southern limits helps in the direction of greater versatility, resourcefulness and capacity for change; in its rising, toward

greater natural endowments, firmness and frankness; in its waning, towards dullness, less fixity of purpose and less renown" (Ptolemy, *Tetrabiblos*, second century CE).

In modern astrology, the moon "stands for the feminine, indrawn, receptive, and imaginative side. It tends toward carefulness, prudence, timidity, shyness, and the secluded life, though the lunar person is shrewd and practical in business" (Charles E. Carter, *Principles of Astrology*, London, 1969, p. 50).

THE MOON IN FOLKLORE. Almost universal are cautions and devices to take advantage of the beneficent (and to avoid the unlucky) aspects of the moon, as well as theories to explain the moon spots. It has seemed an obvious ritual to farmers all over the world to plant during the waxing moon and reap during the waning moon, and this is still done in many parts of the United States. In pre-revolutionary France the law required trees to be felled during the waxing moon so that their wood would be drier. Hair, on the other hand, should be cut at the waning moon to make it thick. In England, shingles laid during the waning moon tend to swell. All over Europe, money, especially silver, the moon's metal, is exposed to the waxing moon or turned over in the pocket to make it grow. In Uganda, potters wait for the waxing moon before firing their pots. Warts are everywhere believed to grow as the moon waxes and to decrease at the wane.

Some Muslims in India practice a ritual called "drinking the moon." They fill a silver basin with water, let it reflect the light of the full moon, and drink it at a gulp as a remedy for palpitations and nervous disorders. Mothers in many places present their babies to the full moon so they will grow. In New Guinea, men on a hunting expedition leave their women at home to sing to the new moon for the success of the hunt. Natives of Greenland believe that women can become pregnant from sleeping in the light of the full moon. To prevent this, women wipe their abdomens with spittle. Weddings are variously believed to be lucky if held at the full moon or at the dark of the moon. The latter is explained by Plutarch (*De facie lunae*), who claimed that the moon rushed to conjunction with the sun so that she might be refreshed by his light.

There are innumerable explanations for the spots that the West calls the "Man in the Moon." Some South American Indians believe they are ashes or menstrual blood smeared on the (male) Moon when he raped his sister the Sun. The Selk'nam of South America say they are the results of a beating the (female) Moon received when the Sun discovered that she had disclosed her initiation rites. The same spots are often described as a hare, a frog, a snail, or some other animal or as some mortal lured up to the moon. In Scandinavian mythology they are a boy and girl carrying water, supposed to be the prototypes of Jack and Jill. The Shawnee Indians see in the spots their creator goddess bending over a cooking pot. Among the Malay, they are an old man making a fishing line under a banyan tree. At the other end of the line is a rat, who is eating the line as fast as the

man can make it. When the old man is finished, he will use the line to catch everything on the earth and reel it up to the moon.

There is widespread belief that the light of the full moon turns humans who are so disposed into werewolves and causes lunacy if one sleeps in its beams. Very common in Europe and America is the idea that, during the night of the full moon, more crimes are committed, more children are born, and more patients committed to mental hospitals than at other times.

SEE ALSO Feminine Sacrality.

BIBLIOGRAPHY

Since there are few books devoted to the religious and mythological aspects of the moon, most information on the subject must be extracted from religious writings and from histories of the religions of different areas. The most important source for ancient Mesopotamia and Egypt is volume 1 of *The Ancient Near East*, edited by James B. Pritchard (Princeton, 1973). For the origin of the calendar, an excellent account is Elias J. Bickerman's *Chronology in the Ancient World* (Ithaca, N.Y., 1968). By far the most complete book on the development of astrology is still Auguste Bouché-Leclercq's *L'astrologie grecque* (Paris, 1899). Franz Cumont's *Recherche sur le symbolisme funéraire des Romains* contains an unusual amount of data on alien sects of the Hellenistic and Roman periods. An essay by Mircea Eliade entitled "The Moon and Its Mystique," in *Patterns in Comparative Religion* (New York, 1958), provides many insights into the symbolism and iconography of the moon. The same author's *Shamanism: Archaic Techniques of Ecstasy*, rev. & enl. ed. (New York, 1964), gives a background for the religions of Siberia and the American Indians. For folklore on the moon a good source is the Funk and Wagnall's *Dictionary of Folklore, Mythology and Legend* (New York, 1950). Åke Hultrantz, in *Religions of the American Indians* (Los Angeles, 1979), gives a concise but thorough summary of the beliefs of the Indians of North and South America. The most recent and fullest account of the religions of the Near East is found in Thorkild Jacobsen's *The Treasures of Darkness: A History of Mesopotamian Religion* (New Haven, 1976). The best, most complete book on the subject of the moon is *La lune: Mythes et rites*, edited by Denise Berndt (Paris, 1962), with essays by separate authors on various areas of the world. Some new insights and original research appear in Julius Lewy's "The Late Assyro-Babylonian Cult of the Moon and Its Culmination at the Time of Nabonidus," *Hebrew Union College Annual* (1945–1946): 405–489. An extremely useful collection of material from all over the world is *The Mythology of All Races*, 13 vols., edited by Louis Herbert Gray and George Foot Moore (Boston, 1916–1932), under the auspices of the Archaeological Institute of America. Martin P. Nilsson brings to his *Geschichte der griechischen Religion* (Munich, 1955) a wealth of information on archaeology and comparative religion. Still the most complete collection of mythological material is *Ausführliches Lexikon der griechischen und römischen Mythologie*, 7 vols. in 10, edited by W. H. Roscher (1866–1893; Hildesheim, 1965). The series "Sacred Books of the East" (1879–1910), containing the sacred writings of India and Persia collected by F. Max Müller, was reissued at Delhi in 1965.

JEAN RHYS BRAM (1987)
Revised Bibliography

MOORE, GEORGE FOOT. George Foot Moore (1851–1931) was an American scholar of Hebrew scriptures, Judaism, and the history of religions. Born of Scottish-Irish ancestry in West Chester, Pennsylvania, Moore received his B.A. degree from Yale University (1872) and his B.D. degree from Union Theological Seminary, New York (1877). Following ordination as a Presbyterian clergyman (1878), he served a five-year pastorate in Zanesville, Ohio. Moore's academic career began with his appointment as professor of Hebrew language and literature at Andover Theological Seminary (1883). Moore became professor of theology at Harvard University (1902) and later professor of the history of religions there (1904), a position in which he remained until his retirement in 1928.

Moore's reputation in biblical studies was established with the publication of *A Critical and Exegetical Commentary on Judges* (1895) and *The Literature of the Old Testament* (1913). His *Judaism in the First Centuries of the Christian Era, the Age of Tannaim* (1927–1930) is still the finest description of the religion of the rabbis of the Mishnah in existence. Moore's work is in line with the then regnant paradigm among Jewish scholars (e.g., Solomon Schechter, Louis Ginzberg) for study of the Pharisees/rabbis. This approach focused primarily upon the religion and literature of the Rabbinic elite and its construction of Judaism. *Judaism in the First Centuries of the Christian Era* has been criticized by more recent scholars, principally Morton Smith and his school, for treating the rabbis as representative of what Morton Smith called "Normative Judaism," without focusing on the mystical, magical, or apocalyptic in Judaism beyond the rabbis. Morton Smith's approach is well in line with Moore's general interest in religious elites.

Moore's two-volume *History of Religions* (1913–1919) filled the need for a new handbook on the history of religions with the unity and continuity that single authorship could provide. In this work, Moore limits his treatment to the religions of the “civilized” peoples, omitting any discussion of “primitive” (i.e., tribal) religions. Moore's treatment of the various religions manifests an impressive capacity to master the best current scholarship. Two uncritical assumptions underlie his work, neither of which was uncommon in his day: an evolutionary theory concerning the development of religion and a basic methodological distinction between the religions of “civilized peoples” and “other” (i.e., “primitive” or tribal) religions.

His contributions as a historian of religions were marked by two notable qualities. First, he demonstrated the possibility of pursuing work in the history of religions in a manner that was characterized by openness to the richness of diverse religious traditions (among the “civilized” peoples) on the one hand and by disciplined scholarship on the other. Second, it was singularly important to the study of religion in North America that, even though most work in comparative religion and the history of religions had tended to focus attention on religious traditions other than Judaism and Christianity, his *History of Religions* extended equivalence of treatment and analytical criticism to these “higher” religions. This approach was significant for the development of the study of religion in America and in the communal realm for the ecumenical movement between Christians and Jews.

Moore made frequent contributions to scholarly journals, writing almost forty articles for the *Encyclopedia Biblica* (1899–1903) alone. He was instrumental in the establishment of the *Harvard Theological Review*, contributed to it often, and twice was its editor (1908–1914 and 1921–1931). Moore held presidencies in such notable professional societies as the American Academy of Arts and Sciences (of which he was a fellow), the American Oriental Society, the Society of Biblical Literature and Exegesis, and the Massachusetts Historical Society.

BIBLIOGRAPHY

Bibliographical information concerning Moore can be found in W. W. Fenn's “George Foot Moore: A Memoir,” *Proceedings of the Massachusetts Historical Society* 64 (February 1932). The most profound reader and interpreter of Moore was Morton Smith. See Smith's discussion of this scholar in *Harvard Library Bulletin*, 15 (1967), 169–179.

Major Works by Moore

A Critical and Exegetical Commentary on Judges. New York, 1895.

This important volume of the International Critical Commentary is still useful and demonstrates Moore's reputation as a careful and diligent scholar of the Hebrew Bible.

The Literature of the Old Testament. New York, 1913. This modest volume in the Home University Library series presents in lucid and concise form both a discourse on the sources, formation, and structure of the Pentateuch and a discussion of every book of the Hebrew Bible, informed by the most care-

ful scholarship of the period and intended for the general reader.

History of Religions. 2 vols. New York, 1913–1919. Volume one discusses the religions of China, Japan, Egypt, Babylonia, Assyria, India, ancient Greece, ancient Rome, and Persia, while volume two discusses Judaism, Christianity, and Islam. Moore's succinct survey of major religious traditions is informed by his mastery of the most competent scholarship in each field and by his special competence in Christianity and Judaism. The approach is characterized more by an interest in the history and thought of each tradition than by a consideration of their sociological and anthropological aspects. A remarkable accomplishment in its time, the work has enduring value.

The Birth and Growth of Religion. New York, 1923. This publication of the Morse Lectures of 1922 presents Moore's theory that religion is grounded in the universal impulse for self-preservation and is developed in an evolutionary fashion, ultimately manifesting an aspiration for self-realization.

“The Rise of Normative Judaism: To the Reorganization of Jamnia.” *Harvard Theological Review* 17 (October 1924): 307–373.

“The Rise of Normative Judaism: To the Close of the Mishnah.” *Harvard Theological Review* 18 (January 1925): 1–38.

Judaism in the First Centuries of the Christian Era, the Age of Tannaim. 3 vols. Cambridge, Mass., 1927–1930. This introduction to the religion of the early rabbis has not been surpassed.

F. STANLEY LUSBY (1987)
STEVEN FINE (2005)

MORALITY AND RELIGION. In the minds of many people, the terms *morality* and *religion* signal two related but distinct ideas. Morality is thought to pertain to the conduct of human affairs and relations between persons, while religion primarily involves the relationship between human beings and a transcendent reality. In fact, this distinction between religion and morality is a relatively modern one. Although tension between religion and morality is already evident in the writings of Plato and other Greek philosophers, the popular modern conception that religion and morality are separate phenomena is probably traceable to the Enlightenment. At that time, a number of thinkers, reflecting Europe's weariness with centuries of religious strife, sought to elaborate ethical theories based on reason or on widely shared human sentiments. In so doing they established the assumption that the norms governing conduct, morality, and ethics (that is, the effort to reason about or justify these norms) were separable from matters of religious belief.

This same cultural context also gave rise to a number of efforts to explain the relationship between morality and religion. Since it was now possible to conceive ways of thinking and acting morally that were not dependent upon religious revelation, it became natural to ask why these two phenomena have usually been so closely linked in human

history. Answers to this question were diverse, but they might be broadly divided between those that were friendly to religion and those that were hostile. Kant's thinking epitomized the views of those who believed that religion and morality are mutually necessary: although he was willing to criticize religious excesses and fanaticism, he was convinced that belief in a God who rewards the righteous and punishes the wicked was necessary to ensure full moral commitment.

In the hands of thinkers less friendly to religion, this claim—that religion involves the assumption of a morally governed world—became the simpler assertion that religion represents the effort to buttress morality by adding to its ordinary social sanctions a concocted series of supernaturally mediated rewards and punishments. This was not a new idea. It had already been stated in antiquity by some Greek, Roman, and Chinese philosophers. Although compatible with a respect for religious belief, it generally laid the foundation for a series of stinging critiques of traditional religion. Since morality could be understood in human or rational terms, it seemed to follow that the use of religious sanctions to support moral conduct was appropriate only where primitive, gullible, or morally weak persons were involved. By this reasoning, religion was at best useful during an early stage of human cultural evolution where it provided the “matrix” for moral concepts; in time, it was bound to be replaced by more rational modes of thought.

Some thinkers doubted the usefulness of religion in any context. A social critic like Marx, for example, viewed religion as the effort to support the moral norms and codes of privileged strata and ruling groups, while also masking worldly wrongs with the false allure of otherworldly rewards. Marx did not usually justify this view and his opposition to religion in moral terms. Indeed, he was equally critical of the moral systems and moral philosophies of his day, believing that they, too, were deeply involved with and compromised by the social and material conditions of the era. Yet, in many ways his attitude toward religion is similar to that of the critical Enlightenment philosophers: religion is to be rejected because it is ultimately opposed to the development of full human freedom and moral responsibility.

Decades later, Freud makes this point even more explicitly in *The Future of an Illusion* (1927), arguing that religion must be put aside because it undermines moral responsibility and encourages fanaticism. Individuals or groups whose only reason for being moral is fear of supernatural punishments cannot be counted upon to respect other persons once these fears lose their hold, as they inevitably must before the advance of reason. Furthermore, religious promises of forgiveness of sin and absolution are an encouragement to morally irresponsible behavior. For a mature and morally healthy world to emerge, Freud concluded, men and women of good will must meet together on the common ground of reason and atheism.

Not surprisingly, criticisms of this sort engendered a reaction. Often accepting the claim that religion and morality

were only problematically linked, thinkers more sympathetic to religion like Friedrich Schleiermacher or Rudolf Otto sought to develop an abiding place for religion independent of its moral significance. Schleiermacher found this in the emotional state of “God-consciousness,” while Otto found it in an essentially nonmoral sense of awe before the mysterious and transcendent. This reaction probably reached its zenith in the writings of Søren Kierkegaard, particularly in *Fear and Trembling* (1843). Although Kierkegaard was fully appreciative of the value of morality, he believed that religious faith ultimately transcended ordinary human moral considerations. In the story of God's command to Abraham to sacrifice Isaac, Kierkegaard discerned a “teleological suspension of the ethical,” according to which morality was essentially subordinated to religious concerns. “Duty,” he concluded, “is precisely the will of God.”

THEORETICAL ASSUMPTIONS OF WESTERN ETHICAL THEORY To an outside observer, these debates among Western philosophers and theologians concerning the relationship between religion and morality may seem culture-bound. The emergence of ethics as a separate field of inquiry, the effort to distinguish morality from religion, and the countervailing effort to reassert a place for religion in human life all arise from a very particular cultural and social context. Nevertheless, the fact that systematic thinking about ethics emerged in the West, and that it generated a series of divergent explorations of the relationship between religion and morality, does not mean that this thinking or aspects of these views have no validity across cultural lines. The physical sciences, too, have been most fully developed in the Western context, but the value of their findings, and even of their different hypotheses, is not limited to this setting. In trying to understand the relationship between religion and morality, therefore, it may be useful to employ concepts and approaches developed over the past centuries by Western philosophers, theologians, and social scientists. If one keeps in mind that concepts or ideas developed in a Western context are at best tentative efforts to penetrate complex realities and that they may not be wholly applicable to moral and religious traditions elsewhere, this approach can provide an interpretive guide through diverse religious and moral traditions.

Definitions of Religion and Morality. Surveying the modern body of thinking about religion and morality, one can identify a number of distinctive ideas. Foremost among these is an idea already mentioned: that morality and religion, however intertwined, are at least conceptually distinct phenomena. Religion involves beliefs, attitudes, and practices that relate human beings to supernatural agencies or sacred realities. It addresses what has been called the problem of interpretability, which includes such persistent questions as the ultimate nature and purpose of the natural world and the meaning of death and suffering. In contrast, morality has usually been thought of as a way of regulating the conduct of individuals in communities. It represents a response to the problem of cooperation among competing persons or groups and aims at settling disputes that may arise in social contexts.

Force also represents a method of adjudicating conflict, but morality differs from force by appealing to principles or rules of conduct that are regarded as legitimate, that is, as having a justification potentially acceptable to each member of the community. The complex interrelationship between religion and morality is illustrated by the fact that moral legitimation may sometimes involve appeal to shared beliefs involving the supernatural or the sacred. But this is not a necessary aspect of moral justification, which can appeal to reason or to considerations of human welfare.

The Superiority and Logical Independence of Moral Norms. Philosophical analysis has also led to a series of more specific ideas about morality and ethics. For example, moral norms are regarded as among the most authoritative guides to conduct. This means that the dictates of morality are superior to and take precedence over self-oriented, or “prudential,” considerations. The fact that something is morally wrong is thus held to be a sufficient grounds for refraining from doing it. Moral philosophers have disagreed over the questions of whether self-interest may play any role in moral decision and whether moral rules may ever be qualified or suspended to protect oneself or those one personally cares for. They have also disagreed over the larger question of whether these rules are absolute or permit exceptions. But that the dictates of morality have considerable authoritative-ness and superiority is widely acknowledged.

A tradition of philosophical analysis, beginning with Plato’s dialogue *Euthyphro* and culminating in the writings of Kant, has also insisted on the logical independence of moral norms and their conceptual priority over religious and other requirements. According to this line of thinking, human reason and conscience must be the final arbiter of right and wrong. Even religious norms and divine commands must be tested by the “autonomous” individual conscience. Recent discussions by philosophers and theologians have softened the contours of this view. Early rationalist claims that, to be acceptable, every religious command or requirement must conform to existing moral beliefs have been replaced by a recognition that religious teachings, in a dialogue with reasoned morality, can instruct and inform conscience. But the point made by Plato centuries ago, that human reason is the final forum of judgment, is still widely accepted, since to subordinate reason to other considerations is to renounce the very possibility of rational discourse and justification.

THE UNIVERSALITY OF MORAL NORMS. The writings of Western moral philosophers also reveal broad lines of agreement about the nature and content of morality. By and large, for example, these thinkers have not been impressed by the position known as “ethical relativism,” which holds that basic moral principles or modes of reasoning differ substantially from culture to culture. While ethicists do acknowledge the truth of “cultural relativism,” the view that accepted or prohibited modes of conduct vary among cultures, they have pointed out that this does not necessarily mean that funda-

mental principles are dissimilar. Different technical and social situations can cause common basic principles to yield different results in specific circumstances. For example, a general principle of respect for parents may produce a stringent ban on parricide in a technically advanced civilization but may lead to a custom of abandoning infirm or very elderly parents in hunter-gatherer cultures where there is no provision for sustaining the disabled and where dependency is regarded by all as shameful.

In contrast to the position of ethical relativism, most Western philosophers have subscribed to the essential universality of moral principles. This understanding, in fact, has several important meanings. First, it implies the descriptive point just made: at their most basic level, very similar basic moral rules and principles are understood and respected by human beings everywhere. Second, it implies the normative claim that not only is this so but that it ought to be so. There is a universal standard of morality to which all persons are accountable. This standard is sensitive enough to the reality of specific circumstances to justify broad tolerance of differing social practices, but even so there are limits. Thus, where a strict ethical relativist might conclude that “right” and “wrong” are definable only by the norms of a particular culture, nonrelativists have pointed out that certain cultural practices are so heinous that they cannot be judged morally acceptable without violating human beings’ deepest moral self-understanding. For example, the fact that some societies have practiced genocide against minorities in their midst cannot be thought of as making this conduct right. Some things are wrong no matter how widely they are accepted in particular societies. Finally, morality has been regarded as universal in the sense that its rules and protection extend to all who are human. Precisely because it is a reasoned method of settling social disputes and, hence, superior to force or coercion, moral discourse remains the preferred method of relating to all who are capable of this method of social adjudication. G. J. Warnock has expressed the logic behind this view:

If conduct is to be seen as regulated only *within* groups, we have still the possibility of unrestricted hostility and conflict *between* groups—which is liable, indeed, to be effectively ferocious and damaging in proportion as relations between individuals within each group are effectively ordered toward harmonious co-operative action. Thus, just as one may think that a Hobbesian recipe for ‘peace’ could securely achieve its end only if all Hobbesian individuals were engrossed within a single irresistible Leviathan, there is reason to think that the principles of morality must, if the object of morality is not to be frustrated, give consideration to *any* human, of whatever special group or none he may in fact be a member. (Warnock, 1971, p. 150)

Warnock and other philosophers who share this view would of course concede that it has more often been honored in the breach than in practice, but we shall soon see that the theoretical assumption that morality embraces the entire human

community has special importance for the understanding of religious ethics.

The Moral Rules. Moral philosophers also display wide agreement on the most fundamental rules of morality. These include rules prohibiting persons from killing other persons, from inflicting injury on them, or from depriving them of freedom and opportunity. Other rules prohibit deception or the breaking of promises. All these rules presume that the recipient of the action in question has not voluntarily consented to it. Thus, a surgeon is not regarded as wronging a patient by cutting into his flesh, nor is a stage actor regarded as practicing immoral deception. In addition, these rules are clearly held to apply only where the persons affected by one's choice have not acted immorally in a way that necessitates breaking a rule with respect to them. While killing others or depriving them of their freedom is ordinarily viewed as wrong, for example, it may be justified when individuals threaten harm to others, as in criminal conduct or aggressive war.

These rules for personal conduct constitute only the minimum requirement for moral conduct. They are largely negative in character, prohibiting certain forms of behavior but not requiring positive efforts on others' behalf. In addition to this, however, ethicists recognize supererogatory actions, performance of which is an occasion for moral praise but omission of which does not ordinarily merit condemnation or blame. These actions include forms of mutual aid, generosity, and self-sacrifice. Along with respect for the basic rules, attention to these supererogatory requirements is ordinarily held to enter into the character ideals or standards of virtue that form part of a full system of ethics. Such ideals are separate from, but conceptually dependent upon, the understanding of right acts, since virtuous individuals are those who can be counted upon habitually to do what is right. Kant's famous statement that the only thing that can be called "good without qualification" is the morally good will is not meant to identify the norm of right or wrong conduct (for that, Kant believed, the test of the categorical imperative is required); rather, it is directed to the assessment of individual moral worth. In this connection, it is important to note that the intention of the agent plays a major role in evaluating conduct in terms of such character ideals. Since it is pointless to hold individuals morally responsible for the unforeseeable or uncontrollable consequences of their actions, the moral worth of persons is usually assessed in terms of what they intended to do, although morally acceptable intentions are ordinarily held to encompass reasonable prevision for consequences.

While moral theorists are widely agreed on at least the basic principles governing individual conduct and defining individual virtue, there is far less agreement on the norms or principles that ought to guide the conduct of social and economic institutions. At least for the context of industrialized societies, various competing theories have been advanced to justify everything from *laissez-faire* through welfare state so-

cieties to fully socialist and egalitarian systems. This is no place to settle a debate that continues to be one of the most heated in contemporary moral literature. It is important to note, however, that the very basic condition that moral principles be potentially acceptable to all persons tends to support views acknowledging a significant degree of social responsibility toward those who, through no fault of their own, are seriously disadvantaged. Thus, even thinkers who minimize society's responsibility for social justice tend to endorse efforts to ensure equal opportunity and hardship relief.

The "Moral Point of View." Behind these specific rules, many philosophers have also discerned a way of reasoning that is basic to moral judgment. This involves, first of all, an element of imaginative empathy for the other persons affected by one's choices and a willingness to consider the impact of one's conduct on their welfare. In addition, it calls for a willingness to reason about moral choices in an impartial way, as though the agent were only one interest among all of those affected by a choice. This perspective of impartiality is sometimes called "the moral point of view." Various moral theories have tried to integrate this way of thinking into decision procedures for moral choice. Views that derive moral decisions from the presumed judgments of an ideal sympathetic spectator and those that see such choices as arising from the decisions of self-interested but impartial contractors are examples.

Why Should One Be Moral? Delineation and justification of the moral rules have been the principal focuses of most moral theory. Yet, beyond specific normative issues, a series of persisting questions has stood at the far side of ethical discussion and has been dealt with increasingly by ethicists, as the nature and content of the moral reasoning process have become better understood. One of the most important of these questions is why one should be moral. Because this question can easily be misunderstood, its full significance and the difficulty of answering it may not be appreciated. If it is asked in the sense of why people in general should think and act morally, why morality itself should exist, then, to answer the question, it is necessary only to point to the general usefulness of morality as a method of settling social disputes. In this sense morality is in everyone's interests. Again, if one who has adopted the moral viewpoint of impartiality and empathy for others asks why he or she should obey the moral rules, then it is necessary only to point out that impartial persons would certainly advocate obeying the rules they would choose. But if this question is asked in its sharpest sense of why one should adopt the moral point of view in the first place, it becomes exceedingly difficult to answer. This is especially true whenever acting morally occasions serious loss for the individual agent.

Some philosophers have tried to answer this question in terms of the demonstrable longterm interest and welfare of the moral agent: they have argued that it is, by and large, advantageous to be a morally upright person and disadvantageous to be an immoral one. They point to the social and

psychic costs that openly immoral conduct or covert and hypocritical behavior can entail. But others have rejected this approach either on the grounds that it is often not correct (immoral people sometimes do very well) or because it introduces essentially nonmoral motives into one's reasons for being moral. Some who argue this way have contended that no self-interested reasons should be given for being moral: that one's decisions to be moral must rest on a respect for moral reasoning requiring no further justification. For these thinkers the voice of duty, in the words of George Eliot, is "peremptory and absolute." Still others, rejecting both the appeal to personal advantage and the claim that no further justification need be given, have stressed the importance of various metaphysical or religious views in grounding, explaining, and justifying commitment to the moral life. These thinkers have argued that without at least some metaphysical or religious basis moral striving makes no sense. This basis may range from the minimal belief that morality is not pointless or futile, that one's efforts do make a difference, to the stronger belief that, however much it may appear true that good people suffer for their commitments, moral acts and dispositions are, in the ultimate scheme of things, acknowledged and rewarded.

It is noteworthy that discussion of the question "Why should one be moral?" returns ethics to basic matters of religious belief. Hence, the separation of ethical theory from theology and philosophy of religion, which ethical theorists effected during the modern period, has to some extent been reconsidered. It is interesting that this development was anticipated strongly in the work of Kant. To be sure, Kant is well known for his emphasis on the rational accessibility of moral norms and for his insistence that moral commitment must be autonomous, in the sense that it must be based on respect for the dictates of reason and conscience rather than on norms imposed from without and enforced by external rewards or punishments. Nevertheless, Kant's later writings, especially the *Critique of Practical Reason* (1788) and *Religion within the Limits of Reason Alone* (1793), were focused largely on questions concerning the philosophy of religion. In these writings, Kant developed the position that, to make sense, moral striving requires belief in a morally intentioned governor of the universe (this was Kant's "moral proof" of the existence of God), and he began to explore the relationship between ethics and themes in biblical theology. Foremost among these were the issues of sin, repentance, and the possibility of moral righteousness. Kant's discussions here are dense, but it can be said that, in perceiving the need to ground moral commitment in voluntarily assumed religious beliefs, Kant also recognized the difficulty of providing any clear and incontestable rational justification for being moral. Thus his work highlighted the difficulty of sustaining moral commitment and opened up, as never before, the prospect of rational persons' defecting from morality. Discussing this problem under the rubric of the "radical evil" of the human heart, Kant introduced themes that were later developed by Christian theologians like Kierkegaard, Barth, and Niebuhr.

MORAL THEORY AND RELIGIOUS TRADITIONS This body of reasoned reflection on basic issues in morality and ethics provides a useful background for exploring the variety of concrete traditions of religious ethics. Regarded superficially, these traditions display a bewildering variety of teachings and beliefs, making difficult any general conclusions about the relationship between religion and the moral life. But when they are assessed against the framework of concepts just presented, religious traditions display some common patterns. Moreover, identifying these common patterns also helps highlight some of the important differences between traditions. In approaching these concrete traditions with the framework of ethical assumptions as a guide, one should keep in mind one other important consideration: religious traditions are not static entities that display finished form at any moment in time; rather, like most human creations, they develop in the course of history. In his book *Beyond Belief* (1970), the sociologist Robert Bellah has suggested that religious evolution, like the evolution of other complex systems, often involves movement from simplicity to greater differentiation of structure (pp. 20–50). In terms of moral ideas, this suggests a development of greater sensitivity to the full gamut of specific issues and questions identified by systematic ethical theory. We shall see that questions or distinctions barely occurring to thinkers or writers within a tradition during its earliest phases emerge as important issues later in the tradition's life. In addition to looking at traditions synchronically in terms of their structure at any given moment, therefore, we must also look at them diachronically over the course of their development.

The Superiority of Moral Norms and Independence of Moral Reasoning. As we look at the variety of religio-ethical traditions, it is striking that a sense of the distinction between religious, ethical, and even legal norms is often not present, and that when it is, it is often a late development. Furthermore, because the very distinctions are lacking, traditions do not always assert the superiority of moral norms over specifically ritual or religious requirements. This does not mean that these ideas are not present; often they are implicit and can be discerned only by a careful examination of how conflicts between norms are handled.

As I have already observed, most historical traditions tend to see the normative structures bearing on human life as an integrated whole, wherein moral requirements are fused with religious, ritual, and legal norms. In this respect it is often strained to speak of Jewish, Hindu, or Islamic "ethics." In Judaism, for example, the sacred norms for human life constitute *halakhah*. Incompletely understood as "law," *halakhah* is more properly thought of as sacred teaching or guidance, although it is also "law" in the sense that many of its specific requirements were upheld by public sanctions and punishments, when Jews were politically able to govern themselves. In all, *halakhah* discusses 613 specific commandments or normative prescriptions identified by commentators in scripture, including the Ten Commandments. While

this body of norms does contain many requirements that are recognizably “moral,” these are not clearly distinguished from what we would identify as ritual or religious norms. At a fairly late date in the development of the tradition, commentators would puzzle over why specific ritual commandments (for example, the requirement that only the ashes of a red heifer be used in a specific ritual of expiation) had been placed on a par with obviously important moral norms. But the early tradition tends not to make distinctions of this sort, and even later commentators who were rooted in this tradition agreed that all the norms of *halakhah* were equally sacred and equally incumbent upon the pious Jew. What is true for Judaism in this case, however, may also be said for *shari‘ah* in the Muslim tradition or *dharma* in the Hindu and Buddhist traditions. In each case we have a legal-moral-religious teaching containing the totality of enjoined actions in an undifferentiated unity.

Neither can it be said that many traditions display ethical theorizing in the contemporary sense of an effort to work out and to justify moral norms in rational terms. Commentators on early Christian ethics have noted the striking difference between the tone of early Christian ethical writing and that of the surrounding Greco-Roman world. Whereas Greek and Roman thinkers were concerned with such questions as what constitutes “the good” for man and what patterns of conduct are most conducive to individual and communal well-being, Christian writers commonly established rules for conduct by citing biblical commandments, or by holding up as models for behavior exemplary persons in scripture. Throughout, it is the hope for God’s approval (or the avoidance of his wrath) that is pointed to as the principal reason for living a Christian life. As is also true for Judaism and Islam, not human reason but God’s will remains the source and sanction for moral conduct.

It is true that in our era each of the biblically based traditions has developed bodies of systematic ethical reflection, and it is also possible today to find treatises on Buddhist, Hindu, or Jain ethics. Yet the separation of moral reasoning from other dimensions of the religious life is largely alien to all these traditions. In Judaism, Christianity, and Islam, the appearance of ethical theorizing initially represents a response to the authority of Greek and Roman philosophy. Thus, some of the earliest thinking about the relationship between religious and rational norms in these traditions—as for instance Sa’adyah Gaon’s *Book of Beliefs and Opinions* (933 CE) and Thomas Aquinas’s discussion of the forms of the law in his *Summa theologiae* (2.1.90–97)—emerges during the medieval period, when classical philosophy was rediscovered. Similarly, modern efforts to develop statements of Jewish, Christian, or Islamic ethics are very much a response to initiatives in philosophical ethical theory. The authority of Western thought has had a corresponding effect in stimulating thinkers in African and Asian religious traditions to develop systematic approaches to ethics. But in all these cases, writers are usually compelled to begin their discussions with

the observation that the moral teachings of their tradition are inseparable from its theological, metaphysical, or ritual dimensions.

Are we to conclude, then, that the separation of ethics from these other aspects of religion is only a Western phenomenon, and one largely traceable to the classical philosophers of Greece and Rome? It is true that systematic, rational thinking about morality—ethics in the modern sense—does emerge primarily in the Greco-Roman world, although one might also speak of ancient Chinese ethics in this sense. Interestingly, in both these cases it was partly the breakdown of an older religious ideal that prompted rational reflection on the human good (a theme we shall return to later). But while ethical theorizing per se may be culturally localized, a sense of the independence, special significance, and even superiority of moral norms with respect to other normative requirements is present throughout many of these diverse traditions.

Criticism of purely ritual efforts to please God, for example, is one of the hallmarks of the Hebrew prophetic tradition. *Amos* 5:21ff. gives classic expression to the theme: “I hate, I despise your feasts, and take no delight in your solemn assemblies. . . . But let justice roll down like waters, and righteousness like an ever-flowing stream.” In less impassioned but equally serious tones, Confucius would criticize members of the Chinese elite who believed that Heaven was satisfied with outward displays of piety and ritual in lieu of sincere efforts at righteousness and benevolence: “A man who is not good, what can he have to do with ritual? A man who is not good, what can he have to do with music?” (*Analects* 3.3). Neither the prophets nor Confucius, of course, would eliminate ritual from the life they believed human beings were called to live. For both traditions of thought, a fulfilled human existence was a moral and religious whole. But their opposition to efforts to reduce morality to one lesser aspect of the religious life evidences their sensitivity to the importance and relative priority of the moral norms.

This point could be further illustrated within a number of diverse traditions, but it becomes even clearer when we survey the historical development of religious thought. Not only do traditions tend to highlight moral requirements as they develop over time, but major religious controversies and schisms giving rise to new religious traditions usually effect dramatic ethicization of aspects of the older traditions, thus indicating how important the issue is for diverse religious communities. Many examples from the history of religions could be given: early Christianity’s prophetic denunciation of Jewish religious observance and its replacement of the many ritual requirements of Jewish law with a simplified set of primarily moral norms; Protestantism’s revolt against Catholic sacramentalism and against the idea that God’s favor could be won by religious observance devoid of moral or religious sincerity; Buddhism’s deliberate rejection of the heavily ritualized Indian caste order, and its replacement of that order with an ethicized hierarchy based on moral and

spiritual attainment; and Daoism's repudiation of alleged Confucian formalism in the name of a simplified religious and moral ideal of spontaneous selflessness.

To be sure, each of these important moments of religious change involves more than moral reform (nor are the allegations of the "reformist" tradition always correct). But it is noteworthy that in each of these cultural contexts the effort to highlight and assert the priority of the moral norms is of such urgency that it could well be an important contributing factor to major religious change. It is also noteworthy that in these quite different contexts change is always unidirectional; religions do not efface the distinction between religious and moral norms as they develop, nor do they subordinate moral requirements over time. On the contrary, just as a theoretical appreciation of the importance of moral norms would suggest, traditions move toward greater clarity about the distinctiveness and relative superiority of moral requirements.

One final matter deserves attention: the claim that the basic derivation of norms in some traditions is religious, not moral. The supreme guide to conduct in these traditions, it is said, is God's command, and because this command is not always moral, these traditions are fundamentally opposed to any idea of the distinctiveness or superiority of moral norms. This viewpoint is associated with forms of divine command ethics in Judaism, Christianity, and Islam. Many believe it finds its strongest biblical support in God's command to Abraham to sacrifice his son Isaac (*Gn.* 22:1–19).

In fact, the issue of divine command ethics is a complicated one. Theoretical defenses of this position (as voiced by al-Ghazali in Islam and by William of Ockham, Duns Scotus, and Kierkegaard in Christianity) usually arise in contexts where the very authority of the tradition is under attack by rationalist critics. These defenses may seek less to represent the tradition in its integrity, therefore, than to place it beyond assault. Examined with less apologetic interests in mind, the traditions themselves do not necessarily support the religiously authoritarian reading they are given. While biblically based traditions trace their norms to God's will, this will is usually viewed in such ethicized terms as to render it unthinkable that God could ever require anything fundamentally wicked or immoral.

The Abraham-Isaac story in *Genesis 22* is no exception to this rule. Readings based on this passage alone (such as Kierkegaard's) tend to omit the fact that, several chapters earlier, in *Genesis 18:23–33*, Abraham has questioned God concerning the possible destruction of innocent persons along with the wicked in Sodom and Gomorrah, asking boldly, "Shall not the judge of all the earth do right?" Abraham's willingness to question God in moral terms and God's willingness to enter into dialogue with Abraham do not support an understanding of the divine character as arbitrary or non-moral. In many ways, the episode in *Genesis 22* reinforces this impression: though a supreme demand is made, the sacrifice itself is not required. The God of the Hebrew scrip-

tures, unlike deities worshiped by idolators, does not demand the slaughter of children. Indeed, this was precisely the lesson drawn by most later Jewish, Christian, and Muslim commentators. In this single text, therefore, we see both sides of the biblical tradition: its emphasis on obedience to God's will and its essential faith that this will is trustworthy and righteous. Taken together, these ideas do not suggest a religious attitude that would subordinate morality, but one that discovers moral intentionality at the tradition's highest level of authority.

Universality and the Moral Rules. We have seen that the term *universality* has several distinct meanings when used in reference to moral rules. It signifies the fact that at least the basic rules of morality are the same across cultures. It also signifies that these rules are to be regarded as applying across cultural lines presumably to every human being. All who are human are members of the moral community and bear the rights and responsibilities of this status. A survey of different historical traditions bears out the presence of these ideas, although historical development and other considerations sometimes render matters complex.

Common moral principles. One of the most striking impressions produced by comparative study of religious ethics is the similarity in basic moral codes and teachings. The Ten Commandments of Hebrew faith, the teachings of Jesus in the Sermon on the Mount and of Paul in his epistles, the requirements of *sādhāraṇa*, or universal *dharma*, in Hinduism (*Laws of Manu*, 10.63), Buddhism's Five Precepts, and Islam's decalogue in the Qur'ān (17:22–39) constitute a very common set of normative requirements. These prohibit killing, injury, deception, or the violation of solemn oaths. C. S. Lewis has called basic moral rules like these "the ultimate platitudes of practical reason," and their presence and givenness in such diverse traditions supports his characterization. Also remarkably similar are norms bearing on social and institutional life, especially economic relations. While none of these traditions condemns private property (though common possession is sometimes viewed as appropriate for the religious elite, or is thought to have prevailed during a utopian era at the beginning of time), all are solicitous of the needs of the disadvantaged or powerless and, in different ways, all encourage active assistance to the poor. Judaism and Islam institutionalize this ethic through rules requiring tithing and charitable donation (indeed, *zakāt*, almsgiving, is one of Islam's Five Pillars of Faith). Christianity accomplishes the same end by encouraging extreme sensitivity to the plight of the weak or needy. Despite their other differences, Confucianism and Daoism share the Chinese conviction that the mark of just rule is a prosperous and happy peasantry. Both laud generosity by the rich and powerful, and both vigorously condemn economic oppression and rapaciousness. The caste system of Hinduism, though opposed to any notions of social equality, aims at ensuring a livelihood and a share in the social product for all members of the community. This was accomplished by means of the *jajmani* patronage system,

involving the exchange among castes of services and goods at socially established and protected rates. Finally, while charitable giving in Buddhism goes largely to the monastic community and is directed toward spiritual attainment and not toward economic need, this community itself often has been a refuge for the poor and for orphans and widows. Furthermore, Buddhism espouses a vigorous ideal of shared prosperity in its conception of the duties of the righteous monarch (*cakravartin*).

Similar assessments of individual moral worth. Beyond these common moral principles, interesting normative similarities may also be identified with respect to the role played by individual decision and intention in the evaluation of moral worth. We have seen that while intention does not figure into the rightness or wrongness of a particular act, it is a crucial consideration in estimating the merit or blame of the moral agent. This aspect of moral reasoning, as well as the centrality of the individual agent as moral subject, is apparently well appreciated by the major traditions under discussion, although again some historical perspective is needed. Very often during their earliest periods, traditions evidence an objective assessment of moral culpability: individuals may suffer social or religious penalties for wrongs accidentally committed. Similarly, the earliest strata of some traditions at times display notions of collective guilt whereby all members of a community are regarded as meriting punishment for the wrongdoing of a few.

Characteristically, however, these less differentiated ideas give way over time to greater precision in the assessment or apportionment of blame. In the Hebrew faith, Ezekiel's rejection of collective punishment (*Ez.* 18:1ff.) represents a watershed in the development of biblical ethics (similar changes in attitude can be discerned in *Deuteronomy* 24:16 and *2 Kings* 14:6). This process of differentiation becomes particularly apparent during moments of radical religious change. None of the "daughter traditions"—neither Buddhism, Christianity, nor Islam—defends the idea of corporate punishment, whereas all put much stress on intention in assessing individuals' deeds. Jesus' criticism of religious and moral hypocrisy may not be fair to the Jewish tradition from which he sprang, but it is fully consistent with the spirit of greater interiority in the assessment of worth that marks the development of biblical faith. Much the same might be said of the Buddhist remolding of the doctrine of *karman* to the effect that karmic consequences are seen to derive from the willing of the agent rather than from the outward deed. The importance of intention (*niyah*) in validating religious and moral observance in Islam and of the kindred concept of *kavvanah* in rabbinic Judaism exemplifies this same process of increasing precision in the assessment of individual worth.

Differences between traditions. Despite all these remarkable similarities, there are also important differences among the codes and teachings of these traditions. Thus, the permitted range of sexual conduct differs from tradition to

tradition, with the concept of sexual chastity apparently not ruling out polygamy in some cases (ancient Israelite religion, Islam, Confucianism) but requiring monogamy and even recommending celibacy in others (monastic Christianity and Buddhism). Wrongful killing, too, is variously defined. For Jews and Muslims, killing is permissible if done in self-defense or to punish wrongdoers whose conduct is believed to threaten the community. The New Testament, however, suggests a stance in which even self-defensive killing of other human beings is prohibited. Buddhism and Jainism take this position one step further by discouraging the killing not only of human beings but of all sentient creatures.

Differences of this sort represent an important object of study. Why is it that traditions whose moral attitudes and teachings are in some ways similar tend to differ in other respects? But the significance of these differences for our basic understanding of the relationship between religion and morality should not be exaggerated. For one thing, these differences are manifested against a background of basic similarities in moral teaching. It is sometimes assumed, because religious traditions hold widely different religious beliefs, that their ethics must correspondingly differ; what is remarkable, however, is that these great differences in beliefs apparently do not affect adherence to at least the fundamental moral rules. Furthermore, where moral differences do occur, they do so within the permitted range of moral disagreement. For example, even though Western religious moralists have vested sexual conduct with great importance (often intolerantly imposing their norms on other cultures), there are many different ways in which societies can organize sexual conduct so as to fulfill the more basic moral objective of protecting human beings from injury. In some circumstances the welfare of women and children might seem best accomplished by polygamous relations; in others, monogamy might be desirable. Changing circumstances within a single tradition can even recommend a movement from one pattern to the next, as has been the case for Judaism and, to a lesser extent, Islam. That traditions would differ over a difficult moral issue like this is almost predictable. What would be surprising, and what would throw open to question any claim that religions are basically respectful of the moral rules, would be teachings that permit rape or other violently abusive sexual acts. But no major historical tradition tolerates anything of the kind.

Some differences in these teachings are also traceable to differing moral ideals or standards of supererogation. We have seen that, above and beyond the basic moral rules (which are largely negative and prohibitory), there are a variety of positive encouragements to generosity, sharing, and self-sacrifice. Since views of what is "above and beyond the call of duty" normally differ even within cultures and between individuals, it is not surprising that differences among religious traditions should be marked. Indeed, some of the disagreements with respect to sexual conduct and killing just mentioned are also differences of this sort. New Testament

Christianity, for example, would interpret self-sacrifice to imply celibacy, disregard for material wealth, and abstention from physical self-defense. Buddhists and Jains adopt very similar norms (possibly less for reasons of self-sacrifice or altruism than as part of a vision of spiritual self-cultivation), whereas Judaism and Islam tend to associate self-sacrifice with unstinting obedience to every provision of their respective religious laws. This may require extreme efforts at charity and the willingness to accept martyrdom in the name of the faith, though neither tradition advocates poverty, celibacy, or the renunciation of self-defense. As important as they may be for the study of comparative religious ethics, however, these differences with respect to supererogatory ideals are matters about which reasonable and morally well-intentioned persons can disagree, and they do not affect the traditions' agreement about the basic moral rules.

"Omnipartiality." Probably nothing makes this agreement clearer than the ways in which diverse religious traditions communicate to their adherents the perspective I have called "the moral point of view." We have seen that this requires imaginative empathy for others, an ability to put oneself in their shoes, and the willingness to make moral decisions from a standpoint of objectivity and impartiality. The element of reciprocity here is aptly expressed by the Golden Rule of Christianity (*Mt.* 7:12). While Christians are justly proud of the moral wisdom represented by this simple decision procedure, the Golden Rule is by no means limited to Christianity. Jesus' teaching is initially drawn from Hebrew scriptures (*Lv.* 19:18). Within rabbinic Judaism a negative form of the Golden Rule ("Do not do unto others. . . .") is presented by the sage Hillel as a virtual synopsis of the law. In the *Analects* (12.2), Confucius utters this same negative form of the Golden Rule, and variants of both the negative and positive forms are to be found in Buddhism's *Dhammapada* (10.129–130). Parallels like these led early missionaries and scholars to speculate on the possibility of historical borrowing or even parallel divine revelation in the East and the West. But this similarity of moral perspective does not have to be attributed to anything more than the essential and universal logic of the moral reasoning process.

While the Golden Rule is an impressive intuitive guide to responsible moral decision, its focus is too narrow. In making moral choices, we must consider not only the immediate neighbor but all other persons affected by our conduct or choice. Hence the requirements of universality, objectivity, and impartiality in moral reasoning. In fact, the term *impartiality*, though widely used in moral theory today, is inappropriate, because it suggests detachment and distance in reasoning when what is really required is genuine empathetic concern for all those affected by our decisions. In this respect either *omnipartiality* or *omnicompassion* would be a better term.

When we examine the very highest reaches of religious thought, we are struck by the ways in which adoption of this perspective is encouraged. In the Western traditions believers

are called upon to imitate God while trying to develop their own moral and religious lives. The various metaphors for God that express the traits to which believers should aspire convey this moral point of view: God is the creator and king of all the world, the righteous ruler in whom there is neither partiality nor injustice. He is also a parent who loves his creatures with tender mercy and concern. Modeling their behavior on God's, Jews, Christians, and Muslims are thus called to distance themselves from selfish interests and to adopt an omnipartial point of view. Some Asian religions share this teaching. Adherents of the *bhakti* (devotional) tradition of Hinduism find a model in the god (often embodied in the figure of Kṛṣṇa) whose love transcends social distinctions of caste, wealth, or gender. In the ancient Chinese and Confucian traditions, Shangdi ("lord on high") and Tian ("heaven") represent the standard of impartial justice. Knowing no favorites, Heaven judges by merit alone and casts out the unworthy.

Mystical traditions, which often place less emphasis on obedience to God and more on the adherent's experience of a transcendent reality, arrive at this standpoint in a different way. Characteristically, once a person has joined with or is in contact with transcendent reality (whether as *brahman*, *nirvāṇa*, or the Dao), the ego assumes reduced importance. No longer clinging to the self, one participates sympathetically in all of reality. In Mahāyāna Buddhism this experience eventuates in compassion (*karuṇā*) for all sentient beings and the desire to help extricate them from suffering. The Daoist adept, in achieving mystical insight into the Way, participates in its spontaneity, generosity, and support of all living creatures.

It may be objected that the picture of universal compassion presented here is one-sided: that while the historical religions sometimes counsel universality of perspective, they have also been seedbeds of intolerance, persecution, and cruelty, and that under the guise of religious devotion, all sorts of nationalisms and even tribalisms have flourished. Certainly these things are true. But once again, historical perspective is in order. One of the salient features of all traditional cultures is their tendency to view themselves as human, while outsiders, often all those beyond the narrowest boundaries of a local community, are looked upon as enemies, barbarians, or less than fully human. Frequently this assessment has a real basis in self-perpetuating conditions of conflict and vendetta that render every outsider untrustworthy and dangerous. To some extent, we see this mentality in the early strata of many of the literate traditions, although even there universalist elements are discernible. For example, *Genesis* contains many passages in which Yahveh is depicted as little more than a tribal deity who fights without quarter on behalf of his people, whereas other passages display remarkable universality of perspective. Sometimes the two impulses are joined. A poignant example occurs in *Genesis* 21 when the working of the divine plan on behalf of Isaac's lineage leads Abraham to expel Hagar and her son Ishmael into the desert.

In a moving passage, Yahveh personally intervenes to save the lives of the abandoned pair. Though his first loyalties may be to Israel, the chosen instrument of his purpose in history, Yahveh reveals himself as a God whose compassion and concern transcend national lines.

As traditions develop, one finds an almost invariant movement from relative particularity to greater universalism. Examples include the lofty visions of prophetic faith, where Israel's chosenness comes to be viewed in terms of a mission of universal instruction and redemption; the emergence of *bhakti*, the devotional strain, in later Hinduism, with its perception of the sanctity of all human beings; and the development of various forms of messianism in Mahāyāna Buddhism, placing salvation within the reach of all and rendering every person potentially an enlightened being, or *bodhisattva*. If such development can be found within the traditions, it once again shows itself most dramatically at moments of decisive religious change. Christianity's abandonment of Jewish religious law, for example, opened its community, "the new Israel," to a membership drawn from the entire ancient world. Paul's statement in *Galatians* 3:28 that in Christ "there is neither Jew nor Greek . . . slave nor free . . . male nor female" fully expresses Christianity's universalizing impulse. Similarly, Buddhism, by rejecting Hindu notions of caste, severed the geographical ties to India that had characterized Hinduism and, as a result, Buddhism became a world religion. By expanding the possibility of salvation beyond the narrow community of mendicants, religious developments in later Mahāyāna Buddhism merely accentuated a tendency implicit in Buddhism from the outset.

But probably no tradition better illustrates this tendency to universalism coupled with the possibility of intolerance than Islam. Over the centuries, Muslims' willingness to use the sword in defense of their faith has earned Islam a reputation, especially among Christians, as a paradigm of religious intolerance and persecution. In fact, Islam's record in this regard is much more complex than its foes admit. Not only is the idea of holy struggle (*jihād*) a less bellicose and more defensive concept in the classic Muslim sources than it is often thought to be, but in many ways Islam's record of religious toleration is enviable. And even if some Muslims have promoted their faith through violence, it must be remembered that, in its essence, this faith has the most universalistic aspirations. The object of Islam is precisely to bring all human beings, whatever their race or nationality, into submission to God's will. Islam would create one human community in which all share obedience to a high moral and religious standard and in which all merit the protection embodied by that standard. The fact that some Muslims have at times been prone to excess in promoting this objective may be thought of as an unfortunate consequence of the breadth of their moral and religious vision. This vision is representative of the tendency of other major world religions to fulfill the promise of universality implicit in the moral point of view.

Why Should One Be Moral? Religions are not just bodies of teaching about right and wrong; they are total ways of life. As a result, it is not surprising that they provide answers, whether explicit or implicit, to some of the more urgent "transnormative" questions of morality, among them the questions of why one should be a moral person and how one can attain a morally estimable character. In many ways, these questions are central in religious teaching. While standards of right or wrong conduct are readily elaborated by traditions, efforts to secure full adherence to these standards are a major preoccupation.

Retribution. Religious traditions commonly provide answers to the question "Why should I be moral?" by affirming the existence of an order in which moral retribution (reward and punishment) is assured. Those raised in the West are familiar with some of the standard forms of this belief: God is consummately righteous; he is the omniscient judge of human acts and intentions; he upholds the moral law by punishing the wicked and rewarding the righteous; and, in some cases, he metes out reward and punishment directly in the course of a person's life. But since there is an apparent discrepancy between moral conduct and one's worldly fate—too often the good suffer and the wicked prosper—divine retribution is usually consigned to an eschatological realm, whether a personal afterlife, a period of judgment at the end of history (the kingdom of God), or some combination of these two.

Although this retributive scheme prevails in Judaism, Christianity, and Islam, it is not the only one that religions (including these same Western traditions) have elaborated. The idea of eschatological retribution is absent from many nonliterate traditions, and even in biblical faith it is a relatively late development. More common is a perception of death as departure to a state where the discarnate soul suffers neither punishment nor reward. The principal expectation for virtuous conduct, therefore, lies in the hope of worldly prosperity, numerous progeny, good health, and long life, so as to "come in sturdy old age to the grave," as the *Book of Job* (5:26) says. It may be that more explicitly eschatological thinking arises, as it did in Hebrew faith, only after massive and repeated frustration of these expectations and, even then, only within a context of historical expectation and sustained reflection and writing about this experience.

Neither is the apportionment of reward and punishment always accomplished by a supreme, morally intentioned deity. In some traditions the sincerity of oath takers is tested by requiring them to undergo a quasi-magical ordeal such as ingesting a poison that is expected to prove fatal only if they are guilty of deception. (An instance of such an ordeal is found in *Numbers* 5:11ff., where an accused adulteress is required to vindicate herself by consuming a draft of "bitter waters.")

In many of the nonliterate traditions of Africa and in some Native American religions, lesser supernatural agents such as witches and sorcerers also play a role—indeed, a com-

plex one—in upholding the moral order. These agents are often “negative exemplars,” embodying attitudes of selfishness and resentment that are the opposite of the open and generous attitudes expected of a good member of the community. Since witches and sorcerers can themselves expect to be punished for their behavior, the lesson to all is clear: avoid becoming persons of this sort. But the presence of these malign agents also reinforces the moral conduct of others. Anyone who neglects hospitality obligations and treats a stranger unkindly, or who deals unfairly with one of his several wives, or who fails to be generous to others while himself experiencing prosperity may easily fall prey to the destructive powers of a witch. Indeed, since witches and sorcerers are masters of deception, combining outward benevolence with inward wrath (and so, once again, are consummate examples of how *not* to be), it is possible that, if mistreated, one’s nearest kin or neighbors may become a threat.

Among the traditions of India, moral reward and punishment are also the province of religious thought, but (at least in the post-Vedic period) they are accomplished by means very different from those in the West. In Indian thought the operative mode is the impersonal, natural-moral law of *karman*: the certainty of moral punishment or reward in combination with a belief in metempsychosis or the transmigration of the individual soul. In the world of *karman*, each act and each volition entails consequences for the welfare of the agent. In a sense, it is misleading to label these consequences rewards or punishments, since they do not result from the action of any judge but are part of the natural law of occurrences in the world. As such, these consequences may be experienced within the lifetime of an individual. More commonly they take many successive lifetimes to work their effect as one’s *karman* “ripens.” When morally caused suffering does occur, it is often suited to the crime. One who habitually lies, for example, may become the victim of slander in some future life; one who drinks to excess may be reborn insane. Just because it is an impersonal, natural law, *karman* is inescapable. As the *Dhammapada* (9.127) says, “Not in the sky, not in the midst of the sea, not if one enters into the clefts of the mountains” can one be freed from the consequences of evil deeds.

Belief in *karman* is so widely shared among the Indian traditions—Jainism, Hinduism, and Buddhism—that it may be called the principal dogma of Indian religious belief. For these traditions, to reject *karman* is to put oneself outside the religious pale. Indeed, the one intellectual tradition of ancient India that did just this, the Carvaka or materialist school, lives on, like the Sophists of ancient Greece, only as an object of ridicule by the other traditions. It is further testimony to the centrality of this belief in Indian religion that Buddhism, whose doctrine of *anattā* (“nonself”) opens to question who or what agent could be the inheritor of continuing karmic forces, nevertheless continues strongly to affirm the reality and significance of this natural-moral law.

One of the future tasks of comparative religious ethics is to better understand why retributive doctrines evolve and

take the different forms that they do. It is also important to understand why, in some cases, religious doctrines of retribution lose their power or vanish altogether. To a large extent, but probably for different reasons, this occurred in ancient Greece and China.

In the case of Greek religion, confidence in a reliable religious-moral order may have been eroded, in an increasingly complex society, by repeated frustration of moral expectations. Furthermore, the traditional religion was based on a panoply of deities whose moral integrity and power had been open to question from an early date. The result was a withering of religious confidence and its replacement with an effort to ground moral obedience in an understanding of the relationship between virtue and personal welfare (*eudaimonia*). Thus the rational discipline of ethics, as found in the writings of the great classical philosophers, arose amid the crisis of a religious-moral culture.

In China an opposite series of events seems to have led to the same result. From an early date, Chinese religious thinkers correctly linked human well-being, in the form of a stable, secure, and prosperous society, to moral conduct on the part of rulers. Misrule, it was believed, would manifest itself in popular unrest, rebellion, and susceptibility to invasion. “Heaven sees and hears as our people see and hear” (*Book of Documents* 3.74) was the teaching of the various Chinese traditions. It may be that, in time, this direct, demonstrable, innerworldly link between virtue and welfare largely obviated the need for an impassioned affirmation of religious retribution (at least among the intellectuals who were shaping the tradition). In the Chinese experience, in a very direct and material way, virtue may have reasonably been thought to bring its reward. This was not always to remain true, of course, and at a later date Buddhist eschatology filled a void left by the earlier tradition.

In these respects, the course of Greek and Chinese religious thought contrasts markedly with that of ancient Israel, where an emphasis on religious retribution was magnified by successive and intense experiences of both failure and vindication of moral expectations. This leads one to conjecture that strong schemes of religious retribution are most likely to flourish where confidence in moral retribution is neither too secure nor too imperiled.

The uncertain link between moral conduct and moral reward has a further very important consequence for religious thought: it contributes to the development of sustained reflection on the problem of human sin and wrongdoing. Earlier, I noted how difficult it is to provide answers to the question “Why should one be moral?” If moral or immoral conduct were always followed by its appropriate reward or punishment, not only would this question be easy to answer but individuals would have little temptation to pursue selfish goals. The fact, however, that this is not the case, and that moral commitment may have to rest on uncertain religious beliefs or on metaphysical beliefs, leads to the recurrent possibility of moral weakness and moral failure.

Redemption. It is important to note that strong affirmation by religious traditions of the existence of a morally retributive order, while it relieves this problem in some ways (by reinforcing confidence in retribution), accentuates it in others. It does so first of all because, in a world assumed to be governed by moral considerations, ordinary forms of suffering (sickness, famine, or premature death) are naturally attributed to moral and religious failures on the part of the individual or community. Not surprisingly, therefore, we find a concern with the expiation of sin present in many nonliterate traditions, and even the earliest documents of the literate traditions (such as the cultic ordinances in *Leviticus*, the *Rgveda*, or the Chinese *Book of Rites*) emphasize these matters. But as traditions develop, a further problem emerges that often leads into the most subtle and paradoxical reaches of religious thought. Earlier I noted that moral reasoning, though it may lead to a recognition of the need for some confidence in moral retribution, is nevertheless opposed to basing moral commitment on crass considerations of personal benefit or gain. Indeed, not only are individuals who calculate their commitments in this way morally unreliable (since expediential considerations can easily lead them to be immoral), but they do not attain to the highest standard of moral virtue, in which a spontaneous and pure love of righteousness is the principal motivating ground of conduct.

But since religions inevitably hold out the promise of reward, how are they, at the same time, to lead their adherents into such an elevated level of moral attainment? Or, as the outward behavior of adherents becomes more refined, how are religions to prevent egoism from corrupting the inner core of intention? To answer these questions fully would require an extensive exploration of various traditions' conceptions of sin and redemption. We can, however, identify a very common direction taken by religious thought at this point. Simply stated, in coming to terms with this problem, traditions tend to qualify and soften their own insistence on moral retribution. The world may be a moral order, but ultimate redemption does not necessarily rest on the moral performance or accomplishments of the individual agent. The effect of this teaching is twofold: it relieves the inevitable self-condemnation of the morally conscientious yet knowingly frail person, but at the same time it eliminates any vestiges of cloying self-regard that might corrupt the moral life and make it an instrument of pride and self-assertion.

Traditions affect this qualification of the retributive scheme differently. Judaism, Christianity, and Islam emphasize God's grace and the recurrent possibility of repentance. Pauline Christianity takes this teaching to the extreme conclusion that salvation comes not by works of the moral and religious law, but through God's free, unnecessitated love. Similar conceptions are found in the devotional (*bhakti*) tradition of Hindu thought, but in the Indian-derived traditions the retributive order is more commonly qualified differently: ultimate redemption requires one to attain the consciousness that full liberation (*mokṣa*, *nirvāṇa*) is open

only to those who transcend attachment to *samsāra*, the karmic realm of merit and demerit.

On the surface, all these teachings appear to undermine the significance of morality and moral striving—indeed, of the very retributive order these faiths have affirmed—and it is true that, at one time or another, teachings such as these have been taken to antinomian conclusions. But religious thinkers or traditions advancing such “transmoral” ideas often seem to have the opposite intent: namely, to free conscientious and morally committed individuals from the last vestiges of self-regard in order to make possible a spontaneous, joyful, and sincere moral life. Thus Paul, after stating his doctrine of justification through grace in *Romans* 5 and posing the rhetorical question “Shall we continue in sin that grace may abound?” (6:1), replies “By no means!” To draw an antinomian or immoralist lesson from this teaching, in Paul's view, would miss the point that it both presupposes and aims at devoted moral commitment.

Hindus and Buddhists are equally vehement in rejecting the idea that, according to their teachings, the religiously liberated person acts immorally. Liberation may take one beyond the moral order of *dharma*, but it is by no means the same thing as *adharma*, or lawlessness. On the contrary, attaining liberation requires a disciplined, righteous life as preparation; for most Hindu and Buddhist thinkers, furthermore, it issues in the most consummately moral existence. Precisely because the liberated person has put all vestiges of egoism behind, he has attained a state of mind where, without regard for personal benefit, he acts out of a free compassion for other beings. This is exactly the state achieved by Arjuna in the *Bhagavadgītā*. Perplexed over the terrible implications for himself and his kinsman if he performs his warrior's duty, Arjuna is unable to act until, in a series of religious encounters, he learns from Kṛṣṇa-Visnu that one's true self is not stained by moral good or evil. This instruction frees him to do his duty and thereby help sustain the cosmic-moral order. Far from being antinomian or immoral, therefore, this teaching of “detached action” (*niskama karman*), as Max Weber observed, is one of the loftiest achievements of Indian moral and religious thought.

CONCLUSION As far back as the historical record allows us to see, religion and morality have been intertwined. This collaboration has not always been fruitful. Such Western critics as Marx and Freud regarded the link between religion and morality as unfortunate. Among other things, they criticized it for producing immoral teachings (whether in the economic or sexual realms) and dubious or morally questionable eschatological schemes, for basing morality on fear of punishment, and for using doctrines of forgiveness for manipulative or immoral purposes. All these criticisms were valid, not just for Western religion in this late period but for all traditions at one moment or another in their history. Religions engage some of the most fundamental and most difficult questions of the moral life, and it is no wonder that their failure to deal adequately with these questions can have the most serious

consequences. In the effort to transcend narrow tribalism, for example, a religion can contribute to the reinsertion of tribal attitudes at an ever higher and more dangerous level.

Nevertheless, this critical word is not all that can be said. Religions, whether nonliterate or literate, characteristically emerge and develop in a process of intense dialogue with the requirements of the moral life. They elaborate codes of conduct, procedures for reasoning morally, and standards of virtue. To support commitment to the moral life, they help configure the world as a moral order. Finally, they are prepared to qualify or refine this order so as to permit anyone to attain the highest level of moral excellence. In all these ways, religious traditions have contributed to human moral development and self-understanding. Religion is not reducible to morality, as some nineteenth-century thinkers argued, because religions address a variety of human interests and concerns. Aesthetic propensities, historical or scientific curiosity, speculative and ritual tendencies—all find expression in religious faith. But no one can deny that moral concerns in their fullest sense have been a central aspect of religious life.

BIBLIOGRAPHY

Among the more important classical discussions of the relationship between religion and morality are Plato's *Euthyphro*, Thomas Aquinas's "Treatise on the Law" (*Summa theologiae*, 2.7.90–97), Immanuel Kant's *Critique of Practical Reason* and *Religion within the Limits of Reason Alone*, Søren Kierkegaard's *Fear and Trembling*, and John Stuart Mill's *Three Essays on Religion*. More recent discussions of the relationship between religion and morality include *Religion and Morality: A Collection of Essays*, edited by John P. Reeder, Jr., and Gene H. Outka (New York, 1973), W. G. Maclagen's *The Theological Frontier of Ethics* (New York, 1961), and W. W. Bartley II's *Morality and Religion* (New York, 1971).

Contemporary ethical theory comprises a large domain of views. Good, brief treatments of a number of basic issues can be found in G. J. Warnock's *The Object of Morality* (London, 1971), in William K. Frankena's *Ethics*, 2d ed. (Englewood Cliffs, N.J., 1973), and in Paul W. Taylor's *Principles of Ethics: An Introduction* (Encino, Calif., 1975). Among widely regarded contemporary rationalist approaches to normative ethical theory are Kurt Baier's *The Moral Point of View* (Ithaca, N.Y., 1958), John Rawls's *A Theory of Justice* (Cambridge, Mass., 1971), Bernard Gert's *The Moral Rules* (New York, 1970), and Alan Gewirth's *Reason and Morality* (Chicago, 1978). For treatments of some key moral issues related to religious ethics, see the collections *Ethical Relativism*, edited by John Ladd (Belmont, Calif., 1973), and *Supererogation: Its Status in Ethical Theory*, by David Heyd (New York, 1982).

Much Western thinking about the relationship between religion and morality has focused on the question of whether morality may be based on a divine command. Two recent collections gather together many of the classical and contemporary discussions of this issue: *Divine Command Morality*, edited by Janine Marie Idziak (Lewiston, N.Y., 1980), and *Divine Commands and Morality*, edited by Paul Helms (Oxford, 1981).

Unfortunately, while there are a number of good specific discussions of Christian, Jewish, Hindu, or Buddhist ethics, relatively little work has been done on the comparative analysis of religious traditions in a way comprising not just their specific normative teachings but also their doctrines of retribution and their fundamental ways of relating ethics to other features of the religious life. Two classic discussions in this area are Edward A. Westermarck's *The Origin and Development of the Moral Ideas*, 2 vols., 2d ed. (London, 1924), and his *Christianity and Morals* (1939; reprint, Freeport, N.Y., 1969). These works provide a wealth of information about the moral and religious beliefs of preliterate and literate cultures, though the moral perspective is colored by Westermarck's moral relativism. Even more systematic comparative discussion of specific traditions can be found in Max Weber's pioneering studies of 1915–1919: *Ancient Judaism* (Glencoe, Ill., 1952), *The Religion of India: The Sociology of Hinduism and Buddhism* (Glencoe, Ill., 1958), and *The Religion of China: Confucianism and Daoism* (Glencoe, Ill., 1951), all translated and edited by Hans H. Gerth and Don Martindale. More recent treatments of comparative ethics include my own study *Religious Reason* (Oxford, 1978) and David Little and Sumner B. Twiss Jr.'s *Comparative Religious Ethics: A New Method* (San Francisco, 1978).

MORAL THEOLOGY SEE CHRISTIAN ETHICS

MORAVIANS. The Moravian church, as the *Unitas Fratrum* (Unity of Brethren) is popularly known, is a Protestant denomination with roots in the fifteenth-century Hussite reformation and the eighteenth-century German Pietist movement. By the late nineteenth century, these influences had coalesced to give the denomination its contemporary form and character.

The Unity of Brethren was founded in March 1457 in Kunwald, Bohemia, as the *Jednota Bratrská* (Society of Brethren), but the issues behind this event stretch back more than a century. From the mid-fourteenth century there had been growing demands for reform within the Roman Catholic Church of Bohemia and neighboring Moravia. The reform movement was centered in the capital city of Prague and the newly established Charles University (1348). Persistent Waldensian influences as well as newer Wyclifite influences from England were evident in this movement.

The calls for reform finally found their most eloquent voice in Jan Hus, priest, university professor, and popular preacher. Although attracted to the doctrines of Wyclif, Hus claimed to advocate independently a return to apostolic simplicity in the church, and he vigorously attacked the lax morality of the clergy. As Hus's popularity increased, so did controversy about his ideas and his difficulties with the hierarchy. He was excommunicated by Pope John XXIII in 1411 but eventually appealed his case to the Council of Constance then in session. After his trial, deemed irregular by later historians, he was burned at the stake as a heretic on July 6, 1415.

Hus's death served to arouse his followers in Bohemia. His ideas soon became entwined with a developing Bohemian nationalism, and Hus himself became something of a folk hero. When civil war erupted, a series of unsuccessful crusades were launched, with the blessings of the papacy, in an attempt to subdue the heretics. Among the most ardent Bohemians, highly respected for their military zeal, were a group of radical religious and political reformers headquartered in the town of Tabor. Although they were destroyed as a separate party by the late 1430s, many of their religious ideas lingered on in the population. Bohemia's political situation would remain unstable for a century after Hus's death until 1526, when the crown was acquired by the Habsburg Ferdinand I.

Upheavals occurred also in the religious life of the Bohemians and Moravians as several groups claiming the heritage of Hus emerged alongside the Roman Catholic Church. One such group, the Utraquists, represented a conservative attempt at reformation, finally insisting only on the right of all believers to receive the bread and wine at Communion and continuing to hope for a reunion with a purified Roman Catholic Church. It was the Utraquist archbishop-elect Jan z Rokycan (c. 1390–1471) whose preaching inspired one of the founders of the Brethren, his nephew Gregory (d. 1474), to pursue more vigorously the goal of reformation.

Jan z Rokycan also introduced Gregory to the writings of the radical reformer Petr Chelčický (c. 1380–c. 1460).

Within ten years of the founding of their society, the Brethren felt the need to establish their own clerical orders to insure the efficaciousness of their ministry. They chose deacons, presbyters, and bishops from among their membership. One of the candidates was a former Roman Catholic priest, and some Waldensians may have participated in the establishment of the new orders. Modern historians see in these events an attempt by the Brethren to reconstitute the style of ministry of the New Testament church. Any attempt by the Brethren to claim apostolic succession as traditionally understood must be laid to a faulty reading of Waldensian history on their part. The orders established in 1467 have been carried on into the contemporary Moravian church.

The first decades of the Brethren organization were marked by sectarian characteristics including pacifism, rejection of oaths, communal organization, use of the titles brother and sister for all members, suspicion of advanced education, reluctance to admit members of the nobility to membership, and a preference for rural living. This trend was reversed under the leadership of Bishop Luke of Prague (c. 1460–1528), who succeeded in 1494 in having the works of Chelčický and Gregory reduced to nondogmatic status. The group gave up much of their exclusiveness and moved into the mainstream of society, though not without the defection of a conservative minority. The majority, although retaining a strict church discipline, grew rapidly. It has been estimated that by the 1520s there were from 150,000 to 200,000 members located in 400 congregations in Bohemia and Moravia.

Under the leadership of such bishops as Jan Augusta (1500–1572) and Jan Blahoslav (1523–1571), the Brethren maintained generally friendly contacts with Luther (who wrote favorably about them) and later with leaders of the Reformed churches. Although ecumenical in spirit and experiencing strong influences from first Lutheran and later Reformed theology, the Brethren maintained their own course. They structured their church with dioceses headed by bishops, abandoned clerical celibacy, and eventually accepted a general Reformed understanding of the sacraments of baptism and the Eucharist.

In worship, while ritual was simplified, the church year was retained and lay involvement encouraged through the publication of hymnals and the Czech-language *Kralitz Bible* (1579–1593) in six volumes with commentary. The church sponsored schools and encouraged the training of clergy in foreign universities.

Since their legal status was often in doubt, the Brethren endured periodic persecutions by the Utraquists and the Roman Catholics. But they continued to maintain their vitality and established congregations in Poland, which later merged with the Reformed church.

The involvement in political affairs of members who were of the nobility helped to bring about disastrous conse-

quences for the Brethren in the opening phase of the Thirty Years' War (1618–1648). With the defeat of the Protestant forces at the Battle of the White Mountain (1620), suppression of Protestantism in Bohemia and Moravia began. The events of this era are highlighted in the career of Bishop Johannes Amos Comenius (1592–1670), the renowned educational theorist. He spent much of his life in exile developing his reforms of education and despite several personal tragedies never lost his belief in the power of the educated mind to serve God's purposes for humanity.

The traditions of the Brethren survived in Bohemia and Moravia through secret meetings and the laxity of government officials in enforcing conformity. Sporadic contacts with Lutherans in border areas also helped to sustain morale.

A group of these secret Brethren were led in 1722 to the German estate of Count Nikolaus Zinzendorf (1700–1760) by the lay evangelist Christian David (1690–1751). There they established the village of Herrnhut. A creative theologian and gifted leader, Zinzendorf became the driving force behind the merger of the Brethren's traditions with the emphases of the Pietist movement.

After initial difficulties, the growing community experienced a series of unifying experiences in the summer of 1727, culminating in a service of Holy Communion on August 13. The fellowship now developed the unique characteristics that would mark its second phase. The residents were organized into residential groups based on age, sex, and marital status ("the choirs"). The intent was to foster spiritual experience appropriate to one's stage in life and to utilize the resources of a concentrated labor force. From Zinzendorf's Christocentric emphasis flowed a rich liturgical life with stress upon the Advent–Christmas and Holy Week–Easter cycles. The Moravian understanding of the joyous nature of the relationship between the believer and the Savior enabled them to develop education and the arts in his praise, sponsoring schools and producing musicians and artists of note. The Brethren's clerical orders were continued through new ordinations by the two remaining bishops in exile. Since the church developed a confederal form of government, however, the bishops became primarily spiritual leaders.

Worship was characterized by a simplified liturgical ritual that observed the festivals of the Christian calendar with particular attention to the Advent–Christmas and Holy Week–Easter cycles. Unique features included the singing of many hymns, with the minister clad in a surplice for the celebration of the sacraments of baptism and Holy Communion. The Lovefeast, patterned after the *agapē* meals of the early Christians, developed as a significant service. In it participants were served a simple meal as an expression of their fellowship with one another.

Under the leadership of Zinzendorf and his de facto successor Bishop Augustus Gottlieb Spangenberg (1703–1792), Herrnhut became the model for some twenty similar communities established in Europe, England, and the eastern

United States. These self-sufficient "settlement congregations" were to serve as the home base for two types of outreach developed by the Brethren.

Beginning in 1727 the Moravians sent forth members to serve in their "diaspora" through establishing Pietist renewal societies within existing state churches. This practice is supported by European Moravians today. In 1732, after Zinzendorf's presentation of the plight of the West Indian slaves to the community, the Brethren Leonard Dober (1706–1766) and David Nitschmann (1696–1772) went to Saint Thomas. By 1760 the Moravians had sent out 226 missionaries to the non-European world. This effort introduced into Protestantism the idea that missionary outreach is the responsibility of the whole church, brought the Moravians into significant ecumenical contacts, such as that with John Wesley (1703–1791) in Georgia and England, and helped shape the contemporary Moravian church.

By the mid-nineteenth century, the settlement congregations were given up as no longer viable and the towns opened to all who wished to settle in them. German and Scandinavian immigration to North America in the last century brought new Moravian congregations into being in the eastern and midwestern United States and western Canada. The end of World War II found Herrnhut and the older settlements in East Germany and, through the movement of refugees, a stronger Moravian presence in western Europe. Immigration continues to affect the Moravian church through the recent movements of Surinamese members to the Netherlands and Caribbean-area members to cities in England and North America.

The Moravians have also experienced constitutional changes as they have moved beyond their European origins. The British and American areas of the church gained independence from the German in the mid-nineteenth century, but the foreign missions continued under control of an international board that met in Germany until the end of World War I. Responsibility for the work was then divided among the European, British, and American areas of the church. A major constitutional change in 1957 resulted in the creation of the present seventeen autonomous provinces located in Europe, England, North America, Central America, and Africa, and the undertaking of educational work in India and Israel. The provinces constitute the Moravian Unity and send delegates to periodic meetings of the Unity Synod. The late twentieth century witnessed the rapid growth of the church in Africa and Central America. In America, the Moravian church did not experience significant growth until after the mid-nineteenth century. Earlier attempts at "diaspora"-style outreach had proved unsuited to America, since there was no religious establishment within which to work. Groups gathered by diaspora workers simply became congregations of other denominations. The retention of the exclusive settlement congregations until the 1840s also retarded outreach.

The church has continued to honor many of its traditions of worship and practice. While eschewing a formal dogmatic theological tradition of its own, it affirms the historic creeds of the Christian faith, continues to emphasize the believer's relationship with Christ, and to encourage fellowship among its members. Both men and women are ordained as pastors. The church's historical ecumenical stance is reflected in its participation as a founding member of the World Council of Churches and in the activities of the various provinces in regional councils of churches. Total worldwide membership in the late 1990s was around 720,000.

MORDVIN RELIGIONS SEE MARI AND MORDVIN RELIGION

MORMONISM. The religious movement popularly known as Mormonism encompasses several denominations

and sects, the largest of which is the Church of Jesus Christ of Latter-day Saints, which is headquartered in Salt Lake City, Utah, and had a worldwide membership of about twelve million in 2003. The second largest organization is the Community of Christ (formerly known as the Reorganized Church of Jesus Christ of Latter Day Saints) with headquarters in Independence, Missouri, and a membership of about 250,000. Perhaps the smallest of numerous Mormon splinter groups is the Church of Jesus Christ of Latter Day Saints (Strangite) in Burlington, Wisconsin—composed of followers of James T. Strang (1813–1856)—with about two hundred members. All of these churches trace their origins to founder Joseph Smith Jr. (1805–1844).

ORIGINS OF MORMONISM. Mormonism began in western New York in the 1820s, a time when the fires of the Second Great Awakening were sweeping across the "burned-over district," and America's most important nineteenth-century waterway, the Erie Canal, was being completed there. Such a mingling of spiritual and physical developments was a perfect expression of the symbiosis between evangelical religion and an emerging industrial order that radically transformed American society, leaving many Americans bewildered and confused. Among those passed by in the rush for progress was the family of Joseph and Lucy Mack Smith, who had left New England with their children in 1816 in search of better economic opportunities in western New York. They settled in the village of Palmyra, directly on the canal route. Though skeptical of the religious enthusiasms of the revivalists, the Smiths were persuaded of the need for religious affiliation. However, they found it difficult to make a choice among competing denominations. Their third eldest son, Joseph Smith Jr., was particularly confused in his search for the one true church. According to a later official church account, in the spring of 1820 the boy, aged fourteen, retired to a grove on his father's farm, where he prayed for divine guidance. In a vision he beheld two personages. One of these spoke to him, pointing to the other, saying "This is my beloved son, hear him!" He was told to join none of the existing denominations, for they were "all wrong."

As young Joseph matured, he had a number of subsequent visions and revelations that convinced him that God had chosen him as his instrument to restore the true church of Christ, which through the course of history had been corrupted by fallible and evil people. In preparation for this restoration, Smith was directed by an angel to unearth a set of golden records from a hill near his parents' farm. He then translated these records with divine aid and published them in 1830 as the *Book of Mormon*, a sacred history of three groups of pre-Columbian migrants to America, including the ancestors of some American Indian tribes. According to the *Book of Mormon*, Christ had visited the inhabitants of the Western Hemisphere after his crucifixion, taught the gospel, and instituted a church "to the convincing of the Jew and Gentile that Jesus is the Christ, the Eternal God, manifesting himself to all nations" (*Book of Mormon*, title page). Although accepted as scripture by believing Mormons, and

popularly called the Mormon Bible by nonbelievers, Smith regarded the *Book of Mormon* as a supplement rather than a substitute for the Bible.

Smith also believed that no scripture, ancient or modern, was sufficient for the restoration of the gospel. More than anything else, mankind needed divine authority to act in the name of God, an authority that had vanished after a great falling away in the early days of Christianity. This authority was restored in the spring and summer of 1829, when the powers of the priesthood of the early church—which included the authority to baptize and the gift of the Holy Ghost—were conferred upon Smith and his associate Oliver Cowdery by John the Baptist and the apostles Peter, James, and John. Smith now felt authorized to restore the church of Christ, which he officially organized under the laws of the state of New York on April 6, 1830, shortly after publication of the *Book of Mormon*. In 1838 the name was changed from Church of Jesus Christ to Church of Jesus Christ of Latter-day Saints.

Although the new religion initially met with skepticism and persecution, it succeeded in attracting a substantial following among restorationists, who saw in Mormonism the fulfillment of the awaited return of the true church of Christ led by a divinely ordained priesthood. Perhaps the most prominent and influential of these early converts was Sidney Rigdon (1793–1876), erstwhile associate of Alexander Campbell (1788–1866). Rigdon brought virtually his entire Ohio congregation over to the new religion, thus inducing Smith and most of his New York followers to establish a Mormon settlement in 1831 in Kirtland, Ohio. There Smith greatly amplified and broadened his theological and organizational principles in a series of revelations first published in 1833 as *A Book of Commandments* and later enlarged into the canonical *Doctrine and Covenants*. The Saints were enjoined to gather in communities as God's chosen people under an egalitarian economic order called the Law of Consecration and Stewardship and to build a temple that was, literally and symbolically, the sacred center of the community. Jesus, Moses, Elias, and Elijah then appeared to Smith and Cowdery in the temple in 1836. These revelations initiated a patriarchal order that harkened back to Old Testament traditions and established the nucleus of a kingdom of God in which the temporal and the sacred became indistinguishable.

These innovations—radical departures from traditional Protestantism—while attracting many new converts, strained the loyalty of some early Saints and also began to arouse the hostility of non-Mormons. When the Saints were forced to leave Kirtland in 1838, it was largely the result of internal conflict; however, as early as 1833 a Mormon settlement in Jackson County, Missouri, had to be abandoned because of persecution. When the Mormons were completely driven out of Missouri in 1839, it was primarily because of opposition to their kingdom. Internal conflict also intensified as Smith continued to move beyond his early restorationist impulse in favor of a kingdom of God that achieved

its fullest expression in Nauvoo. Founded in 1839 for refugees from Missouri, Nauvoo became Illinois's largest city in its day, with a population of about eleven thousand by 1844. It was a city under the full religious, social, economic, and political control of the Mormon kingdom. Much of this development was the result of the spectacular success of missionaries in Great Britain who, beginning in 1837, sent a steady stream of converts to the American settlements.

The success of Nauvoo may well have led Smith to overreach himself. He assumed the leadership of the Mormon militia and announced his candidacy for the presidency of the United States. Smith ostensibly made this gesture to avoid having to make an inexpedient choice between the Whigs and the Democrats, who attracted the majority of voters, but he was also imbued with the millennial belief that, if God wished him to become president and establish Mormon dominion over the United States, who would hinder him? The temple in the center of Nauvoo was much more Hebraic in design and ritual (with Masonic borrowings) than the one in Kirtland, which resembled a New England meetinghouse. Innovative doctrines and ordinances, such as baptism for the dead and especially plural marriage for time and eternity, with Smith and his closest associates secretly taking numerous wives, offended the religious sensibilities of many Saints, who believed they had joined a more traditional, more Protestant kind of Mormonism. Similarly controversial doctrines, such as belief in the preexistence of humans, metaphysical materialism with its attendant denial of the belief in creation *ex nihilo*, eternal progression, a plurality of gods, and the capacity for humans to achieve divinity through obedience to the principles of Mormonism, outraged not only nonbelievers but tested the faith of some of the more traditionally oriented Latter-day Saints. A group of alarmed anti-Mormons effectively capitalized on internal dissent and formed a mob that killed Smith and his brother Hyrum on June 27, 1844.

History has shown that the killers of the Mormon prophet were wrong in thinking that they had delivered a mortal blow to Mormonism. Although Smith's energy and genius started the new religion and kept it going in the face of nearly insurmountable external and internal opposition, a number of able leaders had been attracted to the young religion. They helped ensure its survival after Smith's death. As early as 1834, Smith had organized some of his most loyal lieutenants into a council of twelve apostles in restorationist emulation of the primitive church. In 1840, Brigham Young (1801–1877) became president of this powerful and prestigious group. In this capacity Young was sustained as leader by those Mormons who had unquestioningly accepted Smith's Nauvoo innovations. Most of those devotees followed Young to the Rocky Mountains, while most of the more traditional Saints, who rejected plural marriage and kingdom building, remained in the Midwest. In 1860, Smith's son Joseph Smith (1832–1914) became president of the Reorganized Church of Jesus Christ of Latter Day Saints,

which established its headquarters in Independence, Missouri.

SETTLEMENT IN UTAH. Young's advance pioneering party arrived in the valley of the Great Salt Lake in July 1847 and immediately began to survey a site for a city with a temple at the center. Aided by a steady stream of immigrants, Young built an inland empire, including Utah and parts of present-day Idaho, Wyoming, Arizona, Nevada, and California, which boasted a population of over 100,000 by the time of his death in 1877. A practical leader not given to visions and revelations, he insisted throughout his life that he was implementing the plans that Smith had been unable to realize fully in Nauvoo. Plural marriage, practiced secretly in Nauvoo, was publicly announced to the world from Salt Lake City in 1852. Most of the church leaders took numerous wives to set an example for their somewhat reluctant followers, and by the 1860s more than 30 percent of the Mormon population lived in polygamous households. Temporal government was placed in the hands of ecclesiastical leaders under the auspices of a political kingdom of God whose theocratic model was ancient Israel. An ambitious attempt to establish a Mormon State of Deseret failed, but home rule for the Mormons was only partly thwarted, as the federal government, under the Compromise of 1850, created the Utah Territory with Young as governor.

In 1857, however, President James Buchanan (1791–1868) felt compelled to act on reports by territorial officials, who had accused Young and his followers of disloyalty to the United States and of immoral polygamous liaisons. The president sent an expeditionary force of the U.S. Army to Utah to prove to a reform-minded North that the Democrats were at least against one of the “twin relics of barbarism” (meaning slavery and polygamy), whose elimination had been the rallying cry of the Republican Party platform in 1856. “Buchanan’s blunder,” however, did not gain him any political advantage and ended in a negotiated settlement. Although Alfred Cumming, a non-Mormon, was officially installed as the new governor, the Mormons regarded Young as *de facto* governor of Utah. Nevertheless, the handwriting was on the wall for Young’s Mormon kingdom; further government attacks on polygamy and the political kingdom were delayed only by the Civil War. Beginning in the 1870s, the U.S. Congress exerted increasing pressure on the Mormons, who in 1890 were forced to relinquish polygamy and the political kingdom as the price of their religion’s survival. Mormon president Wilford Woodruff (1807–1898) issued a manifesto disavowing any further sanctioning of plural marriages by the church, symbolizing the passing of an era and the beginning of the reconciliation of Mormonism with the world—a transformation reinforced by a “second manifesto” issued by church president Joseph F. Smith (1838–1918), a grandnephew of the founding prophet, in 1904.

MODERN MORMONISM. Throughout most of the nineteenth century, Mormonism had been an antimodern, antipluralist religious movement in a modernizing, pluralistic world. The

latter was represented perhaps most significantly by the symbiosis between evangelical religion, entrepreneurial capitalism, and political pluralism. Religion, like politics, had become a commodity in the free marketplace of ideas and beliefs. Democrats and Whigs might disagree about means but not about ends. The same was true of Protestant religious denominations, who agreed that ultimately they would all arrive at the same truth, if by different routes. This was a world alien to Smith and most of those who became Mormons. Smith’s original quest, which had sent him to pray in his father’s grove, was for the one true church. Because truth ultimately could not be divided, “correct principles” also applied to economics, society, and government—principles that were incompatible with an emerging, competitive, capitalist American society. Here then was a fundamental source of conflict between the Saints and their adversaries, in which the former were sustained by their millennial expectations of the near advent of their Savior and the eventual triumph of the kingdom of God over its enemies.

When the Saints voted on October 6, 1890, to accept Woodruff’s manifesto, they may not have perceived the full significance of their decision. Yet this event was a watershed in Mormon history, as the Saints then had to jettison some of their most distinctive institutions and beliefs: economic communitarianism, plural marriage, and the political kingdom. Mormons now followed their erstwhile evangelical adversaries into the pluralistic American cultural mainstream, joining what the historian Martin Marty has called “a nation of behavers.” In search of new boundaries and symbols of identification, the Mormons, much like the evangelicals, placed greater emphasis on strict codes of behavior: abstinence from alcohol, tobacco, tea, and coffee; acceptance of regulated dress norms; and more intensive monitoring of sexual morality. These codes reflect the very values that had aided nineteenth-century evangelicals in their adaptation to an emerging capitalist industrial order requiring work discipline that was effectively sustained by internalized behavioral norms. Nevertheless, the question of how close modern Mormonism has moved to the Protestant mainstream remains controversial. In spite of Mormon protestations to the contrary, major conservative evangelical groups continue to reject the Mormon claim to be Christian.

In any case, Mormons found modern values congenial in their own adaptation to a competitive, individualistic social and economic order. They prepared the rising generation to meet this change not only through the family but also through a growing number of church auxiliaries: primary associations for the very young, young men’s and women’s organizations, Sunday schools, priesthood quorums, and women’s auxiliaries. Such institutions were all designed to keep Mormons active in their church from the cradle to the grave, while at the same time allowing them to become productive members of the larger American society. Religion thus became a springboard for social and economic success in the world (though not intentionally so), which was further

facilitated by the Mormons' increasing commitment to education. In the early years of the third millennium CE some fifty thousand Latter-day Saints (LDS) attended church-sponsored institutions of higher learning, such as the flagship Brigham Young University as well as church colleges in Idaho and Hawai'i. Many thousands more studied at secular universities throughout the United States and the Western world, receiving religious instruction at LDS institutes adjacent to such campuses. Mormons serve in prominent positions in the federal government, in the military, in major business corporations, and in major universities.

Many of these Mormons are third- to fifth-generation Latter-day Saints who have a strong cultural identification with their religion that is enhanced by closely-knit family ties. The strong Mormon emphasis on family solidarity finds theological and institutional expression in the belief in the eternal nature of the family when family ties have been solemnized within the sacred precincts of the temple. Temple ordinances, conducted not only for the living but also vicariously for the dead, are intended to bind families and ultimately the entire human race through sacred covenants. Only those Mormons who observe their religion's strict rules of conduct are allowed to enter the temple and participate in these ordinances and rituals. Temples, then, are not ordinary church buildings but are regarded as special edifices and are found only in major population centers. There are more than a hundred of these in various parts of the world. Meetinghouses, on the other hand, are functional buildings where congregations of several hundred members hold simple worship as well as social and athletic events—all open to non-Mormon visitors. Often two congregations share one building.

Modern Mormonism has succeeded in extending its appeal to members of diverse racial, social, and cultural backgrounds around the world. Missionaries who serve the church at their own expense for two years (mostly young men and women of college age) are increasingly successful in attracting converts in Asia, Latin America, and Africa. Many of these converts are attracted by a lay church that offers active participation to all of its members and provides an instant, socially cohesive group whose authoritarian male leaders set boundaries while providing recognition for behavior that conforms to group standards. Many converts are especially drawn to the Mormon family ideal.

This rapid expansion of Mormonism beyond its traditional culture region as it becomes a world religion brings with it some potential for conflict. Some multigenerational Mormons are apprehensive about the erosion of traditional symbols, such as architecture, in favor of a generic utilitarian building style. Others see this as a necessary accommodation of their religion to the cultural needs of new converts. Prophet President Spencer W. Kimball's 1978 revelation extending the lay priesthood to all Mormon males, irrespective of race or color (blacks had been denied the priesthood prior to that date), can be seen as a clear message indicating recognition

of the need for major change. This is not to say, however, that tradition had suddenly lost its hold on a conservative hierarchy. Rather, it could be said Mormonism is cautiously backing into the future. A telling example of continuing conservatism is the persistent opposition to changes in the role of women, who are admonished to remain at home to raise children while partaking of the priesthood only through the male heads of families. (By contrast, the Community of Christ, which had never withheld the priesthood from blacks, announced that women were eligible for ordination to the priesthood.) This emphasis on "family values" is also reflected in continuing resistance to tolerance of homosexuality. At the same time, while not condoning abortion, Mormon leaders are less visible in their opposition than the Catholic hierarchy. They have also refrained from getting involved in the public controversy over stem-cell research, having adopted a wait-and-see attitude. Thus, if their history is a reliable guide to the future, the Mormon hierarchy in Utah will not allow its conservatism to hinder the progress of the Church of Jesus Christ of Latter-day Saints in the twenty-first century.

BIBLIOGRAPHY

For more than a century, studies of Mormonism were highly polemical, divided by a simple dichotomy between believers and nonbelievers. The first sophisticated modern study of Mormonism was by the Catholic sociologist Thomas F. O'Dea, *The Mormons* (Chicago, 1957). For factual detail, a comprehensive and reliable scholarly account is James B. Allen and Glen M. Leonard, *The Story of the Latter-day Saints* (Salt Lake City, Utah, 1976). An interpretive synthesis from a scholarly Mormon perspective is Leonard J. Arrington and Davis Bitton, *The Mormon Experience: A History of the Latter-day Saints* (New York, 1979). An informative and evenhanded interpretation from a non-Mormon perspective is Richard N. Ostling and Joan K. Ostling, *Mormon America: The Power and the Promise* (San Francisco, 1999). A scholarly history of the Reorganized Church and the Community of Christ is Richard P. Howard, *The Church through the Years*; vol. 1: *RLDS Beginnings, to 1860*; vol. 2: *The Reorganization Comes of Age, 1860–1992* (Independence, Mo., 1992–1993). This should be supplemented by Alma R. Blair's "Reorganized Church of Jesus Christ of Latter Day Saints: Moderate Mormonism," in *The Restoration Movement: Essays in Mormon History*, edited by F. Mark McKiernan, Alma R. Blair, and Paul M. Edwards (Lawrence, Kans., 1973), pp. 207–230. For a perceptive discussion of the problems associated with modernization, see Armand L. Mauss, *The Angel and the Beehive: The Mormon Struggle with Assimilation* (Urbana, Ill., and Chicago, 1994). Klaus J. Hansen, *Mormonism and the American Experience* (Chicago, 1981), attempts to place Mormonism in the broader context of American culture. Jan Shipps's *Mormonism: The Story of a New Religious Tradition* (Urbana, Ill., 1985) is written from the perspective of a sympathetic non-Mormon scholar; hers is a successful attempt to transcend the polemical dichotomy.

KLAUS J. HANSEN (1987 AND 2005)

MORRISON, ROBERT (1782–1834), first Protestant missionary to China. Morrison was born in Morpeth, Northumberland, England, on January 15, 1782, of humble Scottish parentage. At an early age he became an apprentice to his father in making wooden boot trees. During these years he joined the Church of Scotland (1798) and soon began studying Latin, Hebrew, and theology. In 1802 he entered the Congregational Theological College at Hoxton (now Highbury College). His Christian upbringing and studies inclined him toward missionary service and in 1804 he offered himself to the London Missionary Society, which, though not yet ten years old, was beginning to prepare workers for China. Morrison spent the next two years at the Missionary College at Gosport. While there he began an intensive study of the Chinese language using a Chinese tutor and a Catholic translation of part of the New Testament into Chinese kept in the British Museum.

Shortly after his ordination on January 8, 1807, Morrison began making final arrangements for his departure for China on January 31. Because the British East India Company (BEIC) was hesitant to promote Protestant missions to China at that time, Morrison could only gain passage to New York. After receiving a personal written recommendation from James Madison, the American secretary of state, to the American consul in China, he set sail from New York and arrived in Canton on September 7, 1807.

Upon arrival, Morrison found the English-Chinese political situation tenuous. The propagation of Christianity was prohibited by the reigning Ch'ing dynasty. The Missionary Society knew this and had instructed Morrison not to preach openly but rather to concentrate on learning Chinese and to make the necessary preparations for publishing religious literature that would be used for long-range evangelism. Morrison stayed in various Western trade houses in Canton, where he assumed Chinese dress and dietary customs while studying the language with two Roman Catholic Chinese. Pressure from the government, however, eventually forced him to seek refuge in Portuguese Macao, where he stayed for one year with an English family, marrying their oldest daughter in 1809. During that same year he became employed by the BEIC as an interpreter. Having thus been able to acquire permanent residency, Morrison began to turn his efforts to ways in which to propagate the gospel. Realizing that under the current circumstances literature was virtually the only open avenue, he focused his attention on the printed word. The BEIC provided invaluable assistance at this point by allowing Morrison to use their press. His works were prolific and diverse: in 1810, his translation of *Acts* became the first portion of scripture translated into Chinese by a Protestant missionary; *Luke* (1812); the New Testament (1814); a Chinese grammar (1815); *A View of China for Philological Purposes* (1817); the entire Bible (written in 1818, published by 1823, 21 vols.); his magnum opus, a Chinese-English dictionary (3 vols., 1815, 1822, 1823); and catechisms (1812) as well as portions of *The Book of Common Prayer* (1833).

Morrison's wife died in China in 1822. He returned to England in 1824 and became a well-received lecturer able to generate interest for Chinese missions. Shortly before returning to China in 1826, Morrison married Eliza Armstrong.

Morrison witnessed his first Chinese baptism on July 16, 1814. After twenty-five years, his Society co-workers and he had baptized only ten individuals. Yet, in spite of difficulties that he encountered in his work, Morrison succeeded in laying down a foundation for others who were to follow. William Milne (1774–1822) came with his wife to assist Morrison in 1813 and was instrumental in helping translate and publish the Chinese Bible. Later, building upon Milne's school for Chinese established in Malacca (1816), Morrison founded the Anglo-Chinese College (1818). The purpose of this institution, besides providing a context for evangelism, was to establish reciprocal cultivation and respect of Chinese and European culture, language, and literature.

For his efforts, Robert Morrison was awarded an honorary degree from the University of Glasgow (1817); he became a Fellow of the Royal Society in 1824. After his death in Canton on August 1, 1834, his eldest son, John Robert Morrison (1814–1843), succeeded his father as Chinese secretary and interpreter for the British authorities in Canton.

BIBLIOGRAPHY

The principal archival sources are those of the London Missionary Society and the Morrison Library (and related collections) at the University of Hong Kong.

A primary source for any study of Robert Morrison is the two-volume *Memoirs of the Life and Labours of Robert Morrison* (London, 1839), compiled by his widow, Eliza, and published five years after his death. It is the main published authority for Morrison's life and contains much firsthand material. Also included are critical notices of his Chinese works as well as an appendix of original documents. Before the turn of the century William Townsend published a biography, *Robert Morrison, the Pioneer of Chinese Missions* (London, 1888). Later, more comprehensive works appeared such as Marshall Broomhall's *Robert Morrison: A Master-Builder* (New York, 1924), which has a list of his publications, and more recently a study with a more limited focus, Lindsay Ride's *Robert Morrison: The Scholar and the Man* (Hong Kong, 1957).

K. S. Latourette, in *A History of Christian Missions in China* (New York, 1929), reviews Morrison's work in the context of overall Protestant missions, as does Suzanne W. Barnett's article "Silent Evangelism: Presbyterians and the Mission Press in China, 1807–1860," *Journal of Presbyterian History* 49 (Winter 1971): 287–302.

PAUL V. MARTINSON (1987)

MORTIFICATION. The term *mortification* derives from the church Latin *mortificare* ("to put to death"), a term that appears several times in the Latin New Testament. In the *Letter to the Romans*, Paul counseled the early Christians,

“if you live according to the flesh you will die, but if by the Spirit you put to death [*mortificetis*] the deeds of the body you will live” (8:13). In the *Letter to the Colossians* the Christian is exhorted: “Put to death [*mortificate*] what is earthly in you: fornication, impurity, passion, evil desire, and covetousness, which is idolatry” (3:5). This “mortification of the flesh” was intimately connected with the “mortification” of Jesus Christ, that is to say, with his crucifixion. According to Paul, Christians carry this death (*mortificatio*) of Jesus in their bodies so that the life of Jesus might also be manifest in them (2 *Cor.* 4:10). All who belong to Christ have “crucified” the flesh with its passions (*Gal.* 5:24). The Christian notion of mortification thus derives from this originally Pauline ideal of participation in the passion of Christ through the putting to death of the inordinate desires of the flesh. This ideal was exemplified by the early martyrs, and when the persecutions eventually came to an end mortification began to function as a sort of self-imposed martyrdom. Thus the adoption of practices of mortification made it possible for future generations of Christians, living in more or less settled times, to recapture some of the self-sacrificing intensity of the early church.

In the general history of religions the term *mortification*, despite its specifically Christian origins, may be extended by way of analogy to refer to a wide variety of practices that aim at the religious transformation of the individual through specific forms of bodily discipline, often entailing a degree of actual physical pain or suffering. Mortification is to be distinct from asceticism in that it is one of the latter’s possible components. The term *asceticism* usually refers to a general regimen or way of life that may or may not include specific forms of mortification. Indeed, if mortification is understood as involving the deliberate infliction of actual physical suffering, then it may be altogether absent from some forms of ascetic life, such as that practiced in Buddhism.

For the sake of the following exposition I will distinguish two general types of mortification: the ascetic type, which is more or less integrated into a general form of religious life (and may include, for example, the wearing of rough or inadequate clothing), and the initiatory type, which is occasioned by specific ritual initiations and is more likely to involve the temporary infliction of pain.

ASCETIC MORTIFICATION. In Christianity, mortification usually has been an element in a more general practice of the ascetic life. Among its most extreme forms are self-flagellation and the wearing of a hair shirt. Flagellation is intended to reproduce the scourging of Christ, while the hair shirt, an ancient penitential symbol, can function as a kind of continuous flagellation. The semantic history of the hair shirt is informative. Originally it was simply a garment made of very rough cloth. In the *Book of Daniel* (9:3) the wearing of rough cloth garments is associated with fasting and with strewing ashes on one’s head in order to entreat God. In the *Gospel of Matthew* (11:23), such garments are associated with strewing ashes on the head as a sign of conversion. In primi-

tive Christianity they were the dress required of catechumens; from the fourth century on they were adopted by monks as a means of mortification. In the sixteenth century the name *hair shirt* was given to what was really a scourge worn as a belt against the naked flesh, the rope made more painful by being knotted or by the addition of metal nails. This type of hair shirt was first used by certain mendicant orders and became a form of private mortification.

These and other less extreme forms of mortification, such as fasting, could be used as means of individual penance for particular sins or as a more general form of asceticism associated in particular with the monastic orders. In both cases mortification was ideally intended to have a transformative effect, aiding in the transition from a life devoted to the gratification of the desires of the body to a higher, sanctified life in the spirit.

The forms of mortification that one finds in various Hindu religious traditions also aim at a radical transformation of the practitioner, but there is a marked difference in the attitude taken to the suffering that this entails. Whereas in the Christian tradition, the suffering is connected with the sufferings of Christ as an *imitatio Christi*, in Hinduism the suffering lacks this positive aspect and is used negatively as an inducement to rise above the human condition. The practices of Yoga, for instance, aim primarily at the suppression of suffering or at the cultivation of an attitude of complete indifference to it. In itself the suffering involved in mortification has no positive religious significance. The ideal is to reach a state of detachment that is in many respects similar to the Stoic ideal of *apatheia* and is thus quite different from the intense involvement implied in the notion of the *imitatio Christi*.

Buddhism is quite similar in this regard, although the Buddhist ideal of the Middle Way served to moderate some of the more extreme forms of mortification found among the ascetics of the Buddha’s day. The Buddha’s own engagement in mortification led him to death’s door before he renounced such extreme practices. To the extent that the idea of mortification implies immoderation it cannot be accepted as a Buddhist ideal. Nevertheless, Buddhist ascetic practices may still be regarded as forms of mortification to the extent that they aim at the cessation of *samsāra*, the cycle of life.

INITIATORY MORTIFICATION. In a wide variety of archaic religious traditions mortification occurs in the context of initiation rituals. In some of these cases, practices of mortification seem intended symbolically to assimilate the initiate into a deathlike condition that is to precede an initiatory rebirth. Such practices thus place the initiate temporarily outside of the normal human order. The practices include a number of temporary dietary restrictions, ranging from fasting to complete abstinence, and various forms of imposed deprivations, such as deprivation of water and of sleep. This may also be the motivation behind several practices designed to test the initiate’s endurance of extremes of heat and cold.

The keeping of watches and vigils is widespread. Such practices have been attested to among the Andaman Islanders and peoples of New Guinea (the Siana), Africa (the Venda), and South America (the Ocaina). Deprivation of sleep, food, and drink seem to be ways of symbolizing death: the dead do not eat, drink, or sleep.

Other forms of mortification associated with initiation rituals are more difficult to interpret. A number of practices of a punitive character, such as flogging, for one reason or another form an integral part of the initiation process. Some involve torture, such as the practice of biting the initiate's head through to the bone (Australia) or that of hanging the initiate from a rope that passes through a hole made between the muscle and the shoulder bone (as among some Plains and Northwest Coast tribal groups of North America).

Ritual forms of abuse are usually interpreted as endurance tests, an interpretation at times suggested by the requirement that the painful ordeal be undergone without complaint lest the rite be invalidated. But there are also cases in which the initiate is not forbidden to cry out, and even cases in which a cry of pain must be heard by those who are present. If, when faced with such cases, we refuse to characterize such ritual abuses as purposeful (for example, as tests of endurance), all that remains is to characterize them as expressions of violence. Violence may serve to separate the initiate from his earlier natural state (the infantile) and to introduce him to the social status of an adult. It is violence of this sort that the smith, a common initiator among many African peoples, exerts upon the natural elements in order to transform them into the tools of culture, through a kind of symbolic mortification. Violence may have a similar purpose in rituals of initiation. In the ritual hanging mentioned above, for instance, the initiate is made to spin around as he hangs until he faints. This loss of consciousness, which is precisely the attainment of a state similar to death, may well be the final goal of this rather grim form of mortification.

In general, however, violence is of secondary importance; it is not strictly required in order to act out an initiatory death. In some cases symbolic death may be achieved merely by conducting funeral rites over the initiate or over something that represents him. The initiate may be mourned, spoken of as deceased, subjected to a fake interment, or in other ways treated like a corpse.

Initiatory forms of mortification that involve the creation of a symbolic state of death may also be detected in baptismal rites that call for the complete immersion of the initiate. The passage from impurity to purity implies not only a rebirth but also a death of the old condition. Immersion in water may signify a mortification through a reimmersion in the primordial waters of chaos prior to rebirth. From this perspective, one can say with Mircea Eliade (1958) that the same logic has produced both baptismal rites and myths of inundation, both involving initiatory forms of mortification endowed with cosmic significance.

MORTIFICATION OF THE KING. There is a cosmic dimension as well in the "mortification of the king," a rite of periodic cosmic renewal. In Babylonia, this annual ritual consisted merely of stripping the king of his regal insignia, slapping his face, and pulling his ears. However, as James G. Frazer argued in *The Golden Bough*, this seemingly harmless "mortification" may be merely a survival of an earlier practice in which the king was actually put to death.

The practice of the mortification of the king recalls the passion of Christ, who was crucified with the title *Rex Judaeorum*: Christ "mortified" as a worldly king so that he could rise again as the heavenly king. The death of Christ also marks the end of a cycle and the initiation of a new order. It is in this death that the Christian participates, both through the initiation of baptism and through the practice of mortification. The initiatory type of mortification, though not prominent, is nevertheless discernible in Christianity in a somewhat attenuated form. This is but one indication that the types of ascetic and initiatory mortification that I have presented here need not be viewed as mutually exclusive.

As a final note, it is interesting that the expression "mortification of the king" (*mortificatio regis*) appears in the literature of alchemy as one of the most frequent symbols of the disintegration of matter. Interpreted spiritually, this *mortificatio regis* is a part of what Renaissance alchemists called the "saving Christian mystery." Meditation on the *mortificatio regis*, therefore, was comparable to meditation on the *mistero doloroso* of the passion of Christ in the Catholic practice of the recitation of the rosary.

BIBLIOGRAPHY

No specific bibliography exists. The reader is referred to the bibliography of *Asceticism* for sources of more information about mortification of the ascetic type and to the bibliographies of the articles on *Initiation* for sources of more information about the initiatory type. Also, for the latter category, see especially Mircea Eliade's *Birth and Rebirth: The Religious Meaning of Initiation in Human Culture* (London, 1958), which places initiatory mortification in the general dialectic between the precosmic and the cosmic. Following this same exegetical line, Eliade's *The Forge and the Crucible: The Origins and Structures of Alchemy*, 2d ed. (Chicago, 1978) discusses the smith as "maître d'initiation" and offers an introduction to the alchemist's mystical theology of *mortificatio*. For a historical overview of the "mortification of the king," see my *Il mito, il rito e la storia* (Rome, 1978), pp. 329–477.

Revised Bibliography

MOSES (c. thirteenth century BCE, but date uncertain), or, in Hebrew, Moshéh, was the leader of the Hebrews in the Exodus from Egypt and giver of the Law at Sinai. Tradition regards Moses as the founder of Israel's religion—the mediator of its covenant with God (Yahveh) and its cultic institutions.

HISTORICITY OF MOSES. Any discussion about the historicity of Moses is entirely dependent upon an evaluation of the biblical account of his life and activity. There are no extant records from Egypt that make any reference to him or to the Exodus. Yet most scholars believe that a person named Moses existed and had a connection with the events of the Exodus and the wilderness journey as described in the four biblical books from *Exodus* to *Deuteronomy*. But there is little agreement about how much can be known about Moses or what role he played in the events, because the biblical accounts have been modified and embellished, and Moses' place in some of the traditions may be secondary.

The one point that seems to argue for regarding Moses as historical is his Egyptian name. An explanation of the name *Moses* that few would dispute is that it derives from the Egyptian verb *msy* ("to give birth"), a very common element in Egyptian names. This verb is usually combined with the name of a god (e.g., *Re*, as in *Remesses*, i.e., *Ramses*), and the shortened form, *Moses*, is in the nature of a nickname. But whether in the long or short form, the name is common in Egypt from the mid-second millennium onward. None of the persons in Egyptian historical records bearing the name Moses can justifiably be identified with the biblical Moses, and to do so is quite arbitrary. The only argument for historicity to be derived from Moses' Egyptian name is its appropriateness to the background of Israel's sojourn in Egypt. Other examples of Egyptian names occur among the Israelites, particularly within the ranks of the priests and Levites. Such names may have survived in Canaan at sanctuaries and urban centers from the time of Egyptian control of the region in the Late Bronze Age.

A name by itself, however appropriate to the time and events described, does not make a historical personality. The various elements of the Exodus story do not correspond with known Egyptian history, and historians have usually set about reconstructing the events to make a better fit between the Bible and contemporary records. For instance, the presence of numerous Asiatic slaves in Egypt during the eighteenth and nineteenth dynasties (1550–1200 BCE) was not the result of an enslavement, out of fear and hatred, of a specific people already resident in Egypt, as pictured in *Exodus*. Slaves were brought into Egypt in large numbers as prisoners

of war from many different peoples and social classes and were dispersed throughout Egypt to serve in many different capacities. Many Asiatics became free persons within Egyptian society and were found at various levels of rank and status. The nineteenth dynasty in particular was one of great assimilation of Asiatic religion and culture in Egypt. Furthermore, while bedouin were allowed certain grazing rights in the eastern Delta, there is no suggestion that they were enslaved or made to do menial labor. Nothing in the Egyptian records suggests any acts of genocide or any distinct group of state slaves resident in the eastern Delta.

None of the pharaohs in *Exodus* is named, but the reference in *Exodus* 1:11 to the Israelites' building the store cities of Pithom and Ramses is enough evidence for many to date the events to the nineteenth dynasty. Yet Pithom (Tell el-Maskhuta), in the Wadi Tumilat, was not built until the end of the seventh century BCE, and the reference to Ramses and the "land of Ramses" hardly suggests the royal residence. The name *Goshen*, as the region where the Israelites were said to reside, is known only from the latest geographic texts. The few specific names and details, therefore, do not point to a particular period of Egyptian history, and scholars differ on the dating and background of the Exodus precisely because so many details must be radically redrawn to make any connection possible. The quest for the historical Moses is a futile exercise. He now belongs only to legend.

LITERARY TRADITION. The traditions about Moses are contained in the Pentateuch from *Exodus* to *Deuteronomy*, and all other biblical references to Moses are probably dependent upon these. The view of most critical scholars for the past century has been that the Pentateuch's presentation of Moses is not the result of a single author but the combination of at least four sources, known as the Yahvist (J), the Elohist (E), Deuteronomy (D), and the Priestly writer (P), and composed in that order. The existence of E as a separate work from J has long been disputed; at best it is very fragmentary. It is best to treat J and E as a single corpus, JE, as will be done below. The usual dating for these sources places them in a range from the tenth to the fifth century BCE, although there is a strong tendency, which the author of this article supports, to view D (from the seventh century) as the earliest work, JE (from the sixth century) as exilic, and P (from the fifth century) as postexilic. This would account for the fact that so little is made of the Moses tradition outside of the Pentateuch.

Whether one adopts the older scheme or the later date for the Pentateuchal sources, a long period of time separates any historical figure from the written presentation of Moses in the Bible. To bridge this gap one is faced with evaluating the diversity of traditions within the Moses legend and with tracing their history of transmission prior to their use by the later authors, as well as with considering the shape and color the authors themselves gave to the Moses tradition as a reflection of their own times and concerns. The history of the pre-literary tradition has occupied a lot of attention but with few

convincing results because it is so difficult to control any reconstruction of the various stages of oral tradition. One is therefore left with an examination of the traditions about Moses in their present literary forms within the larger context of the Hebrew scriptures.

Moses as deliverer from Egypt. The general background for the deliverance of the people through Moses is the theme of the oppression and enslavement in Egypt. This theme of Israel's oppression is often mentioned elsewhere in the Hebrew scriptures as the condition of the people from which God "redeemed" them, often without any reference to Moses (note, e.g., *Ez.* 20). The Pentateuch continues to stress God as deliverer but now makes Moses the human agent.

Within the tradition of enslavement the JE writer introduces a special theme of attempted genocide (*Ex.* 1:8–22), which provides the context for the story of Moses' birth and his rescue from the Nile by the Egyptian princess (*Ex.* 2:1–10). But once this story is told, the theme of genocide disappears, and the issue becomes again that of enslavement and hard labor. The story of Moses as a threatened child rescued from the basket of reeds and reared under the very nose of Pharaoh to become the deliverer of his people corresponds to a very common folkloric motif of antiquity. Similar stories were told about Sargon of Akkad and Cyrus the Persian. However, Moses' initial attempt at deliverance (*Ex.* 2:11–15), whereby he kills an Egyptian for beating a Hebrew, is antiheroic because it ends in failure and leads only to his flight to the land of Midian, where he becomes a shepherd (*Ex.* 2:16–22, 3:1). This prepares the way for the author (JE) to present Moses as a most unheroic leader, totally dependent on the divine word from Yahveh for each action he takes.

The story of Moses' experience of the burning bush theophany at Sinai/Horeb, in the land of Midian (*Ex.* 3–4), has all the marks of a new beginning. It resembles that of the prophetic-call narratives in which the prophet experiences a theophany and then is given his commission (*Is.* 6, *Ez.* 1–3). Moses' protest is similar to that of Jeremiah in his call (*Jer.* 1:6–10), but the author in *Exodus* develops it into an elaborate motif. At the same time Moses' call bears some resemblance to the commissioning of a military leader whose task it is to deliver his people from oppression (*Jgs.* 6, *1 Sm.* 9). But Moses is not given the task of being a military leader, nor are the signs he receives meant to give him confidence of victory. The primary concern in the dialogue between Moses and Yahveh is in Moses' role as a spokesman whom the people will believe and who can speak on behalf of the people to the foreign ruler. The author (JE) has drawn upon both the tradition of classical prophecy and the literary history of Gideon and Saul to fashion his rather composite presentation of Moses' call and commission as Israel's deliverer.

The plague stories (*Ex.* 7:14–11:10) carry out the image of Moses as deliverer through the prophetic word of judgment and salvation. But they also add the element of the

prophet as a wonder-worker similar to Elijah and Elisha. Yet in the plagues tradition the wonders are all carefully circumscribed by divine commands so that Moses and Aaron—aside from a slight gesture—are almost completely passive and unconnected to them (see also *Ps.* 78:43–51, 105:26–36). The notion of the man of God as miracle worker has been largely absorbed by the view of the prophet as messenger and spokesman. The P writer, however, introduces the notion of a contest between Aaron and the magicians of Egypt (7:8–12). The plague stories as a whole are intended to emphasize the greatness and power of Yahveh and add very little to the Moses tradition.

The climax of Israel's deliverance is at the Red Sea (*Ex.* 13:17–14:31), and here again Moses' role is to announce judgment on the Egyptians and salvation for Israel. In the JE account Moses and Israel do nothing but witness the divine rescue, while in the P version Moses, at God's command, splits the sea with his rod to create a path for the Israelites and, again at divine command, makes the sea come back upon their pursuers. The effect is that the people fear Yahveh and believe in him and in his servant Moses. It is remarkable that except for one late addition to *Deuteronomy* (11:4) there are no references to the Red Sea event in this source even though the Exodus is mentioned many times. This suggests that the Red Sea episode is really secondary to the Exodus tradition. In its present form it constitutes a transition to the wilderness themes and to Moses' direct leadership of his people.

Moses as leader. Apart from an initial contact with Israel's elders in Egypt, which did not turn out very well (*Ex.* 5), Moses' direct leadership of the people begins only when they depart from Egypt. As their leader he is the one to whom the people complain about their hardships in the wilderness. But it is always God who meets their needs, with manna from heaven, or quails, or water from a rock. In the case of the people's complaints or rebellions, sometimes directed at Moses (and Aaron), God answers with judgment, and Moses must act as intercessor to mitigate the severity of the punishment. In all of this Moses is primarily a spiritual leader, a kind of prophetic mediator between the people and God with no other form of authority or legitimation.

Moses is also the supreme judge and head of the administrative functions of the wilderness community. In these capacities the tradition tells of two occasions in which Moses sets up civil institutions, one a system of courts for the purpose of sharing the judicial responsibility of the people (*Ex.* 18, *Dt.* 1:9–18) and the other a council of seventy elders for a sharing of the governance (*Nm.* 11:16–30). But these stories merely represent etiologies of later Israelite institutions. Moses' authority is his endowment of the prophetic spirit and the means by which God speaks and directs the people in every decision.

On a few occasions the Israelites are involved in military encounters, but Moses' role in these is very limited. In their fight against the Amalekites (*Ex.* 17:8–16) Joshua is the mili-

tary captain, while Moses raises his hands as if to receive divine aid. When Moses sends spies to survey the land of Canaan, it is Joshua and Caleb who play the major role in support of a military campaign and against the negative report of the other spies. When the people finally attempt a southern assault, Moses does not go with them, and they are defeated. In the campaign against the Midianites (*Nm.* 31 [P]) it is Phinehas the priest who takes charge of the army while Moses remains in the camp. In the campaign against Sihon and Og (*Nm.* 21:21–35, *Dt.* 2:24–3:11) Moses appears to lead the forces in the D account, but in JE he recedes into the background. Moses is not a military hero in these traditions.

Moses as lawgiver. The theme of Moses as lawgiver is more closely associated with the theophany at Sinai/Horeb (*Ex.* 19–20, *Dt.* 4–5), and with the prolonged stay at the mountain of God, during which the Law was given to Israel through Moses. Many scholars have argued that the giving of the Law at Sinai originated as a separate tradition. In many respects it represents a detour on the way from Egypt to Canaan and is parallel to another law-giving tradition, which is reflected in *Exodus* 15:25–26. But the matter is hotly debated and still unresolved.

Within the corpus of laws in the Pentateuch there is great variation of type and function reflecting different social settings and historical perspectives. Some of these laws represent the casuistic style of civil law used in the settled life of Israelite society in the land of Canaan. Others are apodictic commands that express universal principles of ethics and religion. There are also laws regarding cultic observances and regulations. Each category of law contains examples of parallel versions among the various Pentateuchal sources, and the law codes of the various sources can be correlated with certain periods of Israelite history. Thus the comparative study of the laws of the Pentateuch has become an important aspect of the study of Israel's social and religious history far removed from the wilderness period, which is their present narrative setting.

Nevertheless Moses has often been viewed as the author of the Ten Commandments. But the two forms, in *Deuteronomy* 5 and *Exodus* 20, are in the sources D and P respectively, and their language is so characteristic of D that there seems little reason to believe that they are any older than the seventh century BCE. Even in these two sources the “ten words” are said to have been given to the people directly without the mediation of Moses and only later written by the finger of God upon the two tables of stone. Furthermore, the JE corpus does not regard the Ten Commandments as a distinct series and has quite a different set of laws and instructions written on the two tables of stone (*Ex.* 34).

The JE corpus of laws in *Exodus* 20:22–23:33, usually designated as the Book of the Covenant (24:7), is a mixture of all types of law, religious and civil regulations, absolute principles of religion and ethics, and paraenesis. These are all given through Moses at one time on Sinai and constitute

the basis of the covenant between the people and their God (*Ex.* 24:3–8). Portions of the civil laws are generally regarded as quite old in origin and perhaps taken over from the earlier Canaanite society, but this corpus of laws in its present form derives from the exilic period. The Deuteronomic code (*Dt.* 12–26) is the body of instructions given to Moses *after* the Ten Commandments were proclaimed. The D code was delivered to the people in written form in the land of Moab as preparation for their entry into the promised land. In actual fact the code represents a cultic reform movement of purification and centralization of worship in the time of Josiah (c. 625 BCE). The Priestly code is primarily concerned with setting out an elaborate program of cultic regulations to form the basis for the cult of the Second Temple during the restoration. Its view of Judean society is strongly theocratic, with the high priest as the real head of state—hence the elevation of Aaron alongside of Moses. The P writer has much of this code revealed to Moses at Sinai (*Ex.* 25–31, 35–40; *Lv.*; *Nm.* 1–10), but some instructions are given during the remaining part of the wilderness journey. In P, Moses' role as the revealer and instructor in divine law is the most dominant.

For all the biblical writers the wilderness period was the constitutional age, the time of Israel's beginning. Whatever was most fundamental to Israelite society was deemed to have arisen in this period. And Moses as the leader, the prophet, the founder, was regarded as the one through whom all this came about. Modern historical criticism, however, has made the Moses tradition problematic by identifying its anachronisms and by dating its materials to later ages. While some scholars have tried to find some elements of the tradition, particularly within the Decalogue, that may go back to Moses, there are others who dispute that any of the laws and customs of the Pentateuch derive from Moses or the wilderness period.

MOSES AS THE FOUNDER OF ISRAELITE RELIGION. Many scholars believe that Moses is the founder of Israel's religion, at least in the form of a worship of Yahveh alone and, ultimately, in the form of monotheism. This position is based upon a number of arguments. First, the P source explicitly states (*Ex.* 6:2–3) that the name of Yahveh was not known before the time of Moses and that the forefathers worshiped God as El Shaddai. In *Genesis* there are also frequent references to forms of El worship among the patriarchs. Yet the JE corpus clearly regards the patriarchs as worshippers of Yahveh and the El epithets as merely titles for Yahveh. It is the P writer who has created a periodization of revelation out of the El references. The use of *El* as a designation for Yahveh becomes particularly frequent in the exilic period (see *Is.* 40–55) and says nothing about early Israelite forms of worship.

Second, in the call narrative of *Exodus* 3:13 Moses inquires about God's name and is given an answer that seeks to explain the name *Yahveh* (actually YHVH in the unvocalized Hebrew text) in terms of its supposed etymology from the verb *hyh* (“to be”). This could be interpreted as signifying that Moses introduced a new understanding of the name and

character of Yahveh and Yahveh's relations with his people. Yet this piece of dialogue is unrelated to anything else that follows in the tradition and has the character of theological speculation and interests in the author's own time. It tells nothing about Moses.

Third, the first and second commandments of the Decalogue emphasize the exclusive worship of Yahveh and an imageless cult. Those who attribute the Decalogue to Moses also use it as a basis for their view that Moses was the founder of monotheism. But it is unlikely that these laws predate the seventh century BCE. Archaeological evidence confirms the fact that as late as the eighth century BCE Yahveh was regarded by some Israelites as having a divine consort. At Kuntillat 'Ajrud, a Judean sanctuary in eastern Sinai, two inscriptions were found containing blessings "by Yahveh and his Asherah" (a female deity). One of these inscriptions was accompanied by a drawing of a seated female deity alongside two male divinities(?). At Khirbet el Qôm in western Judah a similar inscription referring to Yahveh and his consort Asherah was also found. The first commandment of the Decalogue may be understood as a direct protest against such a consort being placed or named "beside" Yahveh.

Fourth, there are those who would see in the Sinai covenant Moses' achievement in creating a unique politico-religious union centered upon commitment to Yahveh and a new social order among his fellow Israelites. These scholars point to the Hittite suzerainty treaty model of the Late Bronze Age, which emphasizes absolute loyalty to the great king based upon past favors and complete obedience to a series of stipulations regulating relations between king and vassal as well as between vassal states. The force of the argument lies in the attempt to establish parallels between this model and the giving of the law and covenant ratification at Sinai in *Exodus* 19–24, as well as in the fact that the time of Moses and the time of the Hittite empire are relatively close. The theory, however, has come under criticism because the parallels are too forced to be convincing, the treaty form is not so restricted in time, and the greatest correspondences to such a treaty-covenant form is to be found in *Deuteronomy*—very likely written shortly after Judah had experienced such vassalage to Assyria. In fact, it has been strongly argued that the notion of such a Sinai/Horeb covenant between Yahveh and his people is no older than D and cannot be traced back to Moses.

While the critical scholar may doubt that a historical figure, Moses, living in the thirteenth century BCE was the founder of Israelite religion in anything like the form reflected in the Pentateuch, the tradition itself has clearly regarded him as such, and thus he remained in all the subsequent developments of that tradition in later times.

MOSES IN POSTBIBLICAL JUDAISM. The great diversity within Jewish piety and religion in the centuries that followed the Hebrew scriptures does not allow for a simple statement about the development of the Moses tradition in this period. Nor is it possible to do justice to all the sources or varying

viewpoints. Yet a few common features are shared by most of them and may be listed as follows. (1) The Law of Moses, the Torah, becomes understood as the whole of the Pentateuch and not just the laws within it. This means that God revealed to Moses past history as well as future events, in addition to law. (2) The legend of Moses, especially details about his birth and youth, was greatly expanded. (3) Moses is consistently viewed as the greatest prophet of Israel, although the understanding of this "office" and the nature of the revelation he received were not always the same. (4) Moses is the great intercessor and defender on Israel's behalf and the one responsible for mitigating God's punishment for the people's sins. This article now considers some of the special developments of the Moses tradition.

Moses in Hellenistic Judaism. One of the characteristics of Hellenistic Judaism in the period from 200 BCE to 100 CE was its strong apologetic character. A number of pagan writings represented Judaism and its history in a bad light and included Moses in this vilification. In order to counteract this, Jewish writers presented their history in a way that would have special appeal for Gentile audiences and win support for their religion and way of life. Thus Moses was portrayed as a great culture hero and inventor of the arts of civilization, including writing, philosophy, statesmanship, and religion. Moses' early life was modeled after the Hellenistic biography of the divine man, with prophecies about his birth and greatness, accounts of his beauty and royal upbringing, and his great military exploits on behalf of the pharaoh. In all these embellishments of the tradition the authors were responding to criticisms of Moses.

Josephus Flavius, the Jewish historian writing at the end of the first century CE, stands in this stream of Hellenistic historiography. Moses is both the Hellenistic "divine man" and the Hebrew "man of God." As lawgiver he is presented in Greek terms as legislator and founder of the ideal constitution—a theocracy (*Jewish Antiquities* 2.6–24, 3.180, 4.13, 150, 156; *Against Apion* 2.75, 145, 154ff.). At the same time Moses is the greatest of the prophets as the "apostle" of God and interpreter of the words of God (*Antiquities* 4.165, 329; 3.85–87).

Philo Judaeus of Alexandria, who also lived in the first century CE, stands in the tradition of Judeo-Greek philosophy and mystical religion. He identifies Moses as the ideal king of Hellenistic ideology and combines in this role most of Moses' task (*Life of Moses* 1). Moses, with his special qualities as divine man, his royal upbringing, and his life as a shepherd, is prepared to become the king of Israel in the wilderness period. To his role as king is related his function as legislator, because the king is the embodiment of law (2.8ff.). The priesthood is also part of the royal office, and Moses is priest, according to Philo, in his establishment of the cult and in his role as intercessor (2.66ff.). Moses is also *the* prophet for Philo but in the special sense of the ecstatic who gains direct intuition of the truth through the mystical experience (2.187ff.). The theophany of Sinai was such an experi-

ence for Moses whereby he ascended to heaven itself and became a divine king through divinization. In some of Philo's writings he describes Moses as a hierophant, and the Torah is interpreted as a guide into the mysteries of God (*On the Decalogue* 18; *Allegorical Interpretation* 3.173).

The apocalyptic tradition. In two apocalyptic works, the *Assumption of Moses* and *Jubilees*, Moses receives special and secret knowledge about both past and future as well as the unseen worlds of heaven and hell (*Jub.* 1.26; *Asm. Mos.* 1.16–18). The apocalyptic literature reveals this information with special emphasis on the events of the end of time. Great emphasis is also placed upon Moses as intercessor, but this is not restricted to the wilderness period. Because Moses' death is understood as an assumption into heaven, his role as defender of Israel continues throughout Israel's history up to the Last Judgment (*Jub.* 1.18–21; *Asm. Mos.* 11.17).

The Essenes living at Qumran on the shores of the Dead Sea in the first centuries BCE and CE were a community dedicated to living by the Torah. They regarded themselves as the true Israel, who withdrew to the desert "to prepare the way of the Lord" for the last days (*1 Qumran Scrolls* 8.14f.). The biblical wilderness period was a model for their own experience, and a study of the Law was intended to yield an eschatological revelation for their own times. Moses was the great prophet whose words were the primary revelation for this apocalyptic community (*1 QS* 1.3, 8.15; *Code of Damascus* 5.21).

Rabbinic view of Moses. The rabbinic tradition represents a vast array of sources from the second century to the Middle Ages, containing a wide spectrum of belief and opinion. At the same time it fell heir to many of those traditions and impulses in the Moses tradition that has already been noted above.

In the legal tradition (*halakhab*) Moses represents the great "teacher" by which Israel was instructed in the Torah. This includes not only the laws of the Pentateuch but all the subsequent oral Torah, which was handed down from Moses to Joshua and in succession to the rabbis. All students of the law were really disciples of Moses.

The homiletic tradition (*aggadah*) brought to the fore those other aspects of the Moses tradition that were a part of Jewish piety. It continued to embellish the biography of Moses as the "man of God," but more central is his role as the servant of God. As such he was God's agent for bringing about the rescue from Egypt, for mediating the covenant and the laws to Israel at Sinai, and for leading the Israelites to the Promised Land. The role of servant emphasized Moses' function as intercessor for his people and as one who suffered and died on their behalf. Through his death in the wilderness instead of in Canaan Moses was identified with the sinful generation of the wilderness and thus ensured its salvation in the resurrection.

Moses was the supreme prophet as revealer of the words of God and the one to inaugurate the succession of prophets.

The traditions about Moses as king and priest were viewed in a more limited fashion, for while he may have been king during the wilderness period and priest in the dedication of the Tabernacle rites, he was not able to pass on this succession to his heirs, and it remained for David as king and Aaron as high priest to found these lines of succession.

There is also a tradition within the *aggadah* about Moses' heavenly ascent at Sinai that elaborates on his vision of God and his struggles with the angels to acquire the Torah for Israel. These stories have much in common with the ascension materials called *heikhalot*, which Gershom Scholem has seen as reflecting ecstatic mystical experiences. There was a certain reticence expressed by some rabbis toward this form of piety and the rather speculative character of its traditions.

MOSES IN THE NEW TESTAMENT. The New Testament accepts Moses as the author of the Pentateuch (*Mt.* 8:4, *Mk.* 7:10, *Jn.* 1:17), but the real significance of the Pentateuch is as a prophecy that discloses the origins of Christianity (*Lk.* 24:25–27). Yet the whole of the institutional and ritual forms of Judaism as well as the Pharisaic-rabbinic tradition is associated with Moses, so that Moses reflects the ambivalent feelings of Christianity's continuity and discontinuity with Judaism.

In the Gospels, elements in the life of Jesus are parallel to those in the expanded legend of Moses. The infancy narrative in *Matthew* (chap. 2), with its predictions and warnings to king and father, its slaughter of the innocents, its recognition of Jesus' royalty, and the flight into exile until the king's death, is modeled on the Moses biographies. The scene on the mount of transfiguration where Jesus appears with Moses and Elijah has many allusions to the Sinai theophany (*Mt.* 17:1–8, *Mk.* 9:2–8, *Lk.* 9:28–36); Jesus' feeding of the five thousand (*Mt.* 14:13–21, *Mk.* 6:32–44, *Lk.* 9:10–17, *Jn.* 6:1–14) is directly associated in John's gospel with Moses giving the manna in the wilderness (6:25–34); and his forty days of fasting in the wilderness parallel Moses' fast at Sinai (*Mt.* 4:1–2, *Lk.* 4:1–3; cf. *Dt.* 9:9). The story of Jesus' ascension in *Luke* and *Acts* has similarities to the traditions of Moses' assumption (*Lk.* 24:51, *Acts* 1:9–11).

The ministry of Jesus is also compared with that of Moses. In Matthew's gospel, Jesus' teachings are given a setting—that of the Sermon on the Mount—that is parallel to the receiving of the law at Sinai. In *Luke*, Jesus as prophet is a second Moses who has come to redeem his people. In *John*, the comparison with Moses is especially pronounced: "The law came through Moses but grace and truth came through Jesus Christ" (1:17). John's message to Jewish believers is that Jesus is superior to Moses and supplants him so that one must make a choice between Moses and Jesus.

The apostle Paul, using the methods of Hellenistic Jewish exegesis, interprets the time of Moses typologically as a reference to Christianity (*1 Cor.* 10:1–11). But for Paul generally Moses represents a religion of the law, to which he compares his religion of grace.

The *Letter to the Hebrews* draws parallels between Jesus and Moses in order to demonstrate that Jesus is superior. Moses as the servant of God is inferior to Jesus, who is the son of God. Moses instituted the earthly sanctuary, which is only a copy and a shadow of the heavenly, and in this earthly sanctuary the Levitical priesthood ministers according to the law. But Jesus is the eternal high priest who ministers in the heavenly sanctuary by interceding for the faithful (*Heb.* 8:1–6). In the same way Moses is the author of the old covenant, but this was only a preparation for and a foreshadowing of the new covenant through Jesus (*Heb.* 8:7–10:18).

MOSES IN ISLAM. Moses is highly regarded in Islam as the great prophet who foretold the coming of Muḥammad, his successor. Details about Moses' life from the *aggadah* are to be found in the Qur'ān, but there are additional details with parallels from folklore as well as borrowed from other biblical stories and applied to Moses (see especially *sūrah* 28:4–43; also 7:104–158, 20:10–98, 26:11–69). Apart from explicit references there is much in the life of Muḥammad that is implicitly reminiscent of the Moses tradition. This is particularly true of the notions about a dictated revelation received through angels and the experience of an ascent to heaven, in Muḥammad's case, from Jerusalem.

SEE ALSO Israelite Law.

BIBLIOGRAPHY

The vast literature on the figure of Moses makes any selection difficult. The following list is an attempt to provide a fairly broad range of scholarly opinion on this subject. Some general treatments of the life and work of Moses, based upon a critical appraisal of the biblical traditions, are Elias Auerbach's *Moses* (Amsterdam, 1953), translated from the German and edited by Robert A. Barclay and Israel O. Lehman as *Moses* (Detroit, 1975); Fred V. Winnett's *The Mosaic Tradition* (Toronto, 1949); Martin Buber's *Moses: The Revelation and the Covenant* (Oxford, 1946); and a more technical monograph by Herbert Schmid, *Mose: Überlieferung und Geschichte*, "Beihefte zur Zeitschrift für die alttestamentliche Wissenschaft," no. 110 (Berlin, 1968). A classical and still very influential study of the biblical traditions is the one by Hugo Gressmann, *Mose und seine Zeit: Ein Kommentar zu den Mose-sagen* (Göttingen, 1913).

The history of modern research on Moses is treated in Eva Osswald's *Das Bild des Moses in der kritischen alttestamentlichen Wissenschaft seit Julius Wellhausen*, "Theologische Arbeiten," vol. 18 (Berlin, 1962); and R. J. Thompson's *Moses and the Law in a Century of Criticism since Graf*, "Supplements to Vetus Testamentum," vol. 19 (Leiden, 1970).

On the question of Moses' place in history see Roland de Vaux's *Historie ancienne d'Israël* (Paris, 1971), which has been translated by David Smith as *The Early History of Israel* (Philadelphia, 1978); John Bright's *A History of Israel*, 3d ed. (Philadelphia, 1981); and Siegfried Herrmann's *Israels Aufenthalt in Ägypten* (Stuttgart, 1970), translated by Margaret Kohl as *Israel in Egypt* (London, 1973).

Two works that deal with the way in which Moses is used as a paradigm for certain religious and political roles are Gerhard

von Rad's *Moses* (New York, 1960) and J. R. Porter's *Moses and Monarchy: A Study in the Biblical Tradition of Moses* (Oxford, 1963). A book that is especially helpful for the treatment of Moses in Judaism, Christianity, and Islam is a collection of essays published under the title *Moïse, l'homme de l'alliance* (Paris, 1955). On the *aggadah*, see especially Louis Ginzberg's *The Legends of the Bible* (New York, 1956), pp. 277–506. This book is an abridgment of the earlier work *The Legends of the Jews*, 7 vols., translated by Henrietta Szold et al. (1909–1938). On Moses in the New Testament and early Judaism, see also Wayne A. Meeks's *The Prophet-King: Moses Traditions and the Johannine Christology* (Leiden, 1967).

HISTORY AND TRADITION
ARCHITECTURAL ASPECTS

MOSQUE: HISTORY AND TRADITION

The mosque is a built facility with certain unique characteristics for Muslim prayer, as well as an institution dedicated to maintaining community life. As a building its primary and minimal role is to accommodate a congregation that performs its ritual prayers in formation while oriented toward Ka'bah in Mecca. As an institution it marks the sociocultural existence of a Muslim community, acting both as its center and its emblem.

ETYMOLOGY. The original Arabic word for mosque is *masjid* (plural, *masājid*), meaning a place of *sujūd*, the highly symbolic act of prostration (before God) during *ṣalāt* (ritual prayer), when the whole body reaches its lowest position and the forehead is placed on the earth in a prescribed manner. Since *ṣalāt* is universally performed in Arabic, its constituent stages, including *sujūd*, and its place, *masjid*, have maintained their Arabic form in Persian, Urdu, Turkish and other dialects of the Muslim world. The anglicized word *mosque* is widely used, and its transformation from *masjid* can be traced through the Egyptian *masqid*, Italian *moscheta* or *moschea*, Spanish *mezquita*, and French *mousquaie* or *mosquee*. The etymological source for *masjid* can be traced back to the Aramaic verbal root *s-g-d* and the word *msgd* used for Nabataean and Abyssinian sacred places.

THE TWO SANCTUARIES OF SACRED HISTORY. The Qur'ān presented itself as a continuation and completion of earlier

monotheistic revelations through Abrahamic messengers, including Moses and Jesus. The people holding on to those revelations were called *ahl al-kitāb* (People of the Book), and they asserted that they were in possession of revealed books that preceded the Qurʾān. These messengers were introduced as followers of the path of submission (*s-l-m*, the root word for Islam) to the same One God to whom Muḥammad was inviting everyone (Qurʾān 3:66). It is little wonder then that Kaʿbah in Mecca, whose construction is directly associated with Abraham and his son Ishmael, is identified in verses in the Qurʾān, as *bayt* (house), and the precinct around it as *al-Masjid al-ḥaram* (the sanctified mosque). Beyond the historical existence of the word *masjid* before Islam, these verses suggest Muḥammad’s mission to restore the sanctity of *Masjid al-ḥaram* and reestablish the centrality of Abrahamic Kaʿbah as *bayt Allāh* (the house of God) for all the People of the Book, including Muslims (Qurʾān 2:125–128, 3:96–97, 5:97).

Masjid al-aksa (the remotest mosque) is mentioned in the Qurʾān (7:1): “Praise be to Him who made His servant (Muḥammad) journey in the night from *al-Masjid al-ḥaram* to *al-Masjid al-aqsa* which We have surrounded with blessings to show him of our signs.” This verse was revealed during the last year in Mecca before *hijrah* (migration) to Medina. There have been disagreements among historians and Qurʾanic scholars as to the exact identity and location of this “remotest mosque.” It is possible to conclude, however, that the term *masjid* here has been used for a place that existed at the time of this revelation but was not built by Muḥammad or his followers, as they were still in Mecca. If it refers to the destination of *Miʿrāj* (ascension) as a heavenly precinct of the throne of God, then it can only be imagined in a metaphoric sense and not as an earthly mosque. If it refers to the Temple Mount in Jerusalem, then it could only be referring to the memory and continued sanctity of the site associated with the devotions of the prophets Elijah, Abraham, David, and Solomon and not the actual physical presence of the Temple of the Lord (2 Chr. 3:1), which had been destroyed in 586 BCE and then again in 70 CE. The *Masjid al-aqsa* verse revealed around 621 CE, and Muḥammad’s elaborations of his miraculous journey to the Temple Mount and then ascension to heaven (*Miʿrāj*), brought Jerusalem and its sanctuary (Hebrew, *Har Hebayit*; Arabic, *Haram esh-Sharif*) into Muslim consciousness as a remote though unseen place of prostrations (*masjid*) of earlier prophets. Jerusalem, the city of David and Solomon, thus became analogous to Mecca, the city honored as the “first house” of God built by Abraham and Ismael (Qurʾān 3:96–97). The two *ḥarams* (sanctuaries) of Mecca and Jerusalem had thus defined for Muḥammad and his followers the goal of an Abrahamic axis and a shared religious geography of the monotheism. In this context the sequential adoption of Jerusalem and then Mecca for the *qiblah* (prayer orientations) from Medina makes more sense than the oft-implied political strategy in Muḥammad’s choice and then rejection of Jerusalem in favor of “his” ancestral Mecca. In fact, early Islam’s ecumenical attitude to-

ward *ahl al-kitāb* of Syria is demonstrated through the rebuilding of the Temple Mount and accommodating policies of Jewish and Christian prayer during the first century after the conquest in 638 CE, especially when compared with the pre-Islamic treatment by their Byzantine and Roman predecessors.

THE PROPHET’S MOSQUE IN MEDINA. In Mecca, Muḥammad and his followers became progressively disenfranchised by the ones whose pagan and tribal traditions were challenged by Islam. Muslims who called for return to the One God of Abraham could not pray without harassment in the *Masjid al-ḥaram* around the sanctuary of Kaʿbah, whose very existence was credited to monotheism (Qurʾān 2:214, 5:3, 8:34, 22:25). They prayed alone or in small numbers in residences. The Prophet sometimes led a group prayer at the houses of Muḥammad’s wife Khadijah and his friend Abū Bakr, but they never had what could justifiably be called a mosque.

Having failed to dissuade Muḥammad from his mission for over a decade, the Meccans planned his assassination. He decided to migrate to a welcoming settlement called Yathrib (later Medina), some three hundred miles north. The year was 620 CE, and the event is called *hijrah* (migration), which marks the beginning of the new Muslim lunar calendar. There are different traditions about what has come to be known as the first mosque in Medina, *masjid al-Kuba*. One tradition suggests that it was used as a place of prayer by those who anticipated Muḥammad’s arrival and that he stayed there for some days. Another tradition suggests that the Prophet founded this mosque himself, and even after he established the main mosque in Medina, he made a practice of praying there every Saturday. The Qurʾanic reference to this mosque as the one “whose foundation was laid from the first day on piety (*taqwā*),” especially when it is presented in contrast with *masjid al-dhirar* (mischief), later constructed to create infidelity and division in the community, makes it a reference point in ethical intentions rather than the physical fact of a mosque (Qurʾān 9:107–110). Having arrived in Medina, Muḥammad purchased, rather than accepted as a gift, a piece of land for the mosque from the two orphans who owned it. With the help of his companions he built a modest four-sided enclosure of stone foundations and sundried mud bricks. On the outside of the eastern boundary he placed his private chambers (*hujurāt*, Qurʾān 49:4), whose curtained doors opened into the mosque courtyard. On the north toward Jerusalem, and later on the south side as the *qiblah* shifted to Mecca, he built shaded porticos (*riwāq*) of palm tree trunks and dried palm leaves and clay. There was no *mihṛāb* (niche) in the north or the south wall yet. Muḥammad’s presence as leader of the community—and his staff, which he leaned on while delivering sermons—established the *qiblah* orientation. There was no minaret, as the call to prayer was either from the courtyard or from a nearby roof. There was no formal *mimbar* (stepped pulpit), though he did use makeshift platforms to raise himself to be seen while speaking to large gatherings. In spite of an appar-

ent lack of formality in religious practices, political protocol, communal gatherings, and architectural furnishings in this austere compound, the *ḥadīth* literature and the corresponding verses of the Qurʾān suggest much intensity in this mosque as the formative principles of *sharīʿah*, the structure of Islamic life, were being formed. There Muḥammad taught the Qurʾān as revealed to him, elaborated upon the commandments, led the ritual prayers, received delegations, settled disputes, planned campaigns, assigned tasks, and socialized with his family and community. This place became the crucible for genetic codes that are at the core of continuity in basic religious practices and institutions, especially the mosque, all across the Muslim world.

BEYOND THE PROPHET'S MOSQUE. The historical distance between Muḥammad's death (632 CE) and the formalization of both his *ḥadīth* (sayings) and *sīra* (life) literature, especially considering the internal strifes and partisanship during that period, can justifiably stir some doubts about the accuracy of some narrations about the happenings in the *Masjid al-Nabi*. It is noteworthy, however, that the patterns, if not the exact details, associated with that mosque have become widely accepted as the reference for the purest forms of Islam as intended by God and lived out by his messenger. It is this memory of Muḥammad, constructed with direct reference to his mosque and his city, that is fundamental to the codification of Islamic practices. And if the leader, the state, and the city as Islamic polity is absent, the mosque becomes its primary home and essential ecology. It is little wonder then that any Muslim community idealizes its mosque as a place where there is an *imām* (leader) worthy of the Qurʾanic knowledge, where *ḥadīth* is rehearsed, where *jamaʿat* (congregation) is established, and where a communal life is modeled on Muḥammad's example and the legacy of his companions. The development of mosque in history can thus be presented briefly as a mostly positive but sometimes negative interpretation of one or more of the traditions of the Prophet's mosque.

DĀR AL-IMĀRA AND MASJID AL-JAMĀʿ. During Muḥammad's time the intimacy between the leader and his community was maintained by his unique status and was facilitated by the physical adjacency of his residence and the mosque. When the new settlements of al-Basra and al-Kufa in Iraq and al-Fustat in Egypt were established, the Muslim governors, who represented the *Khalīfa* in Medina, maintained the pattern of the Prophet's mosque as both the religious and administrative center. However, factors like local histories of conquered lands, sheer increase of numbers, tribal tensions within the army, ethnic diversity among new converts, and increasing fear of assassinations led to the development of the more secure *dār al-Imāra* (residence of the commander) with a prison and *dīwān* (treasury) that formed one complex in the heart of the new city. In Syria, where the existing structures of Damascus were adapted as the capital of the dynastic caliphate of Umayyads, the existing Roman and Byzantine church was transformed into the Umayyad Mosque and the adjacent palace converted to the *dār al-Imāra* with a secure

connection for the ruler-commander-caliph to enter the mosque from his *qiblah* wall side, avoiding having to walk through the congregation and risking assassination attempts. *Maqsūra*, the secure enclosure, was introduced for the ruler to speak from. While the symbolic unity of the place of communal prayer and the place of governance was maintained through sermons and edicts in the name of the ruler, the two started to develop clearer and harder boundaries and ultimately started to become different buildings.

Impractical distances between the original center of the city with its great mosque and the ruler's palace (as in the newly founded Abbasid city of Baghdad) and the expanded periphery of Muslim settlements, as well as a dramatic increase in population, led to the evolution of a religious geography of primary and secondary centers. Primary were the mosques in which the community formed the obligatory Friday congregation (Qurʾān 62: 9–11) and took the name *masjid al-jamaʿah* (also *masjid al-jumʿah* or *masjid al-jamiʿ*, "place of assembly"). Later they were called *al-jamiʿ* or simply *jamiʿ*, meaning the place where the Friday *khutbah* (sermon) is delivered. Secondary centers were small mosques (*masājid*) where the immediate neighborhood could conveniently offer the daily prayers.

SEATS OF LEARNING AND ACADEMIES FOR TRAINING. Because it was in the capital city, the central *masjid* often had the patronage of the ruler or that of a high-ranking minister of the court, and it usually expanded into a complex with colleges, libraries, hostels, kitchens, and infirmaries. Among many similar cases, the example of *Jamia al-Azhar*, founded in Cairo by the Fāṭimids (970 CE), illustrates such an interpretation of the legacy of the Prophet's mosque as a seat of learning. It is instructive to note that *Jamia* in this sense implies a gathering of faculties (*kulliyeh*), much like a modern university. However, as various sects and schools of law hardened in their respective interpretations of Islam, the mosques started to get identified as such. The character of their associated institution transformed from a university-like environment to that of *madrasah*, where the aim was less to nurture an inquiring and critical scholar and more to train an evangelical protagonist of a particular *madhab* (sect) and *fiqh* (jurisprudence). Many governments in Muslim history supported such mosque-*madrasah* institutions to prepare individuals trained in particular Muslim schools of thought.

FOR REMEMBRANCE OF GOD. Perhaps the most enduring legacy of the Prophet and his mosque is rooted in the Verses of Light (Qurʾān 24:36–37). The first verse, through a rich yet imaginable parable, introduces the likeness of God's light as an unearthly, dreamlike "lamp in a niche." The second verse states that this light resides in the "houses which God has permitted to be elevated to honored status; for the celebration in them of His name and His glorification in the mornings and the evenings, again and again." In the verses that follow one can see the distinctions created between those who remember in these mosques and those who are distracted or even deny the necessity of this remembrance. Beyond

having provided sustained inspiration for the ambience of interior mosque space from the *qiblah* wall to the *mihṛāb*, the light in the *mihṛāb*, the lights in the prayer hall, the niches for keeping the Qurʾān, and the designs of the prayer rugs (*sijjādah*), the Verse of Light is one of the most frequently calligraphed in the mosques. This attitude toward the mosque as a place where a totally noncorporeal omnipresent God could “reside” through individual and collective remembrance of believing humans is corroborated by many other verses (Qurʾān 2:114, 9:17–18, 72:18), which has led to the pervasive belief among Muslims that every mosque is the “house of God.” The understandable desire to build a “house” for God, especially with the *ḥadīth* promise that for anyone who builds a mosque on this earth God will build an equivalent house in paradise, led to many mosques commemorating his blessings. Kings, conquerors, princes, and successful businesspeople commissioned such projects with revenue-generating endowments (*awqāf*) to maintain the building and charitable services like kitchens and the staff who kept such a complex alive. Often such projects encompassed a mausoleum-graveyard of the patron’s family, with the idea that the grace of the mosque and charity will help deliverance of their souls on the Day of Judgment. It is important to note that whereas the state mosque continued the Prophet’s legacy as the governing leader of the community, the devotional mosque preserved those aspects of Islam’s spiritual legacy that had started to become victims of political contingencies. Thus the Prophet’s mosque, while maintaining some fundamental ritual and formal structure, had to metamorphose into specialized categories.

MOSQUES, PROPHETS, AND SAINTS. There is a fine line between a location—especially the burial place of a prophet, an *imām*, a saint, or a martyr—remaining a place of commemoration or becoming a focus for worship parallel with the worship of God. Muslim history has walked a fine and careful line between the veneration of sites that preserve the sacred memories of a great religious personality or even a *qiblah*-oriented congregation in a mosque with an unshared intention to pray to no one except God. With reference to the Qurʾanic story of the *ashāb al-kaḥf* (companions of the cave) (Qurʾān 18:2–22), it is important to note that the prevailing party of believers erected a *masjid* over the place to memorialize them while making sure that it was the mosque that was used for prayers to God, rather than the “cave,” which could have become the object of idolatry. Likewise, while the Prophet’s mausoleum continues to assert his historical presence in his own mosque, the activities of the mosque are totally aimed at the continuation of his mission to establish and maintain a God-conscious, God-directed community based on the Abrahamic monotheistic axis. It is also in this sense that all mosques of the world, whatever particular national, cultural, or historical motivations they have been built upon, maintain the continuity of Muḥammad’s Abrahamic mission.

SYED GULZAR HAIDER (2005)

MOSQUE: ARCHITECTURAL ASPECTS

The mosque (from the Arabic *masjid*, meaning “place of prostrations”) has been the place of congregational prayer for Muslims since the formation of Islam in 622 CE. It takes on numerous regional styles and varies greatly in size from that of the congregational Friday mosque, called in Arabic *masjid al-jamīʿ*, in Persian and Urdu (*masjid al-jumʿah*), or in Turkish (*ulu çami*), to a simple oratory (*masjid*), to an outdoor space for large assemblies (*musalla*) for special times such as Eid festivals.

Formal ritual prayer (*ṣalāt*)—a sequence of standing, kneeling, and prostration—is one of the “pillars” of Islam. Muslims often pray alone, but the *ummah*, the community of believers, is basic to the mosque. Since Islam does not distinguish between the spiritual and the secular, the mosque is a center for both. It is the emblematic building of Islam.

For a Muslim the building of a mosque is a pious act. The prophet Muḥammad said, “whoever builds for Allāh a mosque, seeking by it Allāh’s grace, Allāh will build for him a house in paradise” (related by al-Bukhārī and Muslim). Most mosques are endowed through the creation of a pious trust or *waqf* established by the mosque’s builder. In most Muslim countries the state has by now taken over many of the trusts, usually with a ministry of *awqāf* to manage the properties.

All mosques are places of worship, but they are not sacred or consecrated spaces. In the Qurʾān the word *masjid*, although used many times, is applied only to three specific buildings (usually considered sacred), the most holy place being the Kaʿbah in Mecca and its surrounding mosque, al-

Masjid al-ḥaram. It is, according to the Qurʾān, “the very first house of prayer established for humanity. . . . The place where Abraham stood. . . .” (Qurʾān III: 95–97). The other places are the Dome of the Rock in Jerusalem with the Al-Aqsa Mosque (built originally in 715, in its present form around 1350) and the Mosque of Quba in Medina built by the Prophet himself.

The mosque also often incorporates a variety of other functions. Most common is a *madrasah*, or religious school, and small library, a soup kitchen to feed the poor, and a medical facility. Often there may be a public drinking fountain or well. Sometimes there is a shrine to a saint or ruler, but the dead are usually buried elsewhere. Graveyards adjacent to mosques do occur, notably in Eastern Europe. In urban areas shops often form the periphery of the mosque and subsidize the expenses of the facility.

ARCHITECTURAL AND LITURGICAL ELEMENTS. Architectural elements of the mosque are not prescribed except for the requirement that worshipers pray facing Mecca, the spiritual center of the Islamic world, and that the surface they pray on be clean. Worshipers pray in straight rows, generally making the prayer space wide and shallow. Islam has two main sects, the Sunnī (around 90 percent of Muslims worldwide) and the Shīʿah, but their mosques are generally architecturally indistinguishable. The most apparent differences lie in the choice of Qurʾanic verses that are displayed in the building.

The direction of Mecca in the prayer hall or space itself is denoted by a *qiblah* wall and niche (*mihṛāb*). The *qiblah* may be simply marked by a line on the sand or can be part of a building. The *mihṛāb* is usually outlined and embellished with calligraphy from Qurʾanic passages. The *imām*, who leads the prayers, stands by the *mihṛāb* in front of the congregation.

A pool, fountain, or simply running water for ritual cleansing (ablutions) before praying is usually provided, as are prayer mats to maintain the cleanliness of the floor surface and define individual areas. Worshipers often bring their own rugs to the mosque. Indeed, the prayer hall of the mosque can be regarded as a modular space based on the dimensions of a prayer mat.

The minaret or *minar* (from *minara*, or lighthouse) is usually a tower from which the *muezzin* (*muʾadhdhān*), a specially delegated person, gives the call to prayer (*adhān*). Traditionally the human voice has carried the *adhān*, but in contemporary times the voice is amplified by loudspeakers to rise above the general cacophony of the city. The minaret also acts as a visual marker for the mosque.

Other physical elements commonly used are the entrance portal marking the transition into the mosque from the outside world, the circular dome, an abstraction of the heavens, and the courtyard (*sahn*), also used as an overflow prayer space. In a large mosque, there is often a *dikka*, or raised platform, on which one person or a small group of worshipers transmit the *imām*'s postures to those unable to see or hear the *imām* himself.

Inside the mosque adjacent to the *mihṛāb* is the *mimbar*, or pulpit, from which the sermon is delivered after the Friday prayers. It consists of a movable platform with steps, usually made of elaborately carved wood.

Islamic civilization has made significant contributions to architecture. One is the use of two- and three-dimensional geometry at all scales, which not only organizes space but also imparts symbolic meanings. The three-dimensional *muqarnas*, the so-called stalactite form, is unique to Islam. This device is usually used as a transitional element between two surfaces (for example, at a corner) and acts to “dematerialize” space. Calligraphy, the word of God expressed in written form, is another important contribution. Such texts on buildings—epigraphy—signal the presence of Islam and add beauty and complexity to surfaces. Gardens have always been important reminders to Muslims to be stewards of the earth. They follow geometric principles of design and scientific and engineering principles dealing with sustainability and nature, for example, in the recycling of water. Water features are present in almost all gardens, seen as places of pleasure and individual contemplation, but gardens do not occur frequently in mosques.

TYPOLGY OF THE MOSQUE. Each region of the Islamic world combines these elements to express a local architecture in which vernacular and historic traditions are distinguished. Architecturally, the mosque may be divided into five main types corresponding to historical and regional manifestations.

The first type, the *hypostyle* mosque, originated in the Arabian Peninsula. It also occurs elsewhere, with varied form and construction materials. The mosque consists of a rectangular hypostyle, or many-columned covered hall, usually in wood and earth block or brick, with a flat roof. It is perhaps the most ancient construction method. One enters first into an enclosed courtyard with its ablutions facility, then into the hall from the side opposite the *qiblah* wall. A single square minaret with an internal staircase rises above the building. The hypostyle mosque was the most dominant form from the seventh to the thirteenth centuries and has not significantly altered over the ages. Its model was the Mosque of the Prophet—the Masjid an-Nabi—which as far as we can tell started off as the Prophet's house in Medina, a simple courtyard with rooms on two sides. In 707 CE the caliph al-Walid replaced it with a new building with minarets added as visual markers or to carry the *adhān*. Because of its symbolic importance, it has expanded over the centuries to accommodate the multitudes that pray in it, until today the early mosque is unrecognizable.

The Umayyad Great Mosque (715) in Damascus encompasses the former Church of St. John, itself built on the site of a Roman temple. The Great Mosque of Córdoba, Spain (786–990), has elegant double-horseshoe arches, into which a cathedral was inserted in the sixteenth century. Other prominent examples of hypostyle mosques include the

Mosque of Ibn Tulun (879) in Cairo, and the Kutubiyya (twelfth century) in Marrakech, Morocco.

A different hypostyle earth building tradition is found in Northern Africa, especially in Sudan, and was transmitted by Muslim Arab traders across the African continent to the western sub-Saharan region. Commonly referred to as the Hausa-Fulani tradition, it combines the use of the hypostyle hall with buttressed walls and towers to produce a vernacular common to both monumental and rural buildings. Mosques incorporate older African symbols, such as ancestor pillar fertility symbols and tops covered in ostrich eggs for strength. Construction methods use reinforcing stick scaffolding that remains embedded in the structure. It is a living tradition, which makes these mosques difficult to date. The present building of the Great Mosque of Djenne in Mali was built in 1909, although the mosque is much older. A recent earth mosque in Yaama (1962–1982), Niger, uses the same architectural language and appears to be timeless.

There are two interesting exceptions in Africa. In East Africa, where Islam was brought from India and Oman and rooted itself in the coastal area, there is Indian-inspired mosque architecture. The second is the Afro-Brazilian mosque, so named for West African slaves in Brazil who worked as church builders. In the late nineteenth century they returned to Niger and surrounding countries, where they produced mosques that are clearly Portuguese Catholic baroque. Local people regard them as traditionally Islamic.

The next type is the mosque with four *iwans*, which occurs mainly in Iran, Central Asia, and Afghanistan, developed from the indigenous Iranian building used for houses, *madrasahs*, and caravansaries. In Iran the traditional vault-and-dome building was used to develop *iwans*, or vaulted open porches, encompassed by a giant portal (*pishtaq*) arranged around a central courtyard. Off one *ivan* is the prayer hall. The local tile-making techniques transferred from China produced blue-and-white ceramics to cover the important entrance portals and the *mihṛāb*. Epigraphy attained artistic heights.

The *ivan* mosque coalesced during the Seljuk dynasty (1038–1194) and penetrated Egypt under the rule of Salah ad-Din (Saladin) and his Ayyūbid dynasty (1171–1250). Under the patronage of Mamlūk sultans (1250–1517) elaborate mosque complexes marked the power and wealth of the rulers. The Tilakari Mosque-Madrasah (1660) in Samarkand, Uzbekistan, is a fine example of this style, but the pinnacle of perfection is the Masjid-i Shah (1637) in Isfahan, Iran. This type remained in the architecture of the region and was also transmitted to Central Asia and India, where it was transformed.

The third type is the *Indian mosque*, fully developed by the Imperial Moguls (1526–1828). It is characterized by a wide rectangular prayer hall covered with triple domes, a courtyard with a pool of water surrounded by colonnades, and a monumental entrance. Building material in the Indo-

Pakistani subcontinent was mainly brick, and construction techniques and decorative schemes combined the Persian and Hindu traditions. Mosques varied in scale from the small Moti (Pearl) Masjid of 1662 in the Delhi Red Fort to the magnificent large Badshahi Mosque (1674) in Lahore.

The Ottomans (1281–1922) in Anatolia developed in the sixteenth century the fourth type, the *central domed mosque*, that has become the dominant model for contemporary architecture. It is characterized by a large central domed space without columns. It places pencil-thin minarets at the building's corners. The origins of this form lie in the Byzantine centralized basilica plan of the Hagia Sophia in Istanbul (then Constantinople). It was taken to unprecedented heights by the great architect Sinan in the Sulemaniye Complex (1557) in Edirne, and in the picturesque Sultan Ahmet or Blue Mosque (early seventeenth century) of Istanbul, designed by his disciple Mehemet Agha. Both the courtyard and prayer hall are square in plan, with the courtyard open to the sky and surrounded by domed porches.

The same typology occurs again in Indonesia and Malaysia, where there is essentially a unified central space but in a very different style and in wood construction. Islam spread via the sea routes to Southeast Asia in the eighteenth century. The buildings in this region retained their own traditional forms based on the Javanese pavilion with its central two- to five-tiered pyramidal roof. The structure of the main hall is supported by four columns (*saka-guru*), with the roof covered with either wood shingles or clay tiles. The ablutions space is usually housed in a separate pavilion. The minaret, when present, is a freestanding structure, made usually of brick. The complex is often surrounded by a compound wall. Mosques throughout the archipelago adhere to this model, with variations such as elevation onto stilts. A good example is the Masjid Agung (1474) in Demak, Central Java, the oldest extant mosque in the region. Until the nineteenth century Javanese mosques were often not oriented toward Mecca but retained the culturally auspicious east-west axis: this, however, has changed. Minarets too, perhaps to be more normative, are now commonplace. (However, some of the coastal towns reveal clearly their Indian antecedents.)

The last type is the Chinese *pavilion* mosque, developed using architecture associated with Chinese culture. (The exception is the western Xinjiang region, where wood and brick building traditions of Central Asia prevail.) The first Muslims appeared in China during the Tang dynasty (618–907) and soon began building with indigenous Chinese architecture. The Chinese mosque employs the traditional pitched roof form with upturned ends, a timber structure, and a rectangular columnar prayer hall. As in Southeast Asia, the complex consists of independent structures, each housing a different function. Even the gateway and the minaret are separate structures. The minaret is a square to octagonal several-tiered pagoda. The mosque form is essentially indistinguishable from other public buildings. The surrounding high wall encloses Chinese gardens, where the transition between one

area and another is marked by traditional Chinese moon gates. The most famous example of this type is the Great Mosque of Xian (eighth century, in present form from 1392). It has a minaret-pagoda, a series of pavilions and gardens, and a *qiblah* wall with a very ornate *mihrab* made of wood. Another example is the Niu Jie (Ox Street) Mosque (1362) in Beijing. Islam adapted the techniques and meaning of local architecture while bringing in new elements.

SOME CONTEMPORARY ISSUES. The contemporary mosque often expresses the identity of its users—especially true where Muslims are in the minority. There are three streams of design—the vernacular, historic, and modern.

A fine mud-brick mosque was designed in the vernacular mode by Hassan Fathy at New Gournā (1948) near Luxor in Egypt as an alternative to the pan-Islamic modern architecture.

Perhaps the greatest recent historicist mosque is the Hassan II Mosque (1993) in Casablanca, Morocco. It is the largest contemporary mosque in the world, built on the edge of the city on reclaimed land. The location was inspired by the verse from the Qurʾān that states: “the throne of God lies on the water” (Qurʾān XI: 7). It uses forms of twelfth-century Moroccan architecture, scaled up several times, in a very ornate structure. Its 650-foot-tall minaret has a laser beam projecting twenty miles in the direction of Mecca. The prayer hall can accommodate 25,000 worshipers. The structure’s center acts as a courtyard when the roof slides open. There are some rather fantastic features, such as a swimming pool and the most elaborate ablutions facility anywhere. The craftsmanship of the whole complex reflects some extraordinary features. It is a modern building in the guise of tradition.

Contemporary mosques that proclaim modernity together with Islam can be found worldwide. The Shah Faisal Mosque (1970–1986) in Islamabad, Pakistan, was conceived as a national mosque to reflect the then progressive modern state. The Sherefuddin Mosque (1980) in Visoko, Bosnia, is uncompromisingly modern, and the Manhattan Islamic Center Mosque (1991) in New York skillfully abstracts the Ottoman mosque.

The way in which architecture reflects society is observed in the spaces designated for women’s prayer. Usually 10 to 15 percent of the prayer area is demarcated for women, in a balcony or to the sides, separated from the men. One mosque that places women in a central location is in Kingston, Ontario, Canada. Perhaps this was due to the fact that women were on the mosque building committee—itsself a rare occurrence—and that the community is formed of a liberal university population. In their debate over the physical position for women, some one hundred letters were written to *imāms* all over the world to get their opinions. There was no consensus and the community had to make its own decision.

Women in many countries attend mosque for prayer but also for educational and social functions. In Europe and

the United States, women and children are increasingly frequenting mosques, where the use of the complex is changing. This may affect the design of mosques, which have usually been centers for men.

Mosque design is undergoing a “globalizing” influence in terms of using elements thought to be normative. Indeed, a dome on a mosque built in 2000 in Shanghai, China, is used only as a sign. It has no relationship whatsoever to the building’s structure or interior spaces—it merely sits atop the flat roof. In Indonesia, ready-made tin domes sold along the sides of roads are replacing the indigenous pyramidal roof. It is the dome and the minaret that have become the desirable symbols for the mosque, leading to the neglect of regional architectural traditions. Largely because of the current influence of the Arab Middle East, especially Saudi Arabia, such elements become the expression of an Islam that tries to be universal.

The architecture of the mosque is not just about design and place making. Its importance lies also in the collective meanings it transmits over time. To understand mosques is to understand the architecture of the region and place, and even more significantly, the culture to which it belongs. The mosque reflects the pluralism of Islam while remaining unchanged in its ritualistic aspects. Modernity and internationalism with their own tenets have created new mosque styles, but in the main mosques today continue to emulate either vernacular or historicist models in order to give them legitimacy and instant recognition in the eyes of a global *ummah*-community.

HASAN-UDDIN KHAN (2005)

MOTHER GODDESS SEE GODDESS WORSHIP

MOTOORI NORINAGA (1730–1801), regarded as the preeminent scholar of the Kokugaku (“national learning”) school of premodern Japan. Born Ozu Yoshisada to a merchant-class family in Matsuzaka, Norinaga became interested in literature as a young man. Following the death of his brother-in-law in 1751, Norinaga’s mother skillfully juggled the family finances in order to send her son to the capital, Kyoto, to continue his education. In 1752 he became the student of Hori Keizan, a Confucian scholar, with whom he studied Chinese literature. That same year he also discovered a book on Japanese poetry written by the Shingon monk Keichu, the first Kokugaku scholar (*kokugakusha*). This experience moved Norinaga to undertake the study of the earliest Japanese documents, an occupation that he complemented with the study of practical medicine. As a result of his reading, which inculcated in him a growing awareness of, and sensitivity to, Japan’s long cultural and religious history, he abandoned the name Ozu in favor of his family’s ancestral name, Motoori. Later, he took Norinaga as his personal name.

Norinaga returned to Matsuzaka in 1757 and began to practice internal medicine, but his main interest continued to center on “ancient learning” (*kogaku*), the literary and historical heritage of the early Japanese state. His early works include *Ashiwake obune* (A small boat on a reedy river), which discusses the nature of *waka* poetry; *Shibun yōryō* (The essence of *Genji*), an analysis of the *Genji monogatari* (Tale of Genji); and *Isonokami sasamegato* (Whisperings of Isonokami), in which he developed the celebrated concept of *mono no aware*. This term, which literally means the sentiments or affections felt immediately after experiencing something, Norinaga considered to be the integrating concept of the *Genji monogatari*. Using this notion, he attempted to free the analysis of literature from the moralism of contemporary criticism. His emphasis on human experience for its own sake was fundamental to his existential outlook on life; it was from this standpoint that he would later explore his own cultural identity within the Shintō tradition.

Norinaga’s major work, the *Kojikiden* (Commentary on the *Kojiki*), was begun in 1763, soon after Norinaga’s first and only meeting with Kamo no Mabuchi (1697–1769), a disciple of Kada Azumamaro (1668–1736) and a major figure in the Kokugaku movement. Their meeting took place as Mabuchi was passing through Matsuzaka on a pilgrimage to the Grand Shrine at Ise. Prior to this, Norinaga had already begun to read the works of Mabuchi, intending to study the *Kojiki* with him sometime in the future. After their fortuitous meeting, Mabuchi accepted Norinaga as his student; through a lively correspondence that continued until Mabuchi’s death, Norinaga gradually laid claim to the intellectual successorship of the Kokugaku movement. Some thirty-five years elapsed between the time Norinaga began work

on the *Kojikiden* and its completion in 1798. During that time he produced a number of other important works. These include the most representative of his treatises on Shintō, *Naobi no mitama* (The Spirit of Naobi; 1771); *Hihon tamakushige* (Special Edition of *The Spirit Box*; 1787), a discussion of Japanese politics presented to the Kii (one of three collateral Tokugawa families); and *Uiyamabumi* (Introductory Remarks for Scholastic Beginners; 1798), which marked the end of his scholarly career. In that year he began to draw a pension from the daimyo of Kii in response to an earlier request.

In the year preceding his death Norinaga wrote *Shokki rekichō Shōshikai* (Commentaries on Imperial Edicts in the *Shoku Nihongi*) and his will, which described in detail the procedures to be followed at his funeral. He also purchased land at the top of Mount Yamamuro to be used for his burial plot. Many have interpreted these actions as a rejection of Buddhism and an affirmation of his conviction that his spirit would remain on this earth forever.

In his many works Norinaga combined philological acumen with a keen sense of the primacy of the ancient texts of Japan, providing a basis on which scholars of his generation could forge a new appreciation of Shintō myth. He regarded Shintō as the way of the *kami* (which he defined as anything possessing awe-inspiring or superior power) and thus essentially the way of the emperor, the direct descendant of the deity Amaterasu. According to Norinaga, it is not our fate after death that should be our concern but rather a spontaneous and natural appreciation of life itself. In this life-affirming ethic he advocated a joyous reliance on the will of the *kami*, and maintained that each person was possessed of an innate sense of moral rectitude that renders manmade ethical systems unnecessary. For Norinaga, these attitudes were the very essence of the received traditions of antiquity. He himself eschewed the word *kokugaku*, holding that “learning” could not but refer to the study of the ancient texts and traditions of Japan.

Revised Bibliography

MO-TZU SEE MOZI

MOUNTAINS have an important place in the symbolic geography of religious traditions the world over, although the ways in which mountains are significant have differed. Some have been seen as cosmic mountains, central to an entire worldview; others have been distinguished as places of revelation and vision, as divine dwelling places, or even as geographical manifestations of the divine.

Attitudes toward mountains in general have varied widely. Chinese poets such as Xie Lingyun (fourth to fifth century CE) and Hanshan (eighth to ninth century CE) were attracted by mountains through a sense that these peaks piled one upon the other led not only to the clouds, but to heaven. And yet in the West, the image of jutting mountain peaks touching the clouds has not always had a positive symbolic valence. In the sixteenth and seventeenth centuries, for example, Luther and others held the view that mountains appeared in an otherwise pleasingly symmetrical world only after the flood, which scarred the surface of the earth with “warts and pockmarks” and signaled the fall and decay of nature. Mountains were, in the view of the sixteenth-century English writer Edward Burnet, the ruins of the postdiluvial world, a sign of chaos and fractured creation. However, in the late seventeenth century with the “aesthetics of the infinite” came a new appreciation of the splendor and height of mountains as stretching the imagination toward God. One writer of the time described his response to the Alps as “a delightful Horrour, a terrible Joy, and at the same time, that I was infinitely pleas’d, I trembled” (quoted in Nicolson, 1959, p. 277).

THE COSMIC MOUNTAIN AS SACRED CENTER. As the center of the world, linking heaven and earth and anchoring the cardinal directions, the mountain often functions as an *axis mundi*—the centerpost of the world; it is a cosmic mountain, central to the order and stability of the cosmos. One of the most important such mountains is Mount Meru, or Sumeru, the mythical mountain that has “centered” the world of the majority of Asians—Hindu, Buddhist, and Jain. According to Hindu cosmology, four lotus-petal continents spread out from Mount Meru at the center and beyond them the seven ring-shaped seas and ring-shaped continents of the wider universe. Mount Meru rises heavenward as the seed cup of the world lotus. As an *axis mundi*, this mountain, rooted deep in the netherworld, rises high through the realms of heaven, where it spreads out to accommodate the cities of all the gods. Interestingly, Meru does not form a peak, for the geographical texts of the Purāṇas agree that Meru is wider at top than at bottom, true to both its seed-cup prototype and the polytheistic consciousness that accommodates many gods at the top. Meru has four sides of different colors (*varṇas*) and is flanked by four directional mountains. Above Meru stands the polestar, and daily the sun drives his chariot around the mountain. The heavenly Ganges in its descent to earth first touches the top of Meru and then divides into four rivers that run in the four cardinal directions to water the earth.

As the center of the world-circle, or *maṇḍala*, Mount Meru is symbolically repeated in many Hindu temples that take the mountain as an architectural prototype. The *śikhara* (spire or peak) of the temple rises high above the cavelike womb-chamber of the sanctum and is capped with the cogged, ring-shaped *āmalaka*, the sun itself, a symbol of the heavens. The mountain is also repeated in the architecture of the Buddhist stupa, the reliquary dome with gateways in the four directions and a multileveled mast at the top marking the *bhūmis* (“worlds”) that lead to heaven. The mountain symbolism is most elaborately seen in the stupa of Borobudur in Java, which is actually built over a small hill. There one sequentially circumambulates the nine *bhūmis* of the cosmos to reach the top. In China and Japan, the vertical dimension of the stupa became attenuated in the structure of the pagoda and came to predominate over the dome-shaped tumulus of the reliquary. Even so, the pagodas of the Far East preserve the basic mountain symbolism of the stupa. In Southeast Asia, one of the many duplicates of Meru is Mount Gunung Agung, the great volcanic mountain that is at the center of the island of Bali. Throughout Bali, individual temples repeat the mountain symbolism and are called *merus*. Their nine roof-layers again signify the vertical dimensions of the cosmic mountain linking heaven and earth.

Like Meru, other mountains have been seen as cosmic centers. Mount Hara has a central place in the ancient cosmology of the Zoroastrian tradition. According to the *Zamyad Yasht*, it was the earth’s first mountain, and its roots the source of the other mountains of Iran. Like other cosmic centers, it is the pivot around which the sun and the stars revolve, and like many other sacred mountains, it is also considered to be the source of heavenly waters. In Japan, the great volcanic peaks, among which Fuji is the most famous, have been thought to link earth and heaven. In Morocco, the great Atlas range in the territory of the Berbers is sometimes called the “pillar of heaven.” Mountains that center and stand at the quarters of a fourfold cosmos are numerous, as can be seen in the quadrant mountains of China and in the “Encircled Mountain” of the Navajo, around which stand four peaks, each identified with a direction and a color.

Mountains not considered “centers” in any cosmology still share this image of stability and permanence, of both height and unshakable depth. The *Book of Psalms* speaks of the “foundations” of the mountains and hills. Among the Yoruba, myths stress the durability of the hills and, therefore, their ability to protect. The Yoruba say “Ota oki iku,” meaning “The rock never dies.” In East Africa, one might receive the blessing “Endure, like Kibo.” Kibo is the peak of Mount Kilimanjaro and marks, for the Chagga people, the direction of all that is powerful and honorable.

In a similar vein, there are many traditions of the mountain that stood firm during a great flood. Mount Ararat in Turkey is known as the mountain where Noah found land and the ark came to rest. Among the Native American peoples of the Pacific Northwest, Mount Rainier was a pillar of

stability during the flood. Peruvian myths from the Sierran highlands claim the same for several of the high peaks of the Andes.

The mountain as nature's great link between heaven and earth has also been widely symbolized architecturally, as in the case of Meru. In ancient Mesopotamia, the seven-storied ziggurat, with its high temple at the top and its low temple at the bottom, allows for the descent of the divine. The pyramids of Mesoamerican civilization, such as the ruins at Teotihuacán, are clearly aligned to stand at the center of ceremonial avenues. The Pyramid of the Moon at Teotihuacán is further aligned with Mount Cerro Gordo, which it duplicates.

MOUNTAINS OF REVELATION AND VISION. There are many mountains that may not have a central role in cosmology but that are, nonetheless, places of powerful contact between the divine and the human. For example, on top of Adam's Peak, or Śrī Pada ("auspicious foot"), in Sri Lanka is a large indentation said to be a footprint. According to Buddhists, it is the footprint of the Buddha himself, matched by a similar imprint at Phra Sat in Thailand. For Hindus, it is the imprint of Śiva; for Muslims, that of Adam; for Christians, that of the apostle Thomas. In any case, the belief that the peak was once trod by one larger than life is held by the people of all four traditions who climb to the top on pilgrimage.

In the Islamic tradition, it was on Mount Hira on the outskirts of Mecca that Muḥammad heard the revealed word of the Qur'ān. At nearby Mount Arafat, the entire assembly of pilgrims stands from noon to sunset on the ninth day of the *ḥājj* pilgrimage. This collective act of standing, before God and around Arafat, is considered by many to be the most powerful moment of the *ḥājj*.

Mount Sinai, where Moses encountered Yahveh face to face, is one of the most striking examples of the mountain of revelation. There Yahveh appeared to the Hebrews as a storm, with fire and lightning, or as a cloud that covered the peak. And there Yahveh also appeared directly, when Moses and the elders ascended the mountain and "saw the God of Israel" (*Ex.* 24:10). In the Elohist and Deuteronomistic traditions, Yahveh appeared on Mount Horeb. There Moses encountered Yahveh in the burning bush. And there Elijah stood before the Lord, who, after the rock-breaking wind, the fire, and the earthquake, spoke to him as "a still small voice" (*1 Kgs.* 19:11–12). And Jesus was transfigured upon a high mountain, sometimes said to be Mount Hermon, and appeared to Peter, John, and James with a glowing countenance, in dazzling raiment, and flanked by Moses and Elijah (*Mt.* 17:1–8; *Mk.* 9:2–8; *Lk.* 9:28–36).

The mountain top is a revelatory landscape, its height offering both the vision of heaven and a broad perspective on earth. Mountain ascent is associated with vision and the acquisition of power, as is clear in the vision quest of many of the Native American traditions and in the ascents of the *yamabushi*, the mountain ascetics of Japan. In both cases,

transformation, including spiritual insight, is part of the mountain experience. For the pilgrim who is not an adept, a shaman, or an initiate, the mountaintop still affords ecstatic vision. In the words of the great Chinese mountain poet Hanshan, "High, high from the summit of the peak, / Whatever way I look, no limit in sight" (*Cold Mountain*, trans. Burton Watson, New York, 1970, p. 46).

THE DWELLING PLACE OF THE DIVINE. For the Hebrews, God's "dwelling place" was surely not Sinai, the place of revelation, but Mount Zion, the sturdy, rocky mount of Jerusalem. Zion, neither lofty nor dramatic, was the firm foundation of Jerusalem, the "City on a hill." Here God was said to dwell in the midst of the people. The awesome mountaintop, where God appears in fire and lightning, is replaced with the security and protection of a fortress mountain.

The hills of Canaan were the high places of powerful local *baalim*, and Mount Zaphon was the abode of the great Baal Hadad. In the *Ras Shamra* Ugaritic texts, Baal describes his dwelling place "in the midst of my mountain, the godly Zaphon, in the holy place, the mountain of my heritage, in the chosen spot, the hill of victory" (Clifford, 1972, p. 138). Many of Zaphon's traditions have likely become attached to Zion.

Perhaps the earliest evidence for mountaintop sanctuaries is in the Middle Minoan period (2100–1900 BCE) on Crete, where peak and cave sanctuaries such as those at Mount Juktas, Mount Dikte, and Mount Ida have been found, along with evidence of votive offerings to the goddess. In the Greek mythological tradition, Olympus is the dwelling place of the gods, especially of Zeus, whose cult was widely associated with mountaintops. Hermes, Apollo, Artemis, and Pan had mountain sanctuaries as well.

The hilltop and mountain shrines of both local and widely known gods are also important in the sacred geography of India. Śiva is called Giriśa, the "lord of the mountains." He dwells upon Mount Kailash in the Himalayas and has mountain shrines all over India, such as Śrī Śaila in Andhra Pradesh and Kedara in the Himalayas. Śiva's consort, Pārvatī, is the daughter of the mountain (*parvat*), and she too dwells on mountaintops in countless local forms—as Vindhyaśinī in central North India or as Ambikā at Gīrnār in Gujarat. Similarly, in South India, Skanda has hilltop shrines at Palṇi and Tirutaṇi, Ayyappa dwells on Mount Śabari in Kerala, and Śrī Venkateśvara dwells on the Seven Hills of Tirupati.

In China, there are four mountains that came to be associated with the four directions and four prominent *bodhisattvas*. Most famous among them is the northern peak, Wutai Shan, associated with Mañjusri, the *bodhisattva* of wisdom. When the Japanese monk Ennin visited Mount Wutai in the ninth century CE, it was a bustling center of monastic learning and of lay pilgrimage. The others are Mount Jiuhua in the south, Mount Emei in the west, and the hilly island of Putuo Shan off the Zhejiang coast in the east. According to

popular tradition, the *bodhisattvas* associated with these mountains were to be seen not merely in the temples but would take human form and appear as a beggar or an elderly monk to pilgrims along the way.

In addition to this group of four Buddhist mountains there are the five mountains of the Daoist tradition, again situated at the four compass points, with a center mountain shrine at Song Shan in Henan Province. Tai Shan in Shandong Province is perhaps the most famous of the five, with seven thousand stone stairs leading to the top where, next to the Daoist temple, a stone monument stands uninscribed but for the word *di* ("god"). The poet who was supposed to honor the mountain on this tablet was silenced by its splendor.

MOUNTAINS CHARGED WITH DIVINE POWER. Japanese traditions recognize many mountain divinities—the *yama no kami*. In a sense, they dwell upon the mountain, but it might be more correct to say that the *yama no kami* are not really distinct from the mountain itself. In the Shintō traditions of Japan the separation of nature from spirit would be artificial. In the spring, the *yama no kami* descend from the mountains and become *ta no kami*, *kami* of the paddy fields, where they remain for the seasons of planting, growth, and harvest, returning to the mountain in the autumn. Even as the *kami* change locus, they remain part of the nature they inhabit.

In the Heian period, with increasing Shintō-Buddhist syncretism, the mountain *kami* came to be seen as forms of Amida Buddha and the various *bodhisattvas*, and the Shugendō tradition of mountain asceticism began. Among Japan's important mountain sanctuaries are Mount Haguro, Mount Gassan, Mount Yoshino, Mount Omine, and the Kumano mountains, identified with the Pure Land of Amida Buddha. Religious associations called *ko* organize locally or regionally for the ascent of particular mountains, taking the name of the mountain itself (Fujikō, Kumanokō, etc.).

Many Native American traditions share this sense of the inseparability of mountain and spirit power. The peoples of the Pacific Northwest, for instance, often begin their tales with "Long ago, when the mountains were people. . . ." The mountains, such as Tacoma, now known as Rainier, are the mighty ancestors of the past. Farther south, the divine personification of mountains can be seen in Popocatepetl and his spouse Iztaccíhuatl in Mexico or in Chimborazo and his spouse Tungurahua in Ecuador. The Zinacantecos of Chiapas still honor the tutelary ancestors, the Fathers and the Mothers, in shrines at both the foot and summit of their sacred hills. Among the Inca, the localization of power is called *huaca*, and is often manifest in stones or on mountains, such as the great Mount Huanacauri above Cuzco.

The mountain *is* the temple. Mount Cuchama in southern California, known as the Place of Creation, was one of the four exalted high places of the native peoples. For worship and initiation, it had no temple, for it was itself nature's own temple. India has many such striking examples of divine

mountains, among which is Aruṇācala (Dawn Mountain) in the Tamil lands of South India. This holy hill is said to be the incandescent hierophany of Śiva and is reverently circumambulated as a temple would be.

LIFE AND DEATH. As givers of life, mountains are the source of rivers and, thus, the source of fertility. This is made explicit in the relation of the mountain and rice-field *kami* in Japan. On the south side of Mount Atlas in Morocco, fruits are said to grow spontaneously. And on the mythical Mount Meru the divine trees are said to yield fruits as big as elephants, which burst into streams of nectar when they fall and water the earth with divine waters. As the prophet Amos said of the Land of Israel, "The mountains shall drip sweet wine, and all the hills will flow with it" (*Am.* 9:13).

Mountains are the source not only of nourishing waters but also of rains and lightning. Storm gods are often associated with mountains: Zeus, Rudra/Śiva, Baal Hadad of Ugarit, Catiquilla of the Inca, and many more.

Mountains, the source of the waters of life, are also seen as the abode of the dead or the path to heaven for the dead. Among the Shoshoni of the Wyoming, for instance, the Teton Mountains were seen primarily as the dangerous place of the dead. The Comanche and Arapaho, who practiced hill burial, held similar beliefs. The Japanese elegy literature makes many references to the mountain resting place of the souls of the dead. A coffin is called a "mountain box," choosing a burial site is called "choosing the mountain," and the funeral procession chants "We go to the mountain!" Throughout the Buddhist world, the stupa, which originally is said to have housed the relics of the Buddha, has become on a miniature scale the symbolic form in which the ashes of the dead are housed.

THE PERSISTENCE OF THE MOUNTAIN. Through the ages many sacred mountains have accumulated many-layered traditions of myth and pilgrimage. Moriah, the mount of the Temple in Jerusalem, is a good example. First, it was an early Canaanite high place, a threshing floor and sanctuary for harvest offerings. According to tradition, it was there that Abraham came to sacrifice Isaac. And it was there that Solomon built the great Temple, and Nehemiah rebuilt it after the Babylonian exile. And much later, according to Islamic tradition, it was there that Muḥammad began his ascent from earth to heaven on his mystical "night journey" to the throne of God.

In Mexico, Tepeyac, the hill of the Aztec goddess Tonantzin, became the very place of the apparition of Our Lady of Guadalupe when the Catholic tradition was layered upon indigenous traditions. Similarly, the great mountain-shaped pyramid of Quetzalcoatl at Cholula became, in the age following the conquest, the site of Our Lady of Remedios. In Japan, Mount Koua and Mount Hiei, both charged with the power of their particular *kami*, became in Buddhist times the respective centers of the Shingon and the Tendai traditions. In countless such cases, the mountain persists as a sacred center, while myths and traditions change.

The classic Western study of attitudes toward mountains, including theological, philosophical, and emerging scientific dimensions. The focus of the study is the change in the view of mountains in the literature of seventeenth- and eighteenth-century England, from the view that mountains are the "Warts, Wens, Blisters, Imposthumes" on the face of

Nature to the view that mountains are the grand natural cathedrals of the divine.

DIANA L. ECK (1987)

MOVEMENT FOR THE RESTORATION OF THE TEN COMMANDMENTS OF GOD.

On March 17, 2000, several hundred followers (estimates vary, but there may well have been more than three hundred, including seventy-eight children) of the Ugandan Movement for the Restoration of the Ten Commandments of God (MRTCG) died in Kanungu, Uganda, when their church was burned, in what was alternately called a mass suicide or a homicide perpetrated by the movement's leaders. The subsequent discovery, in various locations, of mass graves containing the remains of people believed to be murdered (most of them stabbed) raised the death toll to 780 and possibly more, the largest such incident in recent history at that time.

The MRTCG, a fringe Catholic group, had been established among an epidemic of apparitions of the Virgin Mary and Jesus in Catholic circles in Africa, most of them not recognized by the Roman Catholic Church. These apparitions occurred during and after a series of famous apparitions in Kibeho, Rwanda, from 1981 to 1989. There, seven "seers" were encouraged and approved by the Catholic hierarchy. The apparitions that led to the formation of the MRTCG started in 1987, when a number of Catholics claimed to have had visions of Jesus and the Virgin Mary in southwestern Uganda after Specioza Mukantabana, a Rwandan girl who claimed a connection with Kibeho (although she was not one of the seven "approved" seers) moved in 1986 to the Ugandan diocese of Mbarara and later to the diocese of Masaka, starting a movement in Mbuye. Among the new Ugandan seers were Paul Kashaku (1890–1991) and his daughter Credonia Mwerinde (1952–2000), a barmaid with a reputation for sexual promiscuity. Mwerinde later claimed to be a former prostitute—probably a false claim and a conscious attempt to replicate the role of Mary Magdalene. Kashaku had a past as a visionary and claimed to have seen, as early as 1960, an apparition of his deceased daughter Evangelista.

Kashaku claimed to have had a particularly important vision in 1988, and he impressed, among others, Joseph Kibwetere (1931–2000), who claimed to have himself received visions since 1984. Kibwetere was a solid member of the Catholic community in Uganda. He had been a politician and a locally prominent member of the Catholic-based Democratic Party in the 1970s. Eventually, a community was established in Kibwetere's home in 1989. The newly formed group attempted to merge the movement with other "apparitionist" groups, including the one established in Mbuye by Mukantabana (a group that had been condemned by the local Catholic bishop). These attempts failed however. A group of twelve apostles (six of them women) was appointed, and Kibwetere became their leader after Kashaku's death in 1991.

The seers claimed to have seen Jesus, Mary, and Joseph in several different visions, which were heavily influenced by recognized Catholic apparitions, such as those at La Salette and Fatima. The visions were also influenced by unofficial Catholic sources, including the messages of the Italian visionary priest Father Stefano Gobbi, several visionaries based in the United States, and William Kamm (“Little Pebble”), a marginal Catholic prophet who claimed that he would eventually become pope. The messages of the seer’s visions addressed typical Ugandan themes, such as the AIDS epidemic and government corruption.

Eventually, the village of Kanungu was designated *ishayuro rya Maria* (rescue place for the Virgin Mary), and the seers moved there in 1994. The group converted to their prophetic visions a handful of Catholic priests and nuns, including Father Dominic Kataribaabo (1967–2000), a Ugandan Dominican priest who was educated in the United States. The MRTCG developed an archconservative brand of Catholicism, and some of its leaders and members were eventually excommunicated by the Roman Catholic Church, although the priests were only suspended from their priestly functions rather than excommunicated. The MRTCG broke with the Ugandan Catholic Bishops on questions of reliability of apparitions (including their own), clerical garb, and the proper ways of taking communion. They regarded as licit only communion taken kneeling, and rejected the practice of the communicant taking the host in his or her hands. Unlike other Catholic traditionalist movements, however, the MRTCG did accept ecumenism and the new ritual of the Mass introduced after Vatican II. The MRTCG’s Masses were celebrated in vernacular rather than Latin. The movement’s publications strongly denied that the MRTCG was a new religious movement, and claimed that it was simply a conservative Catholic group. The Ugandan Catholic Bishops, however, concluded otherwise.

The Movement for the Restoration of the Ten Commandments of God was legally incorporated with this name in 1994, and a boarding school was licensed until 1998, when the license was revoked by the government on the grounds that its teachings that were contrary to the Ugandan constitution. The government also expressed concern over breaches of public health regulations and possible mistreatment of children. In fact, the main message of the MRTCG was that the Ten Commandments had been distorted and needed to be restored in their full value. The third edition of the handbook *A Timely Message from Heaven: The End of the Present Times* (1996), mainly written by Kataribaabo, proclaimed: “Ours is not a religion but a movement that endeavors to make the people aware of the fact that the Commandments of God have been abandoned, and it gives what should be done for their observance.” Additional comments in the book about morality refer to themes common in traditionalist and other Catholic archconservative circles. For example, inappropriate dress is seen as a sign of immorality in the statement: “girls prefer wearing men’s trousers to wearing their own dresses.” The message was also apocalyptic:

All of you living on the Planet, listen to what I’m going to say: When the year 2000 is completed, the year that will follow will not be year 2001. The year that will follow shall be called Year One in a generation that will follow the present generation; the generation that will follow will have few or many people depending on who will repent. . . . The Lord told me that hurricanes of fire would rain forth from heaven and spread over all those who would not have repented.

It is worth noting that these MRTCG visions are very similar to those of the church-approved Kibeho visionaries, who saw rivers of blood, great fires, and decapitated corpses. The Kibeho seers warned, on the basis of what the Virgin Mary had told them, that “there isn’t much time left in preparing for the Last Judgment. We must change our lives, renounce sin. Pray and prepare for our own deaths and for the end of the world” (Maindron, 1985, p. 107). Of course in Kibeho, church approval also meant church control, and the apocalyptic elements were given approved and centuries-old metaphorical interpretations. But once the MRTCG left the Catholic fold, the group acted out some of the Kibeho images literally.

The approximately five thousand members of the MRTCG (the movement had branches in several small Ugandan towns) were said to avoid sex and to rarely talk for fear of breaking the commandment about not bearing false witness, and they were reported to have developed a sign language (reports of their unusual behavior may have been exaggerated after the tragedy). Although most members were former Catholics, the group also included some from the African Initiated Churches (AIC, formerly called African Independent Churches) and from local spiritualist groups.

The MRTCG was considered to be among the less violent local apocalyptic movements in Uganda. However, the group did predict the end of the world for December 31, 1999, later revising the date and claiming that on March 17, 2000, the Virgin Mary would appear and take members to heaven. The prophetic failure may have induced a number of members to doubt the leaders and ask for the return of money they had contributed. This development (similar to what occurred in the Order of the Solar Temple prior to the homicides and suicides of 1994) may have created a category of “traitors” who were killed in various waves prior to March 17 and whose bodies have been found in several mass graves. On the other hand, the mass graves remain in many respects a mystery, and it is also possible that some “weak” members, regarded as not fully prepared to commit suicide, were killed without being regarded as “traitors.”

Shortly before March 17, Kibwetere wrote to his wife Theresa (not a member of the MRTCG), urging her to carry on the movement after his departure. A nun visited nearby villages announcing the coming of the Virgin Mary for March 17. Apparently, while some members did know about the suicide plan, others were simply told about an imminent supernatural event and did not expect to die. As in the case

of the Solar Temple (and notwithstanding the obvious differences) there were three categories of victims: those who knew about the suicide and regarded it as a “rational” way to escape a doomed world (a minority); those who expected to go to heaven but did not know how; and the “traitors” who doubted Kibwetere after the prophetic failure. The latter may have been assassinated before the church fire. The presence of three, rather than two, categories of victims creates a continuum between homicide and suicide.

Among the leaders, Kataribaabo was originally identified among the dead, but later the Ugandan government issued a warrant for his arrest, along with warrants for Kibwetere and Mwerinde. Dental records for the three are unavailable, and it has been impossible to determine whether they died in the fire (as their families believe) or escaped with the movement’s money (as some witnesses suggest and the Ugandan government apparently believes). The idea that the leaders were con artists who escaped with the money was also the explanation preferred by the media and some members of the law enforcement community in the Solar Temple case, before dental records proved this theory wrong. Most scholars believe that the leadership of the MRTCG died in the 2000 fire, and the leaders’ behavior prior to these events supports this conclusion.

Uganda is home to hundreds of religious movements, many of them apocalyptic and millenarian. This is not surprising since Uganda experienced a virtual apocalypse during the bloody regime of Idi Amin Dada (1925–2003) and given the atrocities of the civil war. Followers of apocalyptic movements in Uganda expect justice to come with the end of the world, not through politics. Scholarship about Uganda’s apocalyptic movements warns against applying Western models to situations peculiar to that country. In fact, conflict between “cults” and the national army, as well as protest and violence (even suicide), are often manifestations of preexisting ethnic, tribal, and political conflicts.

In general, tragedies in Uganda also confirm that violence connected to new religious movements erupts because of a combination of factors internal and external to the groups. In the MRTCG case, internal factors included the personalities of the leaders, their literal interpretations of prophecies about the end of the world (as exemplified by Kibehe and Gobbi), and the crises within society and the Roman Catholic Church. Once dissociated from the church’s time-tested metaphorical interpretations, apocalyptic revelations may be taken literally and acted upon. External factors include the difficult situation prevailing in Uganda, particularly in areas ravaged by disaster, famine, and civil war.

After the tragedy of Kanungu, some African governments reacted strongly against “cults.” The risk is that they will engage in witch-hunts, failing to acknowledge that most apocalyptic movements throughout the world are law-abiding and nonviolent. In Africa, as elsewhere, claims that all millenarian and apocalyptic movements are heading for

mass suicide are grossly inaccurate. These assumptions may in fact amplify tension and deviance, thus operating as self-fulfilling prophecies, helping to cause the very evils people claim they want to prevent.

MASSIMO INTROVIGNE (2005)

MOZI. Very little is known about the life of the fifth-century BCE Chinese thinker Mozi (Master Mo), although a number of clues suggest that he may have been trained as an artisan. He was the first major thinker to challenge the heritage of Confucius (551–479 BCE) and is best known as the founder of the Mohist school or lineage of thinkers that flourished in the fourth and third centuries BCE, but he fell into obscurity soon after. Although the teachings attributed to Mozi, under the eponymous title Mozi (the core of which is held to represent Mozi’s own writings rather than elaborations and accretions by later Mohists), were transmitted to posterity, they exercised little influence after the third century BCE and were largely ignored until the nineteenth century.

Whereas in early Confucian writings it is the figures of the ruler and the father that served as authority models, Mozi appealed to a higher authority: *tian* (heaven). For him, it was the ideal model of what is constant, reliable, objective, measurable, and equally accessible to all (Hansen, 1992, p. 100). Many of Mozi’s arguments are backed by an appeal to *tian* or (*shang*) (*supreme ancestor*). This is one of the reasons that Mohism has often been described as a religion. Mozi’s concept of *tian* is conventionally understood as a morally normative force with authority above the ruler, which expressed its wishes through a variety of mechanisms, including portents and the appearance of spirits.

There is, however, a real question as to whether Mozi did, in fact, believe in a normative *tian*. A more pragmatic

interpretation would be that he actually believed that if people act as if *tian* is a normative force, then they will be more inclined to act in ways that conform with Mozi's own philosophical principles. It is important to note that Mozi does not talk of *tian*'s decrees (*ming*), but only of its intentions or goals (*zhi*). From a moral point of view this affords people the responsibility to make their own moral choices. Further supporting the pragmatic interpretation is the fact that order in the world is only achievable through strenuous effort on the part of both humans and *tian*. For Mozi there is no pre-existent order of things: an ordered human society is produced and maintained by the purposeful cooperation of *tian*, spirits, and humans, who work together in the face of the constant propensity of things to revert to a state of chaos (Schwartz, 1985, p. 141). The social upheavals of the times would certainly have reinforced this view.

The message is clear: if humans want order, they, like *tian*, must work at it, and the model they should follow is the one that *tian* itself has shown them: favoring utility and benefit over harm. Moral conduct was defined as acting so as to benefit others, which ultimately will benefit oneself. For Mozi's utilitarianism to work, it is crucial that people believe that their efforts can make it work. Utility/benefit provides a measurable standard that anyone can use with accuracy. For Mozi, utility included such things as food and shelter, peace, and the material conditions of life. The benefit-harm distinction also appeals as being a standard that is natural or pre-social rather than conventional. As such, it seems to offer a neutral basis for ranking alternative proposals about what is the best course of action. Confucian moral standards, by contrast, are derived from the teachings of so-called sages, or culled from tradition. Another weakness with Confucian ethics is that moral concern is graded according to one's relationship with someone, and family members always come first. Mozi argues that morality must involve equal concern for all people. Indeed, Mozi's most celebrated doctrine is the doctrine of ungraded concern for others (*jian ai*). He maintained that the world's disorders are the product of human selfishness and a lack of mutual concern. Mozi's panacea for these ills requires people to be as concerned about others as they are for themselves.

Mozi had four main criticisms of early Confucians: (1) they did not believe in the existence of *shangdi* (supreme ancestor) or spirits, thus incurring the displeasure of these anthropomorphic powers; (2) they insisted on elaborate funerals and practiced three years of mourning when a parent died, resulting in a waste of resources and energy; (3) they attached great importance to music, another extravagant waste of resources; and (4) they believed in predetermined fate, which leads to laziness and resignation.

Mozi applied three standards to gauge the value of any doctrine: its basis, its verifiability, and its applicability. Take the example of fatalism, which Mozi criticizes on the following grounds: (1) Fatalism is not in accord with the intentions of *tian* or the teachings of the ancient sage kings. This is

proved by quoting ancient writings that record the teachings of the ancient sage kings. (2) The real existence of fate cannot be proven by any means. It cannot be proven empirically by the senses of hearing and sight, for no one from the beginning of time to the present could testify that they had ever seen or heard directly from such a thing as fate. Moreover it cannot be proven using moral arguments because moral arguments require the nonexistence of fate. (3) Fatalism is the creation of tyrants, used by bandits and other wrongdoers, and welcomed by lazy people. Although it has been claimed that these three standards are the earliest known example of an attempt to formulate principles of reasoned argument in early China, it should be noted that the appeal to ancient authorities still occupies first place (Graham, 1978, p. 11).

Although Mozi's writings have often been criticized for being dull and repetitive, he did use consistent and rigorous arguments. Positive assessments of his legacy note his attempts to justify his philosophical ideas; his efforts to submit traditional morality to the test of social utility; his defense of innovation; his support for the new kind of centralized state, with merit rather than birth as the grounds for preferment; and for introducing reasoned argument into classical Chinese thought (Graham, 1978, p. 4).

JOHN MAKEHAM (2005)

MUDRĀ. *Mudrā* in Sanskrit means seal or stamp of authority. In ordinary Sanskrit this meaning has always been in use. For instance, a political play written by Viśākhadatta (c. 7 CE) is called *Mudrā-rākṣasa* (The signet [ring] of Rākṣasa). Rākṣasa was the chief minister of the Imperial Nandas, the enemies of Candragupta Maurya, king of Magadha, and this ring was his seal of office.

However, in the medieval Brahmanic tradition, especially in religious practice, another meaning of the term *mudrā* became prevalent. In this context *mudrā* is a symbolic representation of a concrete form, or an idea, presented through gestures (*hastas*) and, sometimes, facial expression. It thus becomes closely associated with hand gestures used in dance and acting. *Mudrā* can also refer to hand gesture in an iconographical context, though this is a late innovation (see Colas). For example, in the Buddhist Tantra the term *mudrā* is sometimes used to describe hand postures found in images of the Buddha and Bodhisattva. Some esoteric Buddhist Tantras, such as the *Guhyasiddhi* written by Padmavajra during the seventh century, call the adept's female partner *mudrā*. According to the *Siddha Tantras*, supreme Sakti who is nameless (*anākhyā*) is designated as *mudrā*. As the term means divine authority and as Sakti is indeed the manifest divine authority, it is correct to call her *mudrā*. Tantric's partner is taken in rituals as a representative of the supreme Sakti and thus the divine authority incarnate (White, 2003).

In early Indian religious understanding, the term *mudrā* refers exclusively to ritual hand gestures symbolizing a variety of meanings and conferring legitimacy on a ritual act. The *Viṣṇudharmottara Purāṇa*, a famous early work on iconography, interestingly associates *mudrā* with esoteric rituals (*rabasya-mudrā*). In book III (the book on dance), it describes techniques of dance, including hand gestures (*ṛtta-hasta*). Not until the middle of the book does it turn to a discussion of the *mudrā* hand gestures (*mudrā-hastān vyākhyāsyāma*), which are presented as being in a separate category from the other hand gestures. Although the whole section on the performing arts in this Purāṇa concerns ritual worship, the mention of "esoteric" (*rabasya*) in relation to the *mudrā-hastas* clearly indicates that such *mudrās* were reserved for esoteric worship and not intended for use in the forms of public worship that incorporated dance along with gestures and mimesis. This esoteric quality becomes obvious when one takes into account the sorts of things that are represented by *mudrā-hastas*. Often these are abstract ideas like the mystic syllable "Om" or the esoteric use of the vowels (Beyer, 1973, pp. 101–102). The same Purāṇa introduces a type of *mudrā* known as *śāstra-mudrā* (3.33.15–16). These gestures depict deities in the special characteristic postures described in the *mantras* associated with them. *Śāstra-mudrās* also include a not particularly esoteric group of gestures used to represent the vehicles of these deities.

It is clear that a gesture is called *mudrā* when it accompanies a *mantra* and has an explanatory mimetic connection with what the *mantra* expresses. It may mime some salient

features of the deity of the *mantra*, or it may mime the abstract idea expressed in the *mantra*; for example, the *mantra* "ah," which depicts the deity of the primal point of creation, must be uttered along with prescribed hand gestures. *Mudrā* also is seen as an agent that invests the *mantra* with the energy of its associated deity, and thus invests the worshipper with that deity's power. During the ritual investment of divine power, a process known as *nyāsa*, the ritual hand gestures indicate the divesting of power from each part of the deity's body to the corresponding part of the worshipper's body. Finally, one may deduce from the *Viṣṇudharmottara Purāṇa* that *mudrā* not only refers to a type of hand gesture but also symbolizes the seal of approval of the deity whose *mantra* the *mudrā* accompanies. It seals the *mantra*'s efficacy with divine authority.

The formulation of *mudrās* in a ritual context has been elaborately systematized. Indeed, all the major religious systems of classical India record the correct formulation of these hand gestures in their canonical texts and exegetical works. *Mudrās* are divided into three categories, each associated with different stages of a ritual. The first consists of *mudrās* associated with ritual purification of the worshipper's person, of the place of worship, and of the ingredients of offerings. These are called purificatory gestures, and are used at the beginning and end of a ritual. The second category is made up of those hand gestures known as *samṣkāra mudrā*. These are associated with the part of a ritual in which the worshipper envisages a cosmogonic sequence through which the deity gradually assumes a personal form and takes up residence in the worshipper's innermost core. This is the adept's heart conceived as a lotus, the seat of the deity, and is known as the lotus-heart. The worshipper invites the deity to emerge from his lotus-heart to sit upon the divine pedestal set up in front of the worshipper, so that offerings may be made. The third category of *mudrās*, *pūjā-mudrā*, comes into play when the worshipper makes offerings and imagines them being received by the deity. The final offering is of the worshipper's own self. A ritual ends with the worshipper envisaging the deity taking leave and being reabsorbed into the worshipper's heart.

The *Mudrās* form a secret system of sign or symbolic language known only to sectarian participants in various rituals. Buddhist, Śaiva, Śākta, and Vaiṣṇava tantric sects each have some sets of *mudrās* that are different from those used by other sects. In fact, members of one tantric sect can communicate with each other secretly by using *mudrās* unknown to an enemy sect.

In general, though, when the same type of object is being referred to, sectarian variation in *mudrā* use is not extreme. Furthermore, some *mudrās* do not vary, at least significantly, from sect to sect. For example, the *mudrā* used to welcome a deity (extrapolated from the everyday gesture used to welcome a revered guest) is almost the same in the Śaiva, Śākta, and Vaiṣṇava sects. Likewise, all sects use an identical *mudrā* called *surabhī* when a jug of water or other drink that

is being offered to the deity is mentally identified with divine nectar. (The name of this *mudrā* is derived from the celestial cow Surabhī, whose milk is nectar.)

Ritual hand gestures are acts of elaborate mimesis. An act of warning toward any malevolent agent is played out either by imitating a weapon, for instance an arrow, or by making an explosive sound by snapping fingers or clapping hands. The ritual worshipper is an actor creating a totally supernatural world of religious reality through focused meditation, vivid imagination, and total understanding of his religious ideology and aims. That is why his gestures carry an authority invested by long religious tradition.

SANJUKTA GUPTA (2005)

MUḤAMMAD ibn ʿAbdullāh (c. 570–632 CE) is revered by Muslims as the prophet to whom the Qurʾān, the sacred scripture of Islam, was revealed. Apart from the Qurʾān and the *ḥadīth*, the main sources for his life history are the biographies written by four early Muslim historians: Muḥammad ibn Ishāq (d. c. 767), Muḥammad ibn Ṣāʿd (d. c. 845), Abū Jaʿfar al-Ṭabarī (d. c. 923), and Muḥammad ibn ʿUmar al-Waqīdī (d. c. 820).

EARLY LIFE (c. 570–610). Born in Mecca, in the Arabian Hījāz, in about 570, Muḥammad was a member of the Quraysh, the ruling tribe of Mecca, but of the clan of Hāshim, one of its less influential family groups. Orphaned early in life, he was brought up by his uncle Abū Ṭālib, and although he was treated kindly, the experience of deprivation made an indelible impression on Muḥammad, who remained poor throughout his youth and a marginal figure in the thriving city of Mecca. Mecca had long been the holiest city in Arabia. The Kaʿbah, the cube-shaped shrine in the heart of the town, was of great antiquity. It was a place of pilgrimage. Each year, Arabs came from all over the peninsula to perform the arcane rites of the *ḥājj* pilgrimage, whose

original significance had been forgotten but which still yielded a powerful religious experience. Because of the great sanctity of the Kaʿbah, all violence was forbidden in Mecca and its environs, and this made it possible for the Arabs to trade peacefully there, away from the endemic tribal warfare that engulfed the Arabian steppes. During the sixth century, the Quraysh had made Mecca a vital station in the spice trade, and they had become rich by trading in the surrounding countries.

Little is known about Muḥammad's early years. After his death, legends developed that indicated that he had been marked out from birth for future greatness, but until he was about twenty-five there was little sign of this glorious future. He grew up to be a very able young man and was known in Mecca as al-Amīn, the reliable one. He was handsome, with a compact, solid body of average height. His hair and beard were thick and curly, and he had a strikingly luminous expression. Yet his orphaned status held him back. He could get no position commensurate with his talents, but became a merchant, whose job it was to lead the trading caravans to Syria and Mesopotamia. But in about 595, his luck changed. Khadījah bint Khuwaylid, a wealthy businesswoman, hired Muḥammad to take some merchandise into Syria, and she was so impressed that she proposed marriage. Even though she was considerably older than he, this was no mere marriage of convenience. Muḥammad sincerely loved Khadījah and together the couple bore a son, who died in infancy, and four daughters who survived: Fāṭimah, Zaynab, Ruqayyah, and Umm Kulthūm.

But by the time he was forty years old, Muḥammad had become deeply concerned about the malaise that was apparent in Mecca. The Quraysh had become rich beyond their wildest dreams and had left the desperate nomadic life of the steppes behind. But in the new stampede for wealth some of the old tribal values had been lost. In the desert, most Arabs lived on the brink of malnutrition, taking their herds from one watering hole to another and competing desperately with the other tribes for food and sustenance. Throughout Arabia, one tribe fought another in a murderous cycle of vendetta and counter-vendetta. In this brutal existence, the unity of the tribe was essential for its very survival, and a strict nomadic code insisted upon the importance of protecting its weaker and more vulnerable members. But the aggressive capitalism of Mecca had resulted in some of the Quraysh making money at the expense of some of the tribe's poorer clans, including Muḥammad's own clan of Hāshim. The old values were disappearing, nothing new had yet appeared to take its place, and while the more successful members of the Quraysh were naturally happy with these developments, the weaker clans felt endangered and lost.

There was also spiritual restlessness in Mecca and throughout the peninsula. Arabs knew that Judaism and Christianity, which were practiced in the neighboring Byzantine and Persian empires, were more sophisticated than their own pagan traditions. Some had come to believe that the

high God of their pantheon, *al-Lāh* (whose name simply meant “the God”), was the deity worshiped by Jews and Christians, but he had sent the Arabs no prophet and no scripture in their own language. Indeed, the Jews and Christians often taunted the Arabs for being left out of the divine plan. Intent on finding a solution, Muḥammad used to retire to a cave on the summit of Mount Ḥirā’, just outside Mecca, during the month of Ramaḍān, where he prayed, fasted, and gave alms to the poor. It was in this cave that on 17 Ramaḍān 610 Muḥammad woke to find himself overwhelmed by a devastating presence, and heard the first words of a new Arabic scripture pouring from his lips.

THE MESSAGE OF MUḤAMMAD. For the first two years, Muḥammad kept quiet about this revelation, confiding only in his wife Khadijah and her cousin, Waraqa ibn Nawfal, who had converted to Christianity. Both encouraged him to believe that this was a genuine revelation from God, who had chosen him to bring the old religion of the Jews and the Christians to the Arabs. In 612, after another powerfully endorsing revelation, Muḥammad began to preach in Mecca, and he gradually gained converts, including his young cousin ‘Alī ibn Abī Ṭālib, his friend Abū Bakr, and the young merchant ‘Uthmān ibn ‘Affān from the powerful Umayyad family. Many of the converts, including a significant number of women, were members of the poorer clans; others were unhappy about the new inequality in Mecca, which was alien to the Arab spirit.

Muḥammad’s message was simple. He taught the Arabs no new doctrines about God: like the Jews and Christians, most of the Quraysh already believed that Allāh had created the world and would judge humanity in the Last Days. Muḥammad had no intention of founding a new religion, but saw himself as the latest in a long line of prophets that included Adam, Noah, Abraham, Moses, and Jesus (Qur’ān 2:129–132). Muḥammad was not attempting to contradict or supersede these prophets, and he never required Jews or Christians to convert to his new Arab faith, because they had received authentic revelations of their own. Constantly, the revelations that he received from God insist that Muḥammad’s followers must respect the *ahl al-kitāb* (People of the Book). God commands them to speak to the Jews and Christians with courtesy: “Say to them: We believe what you believe; your God and our God is one” (Qur’ān 29:46). God had sent one prophet after another to every people on the face of the earth, each of which had expressed the divine message in its own language and cultural idiom (Qur’ān 35:22). In principle, one cult, one tradition, one scripture was as good as another (Qur’ān 6:160). What mattered was the quality of one’s surrender (*islām*) to God, not to any mere human expression of his will.

The essence of Muḥammad’s message was, therefore, not doctrinal but social and ethical. It was wrong to build up a private fortune, but good to share wealth and create a society where the weak and vulnerable were treated with respect. If the Quraysh did not mend their ways, their society

would collapse (like other unjust societies in the past) because they were violating the fundamental laws of existence.

MUḤAMMAD AND THE QUR’ĀN. This was the core teaching of the new scripture, which became known as the *qur’ān* (recitation) because it was an aural revelation, designed to be listened to for the music of its language, rather than perused page by page. Most of the believers, including Muḥammad himself, were not learned, and they absorbed its teachings by listening to public recitation of its chapters (*sūrah*s). The Qur’ān was revealed to Muḥammad piecemeal, verse by verse, *sūrah* by *sūrah*, during the next twenty-one years, often in response to a crisis or a problem that had arisen in the little community of the faithful. These revelations were very painful to Muḥammad, who used to say: “Never once did I receive a revelation without thinking that my soul had been torn away from my body.” In the early days, the impact was so frightening that his whole body was convulsed; he would sweat profusely, experience a peculiar heaviness, or hear strange sounds, such as the tolling of a bell. The great prophets of Israel also felt the divine impact as a near lethal blow and found it almost impossibly painful and difficult to utter the word of God.

Muḥammad had perceived the great problems of his people at a deeper level than most of his contemporaries, and when he “listened” to events as they unfolded, he had to delve deeply into his inner self to find a solution that was not only politically viable but also spiritually sound. He was also communicating a new literary form and a masterpiece of Arab poetry and prose. The extraordinary beauty of the Qur’ān was in fact responsible for the conversion of many of Muḥammad’s first disciples. One of the most dramatic of these conversions was that of ‘Umar ibn al-Khaṭṭāb, who was passionately devoted to the old paganism and initially opposed to Muḥammad’s message. But he was also deeply versed in Arabic poetry, and the first time he heard the language of the Qur’ān, it broke down all his reservations. “When I heard the Qur’ān, my heart was softened and I wept, and Islam entered into me.”

THE MISSION IN MECCA (612–622). The new teaching would eventually be called *islām* (surrender), and a *muslim* was a man or a woman who had made this existential submission of their entire selves to Allāh and his demand that human beings behave towards one another with justice and compassion. It was an attitude expressed in the prostrations of the ritual prayer (*ṣalāt*), which Muslims were required to make three times a day, facing Jerusalem, the city of the Jews and Christians. Thus at first Muslims were turning their backs on the pagan religion, symbolized by the Ka‘bah, and reaching out towards the monotheistic tradition that they were now determined to follow. The posture of their prayer was thus designed to change their fundamental attitude and orientation. The old tribal ethic had been egalitarian. Arabs did not approve of kingship, and it was abhorrent to them to grovel on the ground like a slave. But the prostrations were designed to teach their bodies, at a level deeper than the ra-

tional, to counter the hard arrogance and self-sufficiency that was rife in mercantile Mecca, to lay aside their selfishness, and to accept that before God they were as nothing. Muslims were also required to give a regular proportion of their income to the poor in alms (*zakāt*) and to fast during the month of Ramaḍān, reminding themselves of the privations of those who were too impoverished to eat and drink when they wished.

Social justice was, therefore, the cardinal virtue of Islam. Muslims were commanded, as their first duty, to build a community (*ummah*) in which wealth was fairly distributed. This was far more crucial than any doctrinal teaching about God. The political and social welfare of the *ummah* would have sacred value for Muslims, and would become the chief sign that Muslims were living according to God's will. This habit of mind has persisted to the present day. Muslims would be profoundly affected by any misfortune or humiliation suffered by the *ummah*. Its spiritual and political health is as crucial to Muslims' religious lives as theological doctrines have been to Christians.

Muḥammad found the Christian preoccupation with doctrine difficult to understand. The Qur'ān tends to regard such speculation as self-indulgent guesswork (*ẓannah*). It seemed pointless to argue about abstruse dogmas that nobody could prove one way or the other. He did have to take up certain theological positions, of course. By the sixth century, most of the Arabs were tending towards monotheism, and even though the Ka'bah was officially dedicated to Hubal, a Nabatean deity, and was surrounded by effigies of some 360 gods, many Arabs believed that it had originally been dedicated to Allāh. Indeed, those Arabs who had converted to Christianity felt comfortable making the *ḥājj* pilgrimage because they saw the Ka'bah as the shrine of their own God, and Muḥammad and the Muslims continued to perform the old rites there. Some of the Quraysh, however, were still happy with the old paganism, and they were especially devoted to three Arabian goddesses: Manāt, Allāt, and al-'Uzzah. Muḥammad forbade his followers to take part in their cults, comparing the pagan deities to weak tribal chiefs who were a liability for their people because they could no longer give them adequate protection. The Qur'ān put forward no philosophical arguments in favor of monotheism. Its approach was strictly practical, and appealed to the pragmatic Arabs. The old religion was simply not working (Qur'ān 25:3; 29:17; 44:47). This was evident in the spiritual malaise, the chronic tribal warfare that was tearing the peninsula apart, and an injustice that violated the highest Arab traditions. The way forward was to be found in the worship of a single God, the creation of a united *ummah*, and the pursuit of justice and equity that alone would bring peace to Arabia. But the Qur'ān insisted that it was teaching nothing new. Its message was simply a "reminder" of truths that everybody knew already (Qur'ān 80:11). This was the primordial faith that had been preached to the whole of humanity by all the prophets of the past.

Muḥammad gradually acquired a small following, and eventually about seventy families converted to Islam. At first the most powerful and successful men in Mecca ignored the Muslims, but by 616 they had become extremely angry with Muḥammad, who, they claimed, reviled the faith of their fathers and was obviously a charlatan who only pretended to be a prophet. They were especially irritated by the Qur'ān's description of the Last Judgment, which they dismissed as primitive fairy stories. But their greatest fear was its condemnation of their ruthless capitalism. On the Last Day, Arabs were warned that their wealth would not help them, nor would the power and influence of their family connections. Everybody would be tried on his or her own merits. Had they looked after the poor? Why had they built up private fortunes instead of sharing their money? The Quraysh, who had become rich and prosperous as a result of the new economy, did not appreciate this kind of talk, and an opposition party developed, led by Abū al-Ḥakam, who is called Abū Jahl (Father of Lies) in the Qur'ān. Muḥammad's old friend, Abū Sufyān, an extremely able and intelligent man, and the devout pagan Suhayl ibn 'Amr also joined the opposition. All had relatives who had converted to Islam, and all feared that Muḥammad was plotting to take over the leadership of Mecca. At this stage, the Qur'ān insisted that Muḥammad should have no political function in the city; he was simply a *nādhir* (a warner). But how long would it be before a man who claimed to receive instructions directly from Allāh would feel inspired to seize supreme power for himself?

PERSECUTION IN MECCA. By 617 the Muslims' relationship with some of the Meccan establishment had deteriorated beyond repair. Abū Jahl imposed a boycott on Muḥammad's clan of Hāshim, forbidding the people of Mecca to marry or trade with the Muslims. This meant that nobody could sell them food. This ban lasted for two years, and the food shortages may have caused the death of Muḥammad's beloved wife Khadijah. The ban certainly ruined some of the Muslims, such as Abū Bakr, financially. Slaves who had converted to Islam were particularly badly treated, tied up, and left to burn in the blazing sun. Most seriously, in 619, after the ban had been lifted, Abū Ṭālib, Muḥammad's uncle and protector (*wālī*) died. This made Muḥammad's position untenable. As an orphan, he was now entirely without powerful family backing. According to the tribal laws of vendetta that still prevailed in Mecca, without a patron who could avenge his death, a man could be killed with impunity. It took Muḥammad a long time to find a chieftain in the city who would become his *wālī*. Clearly he had to find a new solution for himself and the community of Muslims.

Tradition has it that it was during this dark period that Muḥammad experienced his mystical flight (*isrā'*) to the Temple mount in Jerusalem. There he was welcomed by all the great prophets of the past, who invited him to preach to them. This vision represents Muḥammad's longing to bring the Arabs, who had apparently been left off the map of salvation, from far-off Arabia into the heart of the monotheistic

family. After his sermon, Muḥammad made the *mi' rāj*, ascending through the seven heavens to the throne of God.

In Mecca, however, the Muslims' position had become so untenable that Muḥammad was ready to listen to a delegation of chiefs from Yathrib, an agricultural settlement some 240 miles north of Mecca, who approached him in 620 with a novel proposal. A number of different tribes had settled in Yathrib, abandoning the nomadic lifestyle, but the habits of tribal warfare were so engrained that they found it impossible to live peacefully together. As a result, Yathrib was caught up in one deadly feud after another. Some of these tribes had either converted to Judaism or were of Jewish descent, and so the people of Yathrib were used to monotheistic ideas, were not so wedded to the old paganism as some of the Meccan families, and were desperate to find a means of living together in a single community. They had heard of the prophet in Mecca who claimed to be the messenger of the one God, and thought that he might be what they were looking for. During the *ḥājj* of 620, delegates from Yathrib approached Muḥammad, converted to Islam, and made a pledge with the Muslims. Each side vowed that it would not fight the other, and they would defend each other from common enemies. There were further negotiations and discussions. Finally Muḥammad reached a momentous decision. In 622, the Muslim families slipped quietly out of Mecca, one by one, and made the migration (*hijrah*) to Yathrib. Muḥammad, whose new protector had recently died, narrowly escaped assassination, and he and Abū Bakr were the last of the Muslims to escape.

THE HIJRAH (622). The *hijrah* marks the start of the Muslim era, because it was at this point that Muḥammad was able to implement the Qur'anic ideal fully in a social setting. It was a revolutionary step. The *hijrah* was no mere change of address. In Arabia, the tribe was the most sacred value of all. To abandon your own kin to join forces with another group, with whom you had no blood relationship, was not only absolutely unheard of, it violated a strong taboo and was essentially treasonable. The Quraysh, shocked to the core by this extraordinary defection, were outraged, and they had no means of accommodating a development that had no precedent in their world. They vowed to exterminate the *ummah* in Yathrib, which had flouted the deepest and strongest sanctities of Arabia.

The Muslims themselves found the migration a wrenching, painful experience. They were not going forward eagerly into a new life, like other emigrants, but were primarily aware only of the trauma of severance. This is clear in the word they used to describe their radical departure from their tribe. The first stem of the Arabic root word *HJR*, *hajarahu*, can be translated: "he cut himself off from friendly or loving communion or intercourse. He ceased to associate with them." The people of Yathrib were also aware that they were engaged in a highly controversial and precarious experiment in promising to give protection (*awliyah*) and help (*naṣr*) on a permanent basis to people who were not kin. Henceforth,

they would be known as the Anṣār, the "helpers" of the Prophet, but the English translation gives rather a feeble impression of what was involved. *Naṣr* meant that one had to be ready to back up one's "help" with force, if necessary. The pledge that the Anṣār had made with the Muslims was therefore called the "Pledge of War."

Muḥammad had not expected to hold political office, and initially had no intention of founding a new polity. But the force of circumstances that he could not have foreseen meant that overnight he had become the head of a collection of tribal groups that had no blood ties but were bound together by a shared ideology—an astonishing innovation in Arabia. Nobody in Yathrib was forced to convert to the religion of the Qur'ān, which forbids any coercion in religious matters in the strongest terms (2:256). But on his arrival, Muḥammad drew the people of Yathrib together in a covenant. The Muslims, Jewish tribes, and those who preferred to stay with the old paganism all belonged to a single *ummah*, could not attack one another, and vowed to give one another protection. They were all to be "helpers" to each other. News of this extraordinary new "supertribe" spread, and though at the outset nobody in Arabia believed that it would survive, it proved to be the inspiration that would bring peace to Arabia, just ten years after the *hijrah*.

Yathrib would become known as al-Madīnah (*the City*) because it became the archetype of the perfect Muslim society in Islamic thought. Throughout history, many Muslims have looked back on the Prophet's sojourn in Medina as a golden age, when the ideals of Islam were fully incarnated in society. They have idealized this period, much as Christians have idealized the primitive church. In fact, however, these were hard and difficult years, full of darkness and danger for Muḥammad. When he arrived in Medina, one of his first actions was to build a simple mosque (*masjid*; literally, a place of prostration). It was a rough building, which expressed the austerity of the early Islamic ideal. The roof was supported by tree trunks, a stone marked the *qiblah* (the direction of prayer), and the Prophet stood on a tree trunk to preach. Future mosques would be inspired by this model. There was also a courtyard where Muslims met to discuss all the concerns of the *ummah*—social, political, and military, as well as religious. Muḥammad and his wives lived in small huts around the edge of the courtyard. Unlike holy places in other traditions, the mosque was not separated from secular activities and devoted only to worship. In the Qur'anic vision, there is no dichotomy between the sacred and the profane, the religious and the political, sexuality and ritual. The whole of life is potentially holy and must be brought into the ambit of the divine. From the start, the aim was *tawḥīd* (making one), a holistic vision that would give Muslims intimations of the unity that is God.

MUḤAMMAD'S WIVES. In Mecca, Muḥammad had remained monogamous, married only to Khadijah, even though polygamy was common in Arabia. In Medina, however, Muḥammad became a great *sayyid* (chief) and was ex-

pected to have multiple wives, but most of the marriages he contracted were politically motivated. The tie of blood was still important, and as he formed his supertribe, Muḥammad bound some of his closest companions to him by marriage. His favorite new wife was ʿĀʾishah, the daughter of Abū Bakr. He also married Ḥafṣah, the daughter of ʿUmar ibn al-Khaṭṭāb, and arranged the marriages of two of his own daughters to ʿUthmān ibn ʿAffān and ʿAlī ibn Abī Ṭālib, his cousins. Many of his other wives were older women who were without protectors or were related to the chiefs of tribes that became the allies of the *ummah*. None of these wives bore the Prophet any children.

In the West, Muḥammad's wives have occasioned a good deal of prurient interest, but they were sometimes more of a worry than a pleasure. On one occasion, when he found them quarrelling about the division of booty after a raid, he threatened to divorce them all unless they lived more strictly in accordance with Islamic values (Qurʾān 33:28–29). Muḥammad was no chauvinist, but he genuinely enjoyed women's company. ʿUmar and some of his other companions were shocked by the way he allowed his wives to stand up to him and answer him back. Muḥammad regularly helped with household chores, mended his own clothes, and took his wives' advice very seriously. On one occasion Umm Salāmah, the most intelligent of his wives, helped him to prevent a mutiny.

The Qurʾān gave women rights of inheritance and divorce centuries before women in other cultures, including the West, were accorded such legal status. The emancipation of women was one of Muḥammad's objectives. In pre-Islamic Arabia, elite women, like Khadījah, enjoyed a degree of power and independence, but the vast majority of women had virtually no human rights and were treated little better than slaves or animals. The Qurʾān prescribes some degree of segregation for the Prophet's wives, as a matter of protocol, but there is nothing in the Qurʾān that commands the veiling and segregation of all women in a separate part of the house. These customs were adopted some three or four generations after Muḥammad's death, when Muslims imitated the customs of the Greek Orthodox Christians of Byzantium (also Iran), who had long veiled and segregated their women in this way. The Qurʾān is an egalitarian faith, and sees men and women as partners before God, with identical duties and responsibilities (Qurʾān 33:35). The women of Medina played an active role in public life, and some even fought alongside the men in battle. It was only later that Muslim men dragged the faith back to the old patriarchy (the same process happened in Christianity).

THE CHANGE OF THE QIBLAH FROM JERUSALEM TO MECCA. When he arrived in Medina, Muḥammad eagerly anticipated the prospect of working alongside the Jewish tribes, believing that they would welcome him as a prophet in their own tradition. Shortly before the *hijrah*, he had introduced some practices that would make the connection with Judaism more explicit, such as communal prayer on Friday afternoon,

while Jews would be preparing for the Sabbath, and a fast on Yom Kippur. He was therefore greatly disappointed when the Jews of Medina refused to accept him as an authentic prophet. Some of the Qurʾanic accounts of such figures as Noah or Moses were different from the biblical stories, and many of the Jews scoffed when these were recited in the mosque. Like many of the pagan Arabs of Medina, the three main Jewish tribes also resented Muḥammad's political ascendancy. They had formed a powerful bloc before his arrival, and now felt their position threatened.

But some Jews in the smaller clans were friendly and increased Muḥammad's knowledge of their scriptures. He was especially excited to hear that in the book of *Genesis*, Abraham had two sons, and that Ishmael, the child of his concubine Hagar, was said to be the father of the Arab nation (*Gn.* 16; 18:18–20). Abraham had cast Ishmael and Hagar out into the wilderness at God's command, and the Jews and Christians of Arabia believed that they had settled in Mecca, that Abraham had visited them there, and that together Abraham and Ismāʿīl had built the Kaʿbah. Muḥammad was delighted to hear this, since it showed that Arabs had not been left out of the divine plan after all, and that the Kaʿbah was not really a pagan shrine, but had been the first temple of the true God in Arabia.

By 624 it was clear that most of Medina's Jews would never accept Muḥammad, who was also shocked to learn that Jews and Christians, whom he had assumed to belong to a single faith, actually had serious theological disagreements. It seemed disgraceful to split the unity of God's religion into warring sects because of abstruse speculations that nobody could prove definitively. Such sectarianism was idolatrous in erecting a human theological system to the unity that was essential to the faith of Allāh. It made people quarrelsome and unkind, and Muḥammad wanted no part of this sectarianism. So, in January 624, he made one of his most creative innovations. During prayers, he told the congregation to turn around so that they faced Mecca rather than Jerusalem. This change of *qiblah* was a declaration of independence. By turning towards the Kaʿbah, which had been built by Abraham, who had lived before the revelation of the Torah and the Gospels, Muslims were tacitly reverting to the original pure monotheism that had pertained before the divisions in God's religion. Muslims were turning to God alone, not to one of the established faiths; they were abjuring divisive sectarianism and would take their own direct route to God (Qurʾān 6:159, 161–162).

JIHĀD. A few weeks after the change of the *qiblah*, Muḥammad took yet another decisive step. The Emigrants who had made the *hijrah* had no means of earning a living in Medina. There was no land left for them to farm, and most of them were merchants and businessmen, with no experience of date cultivation. The Anṣār, as the helpers in Medina were called, could not be expected to feed and support this large community, because their own resources were stretched to the limit, so Muḥammad resorted to the tradi-

tion of the *ghazw* (colloquial, *ghazū*; “raid”). The *ghazū* was rather like a national sport and a crude means of redistributing resources in a region where there were simply not enough of the necessities of life to go round. Raiding parties would attack the herds or trading caravans of a rival tribe and carry off booty and livestock. The trick was to avoid taking human life, because this would automatically trigger a vendetta, and nobody wanted that. It was forbidden to conduct a *ghazū* against a tribe that had become an ally or “client” (a weaker tribal group that had sought protection from one of the stronger tribes).

In order to earn their keep in Medina, some of the Emigrants began to conduct raids, attacking the rich caravans from Mecca. But this was a shocking departure from tradition, because it was unheard of to initiate a *ghazū* against your own tribe. But the Emigrants saw themselves as the victims of the Quraysh, who had persecuted them and forced them to leave their homes. The traumatic breach of the *hijrah* meant that they had been cast out of their tribe. The Anṣār, who had no quarrel with the Quraysh, took no part in these first raids. At first the raiding parties enjoyed some success, but in March 624 Muḥammad led a large band of Emigrants to the coast in order to intercept the largest Meccan caravan of the year. When the Quraysh heard of this shocking project they dispatched an army to defend the caravan, but even though they were heavily outnumbered, the Muslims were able to inflict a defeat on the Meccans at the well of Badr. The Quraysh fought in the old Arab style, with careless bravado, and had no overall strategy, but the Muslims fought under Muḥammad’s unified command with greater discipline. The victory made a great impression on the nomadic tribes, who were not displeased to see the haughty Quraysh humiliated in this way. They began to look with interest at the prophet who seemed to be the coming man in Arabia.

But the Quraysh were certain to retaliate, and Muḥammad now found himself engaged in a full-scale war with Mecca. During the five years of hostilities, the Qurʾān gives instructions about proper conduct on the battlefield, and develops a theory of warfare that is similar to the Christian ideal of the just war. The Qurʾān permits only a war of self-defense; Muslims must never initiate hostilities (2:191). Warfare is always abhorrent (2:217), but sometimes it is necessary to fight in order to bring the kind of persecution the Muslims had endured in Mecca to an end or to preserve decent values (2:217:22:40). As long as the fighting continues, Muslims must dedicate themselves to the war wholeheartedly in order to bring hostilities to a speedy conclusion, but the second the enemy makes a peaceful overture, all hostilities must cease (2:192). But it is always better to avoid warfare, to forgive injuries, to talk rather than to fight, and to forgive (5:45).

The word *jihād* does not mean “holy war,” as Western people often imagine. It means “struggle” or “effort.” It is difficult to put God’s will into practice in a flawed and vio-

lent world, and Islam demands that Muslims make an effort on all fronts: physical, moral, political, social, spiritual, and intellectual. Sometimes it may be necessary to fight, but far more important is the interior *jihād*, the personal struggle to eradicate greed, hatred, and egotism from one’s own heart. Thus, after the Battle of Badr, Muḥammad is said to have told his companions: “We are returning from the lesser *jihād* (the battle) to the greater *jihād*,” the more crucial and demanding effort to reform one’s own society and one’s own self.

But for five years after the Battle of Badr, the Muslims had to fight in order to survive. Abu Sufyān launched two major offensives against the Muslims in Medina, vowing not merely to defeat the Muslims but also to exterminate the entire community, as Arab tradition demanded. Muḥammad also had to contend with hostility within Medina, since some of the pagans in Medina resented the power of the Emigrants and were determined to expel them. In 625, Mecca inflicted a severe defeat on the *ummah* at the Battle of ‘Uhud, but two years later the Muslims overcame the numerically superior Meccan army at the Battle of the Trench, so called because Muḥammad had protected the settlement by digging a ditch around it. This victory was a turning point because it convinced most of the nomadic tribes that the supremacy of the Quraysh was over. The old religion seemed discredited because the gods were clearly unable or unwilling to come to the aid of Mecca. Many of the tribes allied themselves to Muḥammad, who began to build a powerful confederacy whose members swore not to attack one another and to avenge attacks on one another. Some of the Meccans also began to defect and made the *hijrah* to Medina. After five years of deadly danger, it seemed that the *ummah* would survive.

THE MASSACRE OF THE JEWISH TRIBE OF QURAYZAH. Three of the most powerful Jewish tribes of Medina—Qaynuqā’, Naḍīr, and Qurayzah—had joined the disaffected pagans of the settlement and plotted the overthrow of Muḥammad. To this end, the Jewish tribes had formed alliances with Mecca. They were a security threat, since the location of their territory meant that they could easily join a besieging Meccan army and attack the *ummah* from within. When the Qaynuqā’ staged an unsuccessful coup against Muḥammad in 625, they were expelled from Medina. Muḥammad tried to reassure the Naḍīr and made a special alliance with them, but when they attempted to assassinate him, he sent them into exile too. The exiles joined the nearby Jewish settlement of Khaybar, and helped to build support for Abū Sufyān from the northern Arab tribes. When the remaining tribe of Qurayzah sided with Mecca during the Battle of the Trench, Muḥammad showed no mercy. The seven hundred men of Qurayzah were killed and their women and children sold as slaves.

This was an appalling incident, and Muḥammad was acting exactly like a traditional Arab chieftain, retaliating mercilessly to ensure the survival of his own people. An Arab

sayyid was not expected to spare surviving enemies. Had Muḥammad simply exiled the Qurayzah, they would have swelled the Jewish opposition in Khaybar and brought another war upon the *ummah*. The executions sent a grim message to Khaybar and helped to quell pagan opposition in Medina. Muḥammad acted according to the old tribal ethic in an attempt to bring hostilities to an end as soon as possible. This had been a fight to the death, and both sides had understood that the stakes were high.

The struggle did not indicate any hostility towards Jews in general, however, and showed no antipathy to Jewish religion. The Jews of Medina who had not sided with Mecca continued to be a part of the *ummah* and to enjoy Muslim protection. The Qurʾān continued to command Muslims to respect the People of the Book and to revere the Jewish prophets. Later, Jews, like Christians, enjoyed full religious liberty in the Islamic empires. Hatred of Jews became marked in the Muslim world only after the creation of the State of Israel in 1948 and the subsequent loss of Arab Palestine. As a result of this originally secular conflict, some Muslims now quote the passages in the Qurʾān that refer to Muḥammad's struggle with the three rebellious Jewish tribes, thus distorting both the message of the Qurʾān and the attitude of the Prophet himself, who felt no antagonism toward the Jewish people.

A PEACE OFFENSIVE (628–630). The massacre of the Qurayzah may have been a personal watershed for Muḥammad himself. His struggle with Mecca had followed the old patterns of violence in Arabia. The persecution of Muslims in Mecca had led to the *hijrah* and subsequent Muslim raids on the Meccan caravans. *Ghazū* had led to full-scale warfare. Attack had led to counterattack, injury to reprisal and retaliation. There had been atrocities on both sides. This had long been the chronic problem of Arabia. As long as Muḥammad continued to behave like a traditional Arab chieftain, he and his Muslims would be caught in an escalating spiral of violence, vendetta, and counter-vendetta. After his victory at the Battle of the Trench in 627, therefore, Muḥammad felt that it was time to break this vicious cycle.

In March 628, Muḥammad initiated an audacious campaign of nonviolence that eventually brought the conflict to an end. He announced that he was going to make the *ḥājj* pilgrimage to Mecca and asked for volunteers to accompany him. Since pilgrims were forbidden to bear arms during the *ḥājj*, the Muslims would be walking directly into the lions' den and putting themselves at the mercy of the Quraysh. Nevertheless about a thousand Muslims set out for Mecca with the Prophet, attired in the traditional white pilgrim robes and performing the rites of the *ḥājj* meticulously. Muḥammad was well aware that he was putting the Quraysh in a difficult position. If they attacked unarmed Arab pilgrims, they would violate the most sacred principles of Arabia and would be reviled as unworthy guardians of the Ka'bah. The Quraysh did dispatch their cavalry to attack the pilgrims, but with the help of friendly local tribes the Proph-

et evaded them and managed to reach the well of Ḥudaybiyah, at the edge of the Meccan sanctuary, where all violence was forbidden. The Muslims then dismounted from their camels and sat down peacefully to await developments. Eventually the Quraysh were pressured to send a delegation and to sign a treaty with Muḥammad.

The treaty was extremely unpopular with the Muslims because Muḥammad appeared to throw away all the advantages that he had gained in the course of the long conflict. Even though Muḥammad could easily have forced the issue, he agreed to waive his right to complete the *ḥājj*, on the condition that the Muslims could make the pilgrimage the following year. There would be a truce between Mecca and Medina. This meant that Muḥammad had to abandon the economic blockade that was beginning to strangle the Meccan economy and that the Muslims could no longer engage in lucrative raids on the Meccan caravans. Muḥammad also promised to return any Meccan who converted to Islam and made the *hijrah* to Medina. The treaty so enraged the Muslims that there was danger of mutiny. But the Qurʾān insists that as soon as the enemy sues for peace, Muslims must bring hostilities to an end and sign a treaty, no matter how disadvantageous the terms. The Qurʾān refers to the treaty of Ḥudaybiyah as a "manifest victory": it was the spirit of peace that distinguished the true believer from the violence of paganism (48:1, 26–27)

Ḥudaybiyah was another turning point. More tribes came over to Muḥammad's confederacy, and conversion to Islam became an irreversible trend. Arabs were pragmatic people: once the old religion had shown itself to be inadequate, they would not remain committed to it. Many of the new members of the confederacy, however, joined for political reasons and did not alter their religious conviction. Muḥammad was well aware of this and did not press for conversion in these cases.

Eventually, in 630, the Quraysh violated the treaty of Ḥudaybiyah by attacking one of Muḥammad's tribal allies. The Prophet was then free to march on Mecca with an army of ten thousand men. Faced with this overwhelming evidence of the change in their fortunes, the Quraysh conceded defeat, opened the city gates, and Muḥammad took Mecca without bloodshed. He destroyed the idols around the Ka'bah, but nobody was forced to enter Islam against their will, according to Qurʾanic principles. Muḥammad's victory, however, convinced some of his most dedicated opponents, such as Abū Sufyān, that the old faith had failed, and they became Muslims.

LAST DAYS (630–632). After his victory, Muḥammad returned to Medina. He had promised the Anṣār that he would never abandon them in order to return to his native city, and Medina remained the administrative capital of the Islamic polity for another thirty years. His most significant act during these final years was the farewell pilgrimage to Mecca in 632, during which he reinterpreted the old pagan rituals of the *ḥājj* and gave them a Muslim significance by linking

them to episodes in the story of Abraham, Hagar, and Ishmael. Therefore, when Muslims make the *ḥājj*, which is the peak experience of their religious lives, they are not reminded of Muḥammad but symbolically rehearse their relationship with the whole monotheistic family, returning to the roots of this faith. Shortly after this last pilgrimage, Muḥammad died in ‘Ā’ishah’s arms on June 8, 632. He was buried in her little hut in the courtyard of the mosque of Medina by members of his immediate family.

MUḤAMMAD IN MUSLIM PIETY. The Qur’ān warns Muslims against the dangers of idolatry (*shirk*); they must not give to any mere creature the honor due to God alone. Constantly Muḥammad had warned the *ummah* against deifying him, as the Christians had deified Jesus. Muḥammad was a mere mortal, like themselves. Nevertheless, devotion to the Prophet is crucial to Muslim spirituality. Muslims call him the “perfect man” because his life represents the ideal of *islām*, a wholehearted surrender to God. Just as Christians attempt to imitate Christ, Muslims imitate Muḥammad in their lives in order to approximate as far as possible this perfection, and to come as close as they can to God himself. The *sharī‘ah*, the corpus of Islamic law, was developed on the basis of the Qur’ān and the daily practice of the Prophet. During the ninth century, scholars began a process of research and compiled the great collections of Muḥammad’s maxims (*ḥadīth*) and accounts of his customary behavior, traveling throughout the Islamic empire to discover as much evidence as they could.

The *sunnah* (i.e., the model conduct of the Prophet) and *sharī‘ah* taught Muslims to imitate the way Muḥammad spoke, ate, loved, washed, and worshiped, so that in the smallest details of their external lives they reproduce his actions in the hope of attaining his interior submission to God. This means that throughout the Islamic world, Muslims have acquired a clear identity, which draws them together. The way they pray or wash, as well as their table manners and personal hygiene, follow a common distinctive pattern. Muslims from China, Indonesia, and the Middle East, for example, all perform the prostrations of *ṣalāt* in the same way. This devotion also means that Muslims internalize the Prophet at a profound level and identify with him deeply. As a result, if Muḥammad is attacked or denigrated in any way, Muslims may feel personally violated.

The imitation of Muḥammad has also influenced many of the various political movements in Islam. Muḥammad did not retire to a cave or mountaintop, but was a man of the world, who worked incessantly to change his society. The society of Medina in Muḥammad’s time has become the blueprint of the ideal Muslim society and has always been the starting point of political science in Islam. Because of the Qur’ān’s emphasis on the paramount importance of social justice, politics has an inescapably religious dimension in Islam, and from a very early date Muslims have followed the example of Muḥammad’s own life when they have sought to reform the *ummah*. From the early seventh century to the

present day, Muslim reformers have first withdrawn from mainstream society in imitation of the Prophet’s *hijrah*, and then engaged in a *jihād*, a struggle that may or may not include military action, to bring their fellow Muslims back to the Islamic ideal. The pattern of migration and struggle has become an archetypal form of engaging in political action. Most recently, the Egyptian activist Sayyid Quṭb (1906–1966) developed a fundamentalist ideology based entirely on Muḥammad’s life, and he followed this archetypal pattern closely in his seminal book *Milestones* (1964). Quṭb’s vision has inspired almost every single fundamentalist movement in the Sunnī world. Usāmah bin Lādin, the founder of the terrorist organization al-Qā‘idah, whose members attacked the Pentagon and the World Trade Center in New York on September 11, 2001, is a disciple of Quṭb. Unfortunately, Quṭb’s ideology has distorted the Prophet’s life by reducing the meaning of *jihād* to “holy war” and making this the climax of Muḥammad’s career, forgetting that the Prophet finally abjured armed struggle and won victory by an ingenious policy of nonviolence.

The example of Muḥammad also informs Sufism, the mystical dimension of Islam. From the eighth century, Muslims who were disturbed by the growing wealth and luxury of the Islamic empire withdrew from the mainstream and imitated the simple lifestyle of the Prophet. The Ṣūfis may even derive their name from their practice of wearing the kind of coarse woolen cloth (*ṭasawwuf*) preferred by Muḥammad. In their spiritual exercises, Ṣūfis hope to put themselves into the same receptive state of mind as the Prophet when he received the revelations of the Qur’ān, and they see the story of the *mi‘rāj* as the archetype of the return that everybody must make to God, the source of their being. The *mi‘rāj* is regarded as the supreme example of Muḥammad’s surrender to the divine. But Ṣūfis do not withdraw from the world in the same way as Christian or Buddhist monks. Their mystic call is often experienced as an inner rebellion against social or political injustices, and like Muḥammad they engage in a campaign of spiritual effort, which they call the “greater *jihād*.” To this day, an intense spirituality modulates easily into political activism in the Muslim world. Ṣūfis have often been at the forefront of many reform movements or in the vanguard of opposition to anything that threatens the *ummah*, externally or internally.

The prophet Muḥammad is equally venerated in the Shī‘ah. Indeed, because of their devotion to the Prophet they also venerate his descendants, whom they believe should be the political leaders of the Muslim community. According to the traditional ethos of Arabia, the special gifts of a chieftain was handed down to his sons and descendants, and after the Prophet’s death many of the Muslims believed that Muḥammad’s prophetic quality would have been inherited by his male descendants. Because he had no surviving sons, these Muslims believed that some of his prophetic charisma had passed to ‘Alī, Muḥammad’s cousin and son-in-law, to

his sons—Ḥasan and Ḥusayn—and, following Ḥusayn's tragic murder by the Umayyad caliph, to the descendants of Ḥusayn, until the line finally died out in the ninth century. Each of these inspired *imāms* were the spiritual "leaders" of their people; each had inherited a secret knowledge (*ilm*) of divine truth. Each, as it were, kept some of Muḥammad's unique prophetic qualities alive, and in some mysterious way, kept the Prophet alive in each generation.

KAREN ARMSTRONG (2005)

MUḤAMMAD AḤMAD (AH 1260–1302/1844–1885 CE), Sudanese preacher and mystic who claimed to be the Mahdi of Islam. Muḥammad Aḥmad ibn 'Abd Allāh was born at Labab Island on the Nile in Dongola province of a Nubian family claiming descent from the Prophet and was brought up at Karari, just north of Omdurman. He received a traditional Islamic education and at age seventeen became apprenticed to Muḥammad Sharīf Nūr al-Dā'im, a shaykh of the Sammānīyah Ṣūfī order. He spent seven years serving and imbibing mystical wisdom from his master who then authorized him to teach the doctrines of the order and to initiate others.

In 1870 he took up residence on Aba Island on the White Nile just north of Kosti, along with his three brothers, who were engaged in the family trade of boat building. Once settled there his growing reputation as a Ṣūfī teacher and ascetic began to gain him a considerable following among the local peoples. His teacher, Muḥammad Sharīf, also established himself nearby in 1288/1872, but before long the two men fell out, perhaps because of the elder man's jealousy at this pupil's acclaim. Muḥammad Sharīf announced Muḥammad Aḥmad's expulsion from the Sammānīyah order, whereupon the latter declared his allegiance to a rival shaykh of the order and denounced his former shaykh as a man who flouted the *sharī'ah*.

In 1878 his new shaykh, al-Qurashī wad al-Zayn, died, and Muḥammad Aḥmad was immediately recognized as his successor. Shortly afterward he received a visit from the man who was to be his political successor, the *khalīfah* 'Abd Allāh ('Abdullāhi) ibn Muḥammad Ādam. 'Abd Allāh's attachment to Muḥammad Aḥmad, however, was more than that of a Ṣūfī disciple to his master. He recognized him as the expected Mahdi, the final regenerator of Islam who, it was believed, would appear shortly before the end time to usher in a period of justice and Sammānīyah equity and unite the whole world under the banner of Islam.

Up to this point there is no indication that Muḥammad Aḥmad had considered the possibility that he might be the Mahdi, though he must have been aware of the widespread belief in the Sudan and West Africa that the Mahdi would appear in the thirteenth century of the Hijrah (1785–1882 CE). Even now he hesitated, but following a series of visions he became convinced in 1881 that God had designated him as the Mahdi. For three months his Mahdihood was a secret, revealed at first only to trusted disciples and then, on a visit to al-Ubayyid (El Obeid) in Kordofan, to religious scholars and finally to the common people. Finally, on June 29, 1881, his public manifestation (*zuhūr*) as the expected Mahdi took place on Aba Island, and he called upon his adherents to rally to him.

Events now moved rapidly. In keeping with the Prophet's practice to muster his followers and distinguish the true believers, he undertook an "emigration" (*hijrah*) from Aba Island to Jabal Qadīr in the Nuba Mountains of southern Kordofan, naming those who rallied to him the "helpers"

(*al-anṣār*) after the Prophet's allies in Medina. While encamped at Jabal Qadīr, his supporters won two resounding victories against forces sent by the Turco-Egyptian government of the Sudan, gaining for the Mahdi enormous prestige and a considerable quantity of arms and other booty. The Mahdi now turned his attention to central Kordofan, where he had been warmly received before his manifestation and where there was already a body of believers in his mission. An initial attack by Mahdist forces on al-Ubayyīd in September 1882 was repulsed by government troops with heavy losses, but a siege resulted in the town's fall to the Mahdi early in 1883.

The universal implications of the Mahdi's mission were now made plain. A vision assured him that he would eventually offer prayer in Cairo, Mecca, Jerusalem, and Kufa. The first step was to strike at the heart of the Turco-Egyptian administration, Khartoum, and this city was duly occupied after considerable bloodshed in January 1885.

Following this triumph the Mahdi established his headquarters in nearby Omdurman, but he was destined to survive for only six months, dying, it is generally believed, from typhus. The Islamic state he was in the process of establishing, however, lasted for a further fourteen years until the forces of the Anglo-Egyptian "reconquest" mowed down the *khalīfah* 'Abd Allāh in 1899.

The mission of the Mahdi, however, had not been to establish a lasting political structure. His claim to Mahdhood implied that the apocalypse was at hand, and he constantly exhorted his followers to reject the world and its deceptions and to prepare for the life to come. As a divinely appointed leader he claimed a status only a little short of that of a prophet. While preaching strict adherence to the Qur'ān and the prophetic *sunnah*, he placed himself above the interpretations of the *madhhabs*, the Islamic law schools, and issued authoritative pronouncements on ritual, social, and economic matters through a series of written proclamations (*manshūrāt*) and oral rulings issued in public gatherings (*majālis*; sg., *majlis*). Though a Ṣūfī and shaykh of a suborder, he ordained that belief in his mission overrode all other loyalties and that his prayer manual, the *Rā-tib*, superseded the litanies of the orders. Mystical ideas, however, pervaded all his thinking. His mission was announced in visions in which the Prophet invested him as Mahdi in the presence of Khiḍr, the legendary immortal "man of God," and other "saints" (*awliyā*). He was told by the Prophet that he had been created from the light of the core of his heart, an allusion to the preexistent light before creation that God made incarnate in Adam and other prophets and, finally, in Muḥammad and his descendants.

Although his claims to be the Mahdi must be judged to have been unsubstantiated, many Sudanese remained loyal to Muḥammad Aḥmad's memory. His posthumous son, Sayyid 'Abd al-Raḥmān, was won over by the British administration and was able to benefit from popular pro-Mahdist sentiment (especially among the Baqqārah) to establish grass-

roots support for a national political party. The Ummah party, which he founded in 1945, played the dominant role in Sudanese politics in both the first republic (1956–1958) and the second (1964–1969). The Mahdi's great-grandson, Sayyid al-Ṣādiq, a Western-educated Islamic modernist, remains an influential thinker and a key political personality.

BIBLIOGRAPHY

No full-length critical biography of the Mahdi has yet been published in any European language. Ismā'īl 'Abd al-Qādir's hagiographical life, *Kitāb sa'ādat al-mustahdī bi-sīrat al-Imām al-Mahdī*, has now been partially translated in Haim Shaked's *The Life of the Sudanese Mahdi* (New Brunswick, N. J., 1978). The best account of the period as a whole is P. M. Holt's *The Mahdist State in the Sudan, 1881–1898*, 2d ed. (Oxford, 1970). The autobiography of a Sudanese participant in the Mahdiyyah (and later a pioneer of modern education in the Sudan) has been translated in Jousef Bedri and George Scott's *The Memoirs of Babiker Bedri* (Oxford, 1969), as have the memoirs of a European administrator in the Turco-Egyptian government, *The Sudanese Memoirs of Carl Christian Giegler Pasha, 1873–1883*, edited by Richard Hill (Oxford, 1984). No study has yet been made of the Mahdi's religious thought, but ample material exists in the four volumes of his proclamations, rulings, and letters in M. I. Abu Salīm's *Manshūrāt al-Imām al-Mahdī* (Khartoum, 1963–1964).

JOHN O. HUNWICK (1987)

MUḤAMMAD 'ALĪ LĀHORĪ SEE LĀHORĪ, MUḤAMMAD 'ALĪ

MUISCA RELIGION. Located high on the Colombian plateau, the territory of the Muisca people extended a scarce 300 kilometers long by 125 kilometers wide. To history, the Muisca have become known as the Chibcha, a name derived from Chibchacum, one of their major deities (Von Hagen, 1974, p. 78). Their state comprised two principal kingdoms that, for four generations of rulers preceding the Spanish conquest of this area in 1537, were ruled by two hereditary monarchs, the Zipa from Bacata in the south and the Zaque from Hunsu in the north. Independent allied territories bordered the northern region. The city of Sugamuxi, which was governed by an elected *cacique* ("leader") was an important religious center (Falchetti and Plazas de Nieto, 1973, pp. 39–45).

Unlike the theocratic empires of Mexico and Peru, the fledgling Muisca state had no stone pyramids, temples, or sculpture. In common with the religions of other American theocracies, however, that of the Muisca placed special emphasis on the adoration of the sun. In Muisca cosmology, the supreme deity, Chiminigagua, was equated with light. Myth

recounts how, in the beginning, darkness and silence reigned over a sterile world. Light existed only as the omniscient Chiminigagua within an impenetrable shell of clay. On the occasion of the first dawn, the god broke the shell and illuminated with beauty all that had previously been chaos. He then dispatched two ravens to the ends of the earth. As the birds flew, bright light emanated from their beaks, revealing all the creations of the omnipotent god: the sun, the moon, the vivid birds that animate the sky, and the animals and plants of the earth (Pérez de Barradas, 1950–1951, vol. 2, p. 372; Samper, in Camargo Pérez, 1937, p. 186).

Complementing this dawn-creation myth is the legend of Bachue, fecund mother and matrilineal deity. One spring morning, the sun's rays, like a luminescent emerald, projected sparkling colors over the bleak moor. Warm breezes cleared the early mists as brightly hued birds skimmed over Lake Iguaque. With the gentle murmur of waves, Bachue and her three-year-old son appeared from the waters. Bachue raised her son to maturity, at which point they married. With each pregnancy the prolific Bachue gave birth to five or six children and peopled the entire Muisca realm. With her consort, Bachue instructed the Muisca in the moral precepts of society. Finally, after many years, the couple returned to Iguaque, where they changed into snakes and disappeared into the depths of the lake. Thus Chiminigagua is the energizing power of the universe and Bachue is the progenitor of the Muisca people (Arango Cano, 1970, pp. 29–40).

Bochica, the envoy of Chiminigagua, was a protective deity who saved the Muisca from a disastrous flood inflicted by the irate god Chibchacum (Triana, 1970, p. 82). From a rainbow Bochica hurled a golden staff that dispersed the menacing storm clouds and shattered the mountain below, allowing the flood waters to escape into the Tequendama Falls. For the cruelty he inflicted on the Muisca, Chibchacum was condemned for eternity to carry the earth on his shoulders; as he shifts the weight from one shoulder to another, earth tremors are felt (Arango Cano, 1970, pp. 65–72). The conflict between the two deities is thought to symbolize the rivalry between the chiefs, whose patron was Bochica, and the merchant class, which was protected by Chibchacum (Pérez de Barradas, 1950–1951, vol. 2, p. 401).

Muisca gods were worshiped at the streams, lakes, waterfalls, and mountains of the territory. Rocks bearing the footprints of Bochica were venerated, and many cliff and rock surfaces were carved or painted with sacred designs (Pérez de Barradas, 1950–1951, vol. 2, pp. 340–354). The holiest shrine was the Temple of the Sun, a circular building with cane walls that were whitened with mud daub and floors covered with fine esparto mats. On platforms against the walls lay the mummies of illustrious ancestors. In tribute to their forefathers, the faithful brought to the temple offerings of emeralds and gold that were placed in hollow wood or ceramic sculptures. The gold or *tumbaga* (an alloy of gold

and copper) objects, known as *tunjas*, were anthropomorphic or zoomorphic, in the form of snakes, lizards, birds, monkeys, or felines. Kneeling reverently in the temple with arms held high, the supplicant chanted hymns to the omnipotent spirit of the Sun (Camargo Pérez, 1937, pp. 53–59; Samper, in Camargo Pérez, 1937, p. 190).

Birds were sacrificed in the temple in great numbers. Especially valued were macaws and parrots that were taught to speak; after the sacrifice their heads were preserved. Human sacrifice took place prior to departure for war, and head trophies were taken from the enemy to adorn the temples. During the construction of a temple, posts were driven into the ground through the bodies of living slaves. In honor of the Sun, young boys known as *moxas* were procured from alien territories and reared in the temples as priests. Believed capable of conversing with the Sun in song, these youths were considered sacred, and their movements were circumscribed by strict taboo. Sexually innocent, they were sacrificed in early puberty. To the chanting of hymns, the heart and viscera of a *moxa* were removed, his head severed, and his blood sprinkled on the temple posts. To placate the Sun in times of drought, a youth would be sacrificed before sunrise on a mountain peak, the east-facing rocks anointed with blood, and the body exposed on the mountain to be devoured by the Sun (Kroeber, 1946, p. 907).

Another important ceremonial offering took place at the Lake of Guatavita in commemoration of a legendary princess. Long ago, a ruler, upon discovering his wife's adulterous liaison with a young warrior, tortured and impaled the man and forced his wife to eat the heart and genitals of her lover. Grief stricken, the princess fled, seeking refuge with the guardian spirits of the sacred lake. Full of remorse, the ruler sent priests to reclaim his wife, but they found her in an enchanted palace protected by a great snake. In memory of his abused wife, the ruler promised to give bountiful gifts; thus, on nights of full moon, the princess appears above the waters of the lake to remind people of their obligation and to bring prosperity to the Muisca.

At the investiture of a ruler, offerings were made to obtain the benevolence of the lake's tutelary spirits. Before sunrise, to the sound of flutes and drums, the ruler, carried on the shoulders of painted warriors, approached the Lake of Guatavita. Boarding a raft, he shed his cloak and stood naked, his body anointed with fragrant resin and coated with gold dust. Accompanied by nobles and priests, the raft proceeded to the center of the lake, as worshipers along the banks intoned sacred hymns. When the first rays broke across the horizon, the gilded monarch, resplendent in the Sun's divine light, emitted a joyful cry that was echoed by his reverent subjects. Placing in the waters offerings of gold and emeralds, the ruler finally immersed himself in the lake to wash away the precious gold particles. And on his triumphant return to shore he was received with acclaim and celebration (Arango Cano, 1970, pp. 101–119).

Revised Bibliography

MULLĀ ṢADRĀ (AH 979/80–1050, 1571/2–1641 CE), popular name of Muḥammad ibn Ibrāhīm al-Shīrāzī; Persian philosopher, theologian, and mystic. As his name indicates, Muḥammad, titled Ṣadr al-Dīn (“breast-plate [defender] of the faith”) was born in Shiraz; his father, Ibrāhīm ibn Yahyā, is said to have been a governor of the province of Fārs. **LIFE.** Little is known of the details of Mullā Ṣadrā’s life. He came at a young age to Isfahan, which was the Safavid capital and the center of a flourishing school of philosophy established by Muḥammad Bāqir Mīr Dāmād (d. 1631), Mullā Ṣadrā’s mentor and a philosophic thinker of fairly high caliber. Ṣadrā also studied theology with Bahā’ al-Dīn al-‘Āmilī (d. 1621), a theologian, mathematician, and architect whose treatises on mathematics and science were taught at al-Azhar University in Cairo. His third teacher, Mīr Findiriskī (who died the same year as Mullā Ṣadrā), is believed to have taught Ṣadrā the Peripatetic philosophy of Ibn Sīnā (Avicenna).

Sometime in his youth, most likely during his middle twenties, Mullā Ṣadrā left Isfahan under persecution from certain traditionalist circles who, probably among other things, accused him of pantheism; he was also impelled by

a strong inner need to base his thought on a more solid footing than the superficial method of debates and “verbal quibbles,” as he calls them. He settled in the village of Kahak in the mountains near Qom (an important center of religious learning in Iran), where he led a solitary life, devoting himself to deep contemplation of the basic problems of truth and life, particularly of human destiny. This was accompanied by strenuous religious exercises as a means of spiritual catharsis, as he avers, and as preparation for the reception of truth. It is not certain how long he stayed in Kahak: reports vary from seven to fifteen years, but the latter figure appears to be more accurate within the periodization of his life suggested below. In any event, Ṣadrā informs us that during this stay, as he resigned himself to God and passively submitted to truth, his mind was “flooded with invasions of intuitive truth.” This infused new life into him; he had gone into seclusion troubled and brokenhearted, but he came out of it with a new philosophical discovery, a discovery that was to serve him as the master principle for the solution of all philosophical problems, from the theory of movement, through epistemology, to the nature of the self and God. This was the principle of the reality of existence and the fictitiousness of essences. To expound this principle he wrote various works, including his *magnum opus*, *Al-asfūr al-arba‘ab* (The four journeys).

After his stay in Kahak, Ṣadrā returned to his native town, Shiraz, where it is said a mosque school was built for him by Allāhwirdī Khan under orders from Shah ‘Abbās II. This was the “Khan School” mentioned by the seventeenth-century traveler Thomas Herbert as the most prominent school in Iran; it offered courses in philosophy, astrology (that is, astronomy: astrology is prohibited in orthodox Islam), physics, chemistry, and mathematics. The building, though badly in need of restoration, still stands today. Here Ṣadrā wrote practically all of his works and trained scholars, the most famous of whom were Mullā Fayḍ Kāshānī and ‘Abd al-Razzāq Lāhījī. He is said to have died in Basra on a return from his seventh pilgrimage to Mecca; he was buried there. If reports are to be believed, he made several pilgrimages to Mecca on foot. Such a journey is not uncommon among Muslims, but in the case of a busy intellectual leader it would have been an almost incredible feat.

The life of Ṣadrā thus falls into three broad periods. The first covers his childhood and his period of study in Shiraz and Isfahan—up to his early or middle twenties; the second is the period of his self-imposed exile in the village of Kahak, which, if it spanned fifteen years, would bring him to the age of almost forty, and the last period covers the last thirty lunar years of his life, which would give him a total of seventy lunar or sixty-eight solar years.

THOUGHT. Mullā Ṣadrā tells us that in his early youth he held to the primary reality of essences and considered existence to be a “secondary attribute” contributed by the mind to external reality. This doctrine of “essentialism” arose with Suhrawardī al-Maqtūl, “the Martyr” (d. 1191), who criticized the view of Ibn Sīnā that existence is a “real” attribute

of existents. Suhrawardī held that in reality there are only essences, and that existence is a most general attribute contributed only by the mind and with no counterpart in the external world. This doctrine became very popular after Suhrawardī and gave rise to the doctrine of the “unity of being” (*wahdat al-wujūd*), according to which all beings share existence equally but differ in their essences, a doctrine often linked with pantheism since it asserts the unity of the existence of God with all beings. At some point during his period of seclusion, however, Ṣadrā abandoned this view in favor of the idea of the primary or sole reality of existence, which he then used as his master principle in all fields of philosophic inquiry.

The doctrine of the sole reality of existence implies (1) that essences are not real but are produced only in the mind by the impact of outside reality upon it and (2) that existence is in eternal progressive motion, which at each point assumes all previous grades of movement and transcends them. Let us now consider the fuller impact of each of these propositions. First, existence is “something whose nature it is to be in the external world,” while mind is the natural home of essences. The moment we conceptualize existence, therefore, it becomes an essence and falsifies real existence; thus, existence cannot be known through conceptual reason but only through direct intuition, just as we know ourselves. As Ṣadrā puts it, “That which is directly experienced is existence, but that which is understood by the mind are essences.” Even so, however, the concept of existence differs from all other concepts or essences, in that it alone presupposes real existence. Essences are dysfunctional to existence: the more something has of existence, the less it has of essence. God, the most perfect being, is therefore pure and absolute existence without any essence, although this fact does not, in Ṣadrā’s view, negate God’s attributes, because each of them, as an infinite and concrete entity, is identical with God’s existence and is only conceptually distinguishable from the others, while essences are closed and mutually exclusive. Existence alone is all-inclusive; from it, the mind somehow partitions and carves essences for certain practical purposes, but the continuum of reality is falsified in the process.

Second, this continuum of reality is the continuum of eternal progressive motion, which is unidirectional and irreversible. This movement, which Ṣadrā calls “substantive movement,” occurs in the very substance of everything and not just in its accidents or extrinsic attributes, such as color, shape, locus, and so on. This latter kind of movement is reversible in quality and quantity—hot can become cold or vice versa—but such extrinsic motion is dependent upon an inner, intrinsic one that is irreversible. This intrinsic or substantive motion is so imperceptible that we become aware of it only after a great deal of cumulative change has occurred and a critical point is reached. In view of his doctrine of “substantive motion,” Ṣadrā, of course, denies that real motion has any enduring substratum. But contrary to the theologians (*mutakallimūn*), who believe in atomism, he spends a

good deal of effort to prove continuity, without which the whole idea of process would become impossible, and he would end up denying the very motion that he wants to establish. He therefore concludes by asserting that while the idea of a fixed and enduring substratum is real with regard to accidental movements, it is fictional with regard to substantive movement, which is itself a veritable unity wherein the potential and the actual or the “active” and the “passive” principles are one and the same. In a self-actualizing process, any dualism between that which produces change and that which is receptive of change vanishes.

In the entire field of reality, it is only existence that is characterized by substantive change. Existence alone is therefore “systematically ambiguous” (*mutashakkik*) because it is “that which, by virtue of sameness, creates difference”; other phenomena, like extrinsic motion and time, are so only because they are contingent upon this substantive change. This substantive movement of the world process always proceeds from the general to the specific, from the genus to the differentia, from the abstract to the concrete, and every subsequent development contains the prior developments and transcends them. Ṣadrā also describes the process as movement from mutually exclusive to mutually inclusive parts of being, or from the “composite” to the “simple” being. He thus enunciates the principle: “The truly simple is all reality.” A consequence of this principle is that what appears contradictory at a lower level of being appears as a synthetic unity at a higher level, since mutually exclusive factors progressively become mutually inclusive.

Whereas God is absolute existence, the perpetually and progressively moving grades of existence are the “modes” of existence; these modes, in proportion to the measure of existence they realize, are organized according to the principle of “more or less,” or *ad priorem et posteriorem*, a principle that Ṣadrā borrowed from Suhrawardī. But while for Suhrawardī the principle of “more or less” applies to essences, according to Ṣadrā it applies to existence alone, and that is, as we have seen, the “systematic ambiguity” (*tashkīk*) of existence. On the basis of this *tashkīk* of existence, moreover, Ṣadrā asserts that although in this life all humans partake of one species, thanks to the progressive motion from abstract to concrete in the evolutionary process, in future life every human will become a species unto himself. Strictly speaking, on this principle, every form or mode of being has an irreducible reality of its own, which cannot be dissolved without residue: each being, Ṣadrā tirelessly repeats, exists in its own right as a unique and unanalyzable particular (*fard*). Yet so strong is the pull of the pantheistic-monistic worldview of his earlier days that Ṣadrā emphatically tells us that only God is real and truly existent; every other being is only a chimera, a pseudo-being beside God. Here lies the most basic tension in Ṣadrā’s thought, one which he never seems able to overcome; it is the tension between his philosophical and his religious motivations. Thus, while he tells us that the question “why does the world move?” is a meaningless one, like the question,

“why does fire burn?”—for the only answer is “because this is its very nature”—in the same breath, he insists that it is God who creates change at every moment in the world process, that nothing other than him has any reality whatever, and that all contingent beings are not just things related to him, but mere relations, a hardly intelligible proposition.

Nonetheless, Ṣadrā applies his fundamental theory of existence and its evolution to various traditional problems of philosophy with an amazing degree of consistency and success. Thus, in his theory of knowledge he argues strongly against the Peripatetic view that knowledge comes about by way of gradual abstraction of the object of knowledge from matter and its relationships until pure intellectual knowledge is attained. If this is the case, then our intellectual knowledge of an animal, for example, since it is abstracted from the matter of the animal, must falsify the object of knowledge, because the real animal has matter, and “concepts in the mind would become like engravings on the wall.” Knowledge, in fact, since it is at a higher plane of being than material things, is more concrete, simple, and inclusive, until, at the highest level, the full knowledge-being equation is reached as in God.

In his eschatology, Ṣadrā rejects the doctrine of the transmigration of souls, giving as one reason, among others, that when a soul has developed in a body it cannot regress and start from scratch, which it would have to do if it joined a newborn body. Applying his doctrine of the systematic ambiguity of existence to the problem of will, Ṣadrā asserts that will (like knowledge and other intrinsic attributes) is commensurate with a particular form of existence. Fire, for example, has a certain tendency (like other natural objects) but no will; humans have a will with choice between alternatives. They have to choose because they are a mixture of power and powerlessness, knowledge and ignorance; their “free will” means that they have choice, but also that this choice has determinants. Philosophers who hanker after an “absolutely free will” for humans are running after a mirage. God has a free will without choice since, in his case, there is no question of alternatives to choose from; nevertheless, he does not work under constraint. Thus, an individual can say, “If I will, I will write; otherwise not,” and God can say, “If I will, I will create; otherwise not,” even if God must always create, given his nature; but fire cannot say, “If I will, I will burn; otherwise not.” These differences are due to the nature of existence in each case.

WORKS. The editor of *Al-asfār al-arba‘ah* (Tehran, 1958) puts the number of Ṣadrā’s works at thirty-two or thirty-three; S. H. Nasr, in his study *Mullā Ṣadrā and His Transcendent Philosophy*, mentions forty-six, although he includes a number of items entitled “Answers to Questions.” Although Ṣadrā wrote works of religion as well as philosophy, the latter are by far the more important, since the former are products of the application of his philosophical hermeneutics to religious tenets. His writings can also be divided into original works and commentaries; the commentaries on Ibn Sīnā’s

Metaphysics and Suhrawardī’s *Hikmat al-Isbrāq* are very important and certainly more influential even than most of Ṣadrā’s smaller original pieces. His most important and comprehensive work is undoubtedly *Al-asfār al-arba‘ah*. The first part deals with ontology, discussing questions of existence, essence, and movement. The second, apparently addressing the categories of substance and accidents, deals with his natural philosophy. The third “journey” is devoted to a discussion of God’s being and attributes, while the last deals with humanity and its destiny, which is the final purpose of the entire work. Two other important late works are *Al-mabda‘ wa-al-ma‘ād* (The Origin and the Return, that is, of all being from and to God) and *Al-shawāhid al-rubūbiyah* (Divine Witnesses), held to be his last work; these are both in the nature of summaries of the *Asfār*.

Despite his fame, Ṣadrā had little influence in his own lifetime. As mentioned earlier, two of his pupils gained prominence. It appears that since he had synthesized several schools of Islamic thought and also wrote commentaries on some of their prominent texts, his works gradually became a focal point of philosophic studies in Iran and subsequently in the Indian subcontinent, where Ṣadrā’s commentary on Ibn Sīnā’s *Metaphysics* was taught and where numerous manuscripts of his works still exist uncataloged.

BIBLIOGRAPHY

The latest edition of the *Asfār* (Tehran, 1960–) so far includes three “journeys” in nine volumes; the publication of the second “journey,” which exists only in the 1865 Tehran lithograph edition, is still awaited. The first great commentator on the *Asfār* was ‘Alī Nūrī (d. 1831), followed by a series of other commentators, the most able and prominent of whom was Hādī Sabzawārī (d. 1871). A list of important commentaries (which have never been published independently of the text) is given in the publisher’s introduction to the recent edition of the *Asfār* mentioned above. Ṣadrā has had many “debunkers” as well, particularly Abū al-Ḥasan Jalwāh (d. 1894), who claimed that Ṣadrā “stole” practically all of his characteristic ideas without naming his sources, a claim that of course cannot be taken seriously. For the past few decades, Iran has witnessed reinvigorated interest in Ṣadrā. The celebration of his four hundredth anniversary in 1961 occasioned the publication of some valuable information about him and his writings, along with editions of some of his previously unpublished works.

In the West, the first book on Ṣadrā’s thought, *Das philosophische System von Schirāzi* (Strassburg, 1913), was published by Max Horten. This was followed by Henry Corbin’s translation of *Al-mashā‘ir* as *Le livre des pénétrations métaphysique* (Tehran, 1964). I have published a detailed critical analysis of Ṣadrā’s philosophy based primarily on the *Asfār* entitled *The Philosophy of Mullā Ṣadrā* (Albany, N. Y., 1975). Seyyed Hossein Nasr’s *Mullā Ṣadrā and His Transcendent Philosophy* (Tehran, 1978) contains useful information on the life and works of Ṣadrā. James Winston Morris has published an annotated English translation of Ṣadrā’s treatise *Al-hikmah al-‘arshīyah* entitled *The Wisdom of the Throne* (Princeton, 1981), with a lengthy introduction from an esoteric angle.

For general bibliography, see Seyyed Hossein Nasr's work cited above.

FAZLUR RAHMAN (1987)
Revised Bibliography

MÜLLER, F. MAX (1823–1900), German-born philologist and Vedic scholar, professor at Oxford University and celebrated public lecturer in the comparative study of language, mythology, and religion, editor of the *Rig-Veda Samhitâ* (6 vols.), and editor of *The Sacred Books of the East* (50 vols.).

Friedrich Max Müller was born December 6, 1823, in Dessau, in the small German Duchy of Anhalt-Dessau. His father, Wilhelm Müller (1794–1827), had been a distinguished young Romantic poet known to many as the "Byron of Germany" for his *Griechen Lieder*, written in support of Greek nationalism. Before Wilhelm's untimely death, Franz Schubert had composed a pair of song cycles—*Winterreise* and *Die Schöne Müllerin*—that immortalized two of Wilhelm's best sets of poems. Max Müller's mother, Adelheide Müller (c.1799–1883), had been the eldest daughter of Ludwig von Basedow, a chief minister of Anhalt-Dessau. Max Müller was educated in nearby Leipzig, at the Nicolai-Schule where Leibniz also had been a student, and then at the University of Leipzig, where his father's memory opened doors for Müller into the city's artistic circles. Müller at first considered a career as a poet and musician before settling upon the life of a scholar. Although he studied philosophy with Christian Weisse and M. W. Drobisch, Müller proved to be an especially gifted student of languages, mastering Greek and Latin as well as Arabic, Persian, and Sanskrit, the latter of which he had taken under Hermann Brockhaus.

After completing a Ph.D. in philosophy in 1843, Müller continued his studies in Sanskrit and comparative philology at Berlin under Franz Bopp, who had been famous for examining the linguistic links among the so-called Aryan family of languages, and Friedrich Schelling, under whose influence Müller himself began to see striking parallels between the history of language and the history of religion. In early 1845, Müller traveled to Paris to study Sanskrit under Eugène Burnouf. Although Müller's brief stay in Berlin saw the pub-

lication of his first book, a German translation of ancient Indian fables known as the *Hitopadesa* (1844; Eng. trans., 1866), it was in Paris where Müller received the research direction he needed. At Burnouf's urging, and with the diplomatic support of Baron Christian von Bunsen, Müller was commissioned by the East India Company and Oxford University Press to edit a critical edition of the *Rg Veda*, a project that would take him twenty-four years to complete and would culminate in the six-volume *Rig-Veda Samhitâ*, with Sānaya's commentary (1849–1873). In 1846, Müller traveled to London, where a complete set of the Vedas was archived. Bunsen also helped Müller secure his first teaching and research positions at Oxford. Except for brief excursions to the Continent, Müller worked and resided at Oxford for the remainder of his life.

In 1856, Müller achieved broad public recognition when he published his book-length essay "Comparative Mythology." In this essay, Müller applied current linguistic analysis to the study of mythology in order "to account in a more intelligible manner for the creation of myths" (1909, p. 17). According to Müller, the sun in its various phenomenal modes was the chief source of ancient mythology. In myths Müller saw not simply the personification of the sun, the dawn, the twilight, and so on, but a metaphysical correspondence that human thought and human language drew between the perception of nature and the analogies that the ancient Indo-Europeans had used when communicating what they perceived. The names that people gave to these phenomena, the *nomina* (sing. *nomen*), were later mistaken for divine beings, or *numina* (sing. *numen*), and myths began to develop around these names to account for their existence. Thus, for Müller, mythology represented an earlier "mythopoeic" period or strata in the evolution of human thought and, as such, was viewed by him as a vestige of the past that still impressed itself on the thought and language of the present. Though Müller appears to have borrowed this and other ideas from Burnouf, including his assertion that mythology is a "disease" or weakness of language, the solar thesis that Müller had advanced as a young scholar came in time to overshadow much of his later, more original, thought. Beginning in the 1870s, critics, such as Andrew Lang, savagely attacked Müller's views on mythology. Indeed, it was Lang's relentless barrage against Müller that seemed to have had the most deleterious effect on the respect and influence that Müller's views on mythology had earlier enjoyed.

In 1858 Müller was elected fellow of All Souls College, which, along with his stipend as deputy Taylorian professor of modern European languages, provided a sufficient income for him to marry and raise a family. In 1859, he published his most scholarly work to that point, *A History of Ancient Sanskrit Literature*. Although in 1860 Müller had lost a bitter election bid to fill Oxford's Boden Chair in Sanskrit, in 1861 and again in 1863 he presented a series of celebrated lectures on the study of language that were published in two volumes as *Lectures on the Science of Language*. By now Müller had be-

come a leading voice in his field and, in recognition of his achievements, Oxford University created for him a chair in comparative philology, which he occupied from 1868 until his retirement in 1875.

In his lifetime Max Müller achieved renown not only for his work in comparative philology and mythology, but also as a champion for the comparative study of religion as a “science” apart from theology. But, despite his best efforts, Müller’s work would never gain the lasting success for which he had hoped. After his death in 1900, a *Times* of London obituary mourned his loss, acclaiming him “one of the most brilliant and prolific writers of our time; one whose voice has charmed several generations of Englishmen; who was a great scholar . . . possessing . . . a power of breathing human interest into dry bones, a curiously sympathetic intelligence and a rare mixture of the talents of the poet and the savant” (quoted in Voigt, p. 81). But others were much less effusive, such as Louis Henry Jordan, who called Müller’s work in comparative religion “incomplete and strangely defective.” Jordan believed that Müller had “attempted to be an investigator in far too many departments” and thus “was able to devote only such fragmentary leisure as he could manage to command. It was for this reason that he never really found time to apply himself, with resolute and persistent purpose, to the promotion of Comparative Religion” (pp. 153–154).

Although Müller could not resist the temptation to open every door that invited his curiosity, he had in fact outlined for himself a specific research program that focused on questions concerning the origins and development of religion, mythology, and philosophy (or rather, cognitive thought) through a “scientific,” that is, comparative and historical, examination of language. It was near the end of his life, in his *Contributions to the Science of Mythology* (1897), that Müller laid out for his readers the logic behind the four sciences to which he had devoted much of his fifty-year career at Oxford. Following the method of analyzing and clarifying concepts that he adopted from the German philosophers Johann Herbart and Friedrich Schelling, Müller’s aim was to trace the Indo-European (or Aryan) languages back to their common word roots, layer by layer, in order to uncover and comprehend “the whole sphere of activity of the human mind from the earliest period within the reach of our knowledge to the present day” (p. v). As he explained further:

There is nothing more ancient in the world than language. The history of man begins, not with rude flints, rock temples or pyramids, but with language. The second stage is represented by myths as the first attempts at translating the phenomena of nature into thought. The third stage is that of religion or the recognition of moral powers, and in the end of One Moral Power behind and above all nature. The fourth and last is philosophy, or a critique of the powers of reason in their legitimate working on the data of experience. (p. v)

Müller believed that in the ancient Vedic scriptures, especially in its mythology, he had found the roots of human

thought and the earliest form of religion. As he had proclaimed in his *Autobiography* (1901):

All knowledge, whether individual or possessed by mankind at large, must have begun with what the senses can perceive, before it could rise to signify something unperceived by the senses. Only after the blue aether had been perceived and named, was it possible to conceive and speak of the sky as active, as an agent, as a god. The step from the visible to the invisible, from the perceived to the conceived, from nature to nature’s gods, and from nature’s god to a more sublime unseen and spiritual power. All this seemed to pass before our very eyes in the Veda, and then to be reflected in Homer and Pindar (pp. 149, 150).

Over three decades earlier, in the preface to his multi-volume collection of essays, *Chips from a German Workshop* (1867), Müller had already arrived at the interconnection among language, mythology, religion, and thought and the need for scholars to examine these connections historically and comparatively. As he wrote: “There is to my mind no subject more absorbing than tracing the origin and first growth of human thought—not theoretically, but historically” (p. ix). At times he likened his linguistic work to that of an archaeologist and at other times to a geologist, digging down through the rock and shale to find the bottom layer of human consciousness upon which the whole history of the evolution of human thought, mythology, and religion had been founded. “Language,” he continued, “still bears the impress of the earliest thoughts of man . . . buried under new thoughts, yet here and there still recoverable in their sharp original outline. . . . [B]y continuing our researches backward from the most modern to the most ancient strata, the very elements and roots of human speech have been reached, and with them the elements and roots of human thought” (p. ix). As with the roots of language, so with the roots of religion: “The elements and roots of religion were there as far back as we can trace the history of man; and the history of religion, like the history of language, shows us throughout a succession of new combinations of the same radical [or root] elements” (p. x). For Müller, that foundation was the first conscious perception of the Infinite, this “One Moral Power behind and above all nature” mentioned earlier. Müller was convinced that it was from this perception of the Infinite that the root elements of all religions emerged, which included “a sense of human weakness and dependence, a belief in a Divine government of the world, a distinction between good and evil, and a hope of a better life” (p. x).

During his long career, Müller was engaged in nearly every intellectual debate that stirred up controversy, the most important of which was the debate over Darwin’s *On the Origin of Species* (1859). In his *Lectures on the Science of Language*, Müller argued forcefully that the distinction between human- and animal-kind was the possession of language by the former. So strong was Müller’s position that when his younger Oxonian colleague Edward Tylor defended Darwin’s position, Müller took it as a breach of their otherwise

friendly rivalry. Then, when Darwin's book *The Descent of Man* appeared in 1871, Müller responded in 1873 with his *Lectures on Mr. Darwin's Philosophy of Language*, aimed largely to counter Darwin's supporters. Müller reiterated his views more systematically in *The Science of Thought* (1887), and once more in his *Three Lectures on the Science of Language* (1889). It should be noted that in all these works, Müller's main concern had been over the threat that Darwin's ideas posed, not to religion, but to natural science. Müller, for his part, had already accepted the idea of an evolutionary development of religion, rejecting special revelation or any religious faculty or instinct in humankind as the source of religion or religious ideas. As Müller saw it, unless apes could speak and hence reason, Darwin was flatly wrong. For, as Müller declared, "language forms an impassable barrier between man and beast" (1899, p. 5; see 1887, pp. 152–178).

Finally, in addition to his public stand against Darwinism, Müller also began to present to the English public his ideas on the comparative study of religion. Although Müller had been recognized chiefly for his work in comparative philology and mythology, it was his lectures in the "science" of religion that would prove to be his most provocative, earning him praise in some circles, but denunciation in others as being little more than an atheist in academic disguise. For instance, one clergyman condemned Müller's 1888 Gifford Lectures as "nothing less than a crusade against Divine revelation, against Jesus Christ, and against Christianity."

Müller's first lecture series on religion, which he titled "Lectures on the Science of Religion," were given in 1870 and published in 1872 with a later dedication to Ralph Waldo Emerson. His second series of lectures, published in 1878 as *Lectures on the Origin and Growth of Religion, as Illustrated by the Religions of India*, was presented at Westminster Abbey as the inaugural Hibbert Lectures. During this same period, Müller began work as editor of the monumental series *The Sacred Books of the East*, the highly acclaimed fifty-volume collection of sacred scriptures. For this collection, Müller offered several of his own translations, notably of the *Upanisads* (2 vols., 1879–1884) and of the *Dhammapada* (1881), both of which remain in print.

During the last decade of his life, Müller returned once more to his views on the natural, or evolutionary, development of religion in four sets of Gifford Lectures, presented in Glasgow between 1888 and 1892. He published these lectures under the titles *Natural Religion* (1889), *Physical Religion* (1891), *Anthropological Religion* (1892), and *Theosophy or Psychological Religion* (1893). As Müller explained anew, religion began with humanity's first perception of the Infinite in and beyond nature and natural phenomena. The Infinite has always existed but remained unnoticed until human consciousness rose above that of a brute animal. This awareness came, not by a divine revelation, but through human reflection upon the Infinite in nature, in humanity, and in the self. In essence, this is what Müller meant by natural, not nature, religion.

Though almost wholly ignored by most modern critics of Müller's work, these four series of lectures encapsulate Müller's most complete and developed views, which had originated a half-century earlier. And though Müller believed that in his Science of Religion he was moving beyond theology to history, in the end his views were perhaps too heavily imbued with the language of theology—European as well as non-European—to enable him to work out a truly comparative science of religion.

- Trompf, G. W. *Friedrich Max Müller: As a Theorist of Comparative Religion*. Bombay, 1978. A sympathetic overview and assessment of Müller's life and works that lays stress on the Kantian influences in Müller's thought.
- Voigt, Johannes H. *Max Mueller: The Man and His Ideas*. Calcutta, 1967. A sympathetic but balanced overview of Müller's life and works.

JON R. STONE (2005)

MÜLLER, KARL O. (1797–1840), German classical historian and mythologist. Karl Otfried Müller was educated at Breslau and at Berlin under the classical philologist August Böckh. In 1819 he was appointed adjunct professor of ancient art and literature at Göttingen and taught there until 1839, when he left Germany to study and travel. He died of fever in Athens the next year.

Müller may be claimed as the most balanced and versatile classical historian of his time, especially in the area of Greek religion and myth. None before him had portrayed this ancient religion and mythology within such a broad and unfolding historical context. Müller's innovation, as Henri Pinard de la Boullaye said, was "not a thesis but a method." Müller related cult and myth, for example, to such complex matters as the shift from agriculture to war and hunting, the founding of cities and colonization, the movement of tribes, and the way differences in locale and climate affect ritual and belief. His many-sided approach gave scholarly rigor to Johann von Herder's emphasis, a generation earlier, on seeing national culture as an organic whole, developing from its own historical roots, language, customs, and geography. Müller thus opposed the Romantic view, common in his time, of Greek religion as patently derived from India and the East, usually by way of migrating priests. He treated Greek civilization in its own terms and applied any useful method: philology, the history of religions, aesthetics, cartography, archaeology. By this variety of means, he clarified what might be called the historical topography of Greek cults and myths as they arose, flourished, and spread. He traced the way this changed over time, and he tried to assign causes,

explaining, for example, how a single deity (such as Demeter) was replaced by the Homeric pantheon, how earlier cults remained visible in later and different forms, why the role of local sanctuaries changed, and why mystery religions emerged.

Müller postulated that cult originates in symbol, which is both a transcending and a material representation; myth comes afterward, as an explanation of the cult. He treated myth mainly as a historical document, a clue that the Greeks themselves gave to the meaning of existing customs, beliefs, and important events. He took myth to be a most reliable guide, however, and he was convinced that the folk mind speaking in myth does not falsify or even invent. (Here he reflected the influence of his friends the famous German folklorists Jakob and Wilhelm Grimm.) The most exalted role Müller allowed myth was that of giving an ideal representation to otherwise realistic matters.

BIBLIOGRAPHY

Müller's major works are *Prolegomena zu einer wissenschaftlichen Mythologie* (1825), translated as *Introduction to a Scientific System of Mythology* (London, 1844); *Geschichten hellenischer Stämme und Städte*, 3 vols. (Breslau, 1820–1824), translated as *The History and Antiquities of the Doric Race*, 2 vols. (Oxford, 1830); and *A History of the Literature of Ancient Greece*, 2 vols. (London, 1840). First published in English, this last work is a translation of Müller's *Geschichte der griechischen Literatur bis auf das Zeitalter Alexanders*, 2 vols. (Breslau, 1841).

For a general discussion of Müller and other classical historians of his time, see G. P. Gooch's *History and Historians in the Nineteenth Century* (London, 1952), chap. 3. A sympathetic view of Müller in the context of history of religions is given by Henri Pinard de la Boullaye in his *L'étude comparée des religions*, vol. 1 (Paris, 1922), pp. 268–276 and 389. A condensed and learned account of Müller and his disciples and opponents is Otto Gruppe's *Geschichte der klassischen Mythologie und Religionsgeschichte* (Leipzig, 1921), pp. 157–165. Müller as a mythologist is discussed, with translated selections, in *The Rise of Modern Mythology, 1680–1860*, compiled by me and Robert Richardson (Bloomington, Ind., 1972), pp. 416–425.

Revised Bibliography

MÜNTZER, THOMAS (1488?–1525), also known as Münzer; radical Protestant reformer involved in the German Peasants’ War of 1524–1525. Little is known about Münzer’s early life. His name first appears in the 1506 matriculation records of the University of Leipzig, which required entering students to be at least seventeen years old. Attempts to demonstrate that Münzer was born earlier than 1488—perhaps as early as 1468—on the basis of records reporting his membership in a religious order have been successfully refuted by Walter Elliger in his detailed biography, *Thomas Müntzer* (Göttingen, 1975, pp. 10–11). Born of a well-to-do family in the Saxon town of Stolberg, Müntzer attended the universities of Leipzig (1506–1512) and Frankfurt an der Oder (1512–1516), where he received the master of arts degree. He was ordained, perhaps in 1513.

Increasingly curious about the relationship of faith to history, Müntzer learned Hebrew and Greek. He studied Eusebius’s *Church History*, Augustine, Jerome, the apocalyptic speculations of the Italian Cistercian abbot Joachim of Fiore, the German mystics (especially Johannes Tauler), the records of the reform councils of Constance (1414–1418) and Basel (1431–1449), and canon law. Between 1516 and 1520, Müntzer was an itinerant priest and scholar, for a brief period taking the positions of provost and father confessor in the convents of Frose and Beuditz. In 1518, he traveled to Wittenberg, where he may have met Luther, then north to Jüterbog, where he became known as “emulator of Martin.” In 1520, on Luther’s recommendation, he became pastor of Zwickau, the “pearl of Saxony.”

Zwickau had become the center of the silver trade, with a large influx of tradesmen hoping to make a fortune. There Müntzer began a reform program to eliminate socioeconomic differences between the rich and the poor. He organized meetings of small groups of common people, mostly weavers who had lost their jobs in the wake of the silver boom. Nicholas Storch, the leader of the unemployed weavers and a member of a radical Christian group known as the Zwickau Prophets, persuaded Müntzer that there was sufficient evi-

dence to suggest that the end of the world was near. The city council soon accused the Zwickau Prophets and their pastor, Müntzer, of fomenting rebellion. Müntzer tried to enlist the support of Luther who, however, did not respond.

In 1521, the Zwickau council dismissed Müntzer from the pastorate of Saint Catharine’s Church. Müntzer went to Prague, hoping for the support of the Hussites, who were well-known enemies of the Roman papacy. There he posted a handwritten declaration (later known as the Prague Manifesto) on the doors of various churches. Written in German, Latin, and Czech, this manifesto attacked the status quo and announced the beginning of a final reformation leading to a “renewed apostolic church” in which only the Holy Spirit would reign. Müntzer called on the people of Prague to support him in communicating the new “living word” and to oppose anyone defending the status quo. The Prague authorities first placed Müntzer under house arrest and then banned him from Prague.

Once again Müntzer took to the road, traveling through Saxony with brief stops in Erfurt, Halle, and Nordhausen; by 1523 he was penniless and nearly starved. However, he was convinced that his personal suffering was but a prelude to the final tribulations of the world. He met and married the apostate nun Otilie of Gersen in 1523, the same year he received a call to the pastorate in Allstedt, a small town in electoral Saxony. In 1524, the Müntzers became parents of a son.

In Allstedt, Müntzer implemented his new vision of church and world. First, he reformed congregational life by creating a German church order, a German Evangelical mass, and the German Order of Allstedt, this last to help “poor and collapsing Christendom.” He wrote Luther, his Stolberg friends, and Karlstadt that he had become the advocate of the Holy Spirit, who would radically change Germany and the world. In addition, Müntzer wrote several revolutionary tracts. Published in 1524, the tracts *Concerning the Invented Faith*, *Protestation*, *A Clear Disclosure of the False Faith of an Unfaithful World*, and *A Highly Necessary Defense and Answer against the Soft-Living Flesh of Wittenberg* (all written in German) declared that the “elect of God” must experience the “bitter Christ” in the “depth of the soul” in order to be purified for the final battle between good and evil, the final struggle between the status quo and new life in the Holy Spirit. Müntzer now called himself the “new Daniel,” the leader of a “league of the elect” who would smash the opponents of the Holy Spirit. Those who refused to accept the Holy Spirit in their souls, Müntzer proclaimed repeatedly, would have to be forced to do so, if necessary by the sword. No “ungodly” could be tolerated among the “elect.”

When Müntzer led a small band of “elect” in destroying a small Catholic chapel outside Allstedt, Saxon authorities became alarmed. Having been warned by Luther against the “restless spirit of Allstedt,” representatives of the Saxon court met with Müntzer in Allstedt, where he preached a radical sermon to them. They then summoned him to Weimar and

ordered him to stop his agitations. When the authorities confiscated copies of his treatises, Müntzer was convinced that the time had come to oppose the status quo with force. But, in a letter of September 5, 1524, the Anabaptist reformer Conrad Grebel warned Müntzer against the use of violence.

Müntzer never received the letter because he had left Alstedt vainly seeking support in Switzerland, especially in Basel. He then joined bands of rebellious peasants in Mühlhausen. He and the radical priest Henry Pfaffner tried once again to create a model of reform, but the Mühlhausen authorities banned both of them. By the spring of 1525, Müntzer had joined the rebelling peasants in Thuringia and had become their chaplain. In May of 1525, the peasants were cruelly defeated at Frankenhausen, and Müntzer, who had fled before the massacre, was captured, tortured, and beheaded. Luther approved of Müntzer's execution, calling it a "just and terrible judgment of God."

Müntzer was the first Protestant theocrat who advocated a Christian crusade to liberate the world from sin, death, and evil. He was a spiritualist who could no longer endure the compromise between internal spiritual experience and living in an imperfect external world; a truly apocalyptic thinker, he tried to transform theological ideas into revolutionary action. Reformers like Luther and Calvin made him the symbol of villainy, and Anabaptists and other radical reformers refused to support him. Ironically, he would become a hero in the nineteenth and twentieth centuries to Marxists and other communist groups who advocated revolution, although of course without Müntzer's theological foundation.

BIBLIOGRAPHY

A treatment of Müntzer's life and thought and a translation of some of his writings are offered in my book *Reformer without a Church* (Philadelphia, 1967). The most detailed analysis of Müntzer's life and work is available only in German: Walter Elliger's *Thomas Müntzer* (Göttingen, 1975). Müntzer's entire literary production, including letters and notes, has been collected and critically edited by Günther Franz with the collaboration of Paul Kirn in *Thomas Müntzer: Kritische Gesamtausgabe* (Gütersloh, 1968).

Müntzer's language is difficult, since he wrote in medieval Latin and in sixteenth-century German, often using a particular dialect. Two of his works are available in English: "Sermon before the Princes" (1524), in *Spiritual and Anabaptist Writers*, edited by George H. Williams, "Library of Christian Classics," vol. 25 (Philadelphia, 1957); and "Highly Necessary Defense and Answer against the Soft-Living Flesh of Wittenberg" (1524), in Hans J. Hillerbrand's "Thomas Müntzer's Last Tract against Luther," *Mennonite Quarterly Review* 38 (1964): 20–36. Some excerpts from these two works and a portion of his "Confession and Recantation" (1525) have been translated by Lowell H. Zuck in a collection he has edited, *Christianity and Revolution: Radical Christian Testimonies, 1520–1650* (Philadelphia, 1975), pp. 36–44, 46–47. The British Reformation historian E. Gordon Rupp has written a comprehensive essay on Müntzer, "Thomas Müntzer: The Reformer as Rebel," in *Patterns of Reformation*

(Philadelphia, 1969), pp. 157–353. There are also two American historical sketches depicting Müntzer as dissenter and revolutionary: "Thomas Müntzer," in Steven E. Ozment's *Mysticism and Dissent* (New Haven, 1973), pp. 61–97; and "Thomas Müntzer," in Hans J. Hillerbrand's *A Fellowship of Discontent* (Philadelphia, 1967), pp. 1–30.

ERIC W. GRITSCH (1987)

MŪRTI. According to many Hindu religious traditions, *mūrti* is a god's form, its infinite metaphysical reality manifested visibly. Aside from a limited class of objects called *svayambhū* (self-created or natural), *mūrtis* are mainly anthropomorphic figures or symbols. They are the ritually consecrated cult images at the center of *pūjā* (worship), which is the dominant form of Hindu religious practice.

In Vedic sacrifice the deity is unseen, being represented only by the chanted *mantras* of the priests as they move among the abstract geometric forms of the altars that represent the cosmos. The deity's form first emerges in the practice of the orthodox tradition with the later, theistic Upaniṣads, where a vision of the *mūrti* of the personalized deity is summoned through meditation. In the epics, image worship is mentioned and accepted, but it is given only marginal and fleeting notice, while major interest is centered upon the fire sacrifice. Only with the emergence of sectarian Agamic and Puranic literature, from the fourth century CE on, did the notion of *mūrti* and its use in *pūjā* become systematically formulated. There, for the first time, the claim is made that worship of *mūrti* succeeds or even supplants the sacrifice.

Paralleling this textual record are inscriptions and fragmentary temple and image remains from as early as the second century BCE. Very few images of orthodox Puranic deities have survived from before the third century CE, however, and not until the fifth and sixth centuries were *mūrtis* and the temples that house them committed to the permanence of stone throughout the subcontinent. Nearly all earlier images, and most later ones, were made of perishable materials, and so lost.

An image is a *mūrti*, not by virtue of looking like the deity it represents, but because it conforms to prescribed measurements and symbolic conventions and is accorded orthodox consecration (*pratiṣṭhā*) and authentic devotion by those whose activities create it, the initiated artist (*sthapati*), priest (*ācārya*), and devotee (*bhaktā*). This process is expounded in two sets of authoritative texts. Requirements as to materials, measurements, proportion, decoration, and symbolism according to which the *mūrti* is shaped are provided in technical manuals known as the *Śilpaśāstras*. Explanation of the metaphysical significance of each stage of manufacture and the prescription of specific *mantras* to sanctify the process and lodge the power of the deity in the image are found in the Agamas and Tantras, liturgical handbooks. The process is modeled on the instructions found in the Brāhmaṇas for building fire altars.

Mūrti worship also, partially patterned after the fire sacrifice, takes place in the complementary contexts of household and public altars. Images of *iṣṭadevatā* and *kuladevatā*, family deities who are treated as honored guests, are found in a discrete location in every household. The *mūrtis* of public cults are established in palatial temples, where they are served by an attached priesthood and may be visited by their devotees. As material extensions of the *mūrti* and descendants of the sacrificial altar, such temples are created in accordance with the same technical and liturgical prescriptions as the *mūrtis* themselves.

BIBLIOGRAPHY

Along with a consideration of the full range of Hindu deities, going back as far as the Vedas, Alain Daniélou's *Hindu Polytheism* (New York, 1964) contains a section on the representation and worship of deities, in which the discussion of *mūrti* is set in its broader context. T. A. Gopinatha Rao's venerable *Elements of Hindu Iconography*, 2 vols. (1914; reprint, New York, 1968), offers a compendium of Agamic and Puranic lore about deities compared with examples of *mūrtis* and illustrative images. Its general introduction offers a wealth of information, including a discussion of various systems of classifying *mūrtis*. Jitendra Nath Banerjea's *Development of Hindu Iconography*, 2d ed. (Calcutta, 1956), provides a detailed explanation of the origin of *mūrti* worship in both the texts and in the material record. It also presents the historical development of *mūrti* largely based on material findings. To approach an authentic understanding of the richness of textual thought on *mūrti* more closely, one may read a translation of one of the liturgical handbooks: *Kāśyapa's Book of Wisdom (Kāśyapa-Jñānakāṇḍah: A Ritual Handbook of the Vaiṣṇavas)*, translated and annotated by Teun Goudriaan (The Hague, 1965).

GARY MICHAEL TARTAKOV (1987)

MURUKAṆ, the Tamil name for the Hindu deity also known by such names as Skanda, Kumāra, Subrahmaṇyam, or Kārttikeya. The name is sometimes transcribed as Murugan. While Murukaṇ is the most popular god in present-day Tamil India, he has been worshiped in a variety of forms from at least the third or second century BCE. In his earliest South Indian form, Murukaṇ was described in classical (or Caṅkam) literature as a god of hill and hunt, who was worshiped by hill people, the *kuriñcis*, as a possessor of young damsels and avenger of *anaṅku* and *cūr*, malevolent spirits of the hills.

In North India, Skanda was depicted in epic mythology as the son of Rudra-Śiva or Agni, and as a warrior deity patronized by such dynasties as the Śakas, Ikśvaku, and Guptas. By the eighth century CE, and throughout the medieval period, these earlier attributes of the god seem to have merged, as subsequent literature, iconography, and temple architec-

ture attest to Murukaṇ's worship in South India as a high god and the son of Śiva.

Murukaṇ was especially extolled by such medieval Tamil *bhakti* (devotional) poets as Aruṅakirinatha of the fifteenth century and Kacciyapaciva of the seventeenth. Late in the nineteenth century, worship of Murukaṇ was given new impetus by a Tamil renaissance, during and after which temples to Murukaṇ were renovated, pilgrimages to these centers increased, and the god came to be viewed as the quintessential Tamil deity.

The basic myth of Skanda-Murukaṇ's life and exploits is found in the *Mahābhārata* (3.223–232; 9.46–47; 13.130–133). It is repeated in the *Ramāyaṇa* (1.36–37), and further embellished in a wide range of Sanskrit and Tamil literature, especially in Kālidāsa's (fourth century CE?) *Kumārasambhava* and the *Skanda Purāṇa*.

According to Kālidāsa's version of the myth of Skanda's birth, the deity is born of Śiva's semen when the latter marries Pārvatī following an extensive period of meditation and austerities (*tapas*) on Mount Himavat. Later accounts, as in the *Skanda Purāṇa*, say Skanda is born of sparks emanating from Śiva's brow. According to the *Mahābhārata*, Skanda is born of Agni's love-play with Svāhā while she is impersonating the wives of six ṛṣis. Once born, Skanda is suckled by the six Kṛttikā (Pleiades) maidens and engages in a variety of childhood exploits, including the defeat of Indra, the humiliation of Brahmā, and the instruction of Śiva as to the meaning of the sacred syllable *om*. On the sixth day of his life, he is made general of the divine army and conquers the *asuras* headed by Tāraka (or, in South Indian accounts, Surapadma). After the battle, according to the epic myths, he is given in marriage to Devasenā (literally, "army of the gods"); in southern versions, Murukaṇ woos Vallī, a hunter damsel who becomes the god's second consort.

Murukaṇ is the most widely worshiped god among Tamil Hindus in the early twenty-first century, and three of the six most popular pilgrimage centers in Tamil Nadu are temples consecrated to him. One of these, Palani, is the second largest pilgrimage complex in South India. Six major festivals celebrating events in the god's life attract millions of worshipers, from the festivals of Skanda-Ṣaṣṭi in October–November to Vaikāci Vicākam in May–June. The cultus incorporates a whole spectrum of rituals, from classical fire sacrifices and Tantric invocations as prescribed in the Śaivagāmas to folk forms of possession and dancing with the *kāvaṭi*, or peacock arch. In addition, the god is popularly perceived to be the inspirational source of Tamil literature, vanquisher of cosmic and personal malaise, and the embodiment of Śaiva thought and religion.

MUSAR MOVEMENT. The Musar movement for individual self-examination and ethical renewal spread among mid-nineteenth-century Lithuanian Jewry after its founding by Yisra'el Salanter (1810–1883). So called from the Hebrew term *musar* ("ethics, instruction"), the Musar movement can be viewed as one of the first attempts in eastern Europe to organize traditionalist circles within Jewish society in modern forms, although its long-term legacy and influence remained limited to the Lithuanian *yeshivot*.

The Musar ideology was formed during the young Yisra'el Salanter's fifteen-year sojourn in Salant during the 1820s and 1830s. There, in addition to achieving mastery of Talmud in the standard manner, Salanter came under the influence of the saintly reclusive figure Yosef Zundel of Salant. Zundel devoted his attention to the ethical aspects of Jewish law, which in his view had been neglected. He believed that in order to overcome the temptations of evil, special actions were necessary beyond a theoretical knowledge of one's legal obligations. To this end Zundel developed a system of regular self-analysis and study of ethical texts, and he introduced such innovations as the repetition of Talmudic statements on ethical issues as a way to induce the proper mood for soul-searching. Yisra'el Salanter built upon the system of his master, but unlike Zundel he attempted to present the Musar doctrine to the community at large within an organizational framework.

In Vilna in the mid-1840s, Salanter made his first efforts to establish a mass Musar movement. Departing from the standard practice for heads of *yeshivot*, he presented a series of public talks addressed not only to scholars but also to artisans and most particularly to affluent educated businessmen. Salanter called for the inclusion of ethical works in the curriculum of Torah study that is incumbent upon every Jew. Such study, besides making the individual aware of the ethical responsibilities stipulated by Jewish law, would also help him recognize and struggle with his unconscious impulses and bring them under control. For this purpose, Salanter set up a *musar-shṭibl* (Yi., "house of moral instruction") where, through the combined practice of meditation and the somber repetition of moral texts, an appropriately ecstatic-fearful mood could be created for the encounter with elemental passions and drives. During this Vilna period, Salanter arranged for the reprinting of classic ethical texts and attracted the first of his key disciples.

By all indications, Salanter intended the Musar movement to answer the threat to traditional Jewry posed by the

Haskalah, the movement for Jewish Enlightenment, one of whose major centers was in Vilna. Believing that existing institutions could not meet this danger, Salanter instead tried to bolster the religious loyalties of the individual Jew. His emphasis on ethical behavior indicates that Salanter shared many of the Haskalah's criticisms of the social and economic ills of Jewish society, but unlike proponents of Haskalah he did not prescribe a thorough educational and economic reform of Jewry as the proper solution for these problems. In Salanter's view, a revival of the standards for social and economic relations demanded by Jewish law would redress the imbalances in Jewish society.

In 1849, rather than accept a teaching position offered him in a government-sponsored rabbinical seminary in Vilna, Yisra'el Salanter transferred his base of operations to Kovno (modern-day Kaunas). He succeeded in establishing *musar-shṭiblekh* there and in several other towns. Yet the immense personal prestige that Salanter enjoyed in his lifetime was not reflected in a corresponding success for his planned mass movement. By the 1850s *musar-shṭiblekh* existed in only five communities, with an estimated following in the hundreds. More lasting achievements of the Kovno period include the model of a Musar *yeshivah*, where self-examination and the study of ethical tracts formed regular parts of the curriculum, and where responsibility for the students' spiritual development was assigned to a *mashgi'ah* ("supervisor"), who functioned alongside the normal teaching staff. Salanter's disciples from this period spread this model to most of the major Lithuanian *yeshivot*, among whose students the movement found its greatest success. Salanter's letters to his disciples, later collected and published, laid down the basic ideological direction of the Musar phenomenon.

Despite Salanter's unassailable personal moral and scholarly credentials, his innovations aroused no little criticism in rabbinical circles. Some claimed that the stress on ethics undermined the centrality of Torah study, while others worried that the elitist spirit of the Musar groups carried a potential for sectarianism. This polemic over the Musar movement continued into the twentieth century.

After 1857, when Yisra'el Salanter moved to Germany, although he maintained his personal influence over his students, the practical work of spreading the movement's teachings was carried on by the disciples. Through their efforts Musar became the dominant mode in the Lithuanian *yeshivot*, despite occasional strong resistance on the part of more traditional *yeshivah* leaders. Among the major successors of Yisra'el Salanter were Simḥa Zisl Broyda of Kelem (1824–1898), who in the schools under his supervision tried to develop a systematic educational method based on Musar principles; Yitṣḥaq Blazer (1837–1907), former rabbi of Saint Petersburg and interpreter and publisher of Salanter's teachings, who served as head of the Kovno *kollel* (an advanced *yeshivah* providing stipends for married students); Eli'ezer Gordon (1840–1910), rabbi of Telz and head of its

noted *yeshivah*; Note Hirsh (Natan Tsevi) Finkel (1849–1927), known as the Old Man of Slobodka, spiritual director of the central Musar *yeshivah* in Slobodka. Each of these figures put his personal stamp on the basic Musar doctrine and thus helped to evolve variations of its teachings on the nature of man, the nature of evil, and the ways to struggle with evil. All of the Musar *yeshivot*, however, featured daily Musar studies (often at twilight) and the role of the *mashgiach*, whose responsibilities included regular talks to the student body as well as individual guidance. Most extreme among the Musar schools was that directed by Yosef Yosel Hurwitz, the Novaradok (Nowogródek) school, where students were required to pursue intense Musar study and to perform unusual (i. e., socially unacceptable) actions in public as a way of subduing the lower instincts.

The expansion of the Musar *yeshivot* continued in the period following World War I, but was cut off by the Nazi Holocaust. The Slobodka and Novaradok Musar approaches live on, however, in *yeshivot* set up in Israel and the United States.

BIBLIOGRAPHY

The best historical study of the early stages of the development of the Musar movement is in Hebrew, Immanuel Etkes's *R. Yisra'el Salanter ve-re'shitah shel tenu'at ha-Musar* (Jerusalem, 1982). The only full-length study of the movement is the hagiographic and apologetic *Tenu'at ha-Musar*, 5th ed., 5 vols. (Jerusalem, 1974) by Dov Katz. Volume 1 of Katz's work has been translated by Leonard Oschry as *The Musar Movement: Its History, Leading Personalities and Doctrines* (Tel Aviv, 1977). An interesting supplementary volume by Katz entitled *Pulmus ha-Musar* (Jerusalem, 1972) reviews the long-running public controversy over the Musar doctrine. For a short but somewhat superficial survey of the movement, see Abraham Menes's "Patterns of Jewish Scholarship in Eastern Europe," in volume 2 of *The Jews*, 4th ed., edited by Louis Finkelstein (New York, 1973), pp. 177–227. On the inner life of the Lithuanian *yeshivot*, see Gedalyahu Alon's "The Lithuanian Yeshivah," in *The Jewish Expression*, edited by Judah Goldin (New Haven, 1976), pp. 452–468, and Shaul Stampfer's *The Lithuanian Yeshiva* (Hebrew; Jerusalem, 1995). On the Novaredok school, see David Fishman's "Musar and Modernity: The Case of Novaredok," *Modern Judaism* 8: 1 (1988), pp. 41–64. For a vivid but jaundiced portrayal of the director of a Musar *yeshivah*, see Chaim Grade's novel, *The Yeshiva*, 2 vols. (New York, 1977). For personal portraits of some of the figures associated with the movement, see the idiosyncratic and controversial *Making of a Godol: A Study of Episodes in the Lives of Great Torah Personalities* (Jerusalem, 2002), by Noson Kamenetsky.

GERSHON C. BACON (1987 AND 2005)

MUSES. Near the highest peak of snowy Olympus, the nine Muses—Clio, Euterpe, Thalia, Melpomene, Terpsichore,

Erato, Polyhymnia, Ourania, and Calliope, daughters of Zeus and Mnemosyne (Memory)—were born to be, in Hesiod's words, "the forgetting of misfortunes and respite from sorrow" (*Theogony* 55). Like-minded virgins, free from grief, their only concern is song. Always accompanied by the Graces and Desire, they dance in chorus on delicate feet on the mountaintops, bathe in springs with violet glints, and make their way to the radiant abodes of Zeus, which laugh under the spell of their sweet voices (*Theogony* 1ff.).

What the Muses sing is *mnēmosunē*—memory of what is, what was, and what will be. And for the Greeks, memory is truth. The subject of their song is the kingdom of Zeus the father, he who subdued the Titans, who restored his brothers' power and imposed a harsh fate on their father Kronos, and who bestowed honors on all the gods. The Muses sing the victory of the cosmos, of harmony over chaos, and their sweet accents make Zeus's enemies tremble in the depths of the earth (*Theogony* 68ff.; Pindar, *Pythia* 1.13). They also sing the miserable fate of mortals, who live in bewilderment, unable to find a cure for death or a remedy for old age (Homeric *Hymn to Apollo* 190ff.).

With Apollo, the Muses select and inspire the men they cherish. These are the lyre players and singers, and they, too, are able to make sorrow and grief disappear from mortal hearts with the sweet strains that flow from their lips. Thus when poets sing to Apollo and the Muses at the beginning of their songs, they put themselves under divine protection and make an offering at the same time. Invoking the Muses is the price the poet pays in order for his song to be called veracious and in order that he may breathe the imperishable memory and knowledge that the Muses alone bestow. Those who disdain this inspiration and pride themselves on being capable of creating and fashioning their songs without the Muses are punished; they are made to sing untruths and soon become mute, like the poet Thamyris (*Iliad* 2.594ff.).

Each of the nine Muses presides over one of the arts. According to one scheme, Clio is linked with history, Euterpe with music, Thalia with comedy, Melpomene with tragedy, Terpsichore with dance, Erato with elegy, Polyhymnia with lyric poetry, Ourania with astronomy, and Calliope with eloquence. Only Calliope, first among the Muses, has a role in the courts of kings (*Theogony* 80ff.); it is she who gives them wisdom and mellow voices. If the political initiation resembles poetic initiation, the music that Calliope teaches kings can in no case be confused with that of the poet. The Muse inspires kings with the knowledge of the kingdom of Zeus, so that the divine cosmos may be recreated among men.

The spirit that emanates from the Muses is the spring-like freshness that allows mortals to derive some fortune from divine nature and to forget death. That may be why the Muses warn poets that they know how to sing untruth just as well as truth.

MUSEUMS AND RELIGION. The last generations of the twentieth century saw a huge increase in the number of museums worldwide; one estimate suggests ten thousand in 1950 and ten times that number fifty years later. In the more developed countries of the world they took on a dramatic new importance and public recognition. In many of the new museums the emphasis has been on attracting new visitors and offering them both entertainment and education rather than on scholarship and on their collections. So far, though, most have shown little interest in religion.

The first two great modern museums were perhaps the British Museum in London and the Musée du Louvre in Paris. The first was formed in 1759 from the collection of Sir Hans Sloane, who described it as "tending many ways to the manifestation of the glory of God [and] the confutation of atheism and its consequences" (quoted in Altick, 1978, p. 229). The second was formed in 1793 by France's atheist revolutionary government from artworks seized from the church, the king, and the aristocracy. These two traditions—respect for, and hostility to, religion—continue in the modern museum, but even stronger is the Enlightenment heritage of indifference to "traditional" faith. One observer commented that "the message of galleries and museums is that religion is a thing of the past, but that if there is anything sacred in society, it is art" (O'Neill, 1996, p. 191).

THE VICTORIAN MUSEUM: SCIENTIFIC COLLECTING AND PUBLIC IMPROVEMENT. As both urbanization and democracy rapidly grew in Europe and North America in the nineteenth century, the museum became an important expression of emerging national and civic identities, aimed at assertion to the world outside and production of loyal and educated citizens within. The later nineteenth-century museum was not only part of what Habermas (1989) called the "bourgeois public sphere," but a "new apparatus for the production of knowledge" (Hooper-Greenhill, 1992); it took on the job of informal public education, aimed sometimes at the proletariat but more often at the middle and upper working classes. In this new seriousness of purpose, museums were frequently in alliance with the churches and often used the language of faith, even of mission, to describe their efforts not only to improve the lot of the poor but to improve society itself. Vis-

itors were encouraged to consider the wonderful works of the Creator, as well as offered opportunities for self-improvement. The most radical efforts were an attempt to help the poor to "see," in John Ruskin's sense that "To see clearly is poetry, prophecy and religion" (Koven, 1994, p. 25). We should note too the plethora of commercial attractions with a biblical theme (such as panoramas of the Holy Land) Victorian London offered, whose "sacred interest . . . attracted thousands of visitors who were not profane enough to enjoy ordinary sights" (quoted in Altick, 1978, p. 182).

RELIGION AND SCIENCE. The British Association for the Advancement of Science met in 1860 in the newly completed University Museum at Oxford. At this meeting took place the famous exchange between Bishop Samuel Wilberforce and scientist T. H. Huxley, which ever since has been taken (however unjustly) as a symbol of the clash between religion and the theory of evolution. The issue had been caricatured as a question of whether human beings were descended from apes, and the popular version has it that Wilberforce asked Huxley if he was descended from apes on his grandfather's or grandmother's side. Huxley is supposed to have replied that he would sooner be descended from an ape than from a "divine who employed authority to stifle the truth."

It was appropriate that this famous exchange took place in a museum, for museums in the urbanized West were in the later nineteenth century the forums for public debate on fundamental questions in a way in which, perhaps, they have never been since. While for some Victorian curators "the study of natural science was a kind of religious contemplation, and the scope of the museum's displays was thus enormously important in communicating that religious purpose" (Yanni, 1999, p. 65), a sizable proportion of visitors now probably saw specimens as emblems of evolution rather than as evidence of God's handiwork. This tension remains today; in the late twentieth century one half of all U.S. college students were alleged to believe in creationism, that is, that God created the earth and all that is in it pretty much as it is today, so the caution displayed by the Field Museum in Chicago when they wanted to set up a new gallery devoted to evolution is understandable (Asma, 2001).

AMBIGUITY AND RESOLUTION? In 1941 the *New Yorker* published a cartoon by the famous comic artist Charles Addams (Paine, 2000, frontispiece). It depicted a dark-skinned man wearing a suit and tie but also a headband, standing quietly in front of a huge and mysterious statue, holding a goat. One museum guard says to another: "He wants to know if he may make a small sacrifice in front of it." The joke is threefold: firstly, the very idea that a "native person," however respectable, could still have any rights over an object in a museum; secondly, the idea that a once-holy object could continue any longer to retain any of its holiness once it had been transferred to a museum; thirdly, the notion of a goat being sacrificed in a neat and tidy museum. It demonstrates starkly the ambiguity of the sacred object in the profane museum.

Half a century later, in 1990, the Dalai Lama personally consecrated a Tibetan altar, designed and built by a Tibetan trained at a monastery in Sikkim, in the Newark Museum in New Jersey (Gaskell, 2003, p. 149). Those fifty years had seen a radical change in the approach of museums to objects in their care regarded as “sacred” by some. The key to this turnaround of consciousness was the political—and thence cultural—demands being made by the indigenous peoples of “settler” countries, particularly in North America and Australia. In the United States these demands climaxed in the 1990 Native American Graves Protection and Repatriation Act, which required museums to list, and to return when asked, a wide range of significant cultural objects, as well as human remains. Australia had in part led the way with the Aboriginal and Torres Strait Islander Heritage Protection Act, 1984.

At both a legal and ethical level, debate about the care of sacred objects has been closely bound up with debate about the care of human remains, about the restitution of looted property, and—in some countries—about the treatment of sacred sites. The International Council of Museums’ Code of Ethics, adopted in 1986, demanded that material of sacred significance be looked after “in a manner consistent with professional standards and the interests and beliefs of members of the community, ethnic or religious groups from which the objects originated.”

Museums have responded in four ways to the realization that a museum object may also be a sacred object. Many museums have decided that secular values must prevail; that the museum must continue to treat it as a specimen, historical document, material evidence in a framework of scientific inquiry that discounts nonscientific or nonaesthetic explanations.

The second way is to return the object to those who would treat it as sacred. Glasgow Museum in Scotland returned a Ghost Dance Shirt to the Lakota Sioux, with much support from local opinion in the city. In both North America and Australia objects of religious and other cultural significance have been returned to local museums and “keeping places” run by indigenous communities (Simpson, 1996).

The third way is to retain the object in the museum but to house and treat it in ways that those who see it as sacred would approve. Rotorua Museum in New Zealand offers a bowl of water for purification to visitors to their display of Te Arawa treasures. The National Museum of the American Indian in Washington State provides in its Cultural Resources Center a ceremonial room with a fire pit where objects can be “smudged” with burning sweetgrass.

The fourth way of responding is to allow the object to move regularly between the sacred and the secular. In Moscow the Tretyakov Gallery displays the supremely important and powerful Virgin of Vladimir icon in a church attached to the museum, but on three great feast days a year it is removed from its showcase and displayed for veneration; more-

over, the patriarch of Moscow has been accorded curatorial status within the museum (Gaskell, 2003, p. 154).

ART MUSEUMS. Art museums worldwide are full of religious images, very many of them produced for formal liturgical use, as altarpieces or cult statues, or as the decoration of places of worship or the paraphernalia of a cult; the museums of such countries as Italy and India, with a rich heritage of religious art, are famous for their extensive collections. Yet seldom is the original religious purpose of these objects given much prominence in the museum’s presentation: labels will give date, artist, and a brief summary of the iconography but little if any explanation of a work’s liturgical function or religious significance.

The same approach is found even where the title of a gallery, “Islamic Art,” for example, might lead the visitor to expect some explanation of what it is about Islam that informs the works of art displayed and the role they played in Muslim praxis. In reality, religion here is being used simply as a label for a culture, and it is very seldom that an “Islamic Art” gallery gives much attention even to any liturgical use its exhibits may once have had.

Though many modern artists tackle religious themes or more or less consciously incorporate and express spiritual values in their work, it is seldom that these influence either the design of the overall building in which they are displayed or the museums’ public programming. Two exceptional art museums are the Museum of Contemporary Religious Art in St. Louis and the Museum of Biblical Art in New York. Very special is the Rothko Chapel in Houston, Texas, which was opened in 1971 to house a series of fourteen great contemplative abstract paintings by the American artist Mark Rothko, which were designed as a group to create a numinous space. The chapel was intended from the start to be a multifaith center and focus of religious debate.

HUMAN HISTORY MUSEUMS. There is a constant debate among curators of human history museums: should the exhibits concentrate on presenting the objects the museum holds, or should the objects be used to help tell a story? In other words, which comes first, object or story? The majority of museums worldwide probably say “the object,” which is one reason religion too seldom features largely in museums of local history. Even in museums that say “the story,” religion appears as a very minor aspect of local history. With some commendable exceptions (Paine, 2000, p. 157), museums seldom try to analyze the role of religion in local society and in popular culture, in the way that the best of them examine the local economy or try to analyze the role of class and gender.

It is particularly disappointing that social history museums, which aim to present the life of their communities, so seldom include the popular religion that always accompanies and underlies official religion. Museums dedicated to the ethnography of non-European societies are in a different situation, not least because their curators are firmly grounded in the academic study of anthropology and because religious

paraphernalia have attracted the attention of collectors. As a result, ethnography museums have generally treated indigenous religions with great seriousness, though Museon in The Hague is one of very few that address religion as a worldwide phenomenon.

When a human history museum has collected prominent examples of the material culture of religion for other reasons, it may find itself having to tackle the issue. Skansen, the hugely influential open-air museum established near Stockholm, Sweden, in 1891, received its first church in 1916. Today many open-air museums include places of worship reconstructed or moved from elsewhere, and these are very commonly actually used for worship; one African example is the Ghana National Cultural Centre in Kumasi, Ghana, which includes both a chapel and a traditional Ashante shrine (Duah, 1995, p. 110). By contrast with open-air museums where buildings from elsewhere are reconstructed, “ecomuseums” comprise an alliance of buildings, sites, and object collections still in their original places, and very often these include places of worship. The ecomuseum of Hiranocho in Japan, founded by the Ryonin Kawaguchi, priest of the Senkouji Buddhist Temple, comprises fifteen different attractions, including a number of active temples and shrines (Davis, 2004, p. 98).

THE TEMPLE AS MUSEUM. There is no hard-and-fast distinction between museums and historic monuments. Many of these monuments, in countries around the world, are religious, and increasingly they are being subject to the same type of visitor-oriented—sometimes even commercial—management as conventional museums. Inevitably this gives rise to special problems, especially where the site is still regarded as “sacred” by a local population. Indeed, one can see an increasing convergence between museums and sacred spaces—from York Minster charging entrance fees to Druids wanting to perform ceremonies at Stonehenge. These issues are interestingly discussed by Shackley (2001).

Larger places of worship tend to amass treasures, sometimes very rich treasures indeed. The huge Venkateswara temple at Tirupati in eastern India, which sees over ten million pilgrims a year, for example, houses a massive number of valuable items. Many traditional treasuries have evolved into modern museums. Thus, the sacristy of the Cathedral of the Assumption of the Virgin at Dubrovnik, Croatia, was designed in 1712 to display the relics of Saint Blaise and 138 other reliquaries; the intention was both to display relics for veneration and also to display precious gold and silverwork in honor of the saint. The display is very like an early museum.

Throughout Catholic Europe there are diocesan museums; in England many cathedrals have “treasuries” to display gold and silver plate from churches in the diocese. In most of these museums, though, the emphasis has now come to be on the “decorative arts” aspects of the objects; statues of saints are arranged by period and artistic school, silverware by makers. Seldom is there much attempt to explain to visi-

tors the religious significance and function of the object. Even at the Antivouniotissa Museum in Corfu the labels tend to explain the icons in this wonderful collection in terms of Byzantine art history rather than as spiritually powerful tools. A notable exception to this pattern is St. Catharine’s Convent Museum at Utrecht in the Netherlands. Here the story of religion in the Netherlands is told through its artifacts, from an early ninth-century chalice to late nineteenth-century Catholic and Protestant labor union banners.

THE MUSEUM AS TEMPLE. The rhetoric that later nineteenth-century museums shared with churches has continued to be used ever since. Throughout the later nineteenth century and much of the twentieth, art museums in particular were called “temples of art,” “cathedrals,” in which works of art were “enshrined” and some of which became “sacred places of pilgrimage for museum-goers.” For some observers museums do not merely share a rhetoric with religious shrines but actually share many of their functions. Art museums, in particular, share with shrines a separateness from the mundane world, an expectation that visitors will adopt a particular receptive frame of mind and a particular pattern of reverent behavior, that they will follow a ceremonial path. Museums are the forums for a ritual associated with rational, scientific thought. (Duncan, 1990, p. 92; 1995, p. 12). The visitor comes away—or is expected to come away—transformed by communion with immortal spirits of the past, with a sense of being enlightened, spiritually uplifted.

Sometimes museums and shrines converge more literally. Commemorative museums often take on the character of shrines; examples include many Holocaust museums; the Nikko Toshogu Shrine, burial place of Tokugawa Iegasu, the first modern shogun of Japan; and the Tuol Sleng Museum (museum of genocide) in Phnom Penh, Cambodia.

FAITH COMMUNITY MUSEUMS. Faith communities, especially minority communities, often create museums to explain their faith and its history to their own community and to others. Many Jain temples, in India and now also elsewhere, have attached “museums” that—through a series of dioramas—show historical incidents in, and aspects of, their faith. Jewish museums fall into two distinct categories: those that exhibit the paraphernalia of synagogue or domestic worship and balance art history and religious practice and belief, and those that tell the story of the local Jewish communities. The Jewish Museum in London has two sites: one for the former, one for the latter.

Some faith communities maintain museums dedicated to their founder or leaders; an example is John Knox’s House in Edinburgh, dedicated to the sixteenth-century Scottish Protestant leader. In the Buddhist tradition visitors to such museums can gain merit. Wat Tham Khlong Paen, a sacred site near Nong Bua Lamphu in Thailand, was the meditation ground of the late Luang Phu Khao, a highly revered monk. A small museum there exhibits his few personal possessions and a life-size wax figure, and “opens daily to public for merit-making and homage-paying.”

WORLD RELIGION MUSEUMS. The German philosopher of religion Rudolf Otto, professor of theology at Philipps-Universität in Marburg, Germany, set up the *Religion-skundliche Sammlung* in 1927, devoted to the academic study of religion as a worldwide phenomenon. Sadly, Otto “felt obliged, like most curators, to present the objects in a ‘rational’ and ‘scientific’ manner, with no attempt to evoke the ‘feeling for the numinous’ which was at the heart of his own great contribution to the study of religion” (O’Neill, 1996, p. 195). In the 1990s the *Musée des Religions* was opened in Nicolet, Quebec, and the St. Mungo Museum of Religious Art and Life, in Glasgow, Scotland; the motive for both was the encouragement of mutual respect and understanding among mixed populations.

Other museums that seek to address religion on a worldwide basis stem from faith backgrounds but ones that accept that there are many paths to the truth and that an understanding of their different routes will help everyone on the journey. The earliest of these was surely Glencairn Museum at Bryn Athyn, Pennsylvania, established by the Swedenborgian bishop William Henry Benade in 1879. The Eternal Heritage Museum is part of the Sai Baba Ashram at Puttaparthi, Andhra Pradesh, India, while the Museum of World Religions in Taipei, Taiwan, was founded in 2001 by Buddhist Master Shih Hsin-tao. The Museum of the History of Religion in St. Petersburg, Russia, is a museum whose declared purpose has changed dramatically. In 1932 the Kazan Cathedral was turned by the Soviet state into a Museum of Atheism; after the fall of the Soviet Union the cathedral was returned to the Russian Orthodox Church, and the museum has become the Museum of the History of Religion, housed in a new building.

MUSEUMS AND THEIR PUBLICS. Museums today are making a bigger effort than at any time since the mid-nineteenth century to engage with their communities and to attract wider audiences. The fashionable terms are access, social inclusion, and outreach, and if museums seem reluctant to tackle religion in their permanent displays, the situation is improving in their public programming. In Europe and North America, at least, there is a growing number of temporary exhibitions that treat aspects of religion. Some—notably the 2000 *Seeing Salvation* exhibition at London’s National Gallery—take their theme to a new level of serious debate and public response. Education programs, too, regularly tackle religious subjects, sometimes deliberately underpinning the school curriculum but often seeking to address cultural diversity issues.

Museums have adopted a variety of methods of consulting with their publics and encouraging their participation. St. Mungo’s Museum in Glasgow uses a “feed-back board” on which visitors are encouraged to pin their comments and remarks; these have been the subject of a fascinating analysis by the French sociologist of religion Patrick Michel (Michel, 1999).

The impact of mass population movement from the later twentieth century has led many Western museums to celebrate diversity of local cultures, including religions, with the aim of promoting a more tolerant society. The museums of cities like Bradford, Leicester, and Liverpool in the United Kingdom have included Islam, Sikhism, and—to a lesser extent—Chinese religions in their local history exhibits and have promoted educational programs and temporary exhibitions to celebrate and interpret immigrant faiths. This approach has its dangers, not least that the “host” majority community will feel alienated, and this may particularly be true where “their” museums pay little attention to what many may still see as “their” faith (Hooper-Greenhill, 1997; Paine, 2000).

MUSEUMS AND RELIGIOUS CHANGE. Museums have long had a role in religious change. Nineteenth-century European missionaries frequently sent home items relating to the former religions of their converts; in their new homes these objects took on a new life, often symbolizing the dark Other and feeding racism as much as commitment to mission. Today many of these objects survive in European and North American ethnography museums, like the Royal Museum for Central Africa at Tervuren in Belgium (Wastiau, 2000), or, less often, in museums set up by missionary societies themselves, like the Norwegian Missionary Society’s Museum of Mission in Stavanger, Norway. Much more research is needed into the role these religious objects took on in their new homes: to what extent was their “religious” function remembered, or were they regarded simply as “works of art”?

What kind of new material culture was adopted by converts has been even less explored by museums until recently. Fieldwork carried out by the British Museum in the New Guinea Highlands in 1990, presented in a book and an exhibition, contrasted the incorporation of much traditional culture by Wahgi converts to Roman Catholicism, while evangelical converts were urged to make a radical break (O’Hanlon, 1990, p. 35). Nor has much attention—at least in English-language literature—been given to change in the perspective of those studying religion. So far there has been little attention given to changes brought to the way religion is interpreted in museums by the collapse of Marxism in the countries of the former Soviet Union.

During the Civil War in Bosnia many museums and many mosques and churches were damaged and destroyed. Often the heritage of the enemy becomes a target for hatred and destruction, and where intercommunal struggle is also religious conflict, museums can seldom escape becoming involved, even if they try hard to remain even-handed and above the fray—although too often they enthusiastically take sides. Museums, too, are often deeply involved in struggles between religious and secular interests and can be created to assert secular values over religious. The great Byzantine church of Hagia Sophia in Istanbul was turned into a mosque in 1453, but in 1932 it was turned into a museum as part of Atatürk’s secularization campaign (Tunbridge and

Ashworth, 1996). The nearby sultan's palace was also turned into a museum, so that the relics of the Prophet, brought from Cairo in 1517, are now cared for by a secular museum.

FURTHER PERSPECTIVES ON MUSEUMS AND RELIGION. Museums aspire to tell the story—stories—of humankind, to celebrate human creativity, to inspire, to be a forum for public debate, to research every aspect of material culture, and to raise people's awareness of their environment and history. There is scarcely an aspect of human life and endeavor, or of the natural world in which we live, that museums have not at some time or other claimed to explore and reflect upon. Traditionally, museums have been about acquisitions, preservation, and presentation of both the works in their permanent collections and special exhibitions. They have been the centers for explanations and explorations of the ways in which art, in its many forms and varieties, has influenced, shaped, or reflected human history and achievements. The stories of diverse communities—social, ethnic, and religious—have been told in museums; individual artists and curators have presented traditional and controversial opinions about religion, politics, and gender through special exhibitions or permanent displays. Globally, museums have become the storage sites for objects once created for religious purposes but now rendered mundane.

As the idea of taste has been transformed from the concept of selection and decision with moral valuing to that of connoisseurship reflective of class and, thereby, economic and social distinctions, there has been a parallel evolution in the idea of the museum from its beginnings in the Enlightenment into the twenty-first century. However, in recent years, the irony has become that as ethically charged issues confront museums each successive day—from the question of the repatriation of sacred objects to that of the censorship of displays or exhibitions in response to religiously motivated critiques, as, for example, in the outcries surrounding the exhibitions of Edwina Sandys's sculptures to Andres Serrano's photography to Chris Offili's paintings—museums face challenges related to or inspired by religion. As the twenty-first century unfolds, museums will continue to play significant roles in the lives of individuals, communities, and nations; thereby cultural and religious values will continue to impinge upon, to illuminate, and to question each other.

As the role and purpose of the arts, including performance and display, garners more attention from scholars of religion, the museum both as an individual entity and as an institutional repository of religious and sacred art will become a focus for research and a conversation partner. Critical to both museum studies and religious studies, if not to the day-to-day practicality of museums, is the relationship between publicly or privately funded institutions in their displays, presentations, research, and programs for religious and sacred art. The curatorial responsibility in recognizing and privileging the religious history and values of works of art presents a profound responsibility. The questions of distinguishing between religious art and sacred art and the modes

of display and preservation accorded to each further requires sensitivity and knowledge of religion not simply as a historical entity but as a living reality. A working partnership between museum professionals and religion scholars will be necessary to face the challenge of maintaining within the museum environment the individual integrity of the two working principles of museums as caretakers of cultural and religious patrimony and of religion as a communicator of social, cultural, or moral values.

BIBLIOGRAPHY

The growth in their numbers and repute has been reflected in a significant growth in academic interest in museums: their collections, what prompts people to collect and what is going on when they do, their political context, their social function, their history, their educational role and how people learn in museums. As Pearce (1999, p. 1) puts it, "It is . . . incumbent upon the investigator to try to find ways in which, first, the social meanings of individual objects can be unraveled; second, the significance of the museum as a cultural institution can be understood; and third the process through which objects become component parts of collections, and collections themselves acquire collective significance, can be appreciated." A variety of approaches, derived from other disciplines and philosophies, have informed the growth of the modern discipline of museology, and recent scholarship has been increasingly concerned with ways in which museums display culture, construct difference, and produce relations of power. But there has been disappointingly little crossover between such scholarship and the equally lively field of religious studies. O'Neill (1996), Paine (2000), Clavir (2002), and Gaskell (2003) comprise most of the literature in English on museums and religion, while the wider topic of the material culture of religion is admirably introduced by Plate (2002).

Material Religion: The Journal of Objects, Art and Belief is the only journal devoted to the material culture of religion. Published three times a year, it gives close attention to museum issues. Three leading museum journals, which occasionally cover religious matters, are UNESCO's quarterly *Museum International*, the American Association of Museums' bimonthly *Museum News*, and the (U.K.) Museums Association's monthly *Museums Journal*.

Valuable websites on museums in general include the Canadian Heritage Information Network website at <http://www.chin.gc.ca>, the J. Paul Getty Trust website at <http://www.getty.edu>, and the International Council of Museums website at <http://www.icom.org>. At <http://www.icom.org/vlmp> is ICOM's invaluable gateway to museum sites throughout the world; a new museum site is added every day.

 RELIGIOUS MUSIC IN THE WEST

MUSIC: MUSIC AND RELIGION

Music and religion are closely linked in relationships as complex, diverse, and difficult to define as either term in itself. Religious believers have heard music as the voices of gods and the cacophony of devils, praised it as the purest form of spirituality, and condemned it as the ultimate in sensual depravity; with equal enthusiasm they have promoted its use in worship and sought to eradicate it from both religious and secular life. Seldom a neutral phenomenon, music has a high positive or negative value that reflects its near-universal importance in the religious sphere. This importance—perhaps difficult to appreciate for post-industrial-revolution Westerners accustomed to reducing music to the secondary realms of "art," "entertainment," and occasional "religious" music isolated behind sanctuary walls—has nonetheless been pervasive.

Religious "texts" have been sung, not written, throughout most of human history; and religious behavior has found musical articulation in almost every religious tradition. Navajo priests are "singers"; the primary carriers of Sinhala traditional religion are drummers and dancers; and the shamans of northern Eurasia and Inner Asia use music as their principal medium of contact with the spirit world. Through the centuries, priests, monks, and other specialists have sung the Christian masses, Buddhist *pūjās*, Islamic calls to prayer,

Hindu sacrifices, and other ceremonies that form the basis of organized religious observances in the world's major religions.

The values, uses, and forms of religious music are as diverse and culture-specific as the religious traditions in which they are found. Christian liturgical music is generally as characteristically "European" as Hindu devotional music is "Indian"; both use sounds, forms, and instruments from their respective cultures and have contributed greatly to the overall musical life of their own regions. Yet music, like religion, can transcend cultural limits; the religious musical systems of Ethiopia and Tibet, for example, differ almost as greatly from the secular musics of their own respective cultures as the musics of foreign countries.

Religious musical systems may also extend across cultural boundaries. Islam, for example, has forged musical links across vast regions of Asia and Africa; and North American traditions such as the Ghost Dance and the peyote cult have created musical bridges between very diverse ethnic groups. Other well-known intercultural religious musical traditions include Jewish, Christian, Hindu, Buddhist, and West African/Latin American possession music. Additional cases may include (1) the drumming and singing of Asian shamans, perhaps constituting a related tradition stretching from Scandinavia to the Himalayas, and possibly even extending into the Americas; (2) the epic songs, based on improvisatory recombinations of traditional song segments, of Central Asia and eastern Europe; (3) the bronze gong ensembles, associated with cosmological and calendrical symbolism and functions, of Southeast Asia; (4) perhaps the ancient sacrificial chants, linked to modal systems built on tetrachords, of Indo-European peoples extending from India to Greece; and (5) conceivably an even wider connection between Chinese, Indian, and Greek conceptions of music as an embodiment of universal cosmological and mathematical laws.

Yet, second only to its universal occurrence, diversity is the most characteristic feature of religious music, even in the great intercultural religious traditions. Christian music, for example, includes not only Gregorian plainsong, Palestrina masses, Protestant hymns, and Bach oratorios but also the resonant basses of the Russian Orthodox choir, the ornate melodies of Greek Orthodox chant, and the percussion-accompanied dances of Ethiopian Coptic worship; in the postcolonial era, it encompasses West African rhythms, and metallic sonorities of the Javanese *gamelan* orchestra, and the driving beat and electronic tones of the rock band as well. Hindu music aimed at helping to achieve the meditative state of *samādhi* can employ the very non-Indian sounds of Indonesian bronze instruments. Musical diversity in its religious and cultural contexts will be treated in other articles; here, I shall discuss some panreligious and pancultural issues.

DEFINITIONS AND CONCEPTS. Given the close links between musical and religious concepts, a nonsectarian definition of music may be impossible. For example, one common definition of music as "humanly patterned sound" conflicts with

widely held religious beliefs that music is not humanly, but rather, divinely patterned. To members of traditions holding that music or, at least, religious music originates with the gods or with devils, the assertion of the human origin of music must seem the ultimate in Western materialistic dogmatism, however scientifically neutral it may seem to the outsider.

Even definitions as simple as the dictionary staple "art of sounds" carry ethnocentric and sectarian implications. In many religious contexts, music is less an expressive "art" than a technology applied to produce practical results, from the storage and retrieval of information contained in religious narratives and teachings memorized in song to the attraction of animals in hunting, increase of harvests, curing of diseases, communication with the divine, supplication, and control of the various levels of psychocosmic experience. While aesthetic beauty may or may not be integral to such technologies, individual self-expression plays little part in them and may be detrimental to their intended results.

The concept of music as an "art" carries overtones of a late European ideology based on the sanctity of self-expression and individualism, ultimately rooted in Greek and Judeo-Christian notions of ego, self, and soul. For some traditions, music is antithetical to the very notion of an individual self or soul. One group of Buddhist texts takes music as the archetypal embodiment of impermanence and conditioned causality, dependent on external sources and conditions, in order to show that there can be no such thing as an individual self. By contrast, modern Western scholars tend to view music, at least in its ideally purest forms, as fundamentally independent of external causes and conditions; they draw a sharp line between "extramusical" elements such as symbolism, function, purpose, and so forth, and "the music itself," which is supposed to consist of pure arrangements of tones. This concept of music seems to reflect European post-Renaissance religious concepts of an autonomous and inviolable soul wholly contained in the body of the individual. Perhaps it also reflects postfeudal economic concepts of individual entrepreneurial freedom, just as the Buddhist concept of an impermanent music resulting from temporary combinations of causes and conditions reflects basic Buddhist religious beliefs.

Even sound may not play a decisive role in religious concepts of music, at least not in any technical sense. When fundamentalist Muslims ban recordings of Western popular music and fundamentalist Christians burn them, they are not necessarily reacting to the melodic or chordal structures that constitute the essence of music for the technically oriented outsider. The "music of the spheres" extolled by early Christian writers was not sound in the sense of physical waves propagated in a gaseous medium; and, in Tibetan Buddhist thought, music consists of both the "actually present music" produced by sound-making voices and instruments and the "mentally produced music" perceived and imagined by each listener, with different results according to

individual differences in experience, skill, and imagination. Religious traditions have by and large no more conceived music to consist of sounds and the “extramusical” than they have considered persons to be made up of the physical body and the “extrapersonal.” Hence, even the most basic technical definition of music will ignore or deny essential aspects of music as conceived by many religions, while labels such as “symbolism” applied to nonacoustic aspects may appear misguided or even hostile from a believer’s perspective.

The very attempt to define music neutrally and open-mindedly might be objectionable from some religious viewpoints. For certain Christians, some kinds of secular music and the musics of other religions are the works of the devil and should not be mentioned without condemnation; on the other hand, for the Mahāyāna Buddhist author Sa Skya Paṇḍita, all music deserves praise because it relieves human suffering. Some Muslims would object to a discussion of Qur’anic vocalizations and other songs under the same heading and would assign negative connotations to music in general; but some Šūfī writers discuss music only in terms of highest praise for its capacity to lead to spiritual fulfillment, and they would consider a neutral approach as evidence of a lack of real understanding or appreciation of music’s most important meanings and values.

Many religions and cultures do not have a concept corresponding to “music” or “religious music.” For Islam, *al-mūsīqī* (“music”) is, in principle, what the West might consider secular music, controversial for its potential to mislead believers into sensual distractions; melodic vocalizations of the Qur’ān and certain religious poetry are not “music,” however musical they may seem on technical and aesthetic grounds. To avoid violating the integrity of a tradition by imposing a dissonant external viewpoint, it might help to consider all such cases of performances that sound musical to the outsider, but are not music to the insider, as “paramusical.”

Cultures as diverse as those of Ethiopia (Shelemay, 1982) and modern Tibet have distinct terms and concepts for religious and secular music, with no common category of “music” to unite them. The music of the Chinese *chin* (a type of zither), on the other hand, is clearly conceived as music and has strong roots in Confucian and Daoist concepts and practices; but it certainly is not “religious” in the same sense as the singing of monks in Buddhist or Daoist temples. And, although the point lends itself all too easily to distortion and romanticism, it is a well-known fact that in many small-scale kinship-based societies of hunters, nomads, and subsistence farmers, where formal role distinctions are much less prominent than in bureaucratized state civilizations, it is often as difficult to draw a clear line between “sacred” and “secular” musics as it is between religion and everyday life. Are Pygmy honey-gathering songs part of a traditional ritual, a comic entertainment, a social regulatory system designed to ensure and enhance egalitarian universal participation in community life, or an aesthetically exquisite

polyphonic art? The question, if not meaningless, is at least inelegant.

Musics, like religions, are most meaningfully defined in their own terms. Along with aspects of musical sounds and their structural relationships, religious definitions frequently take into consideration such factors as cosmological and mathematical laws, divine origin or inspiration, psychological and emotional effects, social and ethical implications, relations or contrasts between religious and secular musics, and a wide range of other elements.

Since the selection of factors varies widely from one religious tradition to another, as does the relative importance assigned to any particular element, an approach that attempted to define all religious musics “in their own terms” would result in a collection of mutually unintelligible approaches to what must on some level be a cosmically, divinely, or humanly universal topic. For want of a better solution, we must discuss music and religion in the terms most widely shared by the full range of musical and religious traditions; and these, in the first place, require attention to the technical elements of music and of the paramusical phenomena found in religious contexts.

TECHNICAL FEATURES. Music has its technical basis in human voices and/or musical instruments that produce sounds with patterned acoustical characteristics. Religious traditions often stress a distinction between vocal and instrumental music and frequently assign higher value to vocal music. This is usually because of its capacity to communicate meanings through the words of song texts, because the human body seems more a part of divine creation than instruments created by human artifice, or because of negative associations of instruments and their music. In some traditions, such as the Mennonite churches and Theravāda Buddhist monasteries, vocal music is performed *a cappella*, without instrumental accompaniment. No cases are known in which vocal music is rejected entirely in favor of instrumental music; but there are significant examples (such as the Siberian shaman’s drum) where instruments and their music equal or overshadow vocal music in religious importance.

Patterned human vocalizations take two forms: speech, emphasizing contrastive distinctions between units (phonemes, syllables, words) with distinct meanings, and singing, emphasizing prolonged continuity of sounds with controlled pitch (frequency of vibration). Singing without words produces a melody, a patterned sequence of tones; with words sung to the melody, one has a song. A song may be sung on a single, steady pitch level (monotone); or its melody may rise and fall to any number of higher and lower pitches, the total of which, arranged in ascending or descending order, are its scale; or it may consist of continuous, gradually shifting tone contours without distinctly separate high or low levels. Sets of musical scales may be conceived as modes that incorporate standard melodic patterns, ethical and cosmological implications, and other non-acoustic features.

Religious traditions may place greater value and emphasis on either words or melody; and vocal styles may range from formally simple, with few up-and-down melodic movements to avoid distortion of the words of the texts, to more elaborate, with complex melismatic movements to enhance musical beauty. It was once widely believed that such differences represented an evolutionary sequence from “primitive” chant to musical art; but, as Edith Gerson-Kiwi (1961) has convincingly argued, melodic simplicity may be a deliberately developed stylistic alternative to elaborate secular styles in complex cultures. Varying textual/musical emphasis may reflect varying mythic/ritual applications, stressing either the informational content of religious narratives or the aesthetic beauty or power of a religious offering. Contrasting textual/musical emphases may also reflect differences in communicating with human believers in an intelligible language, or with spirits or gods, who may prefer the special mode of musical communication.

Melodies may be performed as a solo by a single singer or instrument player, in unison by a chorus of singers, or accompanied by other singers or instruments playing independent, distinct musical parts. They may be arranged so as to occur simultaneously with other melodies (polyphony), with a steady-pitch monotone (drone), or with conventionally arranged sequences (harmony) of other pitches or simultaneous-pitch clusters (chords). The most musically complex of these features may occur in the smallest local religions of the sociopolitically and technologically simplest cultures. Generally, such traditions tend toward maximum religious and musical participation by the whole group, while the “great” religions of urban civilizations tend toward complex patterns of religious and musical specialization. However, the existence of religious and musical specialists such as the shaman in small cultures, of complex divisions of musical function in the group performances of hunter-gatherers such as the Pygmies and San, and of movements toward community religious and musical participation such as the growth of the Lutheran chorale and Buddhist monastic chant in urban civilizations in Europe and India, show that even the most general rules may find exceptions in religious and musical traditions.

Rhythms are the product of patterned accents and “long” and “short” durations of sounds. Their patterns may be varying groups of irregular or equal-length beats (abstract or actually played accent/time units) and pulses (shortest units actually played); or patterns may recur in cycles of the same number of beats played again and again. Rhythms and cycles may be classified as appropriate to specific gods and ritual activities, and some traditions (such as Tantric Buddhism) use mathematical beat groups extending into the hundreds to musically embody cosmological and other religious concepts. Rhythms often form a link between music, words, and dance. In songs with prose texts, musical rhythms are often free, varying along with long-short syllable and sentence patterns; while songs with poetic texts often reflect the

meter of poetic stanzas, with the same number of syllables and beats recurring in successive lines. However, musical settings may also utilize different rhythmic patterns from the texts set to them. Dance rhythms provide cues of accent and patterning to coincide with movements of the body; they range in style from syncopated (favoring sounds that fall between and overlap beats) and very fast styles associated with some African American possession religions to the asymmetrical, extremely slow rhythms used in Tibetan Buddhist dances.

Musical instruments are scientifically classed into four groups according to the means used to produce sound: idiophones (bells, gongs, etc.), which produce sound by means of a solid vibrating body; membranophones (drums, etc.), which utilize a stretched membrane; chordophones (lutes, harps, etc.), which use strings; and aerophones (flutes, trumpets, etc.), in which vibrating air produces the sound. Instruments of all these classes are widely used in religious music, although one class or another is looked on with special favor or disfavor by various religious traditions. Instruments are often played in groups or ensembles. These are sometimes called “bands” or “orchestras,” with the latter term technically implying greater size and more variety of instrument types; but the terms are often used simply to connote a lesser or greater degree of respect on the writer’s part.

Some Western writings on religion and music, particularly works by early scholars and missionaries, contain misnomers that convey false technical implications. Most common is the term *primitive*, which implies both “early” and “simple”; in fact, historical evolutionary chronologies of musical types are speculative and controversial, and the term has been indiscriminately applied solely on racial grounds to musics comparable in complexity and sophistication to the music of any known civilization. Words such as *noise*, *din*, and *cacophony* often simply indicate lack of understanding or sympathy.

Instruments are frequently misnamed; for example, *flageolet*, the name of a flute, is widely applied to oboes and trumpets; *tambourine*, a frame drum with jingles, is used for every kind of drum; and *guitar* and *harp*, applied to almost any chordophone. A more ambiguous usage is *chant*, a term that should carry technical implications of free rhythm, limited pitch range, and a relatively simple melodic style. In fact, the term is widely used as a simple synonym for “religious vocalization” or “religious song,” even in cases of melodically and rhythmically very complex music; hence, it may impart the misleading impression that a music is of inferior aesthetic quality simply by virtue of its being religious.

ORIGINS, MYTHS, AND SYMBOLISM. The close relationship of music and religion may imply, as some myths and legends claim, a common or related origin. From the eighteenth to the early twentieth century, evolution-oriented scholars debated theories of musical origins in the sounds of birds and animals, emotional cries of grief at funerals, language intonations, stylized recitations of religious texts, and animistic awe

of “voices” heard in natural objects such as shells and bamboo tubes, and so forth. All such theories proving no less speculative and resistant to objective investigation than the traditional myths they were meant to replace, the issue gradually lost scientific interest, and it is now all but ignored in musical research. But, as if in discouragement at having failed to construct their own myth of musical origins, scholars also made little effort to explore the origin question in its traditional context of religious mythology; and today we still find ourselves in the “surprising” position of finding, as did Alan P. Merriam (1964, p. 74), “that there seem to be almost no available accounts of beliefs concerning the ultimate origin of music.”

Accessible information, while insufficient to allow for generalization or systematic analysis, is abundant enough to show that music is as diverse in myths of origin as in any other of its aspects. Music may be thought to originate in a primordial divine power, as in the *nāda-brahman* “God-as-sound” of Hinduism, or in the efforts and discoveries of such human originators as Jubal and his father Lamech, briefly mentioned in Jewish and Islamic traditions (see *Gn.* 4:21), or Fuxi and Huangdi, in Chinese legend the discoverers of music and its mathematical-cosmological basis. Music may also play a cosmogonic role in the origin or maintenance of the world, as in the drum-playing and cosmic dance of the Hindu god Śiva Nataraja or in widespread stories of gods who “sing” their creations and creatures into existence.

The creation of individual pieces of music and musical instruments may involve contact with the divine. In the vision quest of the Plains Indians, individuals would go out alone into the wilderness to fast and seek divine messages revealed in songs, which they would then bring back to enhance the religious and musical life of the community. The Asian shaman’s quest for a drum may take him to the center of the world and the beginning of time, just as the Australian Aborigine’s dreaming of songs may provide a link to the primordial Dreaming. Musical creation may even move in the opposite direction, from the human world to the divine, as in the case of the Tibetan composer Milaraspa (1040–1123), whose songs are said to have been “imported” to heaven by the *mkha’gro ma* goddesses who, like their counterparts in many other religions, fill the Tibetan Buddhist heavens with their music.

The idea that music originally belonged to “other” places, times, persons, or beings is found in many myths, sometimes with connotations of conflict and conquest, as in the South American and Melanesian legends of male theft of sacred flutes from the women who originally possessed them. However, the discovery or creation of music is more often a joyful or ecstatic experience, as in the many vocal and instrumental pieces and religious dances of Tantric Buddhism experienced in dreams and meditations as celestial performances and then recomposed by the meditator for performance in the human world. Handel’s often-quoted account of seeing God and the angels while composing the

“Hallelujah” chorus—to say nothing of the religious experiences the chorus continues to evoke for many of its performers—may indicate the viability of such concepts even in cultures that favor ideas of human composition of music over divine creation and that tend to conceptualize musical “inspiration” in more secular terms.

Specific beliefs in music coming to us from other realms and beings may be a special case of a more general belief in the otherness, the special or extraordinary nature, of music in human experience. Such beliefs are seldom rooted in simple perceptions of music as strange and alien but rather seem based on recognition of the beauty and power of music. Thus, even when some traditions condemn music, they are condemning aspects of it that other traditions find worthy of praise: music exerts a strong appeal on humans, spirits, or gods; it stimulates sensual, bodily, and mental involvement, and so on. Does the power of music come from physical sensations of breath, motion, and vibration, from cognitions of proportion and symmetry as unexpected and serendipitous in the auditory realm as geometric arrays in nature, from socially and culturally conditioned associations? Is there one explanation, or are there separate causes for different kinds of musics and experiences? Whatever the answer, music enhances, intensifies, and—in ways that may elude precise analysis and control but which are nevertheless apparent both to participants and observers—transforms almost any experience into something felt not only as different but also as somehow better. In this transformative power, music resembles religion itself; and when the energies of music and religion are focused on the same object in an isofunctional adaptation of both toward a common meaning and goal, intensification reaches a peak greater perhaps than either might achieve by itself. Thus, the “otherness” of music and the “other” levels of reality and beings encountered in religion merge into a heightened synthesis of religious-musical experience. The possibility of such a synthesis may help to explain the aspect of music in religion that we usually call symbolism.

Symbolism is a problematic concept for both religion and music. Like the gods and spirits who remain invisible to an outside observer or to a camera, music’s religious meanings and functional effects that elude capture by microphones and tape recorders may strike the uninitiated outsider as pure symbolism and yet be at least as real as its physical sounds to the aware and sensitive insider. For the Aztec, songs were flowers, birds, pictures, and the spirits of dead warriors called back to earth (Bierhorst, 1985); we ourselves would probably find it easier to agree that a song “is” a picture than that a song *is*, rather than *symbolizes*, a spirit. And if we adopt the kind of viewpoint that reduces the symbolic relationship between symbol and meaning to questions of physical-intangible and real-unreal, thus disposing of the spirits, we still have not decided whether songs are the symbols of flowers or vice versa. One senses that either choice is equally arbitrary; but if both are admissible as the real basis of the symbol, then why not the spirits as well?

Even if we take musical symbolism as a comparative and technical question of meanings attributed to sounds and forms, there are further questions of how so abstract and nondiscursive a medium can symbolize effectively, other than by purely arbitrary association, in the absence of explicit content that would lend itself to unambiguous communication. Some hear the diabolical in sounds that others find sacred; cross-cultural searches for even the most general agreement on music's cognitive or emotional significance have been unrewarding. There even seems to be a contradiction in the attempt to encode or decipher symbolic meanings in music: its aesthetic power seems to rely on the manipulation of abstract forms, however defined by a given culture and style, to the extent that subjecting form to an externally imposed system of meanings and functions might imply conflicts of purpose and musically inferior results.

Yet, if a symbol is that which stands for and reveals something other than itself, then music throughout the world has been accepted as successfully symbolizing the "other" of religion. Part of its success must derive from its generally perceived qualities of otherness and extraordinariness, and perhaps even from the very abstractness that frees it from associations too narrow to be associated with religious goals and meanings. But symbolic effectiveness must also rely on more specific associations than arbitrary applications to meanings or goals, which, even though they may be isofunctionally linked to the goals of religious practice, may still appear extrinsic to the music. If such associations do not arise from explicit musical content, then they must result from specific forms that accord with other meaningful forms in the religious sphere. Isoformalism of shared musical and religious forms, then, may combine with isofunctional applications to produce music that effectively symbolizes a religious object, and moreover without compromising the aesthetic integrity or viability of music as a medium of structured forms. Taking religious inspiration as the primary element in the process, this synthesis would occur when the form of a religious experience, action, image, or statement stimulated the creation of a corresponding musical form appropriate to and effective in the context of the musical system of its particular culture or religious tradition.

When religious and musical forms and purposes thus coincide, we have the kind of congruence that allows religious meaning to pervade every aspect of music from its assumed origin to the forms of individual instruments, songs, and pieces, and at every level of meaning from the most central to the most peripheral, from the most general to the most specific. The synthesis may be so complete as to leave no certainty whether either component, religion or music, takes precedence over the other; and it certainly allows for influence in both directions. There are, for example, not only myths of music, but also musics of myths; and the influence of music on mythology is almost certainly more pervasive and more important than the influence of mythology on music.

Contrary to a famous assertion by Lévi-Strauss, Wagner was far from the first, even in the Judeo-Christian tradition, to structurally "analyze" myths through music, for there are European precedents for the musical structuring of mythic narratives and themes going back to the Middle Ages, and far older examples from other parts of the world. These range in complexity from dramatizations as musically elaborate as Bach's or Wagner's (for example, the many performance genres of the Hindu epics *Rāmāyaṇa* and *Mahābhārata* in South and Southeast Asia), to the almost universal forms of mythic vocalization that utilize a simple binary contrast of sung myth/unsung ordinary discourse, or melodic and rhythmic highlighting of important words and passages to create a musically enhanced structure for a mythic narrative. For most religions throughout history, myths have been embodied not in written literature but in musical performance; and such performances provide one of the most characteristic bridges between religious belief and action, between myth and ritual.

TIME, SPACE, AND RITUAL. Music is widely used as a demarcator of ritual time and space. In traditional settings all over the world, one may enter a community just before or during a ritual performance and be drawn toward the center of religious activity by musical sounds that grow progressively stronger as one moves toward the center. At the ceremonial site, music may emanate from the exact center of action; or musicians may be placed at the borders of the ritual site, creating a boundary zone of maximum sensual stimulation through which one passes to enter the ritual area itself. In either case, the ceremonial space is pervaded by musical sounds that, more than any other element, fill the entire sacred area with a tangible energy and evidence that a special situation has been created.

Sometimes architectural or geographic isolation is used to confine the sound to the ritual space, and the music becomes an intimate or secret experience restricted to ritual participants and unheard by the general public. In other contexts, musical contrasts may mark the boundaries of sacred spaces by reserving different styles or sounds for sacred centers and profane peripheries: for example, Christian churches with bells that ring on the outside and organ music on the inside, or Theravāda Buddhist monastic ordinations with royal processional instruments outside the temple and choral chanting inside.

Unlike works of visual art, which exist in their entirety and all their details at any given moment, music unfolds through time. Thus, it creates a temporal framework that may be synchronized with ritual time in various ways. At the simplest level, the beginning and ending of a musical performance may coincide with the beginning and end of a ritual performance. Music may begin before a ritual and end after it, enclosing the performance in a temporal bracket or frame; or music may be performed selectively at temporal high points in ritual activity, highlighting significant periods of religious action.

But music also structures the experience of time in more complex ways. The tempo of the sounds that constitute the “events” of a musical performance may be considerably faster or slower than the pace of everyday experience, and they may combine in unusual temporal patterns. Music uses formal devices such as cyclicity, repetition, contrast, variation, and development of one pattern of organization into another. Any or all of these devices may be used to create perceptual impressions of the extension or compression of a moment of experience to a longer or shorter time than normal, the return of a previous moment, or the building of intensity toward a climax and emergence of a new structural and experiential framework.

For both time and space, the structuring effect of music and other performance media may thus function in quite distinct ways. The most obvious way is by contrastive marking of boundaries between music-filled sacred space/time and profane space/time without music. The musical preludes and postludes performed before and after Christian services, or the conch-shell trumpet notes sounded before and after many South Asian rituals, often from a temple door or gateway, exemplify the boundary-marking aspect of music used to highlight ritual activity by creating a sonic frame around it in time and space.

A different mode of organization is used when the spatial and temporal centers, rather than the boundaries, of ritual activity are brought into concentrated focus by music. This phenomenon occurs at a conceptual or “symbolic” level when music is perceived as a spatio-temporal *axis mundi*, a channel of communication with spiritual realms and primordial eras. For example, singing the “drum lineage” songs of the Tibetan Bon religion evokes a link with the beginning of time and the center of the world.

More concretely, the central spatiotemporal foci of ritual actions in the physical world may be highlighted by musical intensification, while movement toward or away from the center is marked by gradually changing intensity rather than a sharp boundary. For example, the religious and musical focus of a Sinhala Kohombā Kankāriya ritual is in the drumming, singing, and dancing of the priests themselves; their sound is heard with decreasing intensity as one moves outward through the concentric rows of the audience in the open-walled ritual enclosure, through the streets of the village, and on out through the fields of the surrounding district, which may be the ultimate space consecrated by their performance.

In such cases, the consecrated space is defined by its relation to the ritual action at its center, rather than by a boundary at its edge; and the gradually diminishing intensities of musical sounds emanating from the center serve well to embody this central-focal mode of spatial demarcation. A similar mode of temporal demarcation seems to occur in, for example, the Shona Bira ritual described by Berliner (1978, chap. 8), in which the *mbira* musicians begin their performance with unobtrusive, unelaborate playing and gradually

build to a peak of musical and religious interaction with the audience. Both musical intensity of creative improvisation and religious experiences of spirit possession occur within this focal period, and both gradually fade away to more ordinary levels as the ritual draws to an end. In such modes of application, music ceases to be a simple boundary marker, enhancer, or accompaniment to ritual action and religious experience: musical and ritual structure and content begin to take on more vital and significant relationships.

The most basic and widespread musical and ritual time-structuring device is repetition, often carried to such lengths as to perplex or bore the outside observer. It may be that repetition and redundancy serve to impart sensations of continuity, stability, and security, that they aid concentration and provide safeguards against distraction, or that they simply allow continuation of a “state of music” to enhance a ritual performance. Whatever the cause, the use of repetition is surely wide enough to show the importance of this little-understood formal device. However, except in unusual cases such as South Asian *mantra*, Japanese Nembutsu chanting, and some kinds of instrumental accompaniments to rituals, which may involve very prolonged repetitions, musical repetition is almost always found in conjunction with variation, and each depends on the other.

For example, we might consider three possible musical settings for the beginning of the Christian Mass, “Kyrie eleison / Christe eleison / Kyrie eleison.” (1) The same melody, musical form, and so forth, is repeated in all three phrases. This would appear to minimize the effect of the textual variation “Kyrie . . . / Christe . . . / Kyrie” and create a musical analogue of the textual continuity provided by the triple repetition of “eleison,” reinforcing the conceptual unity of the plea for mercy expressed in all three phrases. (2) Each phrase is set to a different melody or form. Here, the formal analogue is with the variation of initial words, rather than continuity and repetition, and the cognitive effect might be a heightened awareness that each phrase represents a new act of asking mercy, even though there is textual repetition in the first and third phrases. (3) The beginning and ending “Kyrie . . .” phrases are set to the same or a similar melody or form, with the intervening “Christe . . .” set to a different one.

Here, the use of musical variation and repetition corresponds exactly with the variation and repetition of “Kyrie . . . / Christe . . . / Kyrie”; continuity and conceptual unity are given cyclic expression in the identity of the beginning and ending phrases, while the middle phrase receives the special treatment of being given its own individual musical setting. Both repetition and variation in this context acquire a different significance than in (1), with its triple repetition, or (2), with its ongoing changes. The individualized setting in the second phrase is likely to be experienced by performers and observers alike as a special or climactic moment between the pattern established in the first phrase and repeated at the end; and a participant might experience it as a special en-

hancement of asking mercy in the name of Christ, without special attention to the role played by musical forms. But the formal differences remain: (1) with its repetition and sense of continuity and prolongation of a moment and action already begun, (2) with its emphasis on change and newness, and (3) with its variation-repetition structure and sense of return to a previous moment when the text and music of the first phrase are repeated at the end.

Similar cases can be found in many religious traditions; for example, in the various settings of the Buddhist Triple Refuge, with its three-phrase invocation of Buddha, Dharma (teaching), and Saṃgha (religious community). The actual use of musical structuring through repetition and variation is frequently much more complex, and each tradition tends to develop its own characteristic styles. For example, many Christian Mass settings use extensive repetitions of text phrases such as “Kyrie eleison” with increasingly different variations of the melody, developing it into new forms, and building to climaxes of musical intensity. Buddhist settings of the Triple Refuge, on the other hand, tend to use melodic variation in more restrained ways, and concentrate instead on text/music repetitions that build to mathematical or exponential permutations such as triple repetitions of a three-phrase structure, resulting in a 32 formal structure, and perhaps a sense of transcending cyclic repetition to reach a more abstractly perfect state. However such structures may be felt or interpreted in their own traditions, it is clear that they make equally sophisticated but formally quite different use of such features as continuity, change, and development of basic elements into more complex forms. And since each in its own context is only a small part of a much longer ritual performance, opportunities for complex structuring of musical time are obviously great.

Yet, however natural the concept “musical time” may appear to us, we must treat the issue with caution. Westerners may not be the only ones to conceive of music and its structures in temporal terms. For example, the Javanese prince Mangkunegara VII (1957) and others see the *wayang kulit* (shadow play) in such terms. For them, this all-night performance, with its chronological ordering of musical modes and its complex alterations of repeating sections and new developments, encapsulates the experience of progress through a prolonged state of *samādhi* meditation and through life from birth to spiritual fulfillment. And Judith Becker (1979, 1981), in a series of provocative articles, suggests that Javanese music embodies local and Hindu-Buddhist time concepts from cyclicity to the coincidence of differently ordered calendars.

Alan P. Merriam (1981) has warned that we may be imposing our own prejudices on African music by discussing it in terms of a “musical time” for which African languages have no corresponding terms. Nevertheless, we find areas in Africa with both musical coincidence of different-length beat cycles and calendrical coincidence of different-length week cycles, and the parallel seems too exact and complex to be

unrelated. Perhaps one solution would be, in studying a culture, to adopt a comparative perspective that takes musical time as one of the fundamental modes of human time perception and organization, whether or not the culture calls it by a term that also applies to calendrical or experiential time, just as we continue to identify and study “music” and “religion” in cultures that have no equivalent terms. Since each culture and religion has its own concept of time, some such artificially neutral viewpoint may be necessary to think clearly about questions of musical and ritual durations and structures, questions that transcend both cultural and religious boundaries.

BIBLIOGRAPHY

There is no integrated study of this subject on a worldwide scale. Older studies tended either toward ethnographic-scrapbook approaches, indiscriminately assembling all kinds of traveler's remarks on music hastily encountered and little understood, or to evolutionist approaches meant to “explain” the superiority of European religion and music. The articles on music in the *Encyclopaedia of Religion and Ethics*, edited by James Hastings, vol. 9 (Edinburgh, 1917), exemplify both approaches. More recent research has favored field studies of single communities or ethnic groups. Although such studies have resulted in intensive exposure and considerably more extensive and accurate firsthand information, they have also produced works that frequently tend to one-sided emphasis of either religious or musical factors with inadequate attention to their mutual relationships. Readers who want to learn more about the religious music of a given tradition should consult not only the bibliographies of the articles on music that follow but also the general articles on the same religious traditions elsewhere in the encyclopedia.

The most extensive collection of studies of religious music by individual authors writing on different areas and religions is the *Encyclopédie des musiques sacrées*, edited by Jacques Porte (Paris, 1968), and, in English, articles listed under the names of individual religions and countries in the *New Grove Dictionary of Music and Musicians*, 20 vols., edited by Stanley Sadie (London, 1980). Other collections of recent studies are found in two special “Sacred Music” issues of the journal *World of Music* (Berlin; vol. 24, no. 3, 1982, and vol. 26, no. 3, 1984), and in *Sacred Sound: Music in Religious Thought and Practice*, edited by Joyce Irwin (Decatur, Ga., 1984). Standard works on the theory and method of research on world musics, including religious music, include Bruno Nettl's *The Study of Ethnomusicology* (Urbana, 1983), in which see especially chapters 11, 12, and 15, and Alan P. Merriam's *The Anthropology of Music* (Evanston, Ill., 1964), in which see chapters 4, 11, and 12. The most comprehensive cross-cultural theoretical approach to a single aspect of religious music is Gilbert Rouget's *Music and Trance: A Theory of the Relations between Music and Possession* (Chicago, 1985). Less helpful applications of cross-cultural theory are found in works such as *Man, Magic and Musical Occasions* by Charles L. Boilès (Columbus, Ohio, 1978), which subsumes all kinds of religious practices under “magic,” or Arnold Perris's *Music as Propaganda* (Westport, Conn., 1985),

which evaluates the musics of other religions by European Christian standards.

A number of studies of religious music in specific traditions make effective use of anthropological approaches to religion, particularly those approaches that focus on language and symbolism. Classic anthropological studies include works by David P. McAllester on the Navajo, *Enemy Way Music* (Cambridge, Mass., 1954), and on the peyote cult, *Peyote Music* (New York, 1949). A broadbased anthropological approach is used in *Horses, Musicians, and Gods: The Hausa Cult of Spirit Possession* by Fremont E. Besmer (South Hadley, Mass., 1983), while a focus on symbolism marks Steven Feld's work on the Kaluli of Papua New Guinea, *Sound and Sentiment* (Philadelphia, 1982). Works in the emerging category of "performance studies" place less emphasis on technical description and analysis of music but give it an important place in a multidimensional exploration of the multimedia world of cultural and religious performances; examples include Bruce Kapferer's study of Sinhala lowland possession cults, *A Celebration of Demons* (Bloomington, Ind., 1983), and Ellen B. Basso's study on the Kalapalo Indians of Brazil, *A Musical View of the Universe* (Philadelphia, 1985). These newer studies often show a sophisticated approach to the sung and narrated "texts" of oral traditions that may eventually enable more meaningful comparisons with traditionally text-oriented studies of the literate religions of Asia and the Mediterranean.

Studies of musical and ritual time include Judith Becker's "Time and Tune in Java," in *The Imagination of Reality*, edited by Aram A. Yengoyan and A. L. Becker (Norwood, N.J., 1979), pp. 197–210, and "Hindu-Buddhist Time in Javanese Gamelan Music," in *The Study of Time*, edited by J. T. Fraser et al., vol. 4 (New York, 1981); Alan P. Merriam's "African Musical Rhythm and Concepts of Time-Reckoning," in *Music East and West*, edited by Thomas Noblitt (New York, 1981), pp. 123–141; and Lawrence E. Sullivan's "Sacred Music and Sacred Time," *World of Music* 26, no. 3 (1984): 33–52. Other works cited in this article include Paul Berliner's *The Soul of Mbira* (Berkeley, 1978); John Bierhorst's *Cantares Mexicanos: Songs of the Aztecs* (Stanford, Calif., 1985); Edith Gerson-Kiwi's "Religious Chant: A Pan-Asiatic Conception of Music," *Journal of the International Folk Music Council* 13 (1961): 64–67, which has an overstated but important thesis; Prince Mangkunegara VII's *On the Wayang Kulit (Purwa) and Its Symbolic and Mystic Elements* (Ithaca, N.Y., 1957); and Kay Kaufman Shelemay's "Zēmā: A Concept of Sacred Music in Ethiopia," *World of Music* 24, no. 3 (1982): 52–67.

MUSIC: MUSIC AND RELIGION IN SUB-SAHARAN AFRICA

The most compelling reason for music making in Africa derives from religious experience, for it is generally believed that the spiritual world is responsive to music and deeply affected by it. Acting through human mediums, the gods are known to object to the singing of particular songs and to express dissatisfaction when performances are slipshod or lacking in animation. Now and then they also bring new songs or themes of songs to their worshipers. Hence worship always finds its most intense expression in music making, which can go on for hours or days during major religious festivals, for performing sacred music in this manner gives not only aesthetic satisfaction but also the assurance of continuous contact with the spiritual world. Accordingly, those who worship particular gods often describe themselves in songs as the children of those gods and may distinguish themselves from other members of the community, among other ways, by their repertoire of songs, instruments, and dances.

Ancestral spirits, as well as gods, generate repertoires of songs and instrumental forms. The scale and intensity of expressions related to ancestral spirits, however, varies considerably in relation to the perspective from which they are viewed. While some societies emphasize the spiritual and behavioral aspects of ancestors in the performance of rain rites, curative rites, initiation and other rites of passage and special rites for the dead, others focus on the philosophical aspects of the concept of the ancestor. Celebrations of life or the triumph of life over death indicated by the continuing presence of the dead is given scope in special festivals involving displays of ancestral masks and dramatic enactments accompanied by music and dance. Some centralized traditional states employ music and ritual for political ends.

ORGANIZATION OF SACRED MUSIC. Because the spiritual world is believed to be sensitive to music, performances of sacred music are usually controlled. Accordingly there are occasions during which (1) little or no music is performed (such as personal ritual and worship); (2) music other than the sacred music of the gods is performed (such as events

during which social rather than religious values are emphasized); (3) both sacred and nonsacred music may be performed (for example, the funeral of a priest or priest-medium or religious festivals that incorporate the singing of songs of insult sanctioned by the gods for the release of tension in society); and (4) sacred music is performed (such as fixed days of worship, festivals, and other special occasions on which dramatic enactments, including trance and spirit possession, take place). The repertoire of sacred music used on ritual occasions usually includes either songs and instrumental pieces or sound events that function as codes or signals for indicating divine presence or for inviting undivided attention.

As in many cultures of the world, African songs provide avenues for making references to the sources of religious experience and to the values that hold a community of worshipers together. Marion Kilson shows in her study of Ga songs and symbols that a homogeneous body of sacred songs may include references to the supreme being, individual lesser gods and their interrelations, creatures and objects of nature connected with the religious experience, the seasons, ritual symbols, interpersonal relations, and events in the life of the community of worshipers. Africans sing about their gods and their own social history in their sacred songs because their gods accompany them during their migrations as well as in their encounters with other societies.

Sacred song repertoires usually include items that fulfill special functions related to the details of worship or a ritual occasion. Some songs are sung for the opening and closing of worship while others accompany, precede, or follow particular rites or provide the link between different phases of a ritual occasion. Getting in and out of trance or remaining in a state of trance can be aided by particular songs, while changes in the mood of worship can be effected not only through the content of songs but also through variations in form and singing style, including the occasional use of spoken verse; changes from speechlike chants in free rhythm or recitative style to songs in strict rhythm; and differentiations between simple litany types of songs and songs that utilize more complex forms or occasionally songs in strophic form.

Group singing is invariably led by cantors, who may not necessarily be priests or priest-mediums. Special chants performed as solos that require mastery of particular vocal techniques and repertoire may be performed by specialists in the religious community. In some societies the songs of public worship are performed by a select group of singers well versed in the tradition and not by the entire congregation.

Sacred songs may be sung unaccompanied (especially when they are in free rhythm) or they may be accompanied by handclapping, bells, rattles, friction sticks, or by more complex percussion on drums or tuned idiophones (*mbira* and xylophones). Chordophones such as lutes, harp-lutes, and arched harps are also used in religious contexts in some societies.

In general, instruments that can play complex melodic and rhythmic patterns are treated not only as accompanying

instruments but also as instruments that can stand on their own in ensembles. They may be assigned their own limited repertoire of pieces that are specific not only in their basic materials but also in style and tempo, so that they can be correlated with various songs, movement, and dance. During performances it is the instrumental ensemble that provides the required energy levels for movement expression and more especially for trance and spirit possession.

Because of the different roles performed by vocal and instrumental pieces and the dance, it is customary to combine all three in a full performance. Where this is done, all that a priest-medium who wants to perform a particular dance while in trance needs to do is start a song in the set for the particular dance. The instrumentalists will switch automatically to the rhythms he needs. The singers will similarly take up the song he started and continue with others in the same set.

A number of conventions are used to distinguish the sacred from the secular. For example, a simple ritual act of dedication or the use of external symbols of sacralization, such as marks of white clay, special drapes, pendants, or symbolic carvings, might distinguish sacred instruments from their secular counterparts. There are a few instances where the distinction is made in the form, structure, and tuning of instruments. For example, among the Loflor of Ghana, there is a xylophone used in sacred rituals that has fourteen bars, like other xylophones; however, only twelve bars are played, and a tetratonic tuning is used instead of the usual pentatonic. Similarly the *mbira dzavadzimu*, a tuned idiophone (*sansa*, or hand piano) of the Shona of Zimbabwe, used for playing music connected with ancestral rituals, is distinguished from those tuned idiophones played for entertainment, such as the *mbira dzavandau* and the *karimba*. It has twenty-two keys that are generally wider and thicker than those of other instruments and a keyboard with three manuals.

The organization of sound events that function as signals or codes follows similar conventions. Instead of the clapperless bells used in musical ensembles, clapper bells may be used in ritual contexts. Instead of a regular flute made of bamboo, a flute made out of the tip of an animal horn may be used. Instead of an instrument, voice masks and whistling may be used to indicate the presence of particular gods or spirits. Ankle buzzers and similar devices normally used in the context of the dance may be worn by a novice, a ritual expert, or a medium when he is in ritual contact with his god so that anyone approaching him might take a different route.

Similar functions may be performed by instruments set aside for this purpose. Thus the bull-roarer (or thunder stick) is used in some societies to represent the voice of the ancestor (for example, among the Dogon of Mali) or the voice of a god (such as Oro of the Yoruba of Nigeria). The major god of the Poro initiation society of the Senufo is represented not only by the sound of an eland's horn incorporated into an aerophone ensemble but also by the bull-roarer. Here and there one finds sacred drums that function in the same man-

ner, drums such as the *digoma* of the Lovedu of the Transvaal, beaten twice a year in a ritual addressed to the ancestors; the drums of the Lozi of Zambia associated with chiefship; and the *bagyendanwa* drum in the Ankole region of Uganda.

Coded sounds are not always played as independent sound events. They can also be incorporated into regular pieces. For example, where the gods are worshiped collectively, the entrance and exit of each god can be indicated aurally through changes in rhythm or instrumentation or by a song functioning as a code.

IMPACT OF RELIGION ON MUSICAL LIFE. Because music makers, artists, and crafters are also carriers of the religious beliefs of their societies, religious concepts and practices extend to artistic behavior in the public domain. A music club or association that performs recreational music may begin with libation, a song of invocation, or an instrumental prelude from the sacred repertoire in order to ensure that nothing goes wrong in the course of the performance. Some societies ban all musical performances for a few days after rites performed at the beginning of the planting season or before the annual harvest festival, while others prohibit the performance of certain musical types outside prescribed contexts. The making of instruments such as xylophones and drums begins and ends with rituals irrespective of the contexts in which they will be used. In some societies the rituals continue at various stages in the process of manufacture and on each occasion on which the finished product is used. There are also instances where musicians seek ritual protection not only for their instruments but also for themselves and their art. Belief in ancestors also sometimes plays a role in the recruitment and training of musical specialists, such as the royal musicians (*ingombe*) of the Bemba of Zambia and the royal drummers and fiddlers of the Dagomba of Ghana.

Because sacred music is held in high esteem, the borrowing and adaptation of instruments or musical items of particular aesthetic or verbal interest occurs now and then in the music performed in the public domain. While in the past this was done with discretion, social change now seems to have opened the door to conscious exploitation of the aesthetic potential of sacred music, both in traditional music practice and in the new forms of African popular and art music. The reverse process, whereby traditional sacred music is influenced by secular music, does not seem to be common, although a few notable examples can be cited. The emergence of centralized states in Ghana in the pre-European period, which developed royal court music of a complex order, seems to have encouraged the incorporation of the talking drum (*atumpɔn*), an instrument of kingly command, and the royal heavy drum (*bommaa*) into the ensemble of gods regarded as state gods.

Similarly, the advent of new cults that worship in the traditional manner has led to the development of new repertoires of traditional sacred music that utilize the recitative song style of traditional hunters' associations. These songs are used partly because of their affective character and partly

because the gods of the new associations are regarded as hunter gods who specialize in the neutralization of evil forces such as witchcraft and sorcery.

INTRODUCED RELIGIONS. Although indigenous religions have continued to maintain the vigor and vitality of their beliefs and expressive forms, both Islam and Christianity are also well established in many parts of Africa in spite of the alien modes of worship they brought with them.

Islam. Because Islamic religion does not view the sensuous qualities of music with favor and therefore tends to discriminate between what is admissible in religious life and what is not, the connection between music and Islamic religious observances in Africa has been marginal, in contrast to traditional African religions in which music is integral to worship and ritual observance. Apart from the call to prayer and the Qur'anic recitations that are at the core of Islamic worship and that have been maintained in sub-Saharan Africa, it is religious events in the life of Islamic communities that provide outlets for music. The type of music used in these contexts depends on the community, in particular whether it is an Arab or Afro-Arab community, an African community ruled by an Islamic aristocracy, or an African community with Islamic leaders and a traditional aristocracy.

In all three types of communities the Qur'an is chanted in the original Arabic during worship and on other occasions, while nonliturgical music may be in the local language and idiom. Friday services are observed, while the Prophet's birthday and his ascent to heaven or particular episodes in his life are commemorated in the form of festivals at which music in the local idiom may be performed. The end of Ramaḍān, the period of daytime fasting, is marked by feasts and music, while the routine pilgrimage to Mecca also provides a pretext for music making for the pilgrims, both on the occasion of their departure and on their return.

There is a general tendency in Islamic communities for a simple musical event that satisfies the Islamic ideal to grow into a more elaborate and sometimes inadmissible form, a process that leads to its secularization as entertainment music. The Yoruba Islamic musical types *apala*, *waka*, *fuj*, and *sakara*, for example, which started as modest forms of pilgrimage music, have become part of the general entertainment repertoire. Similarly among the Dagomba of Ghana *damba* music and dance performed at the *damba* festival, which celebrates the birth of the Prophet, is now performed in other contexts by *lunsi* drummers. Sectarianism and syncretic tendencies have similarly encouraged the use of African musical resources at *dhikr* gatherings as well as modifications in liturgical practice that allow for the development of a corpus of songs based on local models.

Christianity. A different picture presents itself when one turns to Christianity in Africa, for it has been less compromising than Islam as far as the use of local musical resources is concerned. Like traditional African religion, Christianity regards music as an integral rather than a marginal

aspect of worship. Accordingly they share a similar approach to the organization of the content of sacred songs.

However, the values that guide the selection and use of music and musical instruments in Christian worship as well as performance organization and musical behavior are very different from those of traditional African worship. Until recently, African modes of expression and behavior seemed to the leaders of the Christian church not only unsuitable for Christian worship, but also not conducive to the restrained Christian life expected of converts. African drumming and dancing and the exuberance of African celebrations such as festivals and rituals of the life cycle were not tolerated. The problem that Christianity in Africa has had to face, therefore, is how to integrate Christian worship with indigenous cultures and preserve at the same time the basic Christian beliefs, values, and norms of behavior that characterize the religion. Although the Ethiopian church could have been used as a model of integration, it was ignored for quite a long time because it did not conform to the norms and values of the Western church.

The most obvious practical step toward indigenization of music widely adopted in the nineteenth century was the translation of hymns in European languages into African languages. It was not generally realized, however, that indigenization, in a fuller sense, would have also meant setting the translated texts of hymns to tunes that reflect African rhythmic and melodic characteristics or that follow the intonational contour and rhythm of texts, since many African languages are tone languages (that is, languages in which tones or pitches distinguish meaning or tend to be fixed for particular words, phrases, and sentences). The retention of the Western tunes invariably led to the distortion of the words, a situation that has not been fully remedied in many parts of Africa.

A few missionaries and African church leaders who became aware of this problem tried to provide other solutions. The Livingstonia Mission in Malawi, for example, encouraged local Ngoni people to adapt their traditional songs for church use, and also arranged for traditional instruments such as bells, drums, and horns to be used for calling worshipers to church. Elsewhere songs in the traditional style emerged (such as the Fanti lyrics of the Methodist Church of Ghana) that could be sung as spirituals or anthems.

The search for solutions to this problem, and to the whole question of Christianity in relation to African cultures, continued in the early decades of the twentieth century with the formation of the International Missionary Council. A more liberal attitude toward African cultures as well as to the indigenization of Christian liturgies and music emerged. This has encouraged not only African contributions to Western hymnody in African languages but also the development of new forms of syncretic church music that combine African and Western resources. Songs and anthems as well as a number of new settings of the Mass that use drums and other traditional African instruments as accompaniment have become

fashionable in Roman Catholic churches. The All African Conference of Churches and local church music associations are also giving encouragement to the creation and dissemination of new African hymns.

African Independent Churches have also grappled with the problem. Beginning with hymns in translation and original compositions in the same style, leaders of these churches give scope to songs in the style of traditional African music as well as songs based on the style of marching songs and African popular music. Both African drums and Western band instruments not generally used in ecumenical churches are utilized by independent churches, since physical movement and expressions of ecstasy are encouraged.

As might be expected, there is a close relationship between trends in African church music and trends in contemporary African secular music, for many contemporary composers of art music are also composers of church music and of music for educational institutions formerly run largely by churches. Church choirs and singing bands as well as school choral groups are the main performers of African choral music in the art music tradition, while the repertoires of the few independent choral societies often include new African church music. Because of the large number of independent churches that have sprung up, composers of African popular music now include religious themes and tunes sung by such churches in their repertoire of dance music, a practice that enables their songs to be performed not only in independent churches but also in ballrooms, cafes, night clubs, and on social occasions.

MUSIC: MUSIC AND RELIGION IN INDIGENOUS AUSTRALIA

In indigenous Australia music and religion are discussed with reference to the concept of the dreaming. The term *dreaming* is an English way of describing the era of creation in indigenous Australian belief when great ancestral beings walked the earth, experiencing, interacting and creating landscape and life. A senior Yanyuwa man from the Aboriginal community at Borroloola in the southwest Gulf of Carpentaria of the Northern Territory explains the dreaming in the following way:

In our language, in Yanyuwa, we call the Dreaming Yijan. The Dreamings made our Law or narnu-Yuwa. This Law is the way we live, our rules. This Law is our ceremonies, our songs, our stories; all of these things come from the Dreaming. . . . The Law was made by the Dreamings many, many years ago and given to our ancestors and they gave it to us. . . . The Dreamings were the first to dance our ceremonies and sing our songs. Some of these songs are dangerous, they are secret and sacred, women and children are not allowed to see them. Others are not secret, everyone can look at them, but they are still sacred. . . . The Dreamings named all of the country and the sea as they travelled, they named everything that they saw. The Dreamings gave us our songs. These songs are sacred and we call them kujika. These songs tell the story of the Dreaming as they travelled over the country, everything the Dreaming did is in the songs. . . . These songs are like maps, they tell us about the country, they are maps which we carry in our heads. (Mussolini Harvey, in Bradley, 1988, p. xi)

His words clearly illustrate the integral relationship of song to *Yijan*, or the dreaming, of song to country and place, of

music to religion and to an Aboriginal sense of spirit or spirituality in Yanyuwa culture. Indigenous Australian language and cultural groups show basic similarities in their understandings of the relationship between music and the dreaming, although each has its own unique and specific stories, language, and discourses of creation and ceremony linked to country and geographical region. For example, Pitjantjatjara-speaking peoples of the Western Desert region in Australia refer to the dreaming as *Tjukurrpa*. The diversity of indigenous understandings and performance of music and religion is enormous. For the purposes of this article, examples will be drawn from Yanyuwa culture to illustrate broader concepts of performance practice and religious belief.

Indigenous Australia has no equivalent term for “spirituality” or “religion” as it is used in English. There are, for example, a number of generic and specific terms that translate as “spirit being,” there are terms for the creative ancestral beings, and there are also terms that speak of one’s spirit having a source; but none of these terms is used to create a term that speaks of the spirit as it is used in spirituality and as such must be used with trepidation (Rose, 1992, p. 59). The words *spiritual* and *spirit* are open to many interpretations. From a Western perspective such terms have their roots in Greek and Christian thought and imply a split between the secular material world and the realm of the spirit. This binary view subtly suggests that enactment of spirituality means leaving the everyday world of the body behind to enter into a separate and disembodied sacred or holy domain. For example, as we have discussed elsewhere (Bradley and Mackinlay, 2000, 2003), in the Yanyuwa context the boundaries between the sacred and the secular are necessarily blurred. For Yanyuwa there is only one world, one environment, one country that is simultaneously material and spiritual. The spiritual is tied to everyday lived reality and immersed in seemingly mundane pragmatic activities. Practices such as singing clearly establish an immutable relationship of what could be called the spirit of place to the spirit of people. Yanyuwa cosmology therefore allows the Western terms *spirit* and *spirituality* to be used in many circumstances but always tightly bound to the expression and performativity of people’s relationship to kin and country.

In many indigenous Australian cultures, a distinction is made between those phenomena, experiences, and knowledges that are considered restricted and unrestricted. These terms delineate who can access the knowledge and information contained within performance through participation. The term “restricted” refers to performance that limits the participants on the basis of gender, age, and/or kinship affiliation. In contrast, the term “unrestricted” denotes performance that does not have any conditions attached on who may participate. The Yanyuwa have two terms, *kurdukurdu* and *lhamarnda*, that could be seen as synonymous with the above terms and by extension with the Western terms “sacred” and “secular.” Yanyuwa people often explain *kurdukurdu* as a correlate to the terms “secret” and “sacred”

and therefore restricted, while *lhamarnda* is described as “free,” or not secret and sacred.

In many ways the Yanyuwa terms *kurdukurdu* and *lhamarnda* resonate with discussions of “inside” and “outside” knowledge in Yolngu culture by both Keen (1994) and Morphy (1991). While we do not want to suggest that Yanyuwa and Yolngu systems of knowledge are the same, it is useful to consider briefly the overlap between them and therefore contextualize Yanyuwa knowledge in relation to other indigenous Australian cultures. Morphy (1991, p. 78) asserts that the concepts of inside and outside in Yolngu culture operate as a continuum and are central to understanding the structure, rationale, and existence of levels of knowledge in Yolngu culture. He also describes “inside” sacred knowledge as “restricted” and “outside” mundane knowledge as “unrestricted” (1991, p. 79) and emphasizes that there is great fluidity between them insofar as “the ancestral world extends into the everyday world, the inside flows into the outside” (1991, p. 80).

Importantly, Morphy acknowledges that there is much interaction and interconnection between inside and outside realms and suggests that “outside forms are in a sense generated by inside forms and not separate from them.” This can generate, as Keen (1994, p. 226) contends, the performance and realization of inside concepts in outside spaces or “secrecy in public.” In such performances, the restricted esoteric “inside” knowledge has clear referents, but the subjects or their significance is not inferred discursively (1994, p. 227).

In most indigenous Australian cultures there is not one singular translatable word for music, and categorization of performance into styles and genres by people is determined according to a complex set of interrelationships between the origins of songs, the purposes they serve, and the people who may participate in performance (Bradley and Mackinlay, 2000, p. 2). Conversations about categories of music often begin with a distinction being made on the basis of whether the creative source of the music resides in ancestral or human beings. For example, in Yanyuwa culture songs from ancestral beings are described as *kujika*, belong to *kurdukurdu* (restricted) forms of performance, and have their basis in the actions of the Spirit ancestors who lived their lives by traveling, marking, and singing the landscape into being during the creative period, which the Yanyuwa call *Yijan* (generally translated into English as “dreaming”). Songs made by human beings (when composed by men, these songs are called *walaba*; by women, *a-kurija*) are *lhamarnda* (unrestricted) and contrast directly with the big history of the ancestral beings in that they document little history or individual and community memory of events within living recollection.

Knowledge of song, both restricted and unrestricted, is but one way people give order to their country and to their history of human and nonhuman kin. Such songs are ultimately concerned with attachment to place and contain many emotional dimensions. It is these emotional dimen-

sions that become the means by which groups of people and individuals are in constant negotiation with each other, for songs are not just free to anyone. All song and music in indigenous Australian performance traditions are bound by negotiations. These negotiations include the legitimacy of claims to knowledge and connections to place and people, to the past, to the present, and also to the future. Thus, even in relation to songs life becomes much more than the pragmatics of singing and performing, or even the often alluded to mystical/religious and historical conceptions; rather, it is about the union of all these things.

The songs of the dreaming ancestors are said by indigenous people to hold and carry the knowledge of the ancestral beings as they walked across the country, and each song verse becomes one footprint in the songline of that Spirit ancestor. In Aboriginal ceremony and ritual, performers aim to recreate the actions of the ancestors by tapping into the power of the dreaming through correct presentation of all the elements of the song cycle, including song text, melodic line, rhythmic pattern, and other ritual behavior such as the painting of body designs, the use of ceremonial objects, the preparation of and performance on ceremony ground, and the actions of performers. In Yanyuwa, song cycles are called by the generic term *kujika*, a word that has widespread use throughout the Gulf region and even into northeast Arnhem Land (Avery, 1985; Merlan, 1987; Trigger, 1992; Keen, 1994), and by its cognate form in the Victoria River region of the Northern Territory (Wild, 1987, Rose, 1992). When people sing a song cycle, they are described as *wandayarra* (following) or *yinbarraya* (singing) the road.

There is no one term for *kujika* verse in Yanyuwa; people use the Kriol term “leg,” a term also recorded by Merlan (1987). Singers or knowledgeable people reference the song verses by what the actual song verse is about; in many instances each song verse has a key word by which that verse is known. In addition, song verses are also tied to the landscape via named places. In Yanyuwa, *kujika* song texts are always described using the present participle form of the verb; thus, they are described as *jiwini ki-awarala* (constantly being in country), *wulumantharra* (running), *wingkayarra* (moving, going), or even in some instances as *wujbantharra* (flowing); when the singers near a place name or a particular species, it is described as *rdumatharra* (getting). The songs are also *windirrinjarra* (ascending) and *lhankanbayarra* (descending) and are always accompanied by a cardinal direction marker. When the song is nearing completion, it is then described as *yibarrantharra* (placing). There is a sense that these songlines are ever present on the country like flowing conduits of meaning. If the code is known, they can be tapped into and followed, and then voice is given to that which is always on or in the country and the sea.

Of importance to any understanding of music and religion in indigenous Australian cultures is the concept of “taste,” “skin,” or “essence.” In Yanyuwa the term for essence is *ngalki* (Kirton and Timothy, 1977). *Ngalki* is best de-

scribed as that thing which marks the individual identity or essence of something. It can refer to the taste or smell of food, one's own particular body smell, or the positioning of people, flora, fauna, and natural phenomena into the four semi-moieties that exist in Yanyuwa society. Broadly speaking, *ngalki* as a concept presents the Yanyuwa way of making sense of the complex relationship between the people who make music, the process of music making, and the sound that is music. In terms of musical structure, the *ngalki* of a particular song is often described by Yanyuwa people as the melody or voice. It also includes the type of beating accompaniment used, the particular types of rhythmic patterns attached to song text, the way these are fitted onto a specific melodic shape, and the way all three components are combined during the act of musical performance. Thus, the correct interlocking of all performance elements gives each Yanyuwa song style its unique identity, and it is through the act of performance that the embedded power within genres is given meaning, accessed, and utilized by performers.

When used in relation to song, the term *ngalki* is often prefixed by a descriptive marker that marks the perceived quality of the performance or a person's opinion of the tune that is associated with a song. Thus *yabi ngalki* (literally, "good essence") can refer to both a good performance or a song that is seen to have an enjoyable tune; *wardi ngalki* (literally, "bad essence"), to a song that is quite plainly not being well performed; *jirda ngalki* (literally, "bitter/bad-tasting essence"), to a song that is not being performed properly because the tune is incorrect or the singers are discordant; *da-burrdaburr ngalki* (literally, "rough/troubled essence"), to the tune of a song that is considered hard to learn and requires a long time spent with older accomplished singers. This is a term often used by men to describe a number of songs associated with various ceremonies and ritual actions. The term has a special relevance to songs that are considered powerful enough to affect other human beings or impact upon the order of the natural world and where the correct tune is considered to be the conveyer of the song's inherent power or *wirrimalaru*.

Within a Yanyuwa understanding of good performance, especially of *kujika*, a person who is seen to be performing song cycles at a high level of emotional engagement and technical skill is often described as *jarrilu-ngalkiwunjayarra*, "he is drinking the essence of the road." It is felt that he has embodied the song to such an extent that it is as if the country that is being sung is through him and sustaining him. It is interesting that song knowledge is described in terms of "food," where the ability to learn and acquire song knowledge, especially that relating to the sacred knowledge of the land, is something that ones needs, like food, in order to survive. This survival can be seen at both the level of the singer and the country itself; perhaps the inverse of this is that if one does not sing and refuses to "drink the essence," then both the individual and country will not be truly seen to live.

To know and to sing in Aboriginal culture is to also know and acknowledge kin and country, to be aware where

one fits in the family, the history of the family, and the country and sea that one's family has moved across and also calls home. While *kujika* may speak of how one belongs to land in terms of a cosmological understanding, there are the other more intimate, humanly composed songs that speak of the totally human dimension to experience. These songs are an excellent example of what Fox (1997, pp. 6–7) terms "social knowledge," a kind of knowledge that allows people constantly to comprehend, interact, and interpret their place-world. These songs are an important part of connectivity between people and place, and in many respects these songs are the containers that hold memories that connect people and places. This genre of new or unrestricted songs in Yanyuwa culture, and more generally across indigenous Australia, includes the diversity of contemporary rock and popular musics—these forms of performance too hold important individual, social, historical, emotional, and spiritual relationships, memories, and meanings. For example, the appearance of specific and nonspecific places, notions of place, and attachment to place (Dunbar-Hall, 1997, p. 62) within the song texts of these new songs plays an important role in naming, knowing, and remembering country in this unrestricted performance genre. This naming of places in unrestricted forms of Aboriginal performance resonates with the texts of restricted songs "[w]here singing about sites and events of the past associated with them are a means of affirming group and individual identity and of stating relationships to places. In this way, Aboriginal sites become songs" (Dunbar-Hall, 1997, p. 62). By specifically naming place in unrestricted singing, the composer reveals the personal, emotional, and spiritual significance implied in a particular locality.

Today, many indigenous Australian peoples and communities fight daily to survive against the contemporary realities of colonial and historical legacy, social upheaval, and cultural dispossession. Many indigenous communities suffer from high rates of family violence and alarmingly high alcohol and substance abuse statistics. Age expectancy is low for both men and women, and suicide among young people is increasing. Combined with increasingly poor health (for example, diabetes, renal failure, heart conditions, disease related to poor nutrition) and inadequate housing conditions, indigenous peoples are struggling to exist under the impact of dramatic social upheaval and change and Western systems of domination and oppression. Beneath these daily experiences of trauma, however, performance remains a powerful way to sustain a strong cultural and spiritual identity for Aboriginal people. Music is a religion in indigenous Australia in the sense that it is the central way to sing, know, and embody relationships to family, place, and spirituality. In the worldview of many indigenous Australian peoples, landscape and song are integrally related whereby knowledge and memories of landscape are named, encoded, and embodied in music performance. Through performance of place and country in restricted and unrestricted contexts, singers negotiate and evoke memory and emotion to continually create and re-create the knowledge associated with landscape and

what it means to be an Aboriginal person in body, mind, and spirit—a unified, complete, and whole person. Understandings of sacred and secular, inside and outside knowledge, and restricted and unrestricted performance are integrally connected and the lines of distinction between them blurred. Lived experience of song, kin, and country enacts a performative memory and knowledge of time, space, and location that connect spirit of place to the spirit of indigenous Australian peoples.

MUSIC: MUSIC AND RELIGION IN OCEANIA

The uttering of formulaic texts, the sounding of musical instruments, and the enactment of physical movements are all integral to the expression of religious beliefs throughout Oceania. The supernatural beings that were contacted varied widely in the extent of their powers and the nature of their physical embodiments, but much human activity was intended to open lines of contact with that other world. Music was not and is not a self-contained art, nor merely the vehicle for communication with the other world, but in many instances it is the means of opening such lines of communication, and it is intended both to express and to reveal. Singing at a predetermined location and appropriate time enables contact with beings somehow residing outside space and time. For participants, religious rituals exist primarily to be perpetuated. A personal understanding of the theological or mystical bases for rituals, or the meanings of song poetry, or the symbolism of their myriad of sacra, is secondary. Essentially, process takes precedence over product.

POLYNESIA. Accounts of the origins of the universe established the first associations between humans and gods. Rituals maintained such links through a body of sacred lore administered through both individual and group expressions of worship, supplication, instruction, and appeasement. Polynesian pantheons consist of named categories of supernatural beings and named individuals within those categories. Major deities—Tāne, Tū, Rongo, and Tangaroa in East Polynesia; Tangaloa and Maui in West Polynesia—were associated with land creation and elements of nature. References in oral tradition to such beings tended to be confined to spoken accounts or recited poetry. East Polynesia, particularly Tahiti and Hawai'i, saw the development of religious specialists in the form of an established priesthood, and religious buildings in the form of temples. The carvings on pre-European East Polynesian drums, particularly those beaten during temple-based rituals, often included representations of major deities. The priesthood also held responsibility for the many years of teaching chants and dances to neophytes. In the many and varied contexts of performance, the agent activating the human-superhuman link was the uttered word.

Mythology credits the importation of the first *pahu* temple drums and their associated sacred dances from Tahiti to Kauai Island, whence its use in *heiau* temples spread to Hawai'i's other islands. The primary use of this sharkskin-covered wooden drum was to signal major events within the temple, summoning gods to enter the precincts and to speak through its sound. It also accompanied sacred dances. On Tahiti itself, such a drum was used both for signaling and for accompanying religious rituals. In both areas, the drums were given personal names.

The areas of association and influence of minor deities included natural events, local topography, and specific domestic activities. Such beings were considered contactable during periods of heightened emotion, particularly at moments of danger, such as illness and warfare. In Samoa, peo-

ple of two villages used a song to summon the deadly Nifoloa to avenge any major insult to local residents. In another village the locally based god Te'e was appeased through a song in its honor. To cure certain ailments, Samoan traditional healers may still resort to exorcism, singing their command to the malign spirit believed responsible to leave the patient's body.

Throughout East Polynesia, minor gods were routinely contacted to ensure ongoing maintenance of the normally benign social relationship with local communities. In this context, the gods were held to share human pleasure in the performing arts, most notably singing and dancing, together with the sight and fragrance of costumed and perfumed bodies in action. The practice of performance as god appeasement was most developed in Hawai'i, where Pele and Laka were considered divine patrons of dancing. Much song poetry was dedicated to these beings—and still is, as part of the ongoing renaissance of Hawaiian culture. Whether invisible or existing in emblematic form, the gods were believed to be present during performances. The religious goal of hula performances was additionally based on a belief in sympathetic magic. By presenting an act in the context of dance, one gains power over it. One can thus govern the outcome of a future act or cause a past act to happen again.

The elevated nature of such expressive arts was emphasized by a corresponding expectation of performance perfection. If such perfection was not achieved due to accidental error, the result was held to be personal disaster. The accidental omission of a word in an incantation performed at the birth of the Maori mythological character Maui resulted ultimately in his death and failure to win immortality for humanity. Avoidance of breath breaks in the melodic flow was a feature of traditional Maori incantations and group chant on the grounds that the consequences were death or disaster. A system in which the group leader, having snatched an early breath, continued singing wordlessly at the ends of poetic lines while the group took breath overcame such concern.

In some regions ancient song poetry addressing gods survived Christian missionizing through prompt transcription, but it exists now more as an artifact of culture than an instrument of religion. In Tokelau, a handful of songs referring to the supreme god Tui Tokelau are now sung at festivals as affirmations of corporate ethnicity, and on Niue a song addressing the god of the ocean, Tagaroa, is routinely featured in cultural displays and competitions. The revival in the 1970s of oceangoing voyaging in reconstructions of traditional East Polynesian canoes stimulated a return of interest in associated rituals and performance styles. A convergence of such canoes at the sacred Tahitian site of Taputapu-atea in 1995 signaled the formal reconnection of ancestral relationships among several Polynesian island groups. The renewed interest in cultural activities, also began in the 1970s in Hawai'i, French Polynesia, and New Zealand—possibly influenced by the newly established South Pacific Arts Festival—has seen the incorporation into public performances of

various reconstructions of practices associated with indigenous religion. In Hawai'i, the construction and use of *pahu* drums, revived performances of chants and dances honoring named gods, and the performance of chants at the opening of the state legislature and other major public events all testify to the renaissance. Recitation of *karakia* incantations to national gods is a routine feature of major Maori activities, such as the openings of new public buildings and museum exhibitions.

In several parts of urban Polynesia, an ironic shift in attitudes has recently occurred. In the nineteenth and twentieth centuries, Christian missionaries strove hard and successfully to ban many performances of dancing on the grounds that the activity was heathen. Now, however, among both island homeland and expatriate communities of Polynesians, Christian churches may include dance tuition among their cultural programs and even numerically dominate competitions of traditional dance at local and national levels.

Although details of most Polynesian religions are now recounted in the past tense following almost two hundred years of intensive and successful Christian missionizing, a few Polynesian-populated outlier islands in Melanesia have attempted to maintain their indigenous practices in a reaction against what they consider the culturally damaging activities of missionaries and Christian churches. Communities on the islands of Takū (Mortlock Islands), Nukumanu (Tasman Islands), and Mungiki (Bellona Island) have participated in such a movement. Although some activities are now restricted to some extent by national legislation, others flourish. On these small, fragile, and remote islands, ongoing supernatural assistance is considered a survival necessity for which the formal performance of a variety of songs and dances is offered as a gesture of gratitude. Men may call on their dead ancestors while fishing, and, in the poetry of songs composed to mark their subsequent success, duly name their ancestors and acknowledge their supernatural assistance. In preparation for formal dances on the ritual arena, both men and women may wear emblems of their clan's founding ancestor as protection against the malevolent spirits believed to be in attendance during the performance. Also on the ritual arena in front of the assembled community, senior men take turns to intone long invocations to clan spirits and ancestors in order both to ensure continuation of clement weather and bountiful fish stocks, and also to avert crop diseases. The poetry of such invocations tends to be fixed by tradition and contains semantically dense language.

MICRONESIA. Preliminary findings from the few published studies of Micronesian religion indicate that religious activities incorporating singing (with or without dancing) tend to focus on village or matrilineal efforts to ensure the maintenance of personal health, food production, and travelers' safety. The Micronesian pantheon contains no recognized paramount individual. Typical group religious activities have a patron god possessing limited geographical authority. Shamans sing to establish contact with such beings and to obtain

advice and admonition, using incantations to lay a mantle of divine protection over hazardous occupations. At shrines, priests lead performances of humanly or divinely composed songs and dances to entertain a village or district god whose reaction in turn is conveyed by the priests.

ISLAND MELANESIA. Diversity features strongly among the many religious practices of Island Melanesia, where speech rather than song tends to be the chief medium of communication with the supernatural realm. Both here and in Papua New Guinea there is no sharp distinction between religion and magic. Human ancestors function not only as genealogical markers of the historical past but also as points of supportive contact for living descendants. Musical performances are featured in ancestor worship rituals in the Solomon Islands, New Caledonia, and Vanuatu. Dances and songs assist families of the recent dead to ensure that the physical severance occurring at death is accompanied by the spirit's enduring departure from the region, since a lingering presence can be mischievous. By contrast, in other regions the ability of the recent dead to maintain useful and essentially benign contact with the world of the living is ritually emphasized as elderly relatives sing in imitation of spirit voices while living descendants dance.

In contrast to Polynesia, specific sound quality itself may assume religious significance in both Island Melanesia and Papua New Guinea. Blasts from conch trumpets may be believed to expel unwanted spirits at a funeral or to represent actual spirit voices. It is a widespread belief that the ghost of a local person influences local affairs, causing or curing sickness, prophesying, and controlling the weather and crops. In regions where male initiation still assumes cultural significance, the real origin of the sounds of conches and flutes is initially kept secret from initiates (who are told that they are hearing spirit voices) and only later revealed as sound-producing devices. Until the mid-twentieth century, secret societies flourished in Vanuatu, where men (and sometimes women) achieved social elevation through competitive grade-taking that culminated in large-scale performances of song and dance.

Until it was sanitized by missionaries to become primarily a social activity in New Caledonia, the round dance was the means of contacting ancestors at the culmination of the large-scale *pilou-pilou* ritual. Processing around a central pole that symbolized the material connection between the living and the dead, Kanak men and women believed themselves to be the very bodies of their own ancestors as they danced. Other Kanak men's dances are totemic, giving visual expression to an association with either a maternal or paternal clan. The totemic ancestors' world, characterized by black land, a rancid smell, and ashes, can be entered only by persons possessing those same features. Dancers therefore plaster themselves with layers of earth and ashes as part of an effort to acquire the ancestors' restorative powers. The totemic bonds between paternal and maternal clans may similarly be given visual expression through dancing.

PAPUA NEW GUINEA. Papua New Guinea represents a maze of sociocultural groups and extreme linguistic complexity. Published information on cultural practices is marginal for many regions and may be nonexistent for others. The following generalized comments are therefore necessarily tentative.

Much New Guinea music is associated with various types of revelation in the context of religious ritual. Religious experience and understanding are the intended results of enhanced sensation and heightened emotion, states that are frequently instigated and sustained by periods of singing and dancing. The sense of mystery may be additionally intensified by the use of lyrics that are ungrammatical, archaic, foreign, or even secret. Men's formal activities tend to be held inside communal longhouses over a period of several days and nights. In contrast with other regions of Oceania, one goal of religious activity here may be the invocation of benign spirits, who are invited to meet with the living and so strengthen them.

Sacred instrumental music tends to be valued more for its sonic qualities than its aesthetic content as such. Flutes and bull roarers are widely used to produce sounds understood by the uninitiated to be spirit voices. Only after their physical ordeal are the real sources revealed to male novices, but even then under pain of secrecy. Slit drums and bull roarers are prominent in this respect in New Britain and New Ireland. Slit drums and paired flutes predominate in the central Highlands, Papua Gulf, and Huon Gulf areas. The absence of finger holes on these end-blown or side-blown flutes from the Sepik and Highlands, whose unequal size represents male and female identities, allows only the fundamentals and selected harmonic pitches to be sounded. The so-called fanfare melodies produced result from a sharing between the two instruments of individual notes in the melodic line. Acoustic continuity is one goal of both the paired flutes and other sound-producing devices, fostering the illusion of a nonhuman source of the sounds. For a similar purpose of subterfuge, men may modify their voices by singing into empty containers such as gourds, bamboo, or conches. In some regions the handles of the hourglass-shaped drums that men carry to accompany their own dancing may be carved with ancestral figures or combine human and avian forms to emphasize mythological connections. Bird symbolism is also common for paired flutes and their repertoires, and is visually represented through men's knee-bending dance movements. Much ritual dancing is more participatory than presentational, constituting statements of entitlement intended for fellow participants rather than acts of entertainment intended for an audience.

Among the Kaluli of the Southern Highlands province, bird calls are simultaneously avian identifiers and talk from the dead, since birds are a frequent visible form of a spirit reflection. In particular, *gisalo* dance songs, whose tonal organization is identical to that of musical representations of the call of a fruit dove, are composed with the intention of moving a male audience to tears. Women's response to the men's

weeping is to break into song, thus creating a culturally activated cycle based on the belief that the *gisalo* performer is transformed into a bird during song and dance performance.

Ancestor appeasement through singing is widely practiced, using a limited repertoire of music that those ancestors themselves either composed or transmitted. Easing the passage of the human spirit from the human world is also a part of religious ritual life in the Trobriand Islands. Songs sung in what is believed to be the language of the dead describe in glowing and erotic terms the quality of life in the afterworld, thus facilitating the departure. These (and other related) activities confirm the spirit's retention after death of aesthetic preferences and values espoused during life.

Mythology frequently attributes the invention or discovery of specific musical instruments to women, who later yielded them to men. Men subsequently appropriated the instruments for themselves and continue to monopolize their use through stealth and deception in an apparent gesture of male self-enhancement. A prime focus of religious music in New Guinea and islands to the immediate east is the widespread practice of puberty rites, in which singing and dancing are integral to each stage of the rituals. In some regions the structure of male initiation rituals suggests the processes of menstruation, impregnation, gestation, and parturition, as men further attempt to obtain for themselves through ritual the female life-imparting capabilities denied to them in reality. In other areas the initiation ritual, together with its complex of songs and dances, may reflect and validate sex-role social structures.

SUMMARY. It is not possible to generalize in a temporal sense for all of Oceania, since continuation of religious beliefs and practices is no longer universal, largely as a result of Christian missionizing. Whereas Polynesia and Micronesia have favored the undisguised human voice in vocal contributions to religious ritual, Island Melanesia and Papua New Guinea seek to disguise it as being of nonhuman origin, furthering the notion of deception by restricting knowledge of the real source of instrumental sounds. In the one region, musical sound is an elevated and consciously refined form of the uttered word, and in the other it was and is a vocal means to an essentially nonmusical end. In much of Oceania, careful contact with the spirit realm was considered expedient, if not essential, for the achievement of essentially positive social outcomes.

Whether through family heads or specialists within the society, contact with a variety of supernatural beings was couched in terms of individuals whose personal identity was known and acknowledged in song poetry. Some activities were preemptive from a position of social balance and were intended to achieve ongoing physical and mental health, continued sexual attractiveness, and the availability of adequate food resources. By contrast, remedial activities such as healing and forceful victory over adversaries arose as a result of perceived social imbalance. In all such spheres of activity, whether by invocation or entertainment or supplication, the

gods' potentially benevolent powers were exploited and their potentially malevolent attributes avoided. And one major means by which peaceful and productive coexistence with the gods was managed was—and in some regions still is—through the performance of song and dance.

RICHARD M. MOYLE (2005)

MUSIC: MUSIC AND RELIGION IN MESOAMERICA

In Mesoamerica, multifaceted music cultures were characterized by an ancient substratum of shared function and meaning. Common to all cultures is the ritualization of both vocal and instrumental music, as well as dance practices. Many studies have dealt with pre-Hispanic musical traditions, starting with "Aztec Music" (1883) by Hilborne T. Cresson and "Altmexikanische Knochenrasseln" ("Bone-rattles of ancient Mexico," 1898), by Eduard Seler. However, only a few explicitly discuss the autochthonal understanding and underlying religious aspects of these traditions (Stanford, 1984; Stevenson, 1996).

METHODS. A rich volume of source material is available for research in the ancient music cultures of Mesoamerica. There are not only numerous preserved musical instruments, but also a large quantity of depictions in art showing ritual functions of music. Written documents from the early colonial period (sixteenth century and early seventeenth century) also provide enlightening information. Moreover, it is possible to make ethnomusicological comparisons on the basis of cultural continuities.

Archaeology. Archaeological information, such as the context of unearched sound artifacts, is of great importance, since it provides insight into invaluable information on the function and meaning of music in pre-Hispanic cultures in

precise chronological order. Depositing musical instruments into burials indicates a use in death cults, whereas using them as offerings in the fills of superimposed temple structures indicates a use by the cults practiced at these locations. Both cases reflect the concept of music in the spiritual realm. In this way the instruments, which possibly represented the personal property of the deceased, were taken with him or her into the world of the dead. Offerings such as those at the Aztec *Templo Mayor* in the Valley of Mexico (1325–1521 CE) represent cosmograms that reflect the notion of numinous spheres filled with specific sounds.

Music iconography. From an iconographic point of view, of interest are both the preserved musical instruments and other archaeological findings, such as figurines of musicians and figurative votive representations of musical instruments, particularly the representation of musicians and dancers in stone relief, mural and vase painting, and picture manuscripts. On the basis of these sources, specific functions of the instrumentary and the context of musical practices can be meticulously reconstructed. Sound scrolls or volutes provide a pictographic clue about instrumental music and recitative song, which attained the level of a complex, incompletely decrypted symbolism in Teotihuacán in the Mexican Highlands (c. 150 BCE–750 CE) (LaGamma, 1991). In Mesoamerica, volutes also symbolized scents, smoke, and precious liquids, such as water or blood, and in the depiction of offerings and sacrificial acts they stood for the connection with the spiritual world (Heyden, 1979; Houston and Taube, 2000).

Ethnohistory. The written sources from the early colonial period provide extensive insight into the musical traditions of Mesoamerica. Because Spanish missionaries mainly composed these sources, a critical interpretation is essential to avoid misinterpretations or disinformation. Valuable information is contained within the descriptions of indigenous musical practices with regard to ceremonial dances, processions, and temple rituals but also comes from traditional myths, in which musical instruments play an integral role (see section on Music in Aztec Myth, below). Dictionaries and bilingual chronicles also provide an important contribution to the understanding of autochthonous musical traditions. In addition to Aztec terminology, Mixtec and other terminologies point to a uniform concept of music in Mesoamerica (Stanford, 1966).

Ethnomusicology. Despite multilayered syncretism, certain musical practices of contemporary ethnic groups in Mexico and Guatemala contain pre-Hispanic elements. Thus, ethnomusicological studies can be highly informative. On the other hand, it should be pointed out that the process is increasingly more difficult the more distant the temporal, spatial, and cultural reference points are from one another. The problem becomes clear when looking at the function of wooden rasps among Mexican ethnic groups, such as the Tarahumara (Sierra Madre Occidental, Chihuahua), in comparison to the function of similar instruments made from

human thighbones by the Aztecs. While the wooden rasps are played on a wooden resonator and on the head of the sick person in a Tarahumara peyote ceremony (Deimel, 2000), bone rasps were played on a skull resonator in the Aztec death cult to help the deceased on his or her difficult journey into the underworld (Seler, 1898). The rasp, called *omichicahuaztli* (instrument for strengthening the bones) by the Aztecs, has maintained a magical function until the twenty-first century, though its culture-specific meanings must be clearly differentiated.

THE HISTORY OF MUSIC IN MESOAMERICA. Some percussion instruments (idiophones and membranophones) and wind instruments (aerophones) used in Mesoamerica are unique in the world with regard to their shape and technical functions. A historical survey shows that the music cultures of Mesoamerica reflected a more than three-thousand-year-old history prior to the Spanish conquest (Castellanos, 1970; Dultzin Dubín and Nava Gómez Tagle, 1984).

Archaic period (prior to 2500 BCE). It can be assumed that the knowledge of bone flutes was brought into the New World when America was first populated, as these instruments were already produced in the Old World during the Upper Palaeolithic Era (c. 40,000–10,000 BCE). Among the prehistoric musical instruments of Mesoamerica that were made by hunters and gatherers around 10,000 BCE are whistles from the toe bones of ungulates as well as ribs with simple perforations that were possibly used to produce calls (Schöndube, 1986, p. 91, photos 1–2). The ability to imitate specific sounds from the natural environment using the human breath with the aid of acoustical tools represented an effective medium of communication with the outside world with which the environment could be commanded and controlled—as with the imitation of animal calls for the hunt. Sound association must have played an increasingly larger role when making instruments that could produce sounds not present in nature. Among the first instruments in Mesoamerica that required sound association were percussion instruments, such as conch tinkles, bone rasps made from the shoulder blades of deer, and turtle shells that were struck with deer antlers, with which complex rhythms could be created.

Preclassic period (c. 2500 BCE–150 CE). Archaeological finds confirm that pre-Hispanic instrumentary was extensively expanded in the Preclassic period, during which the first large ceremonial centers were erected. Simultaneous with the first use of ceramics, sophisticated whistles and flutes were produced, which can hardly be differentiated from subsequent instruments (Martí, 1968). This suggests similar instruments made out of perishable materials, such as cane flutes, were already in existence centuries earlier. Shell trumpets are among the earliest burial findings of musical instruments in Tlatilco, Valley of Mexico, dated to around 1400–1200 BCE, revealing the existence of complex trade relations (García Moll et al., 1991, p. 220). They possibly assumed an important role as ceremonial signaling instruments

whose potent, vibrating sounds could be heard over long distances. In Tlatilco, spherical rattles made from ceramics that could have served as simple hand rattles were also unearthed (García Moll et al., 1991). As suggested by ceramic figurines, they were perhaps attached to the dancers' ritual clothing as row rattles (Feuchtwanger, 1980, p. 140, Figures 28–29). Other figurines show gourd rattles, tripod drums, and flute players (Feuchtwanger, 1980, p. 141, Fig. 32–36). These finds attest to the complexity that musical and dance practices had already attained in the Middle Preclassic period (c. 1200–300 BCE). Among the remarkable instruments that were produced in Tlatilco are whistling bottles, which function on the principle of air pressure against a whistle that is initiated by the movement of water within the axially shaken vase (Martí, 1968, pp. 110–119). Because the instruments seem to sound of their own accord, they must have been related to a particular ritual function with unknown implications. The production of flutes and whistles in the shape of birds and other animals, such as snakes, also suggests a specific cult use, as animals were seen as manifestations of supernatural beings and the instruments cannot always imitate the animal represented.

Mass findings of elaborately decorated shell trumpets in West Mexican shaft tombs, dated to the Late Preclassic period (300 BCE–150 CE), suggest that certain musical instruments became status symbols for high-ranked individuals (Furst, 1966; López Mestas Camberos and Ramos de la Vega, 1998). On the basis of West Mexican figurines that show musicians riding on drums, Peter T. Furst made the interpretation that drums served as vehicles with which the path into the spiritual world was taken (Furst, 1998, pp. 183–185). The high importance of rattles and wooden drums in shamanic practices, which continue in the twenty-first century in the ceremonies of various Mexican ethnic groups, can possibly be attributed to the creation of repetitive rhythmic structures to put the musicians, dancers, and singers into a trance. The high tone frequency of many ceramic wind instruments that lies in a sensitive hearing range and leads to interference effects when played simultaneously can also produce strong psychological effects (Both, 2002b). Among other techniques for selectively evoking altered states of consciousness are hyperventilation and ritual intoxication with highly psychoactive substances obtained from various plants associated with the deities of music (Wasson, 1980, pp. 56–78; Heyden, 1985, pp. 21–39).

Classic period (c. 150–750/900 CE). In the Classic period, in which many important cultures developed in Mesoamerica, the existing instrumentary was further expanded. The large quantity of musical instruments found in ceremonial centers and preserved depictions in mural and relief art show the important position attributed to ritual musical and dance practices. On the basis of the widely distributed production of various ceramic flutes and whistles, it can be seen that even smaller regional centers were characterized by their own unmistakable music. Several findings, including a large

find of ceramic flutes in a burial in Tres Zapotes, Veracruz, suggest the use of panpipes in the Early Classic period (Martí, 1968, pp. 95–106). The production of multi-tubular duct flutes, which reached a climax in Teotihuacán, suggests the development of complex scale systems (Martí, 1968, pp. 191–213). The use of slit-drums in the Early Classic period is suggested by findings of figurative votive representations in West Mexico and at Monte Albán, Oaxaca (Furst, 1998, p. 184, Fig. 23; Martí, 1970, p. 104, Fig. 88). The instruments initially exhibit a box shape with four feet, as indicated also by stone sculptures from the Mayan region (Castellanos, 1970, pp. 47–48, Figs. 7.B–8.A).

Also proven to have been used in the Classic period are ceramic trumpets and long tubular trumpets made out of vegetative material that were used for various occasions, such as battles, processions, and autosacrificial rites, according to the preserved depictions. In the mural paintings of Structure 1 in Bonampak, Chiapas (790 CE), there is a preserved mural of a Mayan court ceremony, in which musicians are depicted with tubular trumpets, turtle shells, a tripod drum, and gourd rattles. Shell trumpets were especially important, so much so that sanctuaries were erected for them. An example of this is the Temple of the Plumed Conches in Teotihuacán, dated to 200 CE (Bernal, 1963, photos 15–16, Lám 7). In the Jaguar Compound in Teotihuacán (c. 450–700 CE), mural paintings of forward-walking cats of prey playing shell trumpets were uncovered, which suggests a procession of jaguar impersonators (Fuente, 1996, vol. 1, pp. 115–119). Other murals in Teotihuacán show shell trumpets playing of their own accord and calling certain divine beings associated with the fertility cult (Séjourné, 1966, Fig. 142; Kubler, 1967, Fig. 5). In Teotihuacán the ceremonial instrument was decorated with the iridescent tail plumes of the quetzal bird, and mouthpieces were attached that possibly consisted of circular ear spools. Also in the Mayan region, organological modifications were made to shell trumpets, with the perforation of up to two finger holes. The instruments were possibly deified both in Teotihuacán and in the Maya culture and were closely related to the fertility cult, sacrificial practices, and the underworld. Unusual instruments that were perhaps also associated with the underworld are huge bone rasps made from whale ribs, which were discovered in an offering at Monte Albán (Caso et al., 1967, p. 103, Figs. 70–71). Even if the conceptual implications of the instruments cannot be determined with absolute certainty, it can be assumed that whale bones were considered to be the remains of gigantic beings from bygone eras, such as the bones of mammoths and other prehistoric animals.

Postclassic period (900–1521 CE). In Postclassic Mesoamerica the ancient concepts were further developed. The instrumentary was expanded with bells and metal discs that could have served as gongs (Flores Dorantes, 1979). Bells made out of copper alloys and gold were found in the Sacred Cenote at Chichén Itzá, Yucatán (750/900–1200 CE) and in the tombs reused by Zapotecs and Mixtecs at Monte Albán

(900–1400 CE). Fine metallic sounds became an expression of stately power (Hosler, 1994).

Aztec music culture finally developed in the Late Postclassic period (1325–1521 CE). Rattle sticks became important instruments and were attributed with a magical function in cults dedicated to rain, water, and mountain gods (Neumann, 1976, pp. 247–248). The preserved slit-drums, which either exhibited an elaborately decorated box shape or zoomorphic and anthropomorphic shapes, suggest high craftsmanship in the production of wooden drums (Castañeda and Mendoza, 1933). On the famous tripod drum from Malinalco, the “four-movement” (*nahui ollin*) sign for the fifth world era and a representation of the deity of music Xochipilli (Flower Prince) in a bird costume are depicted. The drum is additionally ornamented with Aztec war imagery, such as dancing jaguars and eagles as well as volutes in the form of the *atl-tlachinolli* sign, the metaphor for war (Seler, 1904). A stone representation of a slit-drum to scale, on the other hand, shows Macuilxochitl (Five Flower), a deity of music closely related to Xochipilli. The imagery of his eyes is noteworthy, into which the palms of two hands are incorporated, as are the flowers surrounding the mouth, a metaphor for music and sacrifice. In addition, jaguar pelts are represented on the sides of the drum, thus indicating the existence of a hybrid instrument consisting of a slit-drum and a double-sided cylindrical drum, which could have been played by two priests simultaneously.

In the excavations of the previous Aztec temple precinct of Tenochtitlán in the center of Mexico City, many musical instruments were unearthed, such as metal bells, conch tinkles, ceramic flutes, shell trumpets, fragments of shell trumpets, and incense ladles with rattles built into the handles (López Luján, 1993). The context of the findings provides highly informative data about ritual music practiced in the temple cult of the Aztecs and reflects the association of specific sounds with the aquatic underworld or the paradisiacal spheres of the rain god Tlaloc.

In several shrines called the Red Temples, the Aztec deities of music and musical instruments were honored in the form of figurative votive representations (Olmedo Vera, 2002). In a court east of the Templo Mayor, the monumental representation of a shell trumpet was found next to an altar, from which it possibly was knocked down (Luna Erreguerena, 1982). The sculpture underscores the high position of the trumpet, because no other instrument was sculpted in a comparable size.

Written sources from the early colonial period suggest that in Late Postclassic Mesoamerica a differentiation was made between temple music practiced by specialized priests and court and palace music practiced by professional musicians (Both, 2001). It can be assumed that similar differentiations were made in earlier cultures. The priests responsible for the temple music of Tenochtitlán introduced the nightly sacrificial practices with shell trumpets in the *tlatlapitzaliztli* ritual, the “frequent sounding of wind instruments”

(Sahagún, 1997, p. 80). At midnight began the *tozohualiztli* ritual, the night watch of the drummers, which was connected with songs and astronomical observations from atop the temples (Sahagún, 1997, p. 80). The ritual human sacrifice was accompanied by shell trumpets and tripod drums (Sahagún, 1950–1982, vol. 3, bk. 2, p. 28). In a temple designated as “house of mist” (*ayauhcalli*), priests sounded shell trumpets and gongs during ritual cleansing (Sahagún, 1950–1982, vol. 3, bk. 2, p. 77). Ritual music was also practiced by women, who played slit-drums or rattle sticks as representatives of female deities and appeared as temple singers and dancers in various ceremonies.

While the priest-musicians lived in the temple precinct of Tenochtitlán, the professional musicians formed a group that resided at the court. They were responsible for providing music in the ruler’s palace and for large ceremonial dances in the temple precinct, in which cult activities such as ritual human sacrifices were interwoven (Both, 2001). From the depiction of circle dances in picture manuscripts, it can be seen that dancers often carried gourd rattles decorated with feathers, whereas the drummers were positioned in the center of the dancers (Martí and Prokosch Kurath, 1964). In addition, there are reports of music by trumpets, pipes, and portable drums during battles, which served as distraction noise for surprise attacks and for giving signals (Moreno, 1961). It is unclear whether priests or court musicians were responsible for the noise, or whether there was a third group of specialized musicians among the eagle and jaguar warriors.

MUSIC IN AZTEC MYTH. In the Aztec cosmogony some key information shines light on the ritual function and meaning of musical instruments in Mesoamerica. The Legend of the Suns tells of the origin of the shell trumpet while discussing the creation of humankind (Johansson, 1997). At the beginning of the fifth world era the divine creator Quetzalcoatl (Feathered Snake) travels down into the underworld into the kingdom of the ruler of the dead, Mictlantecuhtli. Quetzalcoatl is supposed to procure the bones of the beings of foregone eras, which is to be ground up and mingled with the sacrificed blood of deities to create humankind. In order to be allowed to take the bones, Quetzalcoatl is to blow on the shell of the ruler of the underworld four times and turn to the four corners of the world when doing so. However, Quetzalcoatl must first create the shell trumpet by removing the tip of the spire of the shell thus producing the embouchure. Quetzalcoatl accomplishes what seems impossible through his magical powers with the aide of caterpillars and black bees, which bore a channel into the shell. After Quetzalcoatl performs the shell trumpet ritual, Mictlantecuhtli must let his opponent leave with the bones.

Noteworthy about this myth is that the creation of humankind was announced in the underworld with the shell trumpet, and thus tremendous creative potential is attributed to its sound. As a wind instrument with a spiral-shaped channel, the trumpet was closely related to the magical powers of Quetzalcoatl (Corona Núñez, 1966). The myth addition-

ally provides an explanation for why musical instruments had to be played four times facing the four corners of the world to guarantee the effectiveness of a ritual. This musical practice was paraphrased with a metaphor that can be translated as “carry something [i.e., the musical instrument or the sound] four times in all directions around the precious circular greenstone [i.e., the center of the world]” (*nauhpa xictlayahualochti in chalchiuhteyahualco*). It is important to ascertain that numerical symbolism and musical directionalism, even in conjunction with other instruments, such as in the flute ritual of the deity Tezcatlipoca (Smoking Mirror), played an important role (Both, 2002a).

Another myth that has been handed down in two versions explains the history of the origins of the tripod drum (*huehuetl*) and the slit-drum (*teponaztlí*) (Ceballos Novelo, 1956). At a time when music still did not exist on the earth, the instruments lived as singers at the court of the sun; one had three feet and the other had large ears. To give humans the ability to conduct ceremonies and thus connect with the deities, a representative of Tezcatlipoca in one version and the wind god Ehecatl in the other takes up the journey to the sun with ritual songs to induce the singers to manifest themselves as drums on earth. For this purpose they call up whales and turtles that form a bridge over the ocean to the sun. The sun forbids the singers to hear the song, but it is so powerful that they are enticed to come to earth.

In this myth the drums are described as divine creatures that originate from the sun. Based on the imagery on preserved instruments, these beings could have been Xochipilli and Macuilxochitl. It is therefore assumed that drums represented sounding idols—“vessels” in which the respective deities resided during the ritual. In this regard, music was possibly seen as the ritual voices of divine beings. This principle is still present in the twenty-first century in ethnic groups in Mexico. Thus, the deified ceramic drums of the Maya-Lacandón (Selva Lacandona, Chiapas) exhibit sounding holes that are so situated that the sound emanates from behind the effigy of the deity K’ayom (Ochoa Cabrera et al., 1998, p. 70), and the holes situated in the body of the tripod drum of the Huichol (Sierra Madre Occidental, Nayarit und Jalisco) are considered to be the mouth of the deity T’epu (Berrin, 1978, pp. 180–181). In Mesoamerica this concept was also extended to other instruments, in particular ceramic flutes (Both, 2002a). According to ethnohistorical sources, Tezcatlipoca spoke through the flute to announce his will (Sahagún, 1950–1982, vol. 7, bk. 6, p. 50).

In Mesoamerica, musicians assumed the position of expert mediators. They established a form of communication with the spiritual world that helped the voices of the gods to be heard, and they were therefore attributed high reverence. The autochthonal understanding also explains the high degree of formalization of musical practices, which looked back upon a three-thousand-year varied history at the time of the Spanish Conquest. Even shortly after the Conquest, Spanish missionaries prohibited their practice because it represented an integral component of religious activities.

MUSIC: MUSIC AND RELIGION IN SOUTH AMERICA

South America is a remarkably musical and religious continent. All of its countries show vigorous popular and indigenous traditions, which have music and dance as its core. Catholicism is the predominant official religion in all of South America, but the continental religious scenarios are diverse and constantly changing, especially with the recent growth of evangelical churches and with the development of many alternative religions, most of them derived from local and syncretic practices. One common trait in the majority of these South American religious practices is the role of music in religiosity in communicating with spiritual beings.

The centrality of music in South American sacred rituals has been indicated not only by ethnological and ethnohistorical research, but also by archeological evidences of pre-

Columbian musical instruments. During the last decades, the knowledge about South American pre-Columbian societies has changed the vision of these groups as simple survivals of Andean complex societies. According to recent archeological research, the settlements around the Amazon River were densely inhabited complex societies, organized in agricultural chieftains with intense ritual life. These findings will change the perceptions of Amazonian societies of the past and also of their music. In Brazil, due to climatic conditions and to the fact that most of the musical instruments were made of perishable materials, few archeological evidences have been found until now. One exception is the deer bone flute found at the Northeastern Zona da Mata's Madre do Brejo site, estimated to be two thousand years old. On the other hand, from the Andes and the Pacific coast there are several archeological records of musical instruments such as pottery rattles, metal cymbals, stone and pottery horns and flutes, and leather and wood membranophones.

Rich ethnographical material comes from the writings of the first voyagers who visited South America during the sixteenth and seventeenth centuries. One example is Jean de Léry's description of the religious musical rituals of the Tupi Indians of the Brazilian coast, considered to be the first ethnomusicological account. Voyagers who crossed the continent from the Brazilian coast to Peru through a pre-colonial path named Peabiru provided descriptions of the Guarani Indians' large religious festivals. There are accounts of such musical rituals in various South American lowlands societies, and archeological research reinforces these descriptions with the discovery of enormous pottery vessels used in drinking rituals.

Since the beginning of the invasion of South America by European peoples, missionaries made a systematic and strategic effort to convert indigenous societies to Christianity, trying to make them abandon their beliefs and native cults. The procedures of the missionaries were sometimes violent, involving even the destruction of musical instruments and the demonization of certain music repertoires. European Church music was largely used for this goal, including translation of Christian texts into native languages. Music was largely used to attract indigenous peoples to the missions. A remarkable example of the dimension of these missions is the so-called Sete Povos das Missões (Missions' seven peoples), a conglomerate of Jesuit missions founded in the region of southern Brazil and northern Argentina in the seventeenth century. In these *reduções* (reductions, as those missions are called), hundreds of Indians were taught to construct and play European early Baroque music. At the end of the seventeenth century, Sepp, a Jesuit missionary especially dedicated to musical activities, wrote a letter in which he reported that music was played daily by the Indian musicians at mass and that if all those musicians were assembled, they would amount to 3,000 people. This strategy was largely employed in South America in general.

During the Brazilian colonial period (1500–1822), large populations of people were brought from western Africa to

work as slaves. The religious practices of these people and their Afro-American descendents are very musical, and this religious musicality influenced much of Brazilian contemporary music and culture. Much historical data about the Afro-Brazilian religious and musical practices was preserved. In contrast, in Peru, the music of African descendents was ignored and emphasis was placed upon the Indigenous musical heritage. However, both cases show that the Colonial period was crucial in the construction of South American popular religiosity. The colonial heritage is usually analysed through the idea of syncretism in all South American popular celebrations, many of them part of the Catholic calendar, though there are notable regional differences.

Many popular contemporary Brazilian festivals have dance and music as their central axis. For example, there is the Festa do Divino Espírito Santo (Holy Spirit's Feast), which occurs seven weeks after Easter, in which several musical genres are represented, such as *congadas* and *catiras*. During this ritual, a group of singers visits a villager's house asking for donations. Between Christmas and January 6, hundreds of cities in Brazil celebrate the Folia de Reis (Companies of Kings), their songs recalling the Three Kings' journey to welcome the baby Jesus. Musicians playing *viola* (five-stringed guitar), *pandeiro* (tambourine) and *cavaquinho* (four-stringed mandolin-like guitar) accompany the singers. During the Festas Juninas (June Festivals), which celebrate Saint Peter, Saint Anthony and Saint John, the musical genre played the most is *forró*, which originated in northeastern Brazil and is usually played by a trio of accordionist-singers, a triangle player, and a *zabumba* player (the *zabumba* is a sort of bass drum).

If Brazilian popular religiosity expresses itself through musical practices, one may say the same happens in all of South America, considering its common cultural heritage from the indigenous peoples and the colonizers and immigrants from Europe. Other examples are the Señor de los temblores (Cuzco, Peru), the Señor de los Milagros (Lima, Peru) and the *Cuasimodo* (Chile), this last example a religious procession that takes place on the Sunday after Easter. There is great variability concerning the musical instruments employed and their repertoires.

In Peru, Catholic and agricultural popular festivals are the center of community life in Andean villages like Conima, where they occur at least once a month. In the rituals of *t'inika* and *ch'alla*, Aymara Peruvians worship local deities and also sacred places, such as certain rivers that are conceived as animate and powerful. The maker of the musical instruments is a community member who is considered to be the owner of esoteric knowledge. Recent investigations of similar rites have identified symbols of Indian identity and subversion codified in music, choreography and mask styles.

Since the second half of the twentieth century, ethnological research has shown that shamanism constitutes not only a curing system but a fundamentally religious practice, facilitating the interaction between humans and supernatural

beings. South American lowlands indigenous societies' worldviews reveal simultaneously a deep religious sense and a musical hearing of the world. In all these peoples, there is a central role of the shaman both as curer and mediator between human and spiritual beings. The connection between mythic beliefs and everyday life makes it possible to think of these cosmologies as native systems of thought about the universe, or, in other words, as religions.

The indigenous peoples who live in central Brazil's Upper Xingu Park believe their cosmos is populated by spiritual beings that severely interfere in human lives. They are monstrous invisible spirits, related to certain animals, plants, and other natural beings, and can only be seen by the shaman through his tobacco-induced trance. For the Xinguanos, all human sicknesses originate from these spirits' actions on the body, into which they throw an invisible object in order to provoke sickness and death and steal the precious human souls. The cure of a sick person is highly related to the aesthetic dimension in such a way that the restoration of health may be equated with the restoration of the original condition of beauty. A ritual must be performed in which the music of the specific spirit causing the sickness is played. All native music belongs to these spirits, and it is played in curing rituals in order to please the spirits and to transform them from the sick person's enemy to his life-enduring ally.

The Guarani compose one of the largest indigenous societies of South America, the total population amounting to about 150,000 people living in Paraguay, Bolivia, Brazil, Argentina and Uruguay. After more than five hundred years of contact with European colonizers, of submission to forced labor by Portuguese and Spanish invaders and of threats to eradicate their religious beliefs by Jesuit missionaries, the Guarani continue to speak their language and perform their music in daily rituals. In daily shamanistic rituals, as the Sun, the creator hero, sets in the horizon, the Guarani sing, play and dance, for music is the path to reach the divinities. The communication with the spiritual beings is a means for the Guarani to express their orphaned state, for their ancestors were abandoned by the Gods as they left this earth. Guarani rituals serve to ward off sadness and exercise the body, and at the same time serve to care for the health of the entire earth. The Kaiowa Guarani use maraca rattles and rhythmic sticks, and the Mbyá Guarani use also guitar, fiddle and drum. The Chiriguano Guarani from Bolivia, adorned with leather or wooden masks, play the *quena* flute during the extended festival calendar. The Mbyá use of guitar and violin is an example of how musical instruments introduced by the European colonizers in the early years of contact were appropriated by the Indians into their native mythology. As early as the seventeenth century, a dictionary of Guarani language, elaborated by the Jesuits, presents a definition of *mbaraka* that includes, beside the rattle, string instruments such as the guitar and fiddle. Currently the Guarani in southeastern Brazil and Argentina use in their rituals a five-stringed guitar that is tuned in a special way.

All indigenous rituals show a central role of music, and in fact they may be considered music rituals. At the same time, these ritual activities concern spiritual or supernatural beings, myths and mythic beliefs, or in other words, their cosmology. Ethnologists have been studying Amerindian cosmologies as essentially shamanic, arguing that the figure of the shaman centers all ritual and mythic thought, for he is the subject who can perceive different perspectives to the universe. Several ethnographies emphasize the shamanic practice as both healing and musical, such as the Shipibo-Conibo of the Peruvian Amazon, whose shamanic songs are transformed into invisible drawings that are printed on the patient's skin.

In the last few decades, South American indigenous societies have experienced the reinforcement of native identities and, at the same time, faced the increasing presence of various protestant churches in their villages. In this scenario, in which native cosmologies reveal both adaptation and appropriation of elements of these churches, the role of music remains strategic, as has been shown for the Wichí of Argentina.

In fact, since the 1990s there has been a noticeable growth of evangelic churches—especially the Pentacostal movement—throughout all South America. This growth parallels the retraction of Catholicism, even in Brazil, which is considered the largest Catholic country in the world. A reaction of the Catholic Church has been its so-called *Movimiento Carismático* (Charismatic Movement), which largely employs typically evangelic strategies directly related to music. In this sense, there is a stimulation of musical practices and an opening to a variety of musical genres, particularly those appreciated by the younger generations, such as rock and rap music. This is a model imported from North American protestant churches, widely adopted in Brazil and all South American countries. American black music, like gospel, has been a fundamental influence on this popularization of the evangelic music movement. The Catholic charismatic movement has been trying to adopt the use of popular music genres, but the church's conservative leadership does not approve of this modification. For example, the Vatican released a document ordering the return to the earlier mass ceremony, condemning the use of popular music.

In Brazilian culture, the official and the popular, as much as the religious and the superstitious, intermingle in such a way that there is a generative process that is constantly re-elaborated. Brazilian religiosity is a composite of distinct approaches to the sacred that is simultaneously inclusive and exclusive, moving towards syncretism. New religious centers develop alongside the official religions, creating an ever changing and growing religious field, especially among the poorest classes. A similar movement happens in Brazilian music in general, constantly and creatively transforming itself and generating new musical genres, as if religion and music constitute a means of expressing both the protest for the social condition and the meaning of existence. Recent

studies show that, instead of over-emphasizing the African components in South American black musical traditions, one should envision all the rich dialectics of these practices.

A famous example of Brazilian syncretism is Candomblé, an African American religion organized around the cult of African mythic ancestors called *orixás*, but also with reference to indigenous figures (the so-called *caboclas*) and to Catholic saints. The music of its cults, understood as a fundamental element of Candomblé, is the only means of getting in touch with these ancestor spirits through trance and possession. Candomblé cults have been growing in Argentina and Uruguay. In Uruguay, African descendent populations take to the streets of the capital, Montevideo, many times per year with their drum orchestras. These are rituals of renewing the cultural identity that are marked by a warrior ethos, all these meanings being generated through music.

In South American cities, young generations following the New Age movement of the eighties are still searching for new ways of developing their religiosity. Due to this, there has been an important growth of practitioners of oriental religions, like Buddhism. However, there is also a vigorous valorization of local and regional identities which points to more authentic local practices, for example, those that mix spirituality and the indigenous world. One example in this direction is the recent psychotropic plants-based religions, like União do Vegetal (Union of the Vegetal) and Santo Daime (Saint Daime), which largely use *ayahuasca* (*Banisteriopsis caapi*). The former religion has in its musical repertoire the master's *hinos* (hymns), which are sung for the purpose of teaching and leading the collective hallucinogenic experience. Santo Daime and União do Vegetal churches, as well as the practice of *mestizo* shamans and *vegetalistas* (vegetalists), have been spreading in many locations all over Brazil and neighboring countries, not only around the Amazonian villages from where they originated, but also in large cities. According to Peruvian Amazon *vegetalistas*, the power of curing and traveling through time and space is acquired through the memorization of magical melodies and songs called *icaros*. These songs are learned from plant, animal and stone spirits during dreams or visions.

In northeastern Brazil, the *toadas* and *cantigas* lead the religious rituals in which the participants drink a psychotropic plant called *Jurema*. Amongst indigenous peoples of this region, similar rituals are called *toré*. The *toré* rituals exhibit different configurations according to the group. During the drinking of *jurema*, the Xukurú Indians sing the *toré* songs accompanied by rattle and flutes made of plastic. In the African-indigenous ritual called *catimbó-jurema*, the singers are accompanied by drums. Both of these *jurema* drinking rituals reveal striking Catholic elements.

All the musical performances mentioned here, and others like Carnival, are expanding the connotations of the religious field to other social and political domains. Though they may not be seen by its agents as instruments to make politics, these rituals reinforce the bonds of social identity by

joining religious and ethnic symbols. Thus, many groups that have suffered social prejudice throughout their history recognize that their culture was preserved through the performance of their religious rituals, as the case of Brazilian north-eastern Indians, for whom these practices function today as an affirmation of their emerging ethnicity. This particular mixture of the ethnic and the religious is certainly a characteristic of the relationship between music and religion in South America.

ACÁCIO TADEU DE CAMARGO PIEDADE (2005)
DEISE LUCY OLIVEIRA MONTARDO (2005)

MUSIC: MUSIC AND RELIGION IN THE MIDDLE EAST

Highly developed musical cultures entirely devoted to religious worship flourished in ancient Mesopotamia and Egypt. Each was distinguished by a well-organized ritual, a rich hymnody, numerous musical instruments, and an estab-

lished musical theory. In Mesopotamia cuneiform texts, artworks, reliefs, plaques, and seals provide a wealth of information concerning the musical culture. In Egypt musical scenes frequently appear on the walls of tombs because the Egyptians believed that pictorial reproductions of domestic life secured a pleasurable existence in the other life. Few musical instruments have been excavated in Mesopotamia, but a great many have been found in Egypt, where the aridity of the desert has preserved them from decomposition.

Despite the great variety of cultures in the region, the general approach to sacred music, its nature, function, and meaning, was imbued with a spirit of unity. The music has been characterized as normative and refined, and as giving primacy to such diverse performing styles as singing to a solo instrumental accompaniment, performing with an instrumental group, dancing, and other ritual gestures. Performances were confined to a distinct class of well-trained male and female musicians and dancers.

It is tempting to conclude that this music lacked the freshness, spontaneity, and devotional expression characteristic of folk worship, yet despite its refinement and professionalism it remained linked in many ways to its magical antecedents and the divine origins from which it drew its vitality. Being essentially associated with worship, sacred music served to honor the gods in the performance of the daily liturgy in temples and to accompany the traditional funeral rites and the annual festivals. The link between past and present and between humanity and the cosmos is evident in this music in many respects. Thus the Babylonian New Year festival symbolized the reduction of the primordial epoch to a scale of annual duration. This annual celebration of plant life and fertility has been associated with a wedding of the gods and with the epic of the creation of the world, recited on the fourth day of the festival.

Both in Mesopotamia and Egypt, sacred music has been associated with divinities and celestial protectors. The head of Hathor, the Egyptian goddess of heaven, love, and sacred music, was usually surmounted by the sistrum. This shaken musical instrument, consisting of a handle and a frame with jingling crossbars, was used to accompany ritual ceremonies associated particularly with the goddess. The bull, a symbol of fertility and divine power, shown frequently in the gigantic Assyrian reliefs surmounted by a human head as a guardian against misfortune, was associated in the Ur period (2600–2350 BCE) with the lyre, whose sound box was modeled after the body of a bull. The lyre had a yoke-shaped frame consisting of two arms and a variable number of strings stretched over the frontal soundboard. In a later stylized form, only the bull's head remained as an embellishment. Three precious specimens of the instrument have been excavated at the royal cemetery in Ur.

Any attempt to figure out how this music sounded would be fruitless. It is true that the earliest form of musical writing was the cuneiform system used from the middle of the fourth millennium BCE by the Sumerians, Babylonians,

and Assyrians. However, the few written examples that have been deciphered in recent years do not alter the basic fact that sacred music of the ancient civilizations was oral by nature and conception and regarded as a priestly secret not to be divulged. Hence, like other musical traditions transmitted orally, it did not lend itself to a fixed definite version. However, regarding performance practices and particularly the numerous instruments and their functions researchers are on firmer ground.

Vocal music, which predominated, emphasized the religious texts through varying modes of expression, from a solemn recitation performed in a tense voice to a well-constructed song with instrumental accompaniment. Hymns were sung either by a solo performer or by a chorus in responsorial and alternating rendition. As with the superscriptions of the biblical psalms, Mesopotamian and Egyptian texts frequently included musical instructions whose meanings are still largely unknown. The most significant information concerns musical instruments and their ample usage in worship. They range from the rudimentary to the highly sophisticated. Among the simpler instruments, used mainly for ritual or apotropaic purposes in both Mesopotamia and Egypt, are various small clay or metal bells embellished with symbols of gods; clay rattles in the form of animals; clappers with animal heads or in the form of a human hand, found in Egypt; bronze cymbals of various sizes that can be struck in a vertical or horizontal movement and were used at sacrifices and funerals; and the sistrum.

Drums in various shapes and sizes were also used in worship, particularly in Babylonia where they attained great importance. A table of sacerdotal instructions from Erech, dating from the Seleucid period, gives precise details for making the sizable goblet-shaped drum *lilisu*, as well as a description of its ritual. Made of metal in the shape of a perfectly formed bull, this drum was prepared by means of a long ceremonial process accompanied by sacrifices, libations, and prayers. The instrument was used to raise lamentations of grief for the darkened moon and served as an object of worship in itself. The bronze trumpet made its first appearance in association with cult during the reign of Ramses II (1304–1237 BCE). Two trumpets, richly decorated with bells, were found in the tomb of Tutankhamen. Pipes were rather common in Egypt but rare in Mesopotamia where strings were preferred. The same is true of side-blown flutes, which appeared in the Old Kingdom (c. 3000–2200 BCE).

The richest and most highly developed category of instruments was that of the various harps and lyres. Harps appeared in two main types, one in which the body of the instrument forms an arch and the other in which the neck and body forms an angle. In both types the strings were either vertical or horizontal to the soundboard and were plucked either with or without a plectrum. The arched harp, the earlier type, first appeared in the Sumerian period. The vertical arched harp was most common in Egypt, where it is found in tombs of the Old Kingdom together with flutes and pipes.

The lyre arrived relatively late in Egypt, not earlier than the New Kingdom (c. 1569–1085 BCE).

MUSIC IN THE BIBLE. The Bible is the chief and richest source of information about music and musical activity in ancient Israel. It seems that in the earliest nomadic period and during desert travel music did not play a significant role in worship. However, the biblical texts provide many references to certain types of folk music used for various popular occasions of rejoicing, such as the celebration of the arrival of the sacred ark in Jerusalem (*2 Sm.* 6:5), the singing of the canticle of the sea, which marked the victory over the Egyptians (*Ex.* 15:20, 15:21), and the welcoming of a hero on his return from the battlefield by dancing and drum-playing women (*Jgs.* 11:34, *1 Sm.* 18:6–7). A magical character is associated with the various uses of the ram's horn, or *shofar*, the effects of which are depicted in relation to the theophany (*Ex.* 19:13–19, 20:18) and to the fall of Jericho (*Jos.* 6:6–20). Two references reveal the important role music played in ecstatic prophecies (*1 Sm.* 10:5, *2 Kgs.* 3:15). From the reproachful sayings of the prophets Isaiah and Amos concerning banquets and music, the existence may be inferred of a secular art music (*Is.* 5:12, *Am.* 6:5).

The bulk of biblical references concern sacred music associated with temple worship. This music was similar in many ways to the traditions mentioned above in its ceremonial aspect, organization, and performance practices. It also was confined to a distinct class of highly trained professional musicians, the Levites. The *Book of Psalms* contains many instructions regarding musical performance, as well as the names of the leaders who conducted the ensembles of singers and instrumentalists playing lyres, cymbals, rattles, clappers, and other instruments. However, this music excluded dance from worship and was exempted from all associations with deities or celestial protectors. As to the ultimate origin of music, the Bible ascribes its invention, in antediluvian times, to a human hero, Jubal “the father of them that play upon the harp and the organ” (*Gn.* 4:21). This statement occurs in a passage also naming other inventions including the products of bronze and iron.

MUSIC UNDER JEWISH AND MUSLIM RELIGIOUS AUTHORITIES. After the destruction of the Second Temple by the Romans (70 CE) and the dispersion of the Jewish people, the attitude toward music in worship underwent a significant change. Individual and communal intimate prayer replaced the Temple's ceremonial worship, and theologians became more and more involved in the revision of norms regarding the place and nature of music in the synagogue service. The first consequence of this new attitude was the total banishment of musical instruments except for the *shofar*.

The exclusion of instruments usually has been justified as being an aspect of ongoing mourning over the Temple's destruction. The reasoning involved in the long-lasting debate over the use of sophisticated musical forms in synagogue singing was of a rather ideological nature. It is interesting to note in this regard that the basic views expressed in the rab-

binical arguments, with reference to the scriptures, have much in common with those expounded by Muslim theologians very soon after the emergence of Islam (622 CE). In relation to *samāʿ* (Arabic for “hearing”; often also meaning the thing heard, for example, music) there developed a large polemical literature dealing with the question of the lawfulness of music from a theological point of view. The term *samāʿ* has been contrasted with *ghināʾ*, which means “singing,” and, by extension, secular art music. This identification led the authorities of both religions to assign the concept of music to secular entertainment music. The resulting frictions and conflicts with that flourishing urban music, echoed in the literature, have determined to a large extent the intransigence of those who oppose music.

Another argument found in this polemical literature concerns the respect for the holy texts and for their adequate rendition. Beautifully composed melodies with instrumental accompaniment and dancing were considered distractions that prevented the faithful from concentrating on the message in the text. Those having the most extreme form of this attitude considered music harmful, capable of affecting adversely the behavior and judgment of the hearer. Some authorities went so far as to attribute the origin of music to satanic forces and held that its direct influence on the listener’s soul was basically a temptation of the devil or a delusion.

A Jewish Midrashic exegesis of the biblical verse concerning the invention of musical instruments singled out the fact that the inventor, Jubal, belonged to the posterity of Cain. Cain’s descendants were plunged into amusements that combined music, adultery, and drinking of intoxicating liquors. This combination of music making and depravity was said to have incurred God’s wrath and thereby contributed to bringing about the flood. (See Louis Ginzberg, *The Legends of the Jews*, vol. 1, Philadelphia, 1956, pp. 116–118.) Some Muslim theologians, referring to this exegesis, actually included Satan among the inventors or promoters of music.

An interesting Arabic version of the origin of music, cited by several writers, attributes the invention of music to Jubal’s father, Lamech. It relates that Lamech, at an advanced age, lost his only son. In his grief he refused to be separated from the boy and hung his corpse in a tree so that he could be near him and see him. He later made a *ʿūd* (lute) from a leg of the corpse and sang laments to its accompaniment. Lamech’s invention and the lament corresponding to the first biblical song (*Gn.* 4:19) may refer to ideas concerning the making of a musical instrument out of human bones, thus suggesting the incorruptibility of the corpse, the rebirth of the defunct spirit, and the identification of that spirit with the sound of the instrument within which it continues to vibrate.

MUSIC AND THE MYSTICAL EXPERIENCE. The Jewish and Muslim mystical movements concerned themselves with various complex views regarding music, its role, effects, and origin. In qabbalistic literature all musical topics are interwoven

with a multitude of qabbalistic symbols that are correlated with the whole of creation. Islamic mysticism, or Sufism, which can be traced back to the eighth century, developed complex congregational ritual and spiritual exercises in which music and dance play a determinant role. A related system of symbolism has been elaborated in the appropriate literature.

As to the question of music’s origin, both Jewish and Muslim mystics advanced in different formulations the idea that music is neither monogenetic nor monovalent, that is, it oscillates between the divine and the satanic, the celestial and the terrestrial. The impact of music on the listener depends on the individual’s virtue as well as the degree of mystical cognition of God and his revelation. In its highest form the listening experience becomes entirely spiritual, according to the Spanish Muslim mystic Ibn al-ʿArabī (1165–1240). He claimed that this form of the listening experience consists of hearing with a spiritual ear the singing of all things in creation praising the glory of God, and in seizing and enjoying the significance of this. The role assigned to music as leading to knowledge and the constant repetition of music’s revelation through mystical intention indicates, according to the qabbalists, that music was God’s creation. He created it on the third day, making angels out of his own breath to sing his glory day and night. This highly spiritual function of music led the founder of the Mawlawīyah order, the poet Jalāl al-Dīn Rūmī (1207–1273), to declare: “There are many ways leading to God; I have chosen that of music and dance.”

The analogy between humankind and the universe and the sought-after resonance and harmony between them are frequent themes in mystical speculation. The music created by human beings is considered a pale reflection of the most exalted and perfect harmony embodied in the heavenly spheres. Therefore whoever sets out to learn to enjoy the pleasures of the celestial music will find that in order to do so he must first shake himself free of the defilement of matter and release himself from the shackles of this world. On the level of individual experience, music helps the devotee untie the knots that bind the soul to matter, allowing it to go beyond the barriers of its own personal existence. Indeed, human spirits, whose origin is the superior world, recall their homeland when hearing music. The ascent of the soul from its earthly existence to its divine home, which signifies redemption, has been symbolized in the mystical imagery of certain Šūfī orders by dance and movement. It is said that dance uproots the foot of the worshiper, transporting him to the summit of the world.

Qabbalah went further by introducing the idea that the power of human sacred music exerts an influence in the celestial realm. Thus humankind is a protagonist in the cosmic drama. It is said in this regard that everything done by the individual or the community in the mundane sphere is magically reflected in the upper region, that the impulse from below calls forth one from above. Hence the singing of

hymns on earth causes an immediate resonance in the upper spheres; by means of his mystical intention the devotee contributes to the establishment of perfect tuning and harmony between himself and the macrocosm. However, the ideal perfection, the harmony that signifies salvation, is hard to obtain. This is because the way leading to it is constantly obstructed by evil forces. Adam's fall and the interference of Satan have been the causes of the contamination of divine music and the disturbance of the original harmony. To overcome these obstacles and restore the original harmony, the realm of darkness must first be defeated. Sacred music and prayer directed by mystical intention are the most formidable weapons in the combat for salvation.

- Curt Sach's *The History of Musical Instruments* (New York, 1940) is an authoritative work on the history and morphology of instruments; it includes chapters on Mesopotamia, Egypt, and ancient Israel. Different forms of instruments are discussed in the following museum catalogs: R. D. Anderson's *Catalogue of Egyptian Antiquities in the British Museum*, vol. 3, *Musical Instruments* (London, 1976); Joan Rimmer's *Ancient Musical Instruments of Western Asia in the British Museum* (London, 1969); and Christiane Ziegler's *Catalogue des instruments de musique égyptiens du Musée du Louvre* (Paris, 1979).
- Important contributions to the study of different aspects of Mesopotamian music include Wilhelm Stauder's "Die Musik der Sumerer, Babylonier und Assyrer," in *Orientalische Musik*, in the series "Handbuch der Orientalistik," edited by Hans Hickman (Leiden, 1970), and the same author's article "Mesopotamia" in the *New Grove Dictionary of Music and Musicians*, edited by Stanley Sadie (London, 1980). Among the various studies dealing with music theory and notation, I recommend Anne Draffkorn Kilmer's "The Discovery of an Ancient Mesopotamian Theory of Music," *Proceedings of the American Philosophical Society* 115 (1971): 131–149, and Marcelle Duchesne-Guillemin's "Sur la restitution de la musique hourrite," *Revue de musicologie* 66 (1980): 5–26.
- For discussion of Egyptian music, see Hans Hickmann's *Quarante-cinq siècles de musique dans l'Égypte ancienne* (Paris, 1956). A good general survey on biblical music is Esther Gerson-Kiwi's "Musique," in *Dictionnaire de la Bible*, supp. vol. 5 (Paris, 1957), cols. 1411–1468. Recent specific studies are Bathja Bayer's "The Biblical 'Nebel,'" *Yuval* (Jerusalem) 1 (1968): 89–131, and "The Titles of the Psalms," *Yuval* 4 (1982): 29–123. The institution of synagogal music and its development are studied in depth in Eric Werner's *The Sacred Bridge*, 2 vols. (New York, 1959–1984). On the rabbinical attitude toward music, see Israel Adler's *La pratique musicale savante dans quelques communautés juives*, 2 vols. (Paris, 1966), and the same author's "Histoire de la musique religieuse juive," in *Encyclopédie des musiques sacrées*, edited by Jaques Porte, vol. 1 (Paris, 1968). The question concerning the ideological attitude of the Jewish religious authorities has been treated in my "Der Judaismus" in *Religiöse Autoritäten und Musik*, edited by Dorothea Baumann and Kurt Fischer (Kassel, 1984), pp. 67–83. For discussion of the story of La-

mech and Jubal, see my "The 'ūd and the Origin of Music," in *Studia Orientalia Memoriae D. H. Baneth Dedicata* (Jerusalem, 1979). The most important sources dealing with the lawfulness of samā' are analyzed in my *The Theory of Music in Arabic Writings (c. 900–1900)* (Munich, 1979).

AMNON SHILOAH (1987)

MUSIC: MUSIC AND RELIGION IN INDIA

Music has historically given unity to Indian society and civilization, often doing so in contrast to the discord among the dominant religions and multiple sects of South Asia. The symbolic meanings of music provide common musical substance and practice, and they are shared across sacred boundaries of many kinds. The religious and philosophical unity embodied through musical practice, therefore, has deep historical roots, which has meant that music and religion share many aspects of a common ontology. South Asian musical practices, moreover, have often mediated the conflicts between religions, responding to new possibilities for shared dialogue and intensifying worship. It is, therefore, virtually impossible to separate music from religion in India, for religious meaning, concrete and abstract, is present in South Asian music at every level.

Sound in its infinite varieties is of crucial importance to Indian religious thought. The universe itself is constituted of and by sound, and the omnipresence of sound envelops daily life. Hearing and listening to sound, therefore, are required of the individual to negotiate a path through life. Accordingly, the ontology of music depends on the physical perception of sound as a means of contemplation and worship. In Hinduism the primacy of hearing and listening for devotion is clearly evident in the term given to the foundational sacred scriptures, *śruti* (literally, "something that is heard"), which also refers to the fine divisions of pitch in Indian melodic modes, or *rāgas*. The aural perception of music also serves as the central ontology of music in Islam, in which the term *sama'* (both "hearing" and "listening") refers to music making and establishes the importance of aural perceptions, rather than sound production.

Just as the universe of sound is omnipresent, it is also dense, often even loud and cacophonous. The music of the Hindu temple, for example, is not limited to the sounds of instruments performing discrete pieces in a ritual performance. The general commotion of worshipers usually joins an instrumentarium consisting of percussion instruments of all kinds, as well as horns and woodwind instruments, fashioned to produce the loudest possible volume. The amplification of this sound universe is extreme throughout India, with loudspeakers broadcasting Hindu temple music into the streets or the Muslim *adhān*, or call-to-prayer, across the urban landscape. The density of sound is central to an epistemology of sacred experience through music. Sustaining the universe of sound is possible because of the multitude of musical experiences that channel devotion and join human be-

ings together in communal worship. That epistemology of sacred experience through music crosses religious, linguistic, and socioeconomic boundaries, providing some measure of unity, both real and idealized, to the subcontinent of India.

CORE CONCEPTS ABOUT THE RELATION OF MUSIC TO RELIGION.

Organized and articulated as music, sacred sound has the power to represent the order of the universe and by extension symbolically to sustain human existence. The metaphorical unity of music lies in the capacity to sustain a central pitch, the *ōm* of Hindu metaphysics, the drone of the Indian music. Like the *ōm*, a drone displays characteristics of centrality and unbrokenness. Both characteristics are evident in the most ancient musical practice of Brahmanic Hinduism, the performance of passages from the *Rgveda*, in which chanters sing melodies that surround and return to the symbolically central pitch, which itself is intoned to the syllable, *ōm*. Virtually every Indian musical practice has adapted the symbolic use of sound to articulate the order of the universe, concentrating it in the drone pitch, which is not only played without break by a drone-producing instrument (e.g., the *tambūra* in the classical traditions), but provides the pitch to which the percussion instruments are tuned. Around the drone pitch there is a constellation of pitches in the melodic modes, or *rāgas*, which focus on the drone through their melodic motion. Accordingly, the organization of the universe is symbolically present in virtually every manifestation of sound in Indian music, linking music and religion through shared traits of a common metaphysics.

The temporal organization of Indian music also expresses many fundamental aspects of South Asian religious and philosophical thought. Meter in Indian music relies extensively on cyclical patterns, and rhythm results from additive principles, rather than the division into smaller and smaller units found in Western musical theory. Meter, or *tāla*, unfolds as a hierarchy of patterns, smaller ones embedded in larger ones, which return again and again to the same point of beginning. Musical structure, therefore, does not result from a unidirectional teleology leading toward conclusion—that is, there is no forward movement, no development in the Western classical sense. The cyclical character of musical time reflects the aspects of life and history that are fundamental to Indian religions. The absence of a strict impulse toward a telos of ending reflects many aspects of soteriology in religious thought; that is, it mirrors beliefs in the continuation of both human and musical life in an afterlife. Many musical forms, as well as individual pieces and performances, can be extended through improvisation that reiterates and embellishes the basic cyclical units. In a more practical sense, the epistemological extension of the life of a musical piece can enhance devotion and contemplation; for example, the standard South Indian compositional form, *kṛitī*, revolves around texts which repeatedly enjoin the musician to reflect on the name of a god (and at times on the life-giving acts of the *kṛitī*'s composer).

Cyclical concepts of sacred time and the soteriological relation between birth and rebirth also influence the broader

patterns of music history in South Asia. Music does not change through radical innovation and growing complexity, but rather retains connections to musical principles that have constituted musical theory and thought since at least the eighth century CE. New traditions and new pieces enter Indian music history, but they do so not by displacing the old, but rather by expanding repertoires and musical ideas that already have a long historical presence. This is particularly evident in the retention of many aspects of Hinduism in the musical styles and practices of Muslim North India and Pakistan. The Hindu narratives that provide a representational template for *rāga*, for example, remain no less important in Hindustani music in the Muslim North, even when used for devotional purposes in Islam. Similarly, musical influences from the Middle East, especially from Persia, came to serve Indian musical ends in Mughal India, for example, in the shaping of the Hindustani instrumentarium (e.g., with the integration of the plucked-lute [*sitār*] and pair of drums [*tablā*] associated by some with the fourteenth-century Šūfī, Amīr Khusraw). The epistemological relatedness of musical and religious thought in India historically underlies many of the transformations described by the term *Indianization*.

Just as music is inseparable from most rituals in Indian religions, so too is ritual meaning densely present in much musical activity. Music has the potential to recalibrate the temporal and social components of ritual, transposing them from the everyday to the sacred world. In tribal societies, music making is highly ritualistic, accompanying virtually all seasonal and life-cycle events. Generally speaking, music is most efficacious during ritual when it enhances participation. Ritual music making, therefore, encourages congregational devotion and often accompanies processions and dance. Because certain types of music making are suspect in Muslim rituals, and because Brahmanic tradition suggests a preference for silence in certain Hindu rituals, such as funerals, the use of music in specific rituals can also dispel polemics against music itself. Musical performance, even in the classical tradition, would be unthinkable without the expressive presence of ritual. The choice of *rāga*, the order of genres, and the interaction of musicians from different castes and religions influence the performance itself and account for the ways in which musical and religious connections remain intact.

Religious difference in South Asia is represented by music and mediated, even ameliorated, through musical practice. Musical historiographies, both Indian and Western, divide Indian musical practices, including devotional music, between North and South. That division has both musical and religious distinctions. In the South, Hinduism plays the overwhelming role in determining sacred meaning and musical structure. In the North, Islam is critical for the shaping of music. Despite the musical divisions between North and South, the distinction between Muslim and Hindu ontologies can only be partial, for the musical borders between North and South, as well as between the religions and sectarian groups in all parts of India, have been very fluid.

A more accurate distinction, particularly from a musical perspective, might instead be based on the contrast between change that accommodates religious and social difference and that which more conservatively retains the hierarchical structure of older religious traditions, Hindu and non-Hindu. The tension between these two patterns of religious-social difference does not obey a strict division between North and South, Muslim and Hindu. Religious accommodation in northern India—for example, Vaiṣṇava movements in the Bengali-speaking regions—has led to sweeping changes in music, from the emergence of a new music culture among the mendicant Bauls in Bengal to the crucial presence of musical “houses,” or *gharānās*, with origins in Bengal, such as the Benares *gharānā* in which Ravi Shankar and Ali Akbar Khan are principal members.

Indian music and religion share a common distribution of specialist roles across a hierarchy. This hierarchy is most apparent in Hinduism, in which the most respected musical specialists—those who chant the Vedic hymns or play the *vīṇā*, the classical instrument with the highest status in Karṇāṭak (South Indian) art music—have traditionally been restricted to the Brāhman castes. In contrast, musicians with the lowest status in Karṇāṭak music, drummers who touch the skins of animals, or *paraiyars* (Tamil for “drum maker”), are literally low caste and figuratively outcasts. The sacred priesthood is in many ways interchangeable with the musical specialists of the classical instrumental tradition. In contrast, the nonspecialist sacred repertoires, such as *bhajans*, have the potential to level hierarchical differences, and thus create a common repertoire.

The distinction between musical specialization and everyday music making extends to the nature of the musical repertoires themselves and to their transmission. The religious priesthood and musical specialists perform from written traditions, most often in a “high” sacred language, such as Sanskrit. Nonspecialized traditions, however, are entirely oral, and the texts of songs or hymns constituting ritual and everyday repertoires are regional and vernacular. Though this tension between the classical and the quotidian subsided to some degree in the twentieth century, it remains one of the distinguishing characteristics of the ways in which music reflects the structure of South Asian religions.

Religious narrative inscribes meaning directly and indirectly on the structures of Indian music and musical instruments. Gods and goddesses, real and apocryphal saints, assume many and varied forms throughout the great epic cycles of Hinduism and the genealogies of Muslim shrines. The most frequently appearing musician-god in the Hindu epic *Mahābhārata* is Kṛṣṇa. Kṛṣṇa represents a constellation of divine attributes, among them divine love and beauty (*prema* and *rupa*), but even more important for his symbolic role in musical narrative are the many episodes in his life during which he is associated with *gopīs*, female cowherds, in a grouping that allegorically symbolizes the relation of the soul to god. That relation appears in countless images of Kṛṣṇa

playing the flute to the *gopīs*, in the myths that associate narratives with specific *rāgas*, and in iconography used to depict divine love.

The musical representation of Sarasvatī specifies the different mythological and narrative roles she plays as a Hindu goddess. In Hindu writings Sarasvatī represents an ontology of human understanding, *vidyā*, that allows the human to transcend the cycle of death and rebirth, and it is this ontology that she brings to the most fundamental of all Indian musical instruments, the *vīṇā*. So basic is the meaning of the *vīṇā* to Hinduism that its very physical shape, with a head and vocal cords that sing and a gourd body that resonates as the human body, is regarded as metaphysically human. To enhance Sarasvatī’s ability to effect *vidyā*, she appears frequently in the iconography appearing on *vīṇās* themselves. The *vīṇā* of Karṇāṭak classical music is, in fact, often referred to as the *sarasvatī vīṇā*.

The sacred music of South Asia maps place and identity in complex sacred geographies. Fundamental to the sacred geographies of all South Asian religions is the relation between centers and peripheries. Sacred musical centers coalesce around Hindu temples, Muslim shrines, and Buddhist monasteries. Musical activity at these centers is intensive and usually highly ritualized. Though the musical activity at a temple or shrine may be in the hands of a religious priesthood or musical specialists, it nonetheless depends on the participation of the devout who travel from elsewhere to worship at the center. Musical activity at the centers of the sacred geography is also the densest, and music itself concentrates sensory experiences to heighten the awareness of god and the efficacy of devotion.

The sacred journey from the periphery to the center usually involves pilgrimage, a form of ritual journey and community-formation common to all South Asian religions. The music of pilgrims is communal and congregational, practiced not by specialists but by the devout, who learn and adapt new songs, usually from oral tradition, to their sacred journeys. Folk and regional musical practices characterize peripheries, serving local functions and producing local liturgies and repertoires. Music in particular connects the sacred journey to the shrine at which worship is concentrated, multiplying the ways in which diverse genres of music collectively underlie religious experience. The sacred geographies of India, therefore, create possibilities for unity through the musical practices that reflect their dynamic quality and coalesce through ritual and performance at temples and shrines. **HINDUISM.** Historically, Hinduism has provided the body of religious thought that has most fundamentally shaped Indian musical practices. Music, either possessing a discrete ontology or embedded in other sacred and performative practices (e.g., devotion and dance), appears in the earliest sacred texts, such as in the Upaniṣads and the Vedas. The evidence of Hindu influence on musical thought has remained clear, even profound, until the present day, even in those repertoires and styles that now characterize other religions, includ-

ing Islam. The historiography of Indian musical thought, in certain fundamental ways, runs parallel to the history of Hinduism, with its dynamic relation between central principles and texts, and variant denominations and interpretations. Just as Hinduism itself has not always prescribed a single religious orthodoxy, musical practices that arise from Indian religious thought do not always prescribe canonic classical traditions of music.

Surveying the diverse musics that embody and articulate Hinduism requires an understanding of the ways in which hierarchy and egalitarianism yield two contrasting domains of musical practice. Within the hierarchy there are those, notably Brāhmaṇas, endowed with particular power to practice religious and musical specialties. The resilience of a religious hierarchy is evident in the long history of classical music in India, a tradition based on complex texts and highly developed performance skills. It is not by chance that the classical tradition is full of religious overtones. Until the modern era, for example, some practices of classical music, such as playing the *vīṇā* in the South and singing *dhruvād* in the North, were the restricted domains of high-caste Hindus or high-status Muslims. If the influence of Hinduism on Indian music seems to display a top-down trajectory, it also produces the tension that generates the need for musical egalitarianism. It is for this reason that the most widespread practice of Hindu devotional music, the singing of *bhājans*, attracts the broadest participation from Indian society and spreads across religious and sectarian boundaries. Any discussion of music and Hinduism must therefore account for both highly specialized and broadly egalitarian musical practices.

The mythological concepts concerning the creation of the world and the human position in it that are recounted in the foundational texts of Hindu thought and Brahmanic tradition, the Vedas, are profoundly musical. The Vedas are recognized as a body of revealed texts, compiled during the millennium or so of Aryan invasion and ascendancy in South Asia, from around 1500 BCE to 500 BCE. Although the four basic texts of the Veda—*Rgveda*, *Yajurveda*, *Sāmaveda*, *Atharvaveda*—differ in function and historical appearance, all Hindus recognize that they embody fundamental aspects of Hindu thought. The formal aspects of the Vedas are musical, and the texts are often referred to as “hymns,” compiled into hymnals. *Rc* glosses most often as “hymn,” that is, as a body of songs, employing repetitive patterns, that to some degree rely on collective, even congregational, performance. Other English terms used to describe the Vedas range from “incantation” to “chant,” all of them recognizing the performative foundation in song.

Unlike many religions, Hinduism employs musical concepts in the discourse about and practice of its foundational sacred texts. Performance of the Vedic hymns relies on specific pitch structures, with specific pitch patterns and tonal hierarchies, usually a group of two or three pitches surrounding a central pitch, the sustaining of which symbolizes the unbroken order of the universe. Similarly, the metrical per-

formance of Vedic hymns generates a temporal framework that is rendered musical through the repetition of stress patterns. As foundational sacred texts, therefore, the Vedas generate identifiable musical parameters, and many of these remain central to the structure of music in South Asia until the present, especially: (1) The sustained presence and focus provided by a fundamental tone or drone; (2) a hierarchy of pitches, in which some pitches have greater tonal significance than others; and (3) the logogenic, or word-generated, nature of musical rhythm and meter.

The Vedic hymns are inseparable from Brahmanic ritual, which they transformed into the enactment of everyday Hindu practice. Ideally, the performance of the Vedas is ceaseless and seamless, the ultimate realization of everyday devotion through music. The ritual of performing the Vedic hymns, moreover, gave rise to other texts, specifically the Brāhmaṇas and the Upaniṣads. Of the two bodies of text, the Upaniṣads are more speculative and philosophical, whereas the Brāhmaṇas are more expository, developing principles set forth in the four Vedic canons. The Brāhmaṇas, thus, have performative functions, realized through the articulation of ritual through prayer and song. A Brāhmaṇ literally is “one who prays.”

Already in the second millennium BCE, the Vedas and Brahmanic tradition succeeded in establishing and maintaining fundamental musical concepts, and they historically represent a first instance of the ontological unity afforded to Indian religion through music. Performance of the Vedas established a direct relation between the religious text and the manner of its performance. By extension, a logogenic relation between text and performance emerges. Music becomes a medium or vehicle for the more complete expression of words. The music that serves as such a medium, furthermore, is immanent in the words of a sacred text. The music embodies some aspect of meaning contained in the words, and therefore music is never separable from words, even when words are absent—such as in South Indian instrumental music, in which the composed melody, the *kṛitī*, is always based on a song with a specific text. The logogenic meaning of music may be direct (e.g., when enforced by specific metrical rules) or indirect (e.g., when reflecting the same sense of cosmological order with which the texts of the Vedic hymns concern themselves). Together, musical performance and religious ritual are wedded as music and text become inseparable.

Early Hindu and Brahmanic tradition generated fundamental ideas about music, such as concepts concerning composition and improvisation, and the identity of discrete forms, genres, and pieces of music. Music in the Brahmanic tradition conveys stories, indeed fundamental narratives from Hindu mythology and cosmology. Though a piece of music, such as one of the *kṛitīs* of South Indian classical music, may not be literally “about” a particular story, knowing the story in question is critical to understanding the music. The Vedic hymns are the source of music’s formal

structures, which are developed in performance through improvisation within a system of pitches and patterns functioning in predetermined ways. As with the sacred texts, music contains the *ōm*, the fundamental pitch that focuses the Vedic text and sustains the order of the universe. The fundamental structure and symbolic meaning of music in sacred practice was present from the beginnings of Hindu practice.

Devotion in Hinduism intensifies unity and is itself intensified through congregational prayer and song. The unity of devotion resides in the possibility of evoking *rasa*, a constellation of emotional moods, among them yearning and compassion, but also wonder and fear, through performance. The primary genres of Hindu vocal music enhance *rasa* through their power to facilitate emotional unity and congregational participation. Hindu devotional music is both specific to South Indian regions because of its frequent use of vernacular languages and malleable enough in some genres, notably *kīrtana* and *bhajans*, to extend its egalitarian notion of devotion, or *bhakti*, to other religions and to regional practices in North India and Pakistan.

Beginning roughly in the fourteenth century CE, poetsaints created repertoires of Hindu devotional songs that combined both musical and poetic properties of *rasa*. The emergence of the devotional repertoires was significant for the spread of vernacular musical practice across regional, linguistic, and sectarian borders. The great devotional singer-composers of the early era of *kīrtana* singing came from Kannada (e.g., Narahari Tīrtha, fourteenth century), Bengal (e.g., Caitanya, 1486–1533), and Telugu-speaking regions (e.g., Tallapakku Annamāchārya, b. 1424). Devotional repertoires spread across India, moreover, because of the activities of *haridāsa* singers, devotees of Vaiṣṇava Hinduism, who visited shrines and festivals, and integrated *kīrtana*-singing with pilgrimages. *Kīrtana* were quickly accessible to the diverse communal and linguistic groups who sang them because of their reliance on composed refrains, or *pallavi*, often with repeated meditations on the names of god, and then the unfolding of a series of strophes, or *caraṇam*, that worshipers without previous knowledge could quickly learn.

The most widespread form of Hindu devotional music is *bhajan*-singing. The concept of *bhajan* relates both to a specific vocal genre and to the performance practices necessary for communal singing. As genre and repertoire, the *bhajan* is remarkably accessible, consisting often of a very brief text, in which textual formulae, particularly forms of the names of Hindu deities (e.g., Rāma or Śiva), and even non-Hindu deities (e.g., Allah), will serve as the basis of repeated reflection. The relatively simple texts also ensure mobility, making it possible to move *bhajan* repertoires across linguistic borders and to gather them in such ways that they could become the primary song form accompanying Hindu pilgrims. Musically, too, formulae, such as antiphonal patterns in which a leader is followed by a chorus singing the same text and melody, invite rather than encumber participation.

The social context of *bhajan*-singing is communal, both when performed privately and when performed publicly. Homes, temples, and community centers (sometimes called *bhajan* halls) serve as the gathering place for the intensive performances. Modern technologies, particularly the widespread and inexpensive dissemination of *bhajans* on audio cassette, continue to make devotional song one of the most widely practiced of all musical genres in South Asia at the beginning of the twenty-first century.

BUDDHISM. Buddhist music is important in modern South Asia not so much because of extensive presence, but rather because of the ways it contains fundamental historical-aesthetic concepts about the ontology of music and because its practices provide bridges to the music of East and Southeast Asia. Buddhism survives into the twenty-first century primarily in the north and the northeast, especially Tibet, and in the south, almost entirely in Sri Lanka. The musical practices of the two areas of South Asian Buddhism differ considerably. Monasticism dominates Tibet, and musical practices there represent the ritual practices of monastic life, itself an epistemological realization of the cycles of birth and rebirth. Theravāda Buddhism provides the framework for ritual and musical practice in Sri Lanka, where the interaction of monks and lay practitioners is much more extensive.

Historically, Buddhism has provided a theological impetus for unity and egalitarianism in Indian religion. The rise of Buddhist thought in the centuries following the Buddha's life (c. 485–405 BCE) provided a theological and philosophical counterpoint to the domination of the Brahmanic tradition and the Upaniṣads. From the earliest centuries, Buddhism opened up new possibilities for the contemplation of the external world primarily through mental and spiritual processes. Contemplation, moreover, achieved its highest form through various practices that required discipline, in particular that which takes place in monastic settings. Ritualized and inscribed in treatises, such as the *Śvaraśāstra* (Treatise on melody) and the *Vādyaśāstra* (Treatise on instrumental music), Buddhist concepts of music rely on the intensity and the unity achieved through contemplation that can be both individual and communal. For Indian musical practices, the fundamental principles of Buddhism have been significant for several reasons. Aesthetically, Buddhist thought opened epistemological possibilities for resolving the tensions between elite and vernacular musical practices.

In Buddhist devotion, contemplating sound itself is the most efficacious form of meditation. The sound universe of Buddhist devotion is encountered through various forms of ritual and worship. Early Buddhist texts, for example, stress that the contemplation of sound allows the individual to transcend the limitations of individual being through *śrotra vijñāna*, or “aural knowledge.” The bells and other percussion instruments that accompany monastic ritual, moreover, have direct religious significance, as they recall the ways in which the Buddha entered the world into which he was reborn as Siddhārtha. The contemplation of sound requires

both the listening to and the production of music. Chanting is particularly important as a communal experience, in which vocal performance requires an intense awareness of the relation between individual melody lines and the overall texture of the group's chants; in other words, Buddhist chanting entails heterophonic singing, in which individuality and communality are at once distinct and merged.

Theravāda Buddhists in Sri Lanka base their chanting on oral interpretation of the Pali canon of sacred texts. Melodic ideas remain anchored in an understanding of the Buddha's teachings, that is, in a practice known as *sarabhanṇa*, in which a sustained choral sound elongates text across slowly moving pitches virtually devoid of ornaments. At the same time, Buddhist musical practice contains many of the structural features of Indian music. Critically important, for example, is that sound be unbroken, which in turn means that chanters employ overlapping phrases. Weighted tones, moreover, anchor chanting, and because of the seeming absence of phrases, the sound of chanting produces a sense of deployment around a drone pitch.

Sustained choral chanting and the maintenance of an unbroken flow of sound characterize Tibetan Buddhist worship. In Tibet, however, percussion instruments—bells, cymbals, and drums—produce a much more articulated feeling of pulse and rhythm, in which the temporal qualities of music are not entirely anchored to sacred texts. Tibetan instrumental ensembles may become quite large, and monastic repertoires may become highly stylized and distinct from chanting. Though Buddhist religious and musical thinking so emphatically provides a framework for music in South Asia, musical practice is by no means unchanging. Buddhist repertoires are diverse, as are the ways Buddhists achieve unity and devotion through the contemplation of sound and music.

ISLAM. From the first settlements of Muslim peoples in South Asia in the eighth century CE until the sixteenth century, when the Persian-speaking Mughal Empire established a firm foothold in North India, Islam became an increasing presence in South Asian culture and music. Despite its proscriptions against music in some contexts, Islam offered South Asians an alternative approach to the cultivation and performance of music. As a whole, Muslim music making was more egalitarian than that of Hinduism, and just as Islam attracted converts because of the openness of its religious doctrines, so too did it multiply the possibilities of music making, in both sacred and secular domains of society. In many areas of cultural and musical life, Islam proved to be flexible, encouraging regional diversity in the music of Afghanistan, Pakistan, Kashmir, and Bengal, all of which can claim classical music systems of their own in the twenty-first century. The Muslim regions also fostered extensive musical exchange with the Middle East and Central Asia, which enriched the diversity of musical genres and introducing new instruments and instrumental ensembles.

The Indianization of music that has led to unity throughout India has an historical counterpoint in the Muslim areas of the North, namely Islamicization. Roughly speaking, Islamicization results when a musical concept, form, theoretical system, or ensemble structure undergoes a transformation allowing it to express the cultural distinctiveness of North India or Pakistan. One of the earliest forms of Islamicization is evident in the cultivation of Mughal miniature paintings from the sixteenth century onward. Imported with the Mughal settlement from Persia, miniature-painting frequently included musical subject matter revealing the many ways in which music and musicians were crossing religion-based musical boundaries. Miniature-painting even influenced the visual representation of Hindu myth in *rāgmālā*-painting, which also depicted the *rāga* classification of North Indian classical music. Islamicization is particularly prominent in the modern era—for example, in the modes of popular music that make room for devotional practice (e.g., *qawwālī*) and in pan-Islamic musico-poetic genres (e.g., *ghazal*). In this sense, Islamicization is far less a process of restricting musical activity than a means of expanding the religious significance that South Asian musics have worldwide.

The musical genres of Muslim South Asia fall into two general categories: (1) genres common to devotional practices throughout the Islamic world; and (2) genres with musical, linguistic, and historical roots in South Asia itself. In the case of both categories it is critical to understand just how music finds its place in Islam. Scriptural pronouncements about musical practice in Islam are very much open to interpretation, both because of their ambivalence and because of their paucity. Orthodox interpretations found in the commentaries on the Qur'ān, the *ahādīth*, are conclusive only insofar as they show the Prophet to have found some musical practices acceptable and others suspect. South Asian practice, especially in Pakistan, where Islam is also the state religion, suggests a fairly orthodox and literal interpretation of the position of music in Islamic society. On one hand, music in the strictest sense, especially music including instruments, does not have an official place in the institutions of public worship. Though the Qur'ān employs melody and modes, reciting is considered “reading” (*qirā'ah*) and never “singing.” On the other hand, the aural experience of music, *sama'*, or “listening,” is fully sanctioned, especially when the music in question is used to accompany recitation of the Qur'ān or takes the form of devotional song. Sacred musics in Muslim South Asia respond to these positions in various ways, and their reception throughout the world thus varies as well.

Devotional music in Muslim South India is very widespread, and it provides aesthetic and cultural continuity across the borders of the three largest nations with Muslim populations, namely India, Pakistan, and Bangladesh. Many sacred musical genres are common to the three countries, such as *qawwālī*. The shrines and saintly lineages around which certain repertoires coalesce have local and internation-

al aspects, which reveals the extent to which the borders of the northern parts of South Asia have remained contested through history. Whereas repertoires may be similar, individual practices may differ extensively. Differences are particularly evident in the use of various languages in performances of devotional song, not only due to the prevalence of regional languages and folk melodies in *kāfi*, or “devotional song,” but also on account of the mix and hybrid use of languages and musical styles in *qawwālī*. Instrumental ensembles may also be at once local and global, as seen, for example, in *qawwālī* with its use of the hand-pumped organ, or harmonium, and in the use of variants of the bowed spiked fiddle, or *sārangī*, in Rajasthani and Pakistani devotional musics. Muslim devotional musics, therefore, are never static, bounded repertoires, but rather are fluid musical practices that constantly respond to change and the shifting attitudes toward music within Islam.

Local practices of Muslim devotional music are largely encompassed by the term *kāfi*. *Kāfi* is not one style or genre of devotional music, but many, whose common characteristics reflect musical influences and change from below. The texts of *kāfi* appear to come from regional narratives, often featuring heroes and heroines associated with historical events. In the songs themselves, however, the regional stories and characters take on a larger, symbolic meaning, especially with regard to the ways in which the devout achieve spiritual union. Though the roots of *kāfi* are to be found in the use of folk instruments and strophic structures, they have moved stylistically toward the classical traditions. The string instrument commonly employed with *kāfi*, the *sārangī*, has become a classical instrument only in the past century, but has definitively won its position in the classical instrumentarium of North Indian, or Hindustani, classical music. Even the term *kāfi* has found its way into Hindustani classical music, where it has become the name of a *rāga*.

The most global Muslim devotional music of South Asia is *qawwālī*, which since its introduction to the West by the Sabri Brothers in the mid-1970s and its popularization on an international scale in the 1980s and 1990s, principally by Nusrat Fateh Ali Khan, has become the world music of South Asian Sufism. Like other devotional genres in South Asia, *qawwālī* is not a single style, but rather embodies a constellation of sacred practices and musical sounds that together give it identity. *Qawwālī* is, first of all, a poetic genre, lending itself to an expansive musical repertoire. It is played by specialists, who are also often professionals, namely *qawwāls* (“fluent” or “eloquent” ones), a term that refers to the primacy of the text and is derived from the Arabic word *qawl*, “to speak or to say.”

Qawwālī also has a specific function and venue. Its performances constitute the musical and spiritual life of a shrine dedicated to a specific Šūfī saint. Through performance, therefore, *qawwālī* expresses a specific history and tradition. For Chishtī Šūfīs, the spiritual lineage extends back to Amīr Khusraw (1244–1325), a *qawwāl* and poet himself, who was

a disciple of the Šūfī saint and great spiritual founder of Chishtī Šūfīs, Nizāmuddīn Auliya. The tradition of devotional song thus follows a specific path, made possible by the succession of sheikhs who supported shrines in Pakistan and North India.

The compositional nature and musical structure of *qawwālī* is no less specific, for it is possible to talk about individual pieces transmitted with discrete identities through oral tradition. For example, one of the best-known *qawwālī* songs, “Man kunto Maulā” (see the recorded examples on tracks 1 and 2 of the CD accompanying Qureshi, 1995), contains the following constellation of musical and symbolic meanings and references:

1. “Man kunto Maulā” refers to the Chishtī Šūfī lineage, and is performed at shrines dedicated to both Amīr Khusraw and Nizāmuddīn Auliya.
2. The text is in Persian, which connects the song to Islam in the Middle East.
3. It contains an example of a subgenre known as *basant*, which here serves to signify a specific aspect of a saint’s life, Amīr Khusraw’s reflections on Nizāmuddīn Auliya’s love for his deceased nephew.
4. The melody consists of two segments, one ascending (*asthāyī*) and the other descending (*antbarā*), which together provide the structural framework for almost all melodies in Hindustani music.
5. The *rāga* is a hybrid form, *megh-ushshaq*, which has both North Indian (*megh*) and Middle Eastern (*ushshaq*) connotations.
6. The structure of the *rāga*, which features mixed tetrachords, reflects techniques associated with Amīr Khusraw.

Though technical, this brief analysis of a single *qawwālī* song reveals the ways in which musical ends can provide a direct link to Šūfī religious thought and comment on the genealogy of Muslim South Asia and its historical roots in the Middle East. Symbolic power also moves from religious signification to music in “Man kunto Maula.” Amīr Khusraw, for example, in addition to being a spiritual leader in Chishtī Sufism is recognized as the legendary inventor of the *sitār* and the *tablā*, canonic melodic and percussion instruments in Hindustani classical music. Such associations further suggest an interchange between music and religion, leading some to claim that Hindustani music itself formed from Šūfī practices. If such a claim is in large part untenable, it nonetheless deserves attention for pointing out the religious dimension of musical thought in North India and Pakistan, and for illustrating the ways in which Sufism and its most widely recognized tradition of devotional music, *qawwālī*, has historically established an appropriate place for music in Islam.

OTHER SOUTH ASIAN RELIGIONS AND RELIGIOUS PRACTICES. The religious diversity of South Asia is far greater than the usual concentration of musicological and theological sur-

veys on Hinduism, Buddhism, and Islam suggests. An understanding of religion in South Asia requires the survey of tribal and regional religious practices, some of them religions in their own right, others local variants of the larger religions. The musical practices of such religions and sects also fall generally into two categories. In the first of these, music takes place primarily as the expression of ritual, and its structure and style are linked to function and the efficacy of ritual-musical activity. Regarded in this way, the music of ritual is secondary to the ritual itself, thus limiting the extent to which a musical system with its own structures and independent form can evolve.

In the second category, the music of tribal and regional religions possesses the dominant systemic qualities of a larger Indian music cultures, for example *rāga* and *tāla*, but the variants of these are simpler than in the classical systems, and local inflection often determines the ways in which the music itself functions. Neither of these categories has historically explained the diversity of tribal music with sufficient thoroughness. The study of tribal, regional, and sectarian music, nonetheless, began attracting considerable ethnographic and ethnomusicological attention in the 1980s and 1990s, so much so that scholarship in the first decade of the twenty-first century holds the promise of reformulating the basic study and understanding of Indian music.

The potentially unifying influence of music on Indian religious thought remains present even across the sacred landscapes of smaller religions. Religions that distinguish themselves primarily from Hinduism frequently have embraced hymns, even *bhajans* from the Hindu tradition, as a repertoire for congregational performance. The primary body of songs in Jainism, for example, consists of hymns whose texts and functions owe an historical debt to Hindu devotional music. The *Šūfī* musical tradition of Kashmir (*šūfyānā mūsīqī*) embodies both Middle Eastern and Indian classical traditions, producing a classical tradition of its own, which is suited to performance in mosques and temples alike, as well as in the special shrines of Kashmiri *Šūfīs*, the *tekke*. Sikhism and Zoroastrianism, too, make extensive use of styles and repertoires borrowed from Hindustani classical music, adapting them to their own ritual practices rather than radically breaking from them. These specific cases of sectarian religious tradition in South Asia make it clear that Indianization of religious musics requires the transformation of similarities no less than differences.

Historically, musical influences have been introduced into South Asia by smaller religions and religious sectors that have arrived from elsewhere. Jewish communities established themselves in India as early as the first millennium CE, making communities such as the Cochin Jews some of the oldest in the Jewish Diaspora. Jewish musical traditions remained both relatively isolated and intact, but also sometimes integrated with Indian music—for example, in the theater ensembles in urban centers such as Mumbai.

Christian communities can also claim long and complex histories in South India. Among the oldest Christian sects are those that descend from the Christian Orthodox traditions of the Middle East, especially the Syrian Orthodox church. In some parts of India, especially in Kerala, the Christian population is comparable in size to other religious groups, making it no longer possible to consider them as simply a minority religious community. Christian musical traditions have distinctive qualities, but they also reflect the unifying sound aesthetic of Indian music as a whole. Christian worship is extensively liturgical, lending itself to the congregational performance of hymns. As a result, Indian Christian churches are capable of adapting Christian hymn repertoires from Europe and North America, but are no less disposed to draw upon *bhajan* repertoires.

South Asia has long attracted intensive missionary activity, some of it at the behest of colonial forces, and some under the auspices of Christian denominations in the West. Anglican and evangelical Protestant traditions are therefore present in the cities and regions of English domination, whereas Catholicism is more common in areas of Portuguese colonialism, particularly in Goa and some parts of Sri Lanka. Evangelical Protestantism also has an especially strong presence in Sri Lanka.

The musical traces and transformations produced by the presence of Christianity in South Asia are considerable. During the twentieth century, the publication of hymnals with regional Indian languages supplanting European texts became so extensive that it is possible to speak of an Indianization of Christian hymnody. The instrumentarium of South Asian music, moreover, also reflects missionary and colonial influences, as can be seen in the widespread use of brass bands, including for rituals of various kinds. Another example of this influence is the Indianization of the harmonium, a portable organ of European origin with hand-pumped bellows that has encroached into South Asian music—for example, into *qawwālī*, which would be unthinkable without the harmonium.

Whatever the influences from Christianity and Western religious incursions into India, it is still necessary to recognize the resilience of Indian music itself. Rather than rejecting hymn traditions and Western instruments as foreign, Indian musical traditions have transformed them and integrated them so that they play unifying roles in the interaction between music and religion in India.

POSTCOLONIAL AND GLOBAL SITES FOR MUSIC AND RELIGION. Religious musical practices in South Asia have embraced rather than rejected modernization, with its changing technologies and diverse media. Even the most basic ontologies of sound and its density in the universe have benefited from technologies, not least among them electronic amplification and recording. In the sound universe of the Indian city, the broadcasting of music from loudspeakers, radios, and cassette recorders produces a texture comprised of competing voices and traditions. Extreme volume itself has be-

come a medium for enhancing the contemplation of devotional music in the public sphere.

Modern technology and mediation have also proved particularly useful for the popularization of South Asian religious music. In the vast industry of Indian film-making, for example, the reconciliation of religious difference has long provided one of the most fundamental themes. Whether focusing on the virtually irreconcilable relationships between the families of Hindu-Muslim lovers or on past and present moments of sectarian violence (e.g., Mani Ratnam's *Bombay*, which won international acclaim in 1995), Indian filmmakers and composers draw upon music to signify religious unity, even to effect it symbolically on the screen. In the twenty-first century film is perhaps the preeminent site in which religious themes are expressed through the unifying power of Indian music.

The religious musics of South Asia have also achieved global distribution as world music. The globalization of religious music began during the British colonial era, not least because of the successful establishment of a colonial recording industry by British firms. Recordings broadened the audience base both in South Asia and abroad, creating processes of exchange and hybridity. The first vocalists to achieve global status were the *dhrupad* singers, Faiyazuddin Dagar (1934–1989) and Zahiruddin Dagar (1932–1994). Few musicians anywhere have achieved the global stardom of Nusrat Fateh Ali Khan (1948–1997), whose performances of *qawwālī* wove traditional motifs of devotion into a world-music mix.

The globalization of religious music has further benefited from the South Asian Diaspora, with its extensive patterns of settlement and exchange with India itself. The musical styles of the Diaspora integrate religious musics in complex ways, from the merging of folk and ritual musics in *bhangra*, to the *bhajans* and other devotional practices that provide the template for the styles known as *chutney* in Indo-Caribbean popular music. Throughout the history of India, sacred musics have accommodated religious influences from outside the subcontinent, and they have themselves extended across Asia with the spread of Hinduism and Buddhism, and with the colonial dispersion of Indians to South Africa, the Pacific, Europe, and the Americas. At the beginning of the twenty-first century, the religious musics of India thrive in the Diaspora. Even as they respond to the pressures of globalization, they retain their vigor and their significance in South Asian society, providing unity to the Diaspora no less than during the millennia of religious diversity in India itself.

MUSIC: MUSIC AND RELIGION IN SOUTHEAST ASIA

The ten nation-states of Southeast Asia, namely Brunei, Burma, Cambodia, Indonesia, Laos, Malaysia, the Philippines, Singapore, Thailand, and Vietnam, contain many hundreds of ethnic groups. These regional groups speak thousands of different languages practice various religions, and perform thousands of styles of music. Although many of the Southeast Asian countries are trying to build national cultures, regionalism is usually accepted, sometimes celebrated, and occasionally suppressed. Major faiths practiced in Southeast Asia include Islam, Buddhism, Christianity, and Hinduism.

Vocal and instrumental music has been central to the religious life of the region from antiquity to the present. Most of this music shares some common characteristics that distinguishes it from compositions found in other areas of the world. Separating music strictly by country can be misleading. The mainland countries of Thailand, Laos, and Cambodia, for example, all celebrate certain ceremonial traditions (such as the *wai kruu* ritual) that honor teachers, ancestral spirits, and the Buddha, whereas Malaysia and Indonesia, most of whose residents are Muslim, share several contemporary Islamic musical styles. Vietnam's religious music shares more similarities with the Chinese music of East Asia than with ritual songs in other neighboring countries.

Southeast Asians belong to all of the major world religions. In the past, the religious rituals practiced within any particular faith differed markedly by country. Mass commu-

nications and education throughout the region, however, have reduced or eliminated local adaptations. Reform movements and urbanization also have helped to standardize religious and musical practices. For example, Muslims in southern Thailand or Vietnam now worship in much the same way as do their counterparts in the southern Philippines and the Lesser Sunda Islands of Indonesia.

Despite the modernization that threatens the unique regional traditions, most Southeast Asian countries maintain distinctive strata that represent various periods of cultural developments and belief systems. In central Java, for example, in the courtyards of the royal mosques during the week-long Muslim celebration called Mawlid that commemorates the birth of the prophet Muhammad, musicians still play the *gamelan* called *sekaten*, a musical ensemble that was first developed in the 1600s to help spread Islam. Oddly enough, these performances occur near the headquarters of a Muslim reformist organization Laskar Jihad, which pointedly rejects such music, as it seeks to transform most of Southeast Asia into an Islamic super state. Such unique regional traditions seemingly in contrast to modernist movements are often contested and may disappear or secularize to survive.

Indigenous faiths—once widely practiced—are gradually decreasing as evangelism, modernization, and deforestation encroach on the rural environment. Most premodern ethnic groups are converting, adapting, or moving to urban centers and giving up their rich ritual and musical traditions. Several groups in remote areas of each country, however, have maintained their ancestral beliefs. The Temiar people of Malaysia, for instance, continue to practice their traditional songs of healing, gender relationships, and trance mediums.

Musical activity in Southeast Asia ranges from frequent to rare. In Bali, Indonesia, creating art—dance, sculpture, and painting in addition to music—is a fundamental part of the Hindu religion. In some parts of Malaysia, by contrast, Islamic leaders may prohibit music.

NOTIONS OF POWER. Transformational ideas of spiritual and political power have had a long history in numerous religious traditions. These notions are usually centered on a person, place, or object. Great leaders and artists, for example, are often perceived to have become more spiritually powerful after a religious experience; in Muslim regions, for example, a musician may become purer after having visited the holy city of Mecca. Moreover, many famous composers and compositions often are considered to have been divinely inspired; in Bali, this concept is described by a standard term: *taksu*. Ancient places thought to be invested with spiritual force, such as Cambodia's Angkor Wat and Java's Borobudur, also can be viewed as centers of power. Similarly, certain objects, such as heirlooms and musical instruments, may be believed to contain or emanate divine power.

Gong-chime musical ensembles have often been viewed as vessels of power and as vehicles for ennobling rulers or

framing ceremonial events. These ensembles usually feature hanging or horizontally-mounted knobbed gongs (as distinguished from vertical East Asian flat gongs), sometimes accompanied by wind or stringed instruments or drums. The craft of metallurgy, which has been practiced for thousands of years, was initially developed in Vietnam. Bronze musical instruments gradually assumed ritual prominence throughout the region; religious ceremonies incorporated bronze drums, for instance, as early as 100 BCE. Later artisans constructed foundries in order to manufacture instruments; by the second millennium CE, the smiths who crafted these instruments were being hailed as artists that could harness the power of the earth.

Examples of these ensembles include the various gamelans of Java, Bali, and Lombok, in Indonesia; the *kulintang* of the southern Philippines; the Thai *piphat*; the Burmese *hsaīñwaīñ*; the Cambodian *pinñ peat*; and various others found in Malaysia, Laos, and elsewhere. According to their believers, these ensembles frequently mediate power. For example, in some ensembles musical instruments or elements that unite male and female (in counterpart pairs) or other cosmological symbolism may be thought to invoke the divine or balance the world through performance. Similarly, in Thailand, worshipers believe that elder *piphat* musicians can access power through a sacred repertoire and then manifest the divine while they play.

Many Southeast Asians also believe that these gong-chime ensembles possess a residing spirit; faithful listeners will provide offerings on a regular basis. In Indonesia, older ensembles are generally thought to be more sacred; the greater the age of the instruments, the greater their interaction with the ancestors, and therefore the greater reverence and power the ensemble commands. In these gamelans, the gong is the spiritual center; it may receive a title or name during a consecration ceremony on behalf of the ensemble. Some scholars have asserted that gamelans are symbolic depictions of macrocosm and microcosm, and that they represent a tripartite universe or anthropomorphism of head, body, and foot; others note that some of the ensembles are considered to be living organisms. Reports in Java, of particularly “alive” gamelans playing on their own without human musicians, add to the ensembles’ identity and mystique.

Gong-chime compositions also are believed to be powerful, able to influence nature, time, places, people and objects. For example, some Javanese believe that a composition called *Anglir Mendung* (Like storm clouds) can cause rainfall if it is performed at the proper time. Many scholars have also suggested that the cyclic nature of the gong-punctuated music produced by gamelans in Java and Bali echoes the passage of time; they compare it to the region’s complex calendar systems and interpret the music as a powerful metaphor of the structure of life and the cosmos.

Most of the ancient concepts of power and music were originally based on Hindu-Buddhist ideas; they were widely adopted in the region partially because early monarchs found

these notions appealing. Later, Muslim evangelists who traveled to the region appropriated these ideas as they sought to gain converts in areas like the southern Philippines and Java. They also developed new instrumental, vocal, and dramatic musical forms in order to spread Islam; similarly, Christian missionaries adapted Western hymns to the regional musical genres to draw converts to their faith.

Poetry in song form—intended to communicate new teachings, sacred stories, and prayers—has been central to Southeast Asian religious life for generations. Sacred texts sung in many different sacred languages—Hinduism in Sanskrit, Buddhism in Pali, Islam in Arabic, and Catholicism in Latin—accompanied these new religions into Southeast Asia. At first, these languages were used solely in the courts, in order to legitimize authority through sung poetry and chant. Stories from religious texts—such as the *Rāmāyana*, the *Mahābhārata*, the Qur’ān, or the Bible—often became songs that were sung in either the local or the imported language; these songs, in turn, popularized the new beliefs. Some songs that blended the old and the new had particular powers; in Java, for example, certain songs could be sung to stop heavy rains, tame crocodiles, or to exorcise malevolent spirits. In Sumatra, a shaman trained in black-and-white magic could use eleven different grades of song to entice and capture renegade tigers that had trespassed onto human lands.

One powerful musical ritual celebrated in several countries is the shadow puppet theater. In many cultures, it carries cosmological significance, particularly in the Indonesian areas of Java, Bali, and Lombok. There, puppeteers (*dalang*) are greatly respected for their power to re-create the universe, restore spiritual balance, achieve healing, and perform other transformations. The accompanying music is also powerful; in Java, the gamelan compositions played during the overture symbolize the span of a human life, while in Lombok, the opening gamelan pieces invoke the elements of life (fire, air, water) to help re-create the world. A *dalang* transmits the morals of a story and imparts spiritual and ethical values while entertaining and educating the audience. Moreover, a puppet theater performance might affect the environment. In Cambodia, the Reamker shadow theater, a local appropriation of the *Rāmāyana*, is believed to attract rain.

AUTHENTICITY AND ACCULTURATION. Musical ideas frequently accompanied new religions into the region; these either were retained fairly intact, such as the Buddhist chants that were adopted in mainland Southeast Asia, or absorbed into local forms. Religious influences from India came to Southeast Asia unevenly and over many centuries; most of the regions modified a particular faith’s notions of hierarchy, city-state, ruler, and texts to suit the local environment. Musical incorporations are much less obvious, though some scholars have suggested that the cyclic metric cycles used in the gong-chime ensembles may have originated with Indian *tala* systems, and some Sanskrit terms have become part of the musical vocabulary.

The texts of Hinduism and Buddhism have been inspiring and powerful influences, and the scriptures have stimulated dance dramas based on epics such as the *Rāmāyana* and the *Mahābhārata*, as well as poetry and song. The forms that developed were generally indigenous and based on preexisting frameworks. For example, artists in some mainland Southeast Asian areas, such as Laos, constructed unique courtship songs to transmit Buddhist *Jātaka* tales and Hindu-Buddhist cosmological stories. In the lowland Philippines, the passion of the Christ (*Pasyon*) was recited or sung following performances of older, pre-Christian epics, and the all-night singing that recounts the birth of Muḥammad in the southern Philippines adopted the same framework.

Influences from China, too, have been widespread and particularly prominent in Vietnam, where many Buddhist texts have been translated and maintained in classical Chinese. Chinese instruments have found favor in several areas, and some Chinese narratives have spread as far away as Bali. Chinese immigrants throughout Southeast Asia (the fewest of whom live in Laos, with the majority in Singapore) have maintained or adapted their religious and musical traditions to their particular context. Though India and China have been religious “donor” countries to some extent, it is unwise to suggest that Southeast Asia merely adopted their influences. Each ethnic group and country has changed over time; in addition to exporting socioreligious ideology, India and China also have actively borrowed beliefs from Southeast Asia.

Southeast Asian countries have exploited each other for millennia. Victors in early Siam often carried off Cambodian music organizations following a conquest, and then institutionalized Cambodian music in Thai courts; Thai musicians, in turn, were often kidnapped and taken to Burma; Laotian court music is thought to have originated in Cambodia; and monks from these countries frequently visited Buddhist centers in other nations, thus spreading and sharing liturgical and musical ideas. Javanese religio-cultural influence was imposed upon much of the archipelago during the reign of dynasties such as the Hindu-Buddhist Majapahit and the early Islamic Mataram. Religious and cultural concepts and musical instruments thus moved frequently throughout the region, inspiring local artistic responses to Hinduism, Buddhism, Christianity, and Islam. Reform movements, found primarily within Islamic societies, have fought against such heterogeneity and striven for purity in religious and musical practices.

Islam in Southeast Asia is often termed moderate by scholars. In rural areas, Islamic events may still be celebrated with local music, though in coastal and urban areas, orthodox or standardized forms of worship are the norm. The Islamic Minangkabau people in west Sumatra, who live in coastal and inland areas, are a case in point. While the coastal Minangkabau have discontinued most of their indigenous poetic forms, gong-chime ensembles, and matrilineal family patterns to follow Islam, most of those that live inland have retained them.

The Christian Batak in north Sumatra faced a similar dilemma. Barred from using indigenous music in church, many of them switched to German-style brass bands in conforming to so-called Christian notions of proper music. These ensembles, however, soon lost favor; coupled with a change to local control and a revival movement, the “traditional” drum-gong ensemble, *gondang sembilan*, was then brought into the church for services. Much earlier, in fact, Catholics in Central Java had featured masses that were accompanied by gamelans. Such blending of the local music with the adopted religion is often contested, however, particularly within the Islamic communities.

Though the relationship between music and Islam has been complicated, many Southeast Asian Muslims regularly enjoy music. Several instruments have become associated with pan-Islam in the region, including barrel drums, frame drums, plucked lutes, and oboes. The two musical-like behaviors directly associated with Islam—Qur’anic recitation and call to prayer—are fairly uniform throughout the region. Earlier distinctions in practice seem to have largely disappeared, with the development of telecommunications, Islamic schools, recordings, and the visits of specialists from countries such as Egypt. Many Southeast Asian Muslims also travel to the Middle East to study these prayer forms, and participate in frequent national and international contests designed to standardize these activities. In some areas, such as Indonesia, chant is accepted as a form of “music”; a separate genre (*seni musik Islam*, or Islamic musical art) can promote music as an agent of *dakwah* (bringing people to Islam); while in other areas (similar to Arabic countries), chant is not considered to be music because it is based on the divine word of the Qur’ān, and music in Islam is rarely approved. One intriguing development in Malaysia and Indonesia is participation of women and girls in Qur’anic recitation. They perform in public and on television, and, in modern Indonesia, even in the company of men. In these respects—allowing women to publicly perform recitation and generally accepting music—Islam in Southeast Asia appears to be more moderate than in most of the Middle East and South Asia.

The spread of Islam to many areas has led to a marked decrease or a secularization of non-Islamic musical forms. For example, the shadow puppet theater has disappeared in several parts of Malaysia (where it conveyed Hindu epics), while that on the Indonesian island of Lombok has further secularized and is frequently aimed at tourists. Other forms have had to become more Islamic to survive; for example, many poetic forms in Sumatra are now prefaced by Arabic prayers. Modernization and globalization have also affected these and hundreds of other genres. Forms that used to be “functional” (ritually transformative or educational) are now “aesthetic” (placed on a formal stage for appreciation) and compete with television for an audience, or are repackaged for tourism. The Cambodian Reamker shadow theater, for example, once performed as a part of various complex rituals

over several nights, now is staged only as a one-hour presentation at universities. Younger generations of Southeast Asians have not generally been interested in retaining ritual music traditions different from orthodox or modernized forms.

ORTHODOXY, TRADITIONALISM, AND POPULAR MOVEMENTS. Some tension exists between orthodox and local practices in most of Southeast Asia, not only in the Muslim regions but also among Christians, Buddhists, and Hindus. For centuries, people throughout much of Southeast Asia believed that the landscape was populated by ancestral or natural spirits, who were the original owners of the land, water, and trees; these notions have been fundamental in creating and systematizing rice culture and associated ritual practices featuring music. External religions have acculturated to the context and contributed new inspiration and meaning to the arts. In some areas, indigenous and external beliefs were constructed into a complementary duality of female and male; local faiths (female) functioned in fertility and healing and often involved female officials, while imported ones operated in royal houses and formal places of worship and were dominated by men.

Even today, many mainland Southeast Asians perceive no contradiction in honoring Buddha [Siddhārtha Gautama (c. 563–c. 483 BCE)] in addition to a supreme being and a pantheon of deities; similarly, some Catholics in Vietnam, Muslims in Java, and Hindus in Bali include altars for spirits or deities. In this model of acculturation, earlier music practices are often incorporated into syncretic rites. For example, traditional gong ensembles have become part of animistic funeral practices in upland Christianized Vietnam; the sacred gamelan *Mawlid* is performed during the ceremony of the same name to honor Muḥammad in north Lombok in Indonesia, while a different sacred gamelan, *jerujeng*, is used for Buddhist festivals in the western part of the island. A free-reed mouth organ accompanies female spirit mediums who intervene in the curing rituals performed in the Buddhist areas of northeast Thailand and Laos; the *hsaiñwain* ensemble accompanies possession trances held at Burmese temples; the *kulintang* ensemble accompanies Islamic rites in parts of Mindanao and the Sulu Archipelago in the Philippines, while a gong marks the hours during Ramaḍān in Datu Piang. In Indonesia, gamelans direct Muslim performers of hobbyhorse trance dancing in East Java, and Roman Catholic Torajans in Sulawesi dance in large circles as part of elaborate funerals to send the spirit of the deceased to the next world. Among those who practice the pure forms of world religions, indigenous music and ritual may be invited as a last resort. Orthodox Muslims in Sumbawa, Indonesia, have incorporated female performers, gong ensembles, and pre-Islamic ritual forms when Western medicines and Islamic prayers are not enough for their congregations. Similarly, Indonesians say that, although most of them are practicing Muslims, they all worship the volcano deities whenever a nearby volcano threatens to erupt.

Colonization by European powers profoundly affected every Southeast Asian country except Thailand, which has never been subject to Western rule. Europeans introduced Christianity, established missions, and imported and modified hymns; the new religion found favor in the Philippines and in parts of mainland Southeast Asia and Indonesia. Movements since the late twentieth century have aimed at developing “indigenous hymnody” (hymns based on scripture in local languages with local music elements) to maintain and multiply the faithful. Warfare and communism have exerted equal forces on the music of the region, despite the fact that many countries were not directly involved in either disruption. Buddhist and Christian music and services in the affected mainland countries (namely, Laos, Cambodia, and Vietnam) were largely restricted, and sometimes allowed to be performed only in service to the state. In Cambodia, court music quickly disappeared in the 1970s; after the disastrous Khmer Rouge leadership, many other musical forms also vanished, along with thousands of musicians. Due to poverty, isolation, and political conservatism, sponsored music activities in Laos are similarly lacking.

Beginning in the late nineteenth century, Islam in Southeast Asia, once tremendously varied, began to assume a recognizable shape. In Indonesia, Malaysia, and Brunei, a reformist movement took hold and began to enforce the pillars of Islam, establishing schools taught by Arab specialists or returning Ḥājjī (pilgrims who had traveled to Mecca). A number of pan-Islamic musical forms soon developed, including *hadrah* (Šūfī-related music/ritual events), *burdah* (hymn singing), and *zikir*, *dabus*, or *dhikr* (Šūfī ritual music involving repetitive phrases), generally accompanied by frame drums and often stimulating trance. Many of the early Muslim evangelists were Šūfī and their legacies remain; perhaps this fact has contributed to a more permissive attitude toward music in the region. As the language of the Qurʾān, Arabic has a special status in all Muslim areas of Southeast Asia. Songs in Arabic, regardless their source or meaning, are generally considered proper and spiritually meritorious.

What Arabic has been for Islam, the language of Pali has been for Buddhism. Chant assemblies, convoked by signals played on bells, gongs, drums, and other percussion instruments, perform the Pali canon of liturgy. Music during services, however, varies by country. In Vietnam, monks often perform on a lute, and lay musicians may be asked to accompany funeral ceremonies; in Burma, tempo is marked by a bell and clappers, in Laos by bells and a drum; the Chinese diaspora communities use a diversity of ritual instruments in numerous Buddhist, neo-Confucian, or other ceremonies. Buddhist reform movements are not known, though some Thai communities are concerned about a Hindu layer (found throughout much of mainland Buddhism) underlying many rites and music. Furthermore, isolated Buddhist groups today often wish to be part of a larger community, and they may ultimately sacrifice local traditions for their identity and survival. The Boda of Lombok, for example, frequently in-

vite Javanese and occasionally Japanese Buddhist monks to update their training, chants, and services as they coexist with a strong society of Muslims.

Popular religious music is widespread in Malaysia and island Southeast Asia. In Indonesia, *pop rohani* is Christian pop; *qasidah moderen* and some styles of *dangdut* (combining national, Western, Arabic, and Hindi film music elements) are Islamic. The performer Rhoma Irama pioneered *dangdut* in the 1970s. Commentators have credited or accused Irama of proselytizing for Islam; most artists, however, do not promote Islam. Singer and dancer Inul Daratista rose from poverty to become one of the most popular and controversial *dangdut* artists in twenty-first-century Indonesia. She became a superstar through music videos that showcased her erotic dance movements. She was soon censured by a conservative Muslim organization, the Indonesian Ulemas Council. The public rose to her defense, however, and created a backlash against the council, demonstrating the limited popularity of reformist Islam. In other areas, Balinese popular music frequently discusses issues of Hindu experience, and in Singapore and Malaysia, videos and video CDs of Buddhist songs in a karaoke format are produced for national and international markets.

DAVID HARNISH (2005)

MUSIC: MUSIC AND RELIGION IN CHINA, KOREA, AND TIBET

The three main streams of religion in East Asia—Confucianism, Buddhism, and Daoism—all employ music to express beliefs and ideas. Ancient shamanic practices as well as Christianity and Islam also play a part in the musical histories of China, Korea, and Tibet.

CHINA. Popular religion in China has for centuries drawn from Confucianist, Daoist, Buddhist, and animist elements. Extremely diverse in their local practices, the various forms of popular religion serve as vehicles for intense spiritual expression. Music is an integral part of this local structure. Festivals of popular religion almost always include processions accompanied by outdoor bands, and lion or dragon dances. Performances of music drama dedicated to the gods also form a key part of these festivals.

Aside from the three major groups, numerous minor religious communities also exist in China, Taiwan, and Hong Kong. Islam, for example, is practiced by about 3 percent of the population in China. No systematic report on Chinese Islamic practice is available to this author, but while conducting research on Chinese theater in China during the early 1980s, this author observed an evening service in a local mosque in Hangzhou celebrated by a small group of Chinese Sunnī Muslims. The service lasted about an hour and consisted of a cappella chanting of Qur'anic texts in Arabic by the congregation, lead by a mullah with appropriate obeisances.

Christianity also has a small following in China. Chinese Christian liturgies, whether of the Catholic or the Protestant church, follow their Western models closely. Hymnals used in the Chinese Protestant churches contain primarily hymn tunes from the West with Chinese texts, but "acculturated" hymns by Chinese composers based on Western models are occasionally included in Chinese Protestant hymnals. Protestant hymn tunes became one of the important predecessors of the modern Chinese song genre known as *gem-ing geju* ("revolutionary song").

Imperial ancestral cult rites. *Yayue* ("elegant music") was the music used in solemn state rites. The term may be used broadly to denote music used in court rituals and enter-

tainments, as well as that performed in secular government ceremonies. Since the Han dynasty (206 BCE–220 CE), however, the term has come to be used more narrowly to denote music used in solemn sacrificial rites with religious overtones, such as the imperial ancestral cult rites, Confucian rites, and rites dedicated to Heaven and Earth. It is in the latter, more restrictive, sense that the term *yayue* is used here.

Even though the repertory and musical styles of *yayue* changed from one dynasty to the next, it has always been performed by chorus and instrumental ensemble. The *yayue* chorus, called *dengge*, varied in size from one dynasty to the next. The *yayue* instrumental ensemble is sometimes called *bayin* (“eight sounds”) because its instruments represent eight essential kinds of timbres: metal (bell), stone (chime), clay (ocarina), wood (pounded wooden box and wooden scraper), gourd (mouth organ whose base was made of gourd), silk (zither), bamboo (flute), and leather (drum). A partial list of *yayue* instruments, according to modern classification, includes, among the idiophones: the *zhong*, suspended clapperless bronze bells of varying sizes struck with a mallet; the *xing*, suspended stone chimes of varying sizes struck with a mallet; the *zhu*, a pounded wooden box; and the *yu*, a tiger-shaped wooden scraper scraped with a bamboo whisk; among the membranophones: the *gu*, suspended drums of varying sizes and shapes; the *bofu*, a two-headed barrel drum placed on a wooden stand, played with bare hands; among the aerophones: the *xun*, an ocarina; the *zhi* and the *di*, transverse bamboo flutes; the *dongxiao*, an end-blown notched bamboo flute; the *paixiao*, a panpipe; and the *sheng*, a mouth organ whose sound box was first made of gourd, now of wood; and among the chordophones: the *qin*, a bridgeless zither with seven strings; and the *se*, a twenty-five string zither with bridges. The number of individual instruments included in the *yayue* orchestra varied from period to period. Qin with one, two, three, five, and nine strings at various times have been included.

Dance was also an integral part of solemn state sacrificial rites. Two kinds of dances were performed: the *wenwu* (civil dance), and the *wuwu* (military dance). The number of dancers prescribed was thirty-six in six lines of six persons (*liuyi*, “six rows of six dancers”) or in eight lines of eight persons (*bayi*, “eight rows of eight dancers”). *Liuyi* was prescribed for rites for emperors, and *bayi* for rites for lesser personages. Occasionally more than sixty-four dancers were used, but such an occurrence was rare and was usually viewed as an aberration. All dancers were male. The *wenwu* dancers, dressed in civilian clothes, held long pheasant feathers in their right hands and flutes in their left hands; the *wuwu* dancers, dressed in military clothes, bore swords in their right hands and shields in their left hands.

In addition to the use of music and dance in solemn state rites, other important ceremonial features included animal sacrifice and the offering of vegetarian food and wine to the personage being honored. Two kinds of animal sacrifice were defined: the *tailao*, or “great sacrifice,” involving the

sacrificial killing and offering of oxens, sheep, and pigs; and the *xiaolao*, or “lesser sacrifice,” involving the sacrificial killing and offering of oxen and sheep only. *Tailao* represented the highest honor to be bestowed and was prescribed only for the rites for emperors and Confucius.

Confucian rites. Shidian, a state sacrificial ritual held in spring and autumn in honor of Confucius, was established by the first emperor of the Han dynasty, Gaozu (r. 206–193 BCE), who made Confucianism the state ideology. Ceremonial features of Shidian rites conducted by the emperor were similar to those of the imperial ancestral cult rites, and like them they underwent many changes over the centuries. Four components remained basic: *tailao*, the Great Sacrifice; three rounds of offering of food and wine to Confucius, known as *sanzhan* (“three offerings”); *yayue* performance; and *wenwu*.

Prior to the middle of the Qing dynasty, two ensembles made up the *yayue* orchestra. One, called *tangshangyue* (“ensemble on the terrace”), sat on the terrace adjacent to the main shrine hall where the rite took place; the other, called *tangxiayue* (“ensemble on the ground”), was performed in the courtyard below. After the mid-Qing period (around 1766), however, only the *tangshangyue* was used.

In Shidian rites conducted by the emperor, the *wenwu* was always performed by thirty-six dancers (i.e., *liuyi*), except during the mid-Ming period, from about 1477 to 1531 CE, when the prescribed number of dancers increased first to sixty-four (i.e., *bayi*), then to seventy-two. After 1531 the number of prescribed dancers of Shidian was reduced once again to thirty-six.

Yayue compositions played at Shidian rites are referred to collectively as *dachengyue* (“music of completeness”), a term derived from the name customarily given to Confucian temples, *dachengmiao* (“temple of completeness”). The musical styles and repertoire of *dachengyue*, as well as its tunings and modes, changed frequently over the centuries. The most recent *dachengyue* was commissioned in 1742 by the emperor Qian Long of the Qing dynasty (r. 1736–1796). The Qing repertory consisted of six compositions and their transpositions. The original and the transposed versions were played in the spring and autumn rites respectively. All six compositions are for chorus with accompaniment by *yayue* orchestra. The chorus was made up of twelve male voices.

The texts of the six compositions are hymns of praise to Confucius uniformly composed in eight lines of four words each. Individual words are set syllabically to pitches of equal duration. Melodically, all the compositions are pentatonic with disjunct melodic movement; they were sung in unison in a slow, stately manner.

The vocal melodies were accompanied in unison by bell and stone chime sets and by the entire body of chordophones and aerophones. All the drums and single bells and stone chimes, as well as the *zhu* and the *yu*, perform colotomic, that is, structure-marking, functions. Three strokes on the *zhu*

signaled the beginning of a piece; three strokes on the *yu* signaled the end. The melodic phrase setting of each four-word line was initiated by one stroke on the *bozhong* (“big bell”), and concluded with three strokes on the *jiangu* (“big drum”) and three more on the *bofu*; these three-stroke *bofu* patterns consisted of a light first beat played by the left hand, an accented second beat played by the right hand, and a concluding beat by both hands. Preceding the singing of each word, the pitch was sounded on one bell of the bell set; afterward the same pitch was struck on a stone chime of the chime set. The dances were accompanied by chorus and orchestra.

Buddhist liturgical music. Traditional Buddhist services comprise four major categories: regular services; rites for the dead; rites for special services; and services commemorating birthdays of Buddhist deities. Regular services are conducted in two types of Buddhist institutions: monasteries and lay Buddhist organizations. In the monasteries, morning and evening services are held daily; in the lay institutions, regular services (modeled after those of the monasteries) are held once or twice weekly.

In all categories of Buddhist services, music, both vocal and instrumental, plays an integral part. Vocal and instrumental items follow one another without break in any given service. In general, Buddhist liturgical music can be characterized as simple, serene, and solemn. Liturgical texts used in Buddhist services are always chanted or sung, either solo or in chorus. *Fanbei* is the generic term for all vocal liturgical music. *Fanbei* is a distinctively Chinese style of liturgical song, though it may have been inspired by the Indian principle of syllabic, monotonic recitation.

Eight types of liturgical texts, some in verse format and some in prose, are used in Buddhist services:

- (1) *Sūtra* (*jing*)—Buddhist scripture in Chinese verse translation with ten syllables to the line. This type contains discourses of the Buddha and the *bodhisattvas*.
- (2) *Mantra* (*zhou*)—Central Asian, Pali, or Sanskrit devotional incantations in Chinese syllabic transliteration; *mantra* texts are meaningless to Chinese, though their general import may be known.
- (3) Hymn (*zan*)—eulogy in verse having irregular meter.
- (4) *Gātha* (*ji*)—verse exposition organized in eight-stanza structure, each stanza having four lines of equal length and each line containing either five or four syllables.
- (5) *Nianfo*—chanting the names of the Buddha or *bodhisattvas*. The length of a line is determined by the number of syllables that make up a name.
- (6) Prayer (*xuanshu* or *wen*)—prayers in verse to Buddhist deities.
- (7) Invocation (*shangyin* or *zuofan*)—verse text calling the congregation to worship.
- (8) Instruction (*shisong*)—priest’s address to a deity; in verse.

Fanbei music is pentatonic. Some items, such as hymn and *gātha*, feature a wide melodic range and varying melodic con-

tour; others, such as *sūtra*, *nianfo*, and prayer, have a narrower range and a somewhat static melodic contour. The *mantra* tends to be monotonal. A dominant feature of *fanbei* music is the consistent use of repetitive motifs or pairs of motifs. Variation of motifs is also frequent.

In regular services, each *fanbei* item is begun by the precentor (*weina*), who sings the first phrase and is then joined by the congregation of monks or laypeople. A vocal piece always begins slowly and gradually gets faster. Heterophony frequently results as some members of the congregation sing variants of the melody according to their different abilities. Instruments are always used to accompany singing in regular services. *Fanbei* are frequently chanted or sung by a solo voice in special services, but responsorial and antiphonal singing may also be used. Instrumental accompaniment may be absent in solo chanting in special services.

Three melodic styles of *fanbei* are distinguished by modern writers: syllabic, neumatic, and melismatic. *Fanbei* in syllabic style have one or two notes to each syllable of the text. To this type belong *sūtra*, *mantra*, prayer, and some *nianfo* chants. *Fanbei* in neumatic style feature three, four, or more notes to each syllable. *Gātha* and some *nianfo* used specifically to accompany the obligatory circumambulation in regular services belong to this type. *Fanbei* in melismatic style have ten or more notes set to one syllable. To this type belongs the hymn.

In traditional Buddhist services, nonpitched idiophones and membranophones are used to accompany *fanbei* singing. Instruments are also used to play the preludes, interludes, and postludes of services. In contemporary practice seven types of instruments are used: the *dagu*, a suspended two-headed barrel drum played with a mallet; the *dazhong*, a suspended bell played with a stick; the *dajing*, a large inverted metal bowl-shaped bell resting on a cushion and struck with a mallet; the *yingqing*, a small inverted bell fastened to a wooden handle and struck with a stick; the *muyu*, a wooden slit drum in the shape of a stylized fish head, struck with a wooden stick; the *danzi*, a small framed gong fastened to a handle and struck with a stick; and the *hazi*, a pair of cymbals. These instruments are made in various sizes to suit the demands of different ritual contexts. Those used in monasteries, for example, are usually larger than those used in lay institutions.

Buddhist worship manuals provide instrumental notation indicating the usage of musical instruments. Duration of notes and dynamics are not indicated in such manuals but are transmitted orally. Vocal melodies are transmitted entirely by oral means.

The arrangement of percussion patterns in a given vocal piece can be divided into three kinds: regular meter, in 4/4 or 3/4; composite meters, alternating between 4/4, 3/4, or 1/4; and unmeasured pieces, having no fixed temporal units. Some instruments use specific rhythmic patterns known by particular names. For example, the *muyu* (slit drum) pattern, known as “Eighty-eight Buddhas,” is characterized by a series

of accelerated strokes in diminishing volume. Another pattern, “Nine Bells and Fifteen Drums” (referring to the number of strokes on each), is used for the *bozhong* and *jiangu*. This pattern is made up of an initial slow section consisting of alternating drum and bell strokes, a fast central section consisting of simultaneous strokes on both instruments (with the drum being played twice as fast as the bell), and an accented drum stroke to conclude the pattern. During a regular service this pattern is played several times as an interlude and thereby performs a structural function for the entire service similar to that of the ritornello in Western compositions.

Music in Daoist rituals. The role of music in Daoist ritual practices has not been studied systematically by musicologists. Hence any discussion of music in Daoist rituals will necessarily be highly tentative. The following remarks are based primarily on the examination of a limited number of samples recorded in Taiwan, where monastic Daoism (such as it existed in China prior to the 1950s) does not exist. These examples are from rituals performed by different groups of ordained or lay priests belonging to a variety of orders. In addition, some of the description provided here is based on my observations in Hong Kong.

In contemporary Taiwan and Hong Kong, the most frequently performed Daoist rituals are funeral rites, exorcist rites, and the community rite of purification (Jiao). These rites are normally performed by a chief Daoist priest, the *daoshi*, with a small group of assistant priests and a few lay instrumentalists. Performances of rituals usually take place in the local Daoist temple or in the local temple of a popular religion, such as the Temple of Mazu (a goddess protector of seafarers) in Taiwan or the Temple of Tianhou (“heavenly mother”) in Hong Kong. Funeral rites may be performed at the home of the bereaved family. Some rites are performed in full view of the public, while others (e.g., certain purification rites) are performed behind closed doors to shut out the profane in order that the ritual purpose of purification may be fulfilled.

Music and dance play a central role in Daoist rituals. Both vocal and instrumental music are used. Vocal music, with or without instrumental accompaniment, includes passages in heightened speech, monotonal incantation, chants, and hymn tunes. Texts, in Chinese or Sino-Sanskrit prose or verse, are set syllabically or melismatically to pentatonic or heptatonic melodies; both measured and unmeasured melodies are found. Structurally, most compositions are in strophic form, but some are through-composed. In chants and hymn tunes, repetition of a motif or a phrase appears to be a prominent feature.

Vocal pieces are recited or sung mainly by a solo voice; occasionally responsorial singing and ensemble singing in unison are also employed. Singing is commonly done in a relaxed manner; use of special vocal techniques such as shouts, groans, microtonal vocal inflection or glides, and falsetto are not uncommon. A characteristic opening glissando

often precedes a vocal piece, and the insertion of vocable passages are by no means rare.

Instruments are used either singularly or in a group. These include, among the nonpitched idiophones: the *daqing*, an inverted bowl-shaped bell struck with a mallet; the *muyu*, a wooden slit drum struck by a stick; the hand bell; cymbals; and the gong; among the membranophones: the *fagu*, the ritual drum, which is a barrel drum played with two sticks; among the chordophones: the *sanxian*, a three-stringed, unfretted, plucked lute; and the *erhu*, a two-stringed, bowed fiddle; and among the aerophones: the *suona*, a shawm, and the buffalo horn.

Symbolically, the *daqing* represents heaven and the male principle, *yang*, while the *muyu* represents earth and the female principle, *yin*. When the ritual drum plays a certain pattern, it signals the beginning of a significant phase of a given ritual. Musically, all the idiophones beat time as well as mark off sections of music. Beats of the ritual drum also serve to regulate the tempo in passages where varying tempi occur. In addition to serving a colotomic (structure-marking) function, the cymbals are also used as a solo instrument playing various rhythmic patterns in a virtuosic manner as overtures, interludes, or postludes. One of the special cymbal playing techniques involves the manipulation of the dynamics of the sound after a clash by varying the degree of proximity between the two cymbal plates, resulting in a voicelike quality that can be quite eerie. This technique is used in funeral rites.

Instrumental melodies are played by the *suona*(s) and *erhu*; when serving as accompaniment to the vocal melodies, these instruments play a heterophonic version of the vocal melodies. The *sanxian* is used mainly as a colotomic instrument; it plays tremolo or chords to mark off vocal sections.

In ritual performances Daoist priests not only sing but also dance either alone or in groups. All dance gestures, as well as choreographic formations, have symbolic meanings.

To a believer, a Daoist priest is an indispensable intermediary between the human world and the spirit world. His presence is therefore necessary at a funeral in order to perform rites that ensure repose for the deceased. His presence is also required at exorcism or purification rites in order to perform rituals that will render evil ghosts harmless or to restore health, tranquillity, and purity to a community.

One of the most important community purification rites is the Jiao. Dividing into several phases, Jiao rituals may last three to five days or more, depending on the requests of the sponsors. The introductory part of Jiao is known as *qingsheng* (“inviting the spirits”). It is initiated with a liturgical item called *buxu* (“dancing in the void”), a generic term for an opening ceremony in which dance and hymn singing serve as preparation for ritual meditation. Both dance and hymns are accompanied by an instrumental ensemble of shawms, gong, drum, and *muyu*. The introductory part of Jiao also includes a liturgical item called “Flower Offering,” accompanied by voices alone. In the middle part of Jiao the

key ritual feature is a liturgy for the souls in purgatory, known as Pudu (“salvation”); it is a sung liturgy accompanied by an instrumental ensemble. The most colorful part of Jiao is an exorcist rite for the community called Dawanghang. To the accompaniment of shawms, gongs, and cymbals, the *daoshi* makes preparations to launch a paper boat, the vehicle that is to transport demons of infectious diseases away from the human world. When preparations are complete, the sounding of a series of water buffalo horn calls, accompanied by the ritual drum and gong strokes in accelerated speed, signals the actual launching of the paper boat. When the music stops, the *daoshi* calls upon the demons by name to board the boat and is answered by his assistant. Once this roll call is completed the *daoshi* plays the water buffalo horn, a signal to launch the boat by burning it.

The final phase of Jiao is a celebration of the restoration of health and purity to the community through the marriage of yin and yang. In heightened speech the *daoshi* offers incense to heavenly spirits. He then states the purpose of the Jiao and names the sponsors; both statements are chanted. A prayer whose text is written on a piece of paper is chanted next; it is a petition to the heavenly spirits on behalf of the community. When the prayer is finished, the written text is burned. Thereupon the sounding of drum rolls indicates that the climax of the ritual is to be unfolded. The *daoshi* calls out the name of Laozi three times, inviting him to visit the site of the altar; each call ends with an abrupt vocal leap encompassing the interval of an eleventh, followed by a long drum roll. Then eight drum beats are sounded three times. The number three symbolizes heaven, earth, and water, the three elements of the cosmos, and also the head, chest, and abdomen, the three essential parts of a person. These drum beats summon the spirit of the *daoshi* to offer tea and incense to Laozi. He first chants and then dances, using stylized and symbolic gestures simulating the acts of offering tea and incense to Laozi.

KOREA. Shamanism, the oldest of Korean religions, consists of a group of unorganized beliefs about the supernatural world. It still has some following today, particularly among the rural population. In modern times, the two major social and religious forces existing in the Republic of Korea (South Korea) are Confucianism and Christianity. Christianity was introduced into Korea as early as the late sixteenth century, but it was not until the late nineteenth century that missionaries from the West—both Protestant (mostly Methodist and Presbyterian) and Roman Catholic—began full-fledged missionary work. Korean Christian liturgies follow their Western models closely. Western hymn tunes with Korean texts are used in services. Occasionally, hymns composed by modern Korean composers are also included in the Korean hymnals. Some of these hymns are set in triple meter, a characteristic feature of indigenous Korean music.

Mahāyāna Buddhism was introduced to Korea from China during the late fourth century CE. Today Buddhist rituals, if performed at all, usually take place in a few temples

staffed by a handful of married priests. Some of these priests conduct classes for the laity in Buddhist chanting and in so doing have become the sole perpetuators of the now fragile Buddhist ritual tradition in Korea. The survey given below of Buddhist ritual music is based on field reports conducted by Korean musicologists among married Buddhist priests.

Sacrifice to Confucius. Music used in the rite of sacrifice to Confucius is called *a-ak*. This term is the Korean pronunciation of the Chinese term *yayue* (“elegant music”). In contemporary usage the term *a-ak* denotes the whole repertory of court music, but in the Yi dynasty (during which *a-ak* was first codified) the term denoted music performed in a number of sacrificial rites observed by the royal court and in government ceremonies. It is in this latter, more restricted sense that the term *a-ak* is used here.

The Korean *a-ak* tradition began in 1116, when the Chinese emperor Huizong (r. 1101–1125) of the Song dynasty sent a large number of *yayue* instruments to the Korean emperor Yejong (r. 1105–1125) of the Koryo dynasty, as a political gesture. Subsequently, during the Yi dynasty, and particularly during the reign of Emperor Sejong (1455–1468), *a-ak* was codified and expanded. Its codification was directed by the music theorist Pak Yon (1378–1458), who undertook not only the theoretical clarification of *a-ak* based on Chinese sources but proceeded also to construct a large number of musical instruments based on Chinese models. In addition, Pak Yon reconstructed music for the *a-ak* ensemble based on a limited number of notated Chinese ritual melodies, adding to these melodies his own interpretation of Chinese musical concepts and tunings. The result was a body of music with a mixture of Chinese and Korean elements but essentially Confucian in spirit. *A-ak* has been performed continuously from the fifteenth century till the present, with no evidence of decline.

Reflecting the Confucian doctrine of universal harmony, the *a-ak* orchestra employs eight kinds of instruments representing the eight essential kinds of instrumental timbres: metal (bells), stone (chimes), silk (zithers), wood (pounded wooden box and wooden scraper), bamboo (flutes), clay (ocarina), leather (drum), and gourd (mouth organ). In the modern *a-ak* orchestra the gourd category is missing, and wooden clappers (*pak*) have been added; this latter instrument performs a very limited function.

According to present-day performance practices, *a-ak* played in the rite of sacrifice to Confucius is performed antiphonally by two orchestras, one placed on the terrace of the main shrine building and the other placed in the courtyard below the terrace. The terrace orchestra, called *tŭngga*, consists of seventeen players; the courtyard orchestra, called *hōn'ga*, consists of fifteen players. During Emperor Sejong's reign the number of players in both orchestras was much larger, and vocal items were included. But today *a-ak* is purely instrumental. Two ritual dances are performed in the sacrifice to Confucius, the *munmu* (civil dance) and the *mumu*

(military dance). Sixty-four dancers are prescribed for this ritual.

The overall musical characteristics of *a-ak* are refinement, serenity, and simplicity. The repertory consists of two basic heptatonic compositions and their transpositions. Structurally, each composition has eight phrases of equal length, each phrase consisting of four notes of equal duration. The tempo is exceedingly slow. Melody instruments including flutes, panpipes, ocarinas, and stone chimes play in unison; the flute, however, ends each note with an upward slide of about a semitone from each pitch. The drums and bells perform purely a colotomic function by marking off sections of each composition.

Royal ancestral shrine music. The music repertory for this ritual contains a limited number of compositions said to be chosen by Emperor Sejong. In terms of musical style they reflect an acculturated mixture of Chinese and Korean music; native Korean music (*hyangak*) current in the fifteenth century is also represented. These compositions are vocal pieces in Chinese with orchestral accompaniment arranged in suite form. Two orchestras are used to perform this ritual. These orchestras are also called *tŭngga* and *hŏn'ga*, as in the *a-ak* orchestra, but their instrumentation is different.

Buddhist rituals. Traditional Korean Buddhist rites consist of three components or performing genres: ritual chant with or without instrumental accompaniment, outdoor band music and ritual dance with vocal and instrumental accompaniment. Of the three, ritual chant is by far the most important.

Five categories of special Buddhist rites in which music plays a prominent role are distinguished: Kakpae-je, a rite in praise of ten Buddhist deities whose rituals call for the largest repertory of chants and dances; Saengjŏn yesu-je, a purification rite; Sangju kwŏn'gong-je, a rite dedicated solely to Buddha; Surguk-che, a rite for the spirits of water and earth; and Yŏngsan-je, a tribute rite. In addition a number of small-scale rituals associated with rites for the dead also employ music and dance. Today large-scale special rites are held only at the demand of sponsors. A rite may last from one to several days depending upon the request of the sponsors.

Three categories of ritual chants are differentiated: sūtra (Buddhist invocation), *hwach'ŏng* (chant based on folk style), and *pŏmp'ae* (a long solemn chant). Sūtra chants, also called *yŏmbul* ("invocation"), are of two kinds, each having different texts and employing different instrumental accompaniment. Texts of the first type are Chinese transliterations of Sanskrit and hence are unintelligible to laypeople. Texts of the second type are Chinese translations from Sanskrit whose general import may be understood by the laity. In the following discussion the first type of chant will be called "Sanskrit sūtra" and the second type "Chinese sūtra."

The repertory of Sanskrit sūtra is small. The music is for unison chorus with instrumental accompaniment. The vocal part consists of the repetition of a few sets of syllabic

phrases. The instrumental part, played by an ensemble of reeds, drums, large gong, and a wooden slit drum called *mok'tak*, consists of the repetition of a melody independent of the vocal one and played by the reeds, with isorhythmic patterns played by drum and gong and the constant beats of the *mok'tak*. There is a subtle relationship between the accentuation of the vocal melody and the instrumental rhythm. Chinese sūtra chants are also performed by unison chorus, which sings repeated sets of texts having a limited compass. The constant beats of the *mok'tak* accompany the voices, each beat coinciding with the utterance of a textual syllable. The repertoire of Chinese sūtra is relatively large. While Sanskrit sūtra chants are employed mostly in special rites, Chinese sūtra chants are employed in both regular and special rites.

Hwach'ŏng (lit., "humble request") are chants for solo voice with texts in vernacular Korean. The singer traditionally accompanies himself with strokes played on a small gong; another accompanying instrument used is a suspended barrel drum (*puk*) played by someone other than the singer. The drum player strikes the bottom of the drum with one bare hand while at the same time striking the wooden frame of the right side of the drum with two sticks. Triple meter, a common feature of Korean indigenous music, is usually found in *hwach'ŏng*. *Hwach'ŏng* texts, expounding the benefits of Buddhist enlightenment, are set in verse form.

The third category of Buddhist chants, the *pŏmp'ae*, is said to derive from the Chinese *fanbei*. *Pŏmp'ae* texts are in Chinese verse, but Chinese rhyming schemes and tonal patterns are not observed in these texts. *Pŏmp'ae* music is made up of repetition, variation, and structural rearrangement of a basic set of stereotyped motifs or phrases. As performed today, *pŏmp'ae* is always sung in free rhythm and in a low register. The meaning of the texts is frequently difficult to grasp because each syllable is set melodically to notes of long duration. In addition, the practice of liberal insertion of passages of vocables further obscures the meaning of the texts.

Two types of compositions are found in the *pŏmp'ae* repertory: the *hossori* (short chant) and the *chissori* (long chant). Each type is characterized by a distinct melodic and textual organization, as well as by the employment of different styles of performance. *Hossori* consists of solo, choral, and responsorial chants, all of which are sung in a relaxed, open-throated manner to the accompaniment of a small hand bell. Structurally, *hossori* texts are organized in quatrain form with lines of equal length. These four lines are set to a pair of melodic phrases in repetition; thus musically the structure of *hossori* is in binary form: *a b a b*. *Hossori* are always sung slowly at first, then faster, and then slowly again to conclude. In the fast sections the motifs within each phrase undergo a process of rhythmic reduction.

For special rites *hossori* may be performed in conjunction with a ritual dance, accompanied by an outdoor band made up of one or two conical double-reed instruments

(*t'aep'yongson*) and a large gong (*ching*). A barrel drum (*puk*), a pair of cymbals (*chegum*), a long trumpet (*nepal*), and a conch shell (*nagak*) may also be added to the band. The band plays repetitions of a long melodic cycle that has only a tenuous correlation with the vocal melody.

The other type of *pōmp'ae*, the *chissori*, is regarded as the most important and sophisticated of all Korean Buddhist chants. It is seldom performed today; when performed, *chissori* is always used in conjunction with large-scale special rites. Music for the *chissori* is drawn from a pool of stereotyped melodic phrases, each in turn built on a series of motifs. The way in which these motifs are organized into a piece defines the individuality of a *chissori* composition. The entire repertory of *chissori* contains seventy-two compositions.

Like that of *hossori*, the performance of *chissori* begins slowly and then speeds up; in the fast section the motifs undergo a process of rhythmic reduction; it then concludes slowly. Most *chissori* are performed primarily by an ensemble of voices in unison. But a few compositions may have one or two solo sections inserted either at the beginning, in the middle, or at the end. These solo interpolations (*hōdōlp'um*) are optional groups of fixed melodies independent of those of the ensemble and made up of stereotyped motifs. Depending on the time available, *chissori* may be sung either with measured rhythm, or with unmeasured rhythm in which the duration of each note is greatly prolonged. Consistent use of microtonal glides characterizes *chissori* performance. A special feature is the application of a microtonal upward glide prefixed to a given note; this note is then followed suddenly by a falling glide encompassing the interval of an octave. *Chissori* is sung in a tense-throated manner. For notes in the high register, falsetto technique is used.

TIBET. The indigenous religion of Tibet is Bon, which evolved from northern and Inner Asian shamanism. During the periods of the first kings (seventh–tenth century CE), North Indian Mahāyāna Tantric Buddhism was introduced to Tibet. Subsequently Bon and Tantric Buddhism merged and resulted in a highly syncretic form of Tibetan Buddhism.

Music in Bon ritual. Monastic forms of Bon have been largely assimilated by Tantric Buddhism. Many ritual practices of Bon have also been influenced by Buddhism. Bon ritual music employs chanting and instrumental music; the chief instruments are the indigenous *phyedrña* (single-headed drum) and the *gshañ* (“flute bell”). Flutes and trumpets made of animal bones are also used. In the instrumental part of the ritual the drum occupies a central place. According to legend, when a Bon priest plays a drum he is thought of as mounting a flying steed to heaven to communicate with the gods. Bon chants are organized in strophic form, and in performance a large variety of vocal techniques are used, such as gliding before and after a given note, whistling, shouting, or masking the voice. Some of these sounds are said to represent the voices of spirits heard through the singer as medium. As the ritual progresses, the tempo of chanting and instrumental

music accelerate, and the volume also increases; great intensity is generated as a result.

Buddhist liturgy. Tibetan Buddhists hold that music prepares the mind for spiritual enlightenment. Accordingly, music (vocal as well as instrumental) is employed in the monastic routines that focus on five daily assemblies held in the monastery shrine hall between sunrise and sunset. The daily services consist predominantly of choral chants, with or without instrumental accompaniment, and antiphony between choral chant and instrumental interludes. All music is notated. Important liturgical items include the monks’ “invitation” to the deities to visit the place of worship, the ritual of offering, thanksgiving hymns, and hymns of praise to the Buddha and the *bodhisattvas*.

Monks participating in the daily services sit cross-legged in paired rows facing one another. The music of the service proceeds under the direction of the *dbumdza* (chant leader). The choral chant is normally sung in unison in a quiet and restrained manner; heterophony occasionally occurs. Texts for choral chants are drawn mostly from the sacred scripture known as the Bka’ ’gyur (Kanjur, doctrine attributed to Buddha) and from Bstan ’gyur (Tanjur, commentaries). Three main chant styles are distinguished: solo parlando recitation, *gdañ* (hymn), and *abyañs* (sustained chant).

Solo parlando recitation, in measured or unmeasured rhythm, is usually employed in short introductory passages. The *gdañ* is chanted in a series of meters (duple, triple, or asymmetrical meter such as 11/8), depending on the textual structure. Melodically, sections of *gdañ* are made up of repetitions of one or two pairs of phrases having a limited range in predominantly conjunct motion. The chant may also be monotonal. Words in *gdañ* are set either syllabically or melismatically. In performance a variety of ornaments, such as glissando and glides before and after a note, are used. *Gdañ* is accompanied by a cymbal and drum whose function is simply to beat time.

The *abyañs* is chanted in an extremely low register and essentially in a monotone. Words are set syllabically to notes of long duration prefixed or affixed by a variety of microtonal inflections or vocal glides. A special vocal technique has been cultivated by two monasteries of the Dge-lugs-pa order in which each chanter simultaneously sings two pitches, a deep fundamental and a clear harmonic (either the fifth or the sixth harmonic), resulting in a choral effect. The *abyañs* is chanted in a quiet manner.

In contrast to the quiet vocal chanting of *abyañs*, instrumental interludes of *abyañs* are played loudly. The aerophones are always played in pairs. One of the two *rgya glin*s, which are shawms, plays the main melody in an unadorned manner while the other plays the main melody with ornamentation. The other aerophones, the *duñ*—a trumpet of varying sizes with a low tone quality, the *rkañ glin*—a trumpet made of animal femur or of metal, and the *duñ dkar*—a conch, play long, sustained notes and repeat chords of two

itches, a two-note ostinato figure. The *domaru*, a rattle drum, and the *dril bu*, a handbell, are played by one person whose strokes serve mainly as signals marking sections of the chants. The cymbals (*gsil snyan* and *rol mo*) and the two *ruqa* drums, untuned double-headed drums each struck with a crooked stick, play a variety of rhythmic figures as well as beating time. The resultant instrumental texture is complex and its timbre full of subtle nuances. In contrast to the rhythmic complexity and subtlety of the percussion part, the music for the shawms—the only melody instruments in the ensemble—is rather simple and straightforward; it is played in a rhythmically fixed manner with penetrating volume. Circular breathing is employed in shawm playing so that a continuous line is achieved.

Liturgical drama. The *'cham* is a quasi-liturgical ritual drama performed to exorcise evil spirits. The ritual is performed outdoors and involves the use of music (both vocal and instrumental), mime, and dance, as well as elaborate costumes and masks. The music ensemble consists of groups of chanters and an instrumental ensemble similar to that used in monastic liturgical services, with the addition of special sound effects not found in those services.

MUSIC: MUSIC AND RELIGION IN JAPAN

Traditionally, religious music in Japan consisted of songs and dances that were performed as offerings to various gods.

Songs and dances also served to work performers into trances in *kamiasobi* (singing songs and dancing for gods) in order to call a god or gods into attendance. During the Tumulus period (third to seventh century CE), songs and dances were performed by virgins consecrated to deities, continuing a tradition of shamanistic music from the Yayoi period (fourth century BCE to third century CE). Such performances were accompanied by *koto* (a long four- or eight-stringed zither) and *tsuzumi* (a hand-beaten drum). These instruments appear in clay figures of consecrated virgins and the songs and dances are described in several ancient texts, including *Kojiki* (712 CE), *Nihonshoki* (720 CE), and *Fudoki* (first half of the eighth century). The songs incorporated into these works were probably sung for feasts, funerals, and similar occasions.

Kagura (music of the gods) refers to the music and dance used in Shintō ceremonies. *Kagura*, called *kamiasobi* in old times, originated in the song and dance of ancient religious services. *Kagura* can be divided into the two forms: *mikagura* and *okagura* (*satokagura*). *Mikagura* is performed at the imperial palace, whereas *okagura* is performed at local shrines. *Mikagura* originated in *kinkashinen* (religious feasts), which were held in Seishodo Palace during the reign of Emperor Seiwa (r. 858–876) of the Heian era. Singers were accompanied by a type of *koto* (probably a *wagon*, a long six-stringed zither). In the reign of the Emperor Ichijō (r. 986–1011), *mikagura* was performed in the Naishidokoro (Kashikodokoro) Palace to the accompaniment of *kagurabue* (a bamboo transverse flute), *hichiriki* (a double-reed pipe), and *wagon*.

Mikagura performers sang several types of songs, including: (1) *niwabiuta* (songs of the garden bonfire), consisting of chants of *niwabi* and *ajimesahō*; (2) *torimonouta* (songs of holding hands for dance), consisting of *sakaki*, *mitegura*, *tsue*, *sasa*, *yumi*, *tachi*, *hoko*, *hisago*, *kazura*, and *karakami*; (3) *sai-baraburi* (songs of *saibara*), which are folk songs collected from various regions and which includes forms known as *ajime*, *oosabari*, *kosaibari*, *senzai*, and *hayauta*; (4) *hoshiuta* (songs of stars); and (5) *zōka* (songs of various kinds), including *akaboshi*, *tokuzeniko*, *yuuzukuru*, *hirume*, *yutate*, *kamiage* and *asakura*, *sonokoma*, *hetsuiasobi*, and *sakadono*. The chant, sung in slow tempo, is rich in melismatic style. Singers were divided into two groups called *motokata*, which faced the shrine from the left, and *suekata*, which faced the shrine from the right. Each one of the principal singers, called *ondō*, beat a *shakubyōshi* (a wooden clapper). The *ninnyō* (a male dancer) performed in the evening at the small shrine in Kashikodokoro Palace with the emperor in attendance.

Okagura has been performed at shrines during folk ceremonies since the modern period. There are several forms of *okagura*: *mikokagura* (dance of a maiden in the service of a shrine); *izumokagura* (dances using mats, bells, sacred trees, swords, and other objects with mythical significance); *isekagura*, which consists of *yudateshinji* (sprinkling hot water of an iron pot) and dances illustrating various stories; and *shishikagura* (dances with lion's mask). In *ōmotokagura* (worship of ancestors called *Ōmoto*), which is performed in Shi-

mane prefecture, a spiritualistic male medium works himself into a trance and reports the oracle of the god concerning that year's harvest.

Some shamanistic practices persist among shamans called *itako* (Aomori prefecture) and *yuta* (Amami Island and Okinawa). Here the spirit of the dead possesses a *miko* (female shaman) and speaks through her in simple chanting.

The authentic music of Chinese Confucian ceremonies was never performed in Japan, but the spirit of Confucianism can be found in the music of the *ch'in* (a long seven-stringed zither), an instrument favored by the intelligentsia interested in Chinese philosophy and literature during the Edo period (1603–1867).

When Buddhism was introduced from Kudara on the Korean peninsula by King Kinmē in the early sixth century, dances called *gigaku*, which originated in China, were performed in order to dedicate temples to the Buddha. The masked characters of *gigaku* performed to the accompaniment of a *yokobue* (a bamboo transverse flute), a *shōban* (a gong), and ten *yōko* (hand drums hung at waists).

Kenzuishi and Kentoshi, Japanese envoys to Sui and Tang dynasty China, introduced Buddhist chanting (*shōmyō*) and *gagaku* (court music and dance) to Japan. In 752, to celebrate the completion of a colossal bronze statue of Vairocana Buddha at Tōdaiji, the principal national temple in Nara, a magnificent Buddhist service was held. A thousand or more monks sang *shikahōyō*, composed of four Buddhist chants (*bonnon*, *shakujyō*, *bai*, and *sange*), and performances of *gagaku*, *gigaku*, and other types of music and dance were presented. Eighteen types of instruments, *gigaku* masks, and a number of the costumes that were used in this service have been preserved in the Shōsōin (the treasure house of Tōdaiji) in Nara. In 861, *mushataie* (another type of Buddhist service) was held in Tōdaiji to celebrate the completion of repair work on the head of the Vairocana Buddha, which had been damaged during an earthquake. On a stage in front of the Daibutsuden (the large building housing the statue of Vairocana Buddha) *gagaku* and *bonnbai* (a form of *shōmyō*) were performed, and Buddhist chanting called *narashōmyō* or *nantoshōmyō* was conducted in several Nara temples.

When in the early years of the ninth century the Tendai and Shingon sects were introduced by the monks Saichō, Ennin, and Kūkai from Tang dynasty China, *shōmyō* was newly reformulated as the *tendaishōmyō* and *shingonshōmyō*. The *goenembutsu*—repeating the *nembutsu* (chanting of the name of Amida/Amitabha Buddha) in five kinds of voice—that Ennin brought to Japan from China was performed as *inzēnembutsu* (drawing voice *nembutsu*) on Mount Hie, the headquarters of the Tendai sect. The *fudannembutsu* (*nembutsu* ceremony) was developed by the monk Sōō in the Mudōji temple and handed down by the monks Sengan and Genshin, who also developed a form of chant praising the Buddha called *wasan*. In addition, Shōrinin, which the monk Jakugen set up in Ohara (Kyoto), and Raigoin, founded by

the monk Ryōnin in Ōhara, served as *shōmyō* fundamental schools. Ryōnin contributed to the reunification of *tendaishōmyō*, which had split into branches after Ennin. *Gyozan shōmyō rokkanjyō*, a book expounding the theoretical and practical principles of the music, was edited by the monk Kekan, a pupil of Ryōnin. *Shōmyōfyojinshū*, a work edited by the monk Tanchi, established the basis of modern *shōmyō* by applying the musical theory of *gagaku*. The monk Kanchō established the basis for *shingonshōmyō*, although this style later developed into several schools, including *ninnajisōinryū*, *nakanokawadaijyōshōinryū*, and *daigoryū*.

Various Buddhist sects that were opened to membership from the wider public were formed during the Kamakura period (1185–1333). Hōnen, the founder of the Jōdo sect, emphasized the importance of the *nembutsu*: “Namu Amida Butsu.” Ippen, founder of the Ji sect (a branch of Jōdo), propagated *nembutsu* through the *odori-nembutsu* (dancing *nembutsu*). The forms of chanting practiced by the Jōdo, Jyōdo-shin (founded by Shinran, a pupil of Hōnen), and the Ji sects were influenced by Tendai Buddhism. On the other hand, the chants of the Rinzaï and Sōtō Zen sects, newly transmitted from China by Ēsai and Dōgen respectively, were influenced by Chinese practices.

The general term for Buddhist chanting is *shōmyō*, or *bonbai*. *Shōmyō* texts can be classified into three types based on the language used: Sanskrit, Chinese, or Japanese. *Bongosan* are Sanskrit chants. Several types of chants are performed using classical Chinese (*kangosan*). Chinese-language chants include *bai* and *kada* (verse chants praising a blessing of Buddha); *nyoraibai* (a *tathagata* chant); *gobai* (a later chant); *sōrēkada* (all-praising chant); *ekōkada* (chant to hold a memorial service); *sange* (verse chant performed while scattering flowers); *bonnon* (verse chant for a memorial service before the principal image of Buddha); *shakujyō* (verse chant involving a priest’s staff); and *sange* (chant to repent sins). Japanese-language chants include *wasan* (verse chant praising a blessing of Buddha); *saimon* (prose chant repaying Buddha or the founder of a sect); *hyōbyaku* (prose chant explaining the purpose of a Buddhist service); *kyōshaku* (prose chant explaining the content of a sūtra); *kōshiki* (prose chant praising the Buddha), and *rongi* (prose chant summarizing content of a sūtra).

Bongosan texts are written in Chinese characters that yield phonetic approximations of the Sanskrit. *Kangosan* is a system of chanting Chinese texts according to their *kan* reading (i.e., according to the Japanese equivalents of the sounds of the Chinese graphs). *Wasan* consists of Chinese texts translated into Japanese.

Shōmyō influenced various forms of chanting directly or indirectly. *Kōshiki* and *Rongi*, forms of narrative *shōmyō*, musically influenced *Heikyoku* (the recitation of the *Tale of the Heike*). Musical terms associated with *shōmyō* include *shojyū* (the lower set of notes), *sanjyū* (the upper set of notes), *chūon* (the middle set of notes), *sashigoe* (the chanting of syllables smoothly), *shiragoe* (chanting in conversational style), and *yōkyoku* (the chanting of Nō dramas). *Shōmyō* also includes

sashi (chanting in rhythm as speech), *sanjyū* (the opening style), *yōkyoku* (the chanting of Nō dramas), and *jyōruri* (a dramatic narrative chant). *Jyōruri* was originally the recitation of the romance of Minamoto Yoshitsune (a military commander) and the princess Jyōrurihime, chanted to time kept by tapping a fan or by *biwa* (a four-stringed lute) accompaniment. *Jyōruri* was accompanied by the *shamisen* (a three-stringed plucked lute) after that instrument was introduced to Japan from the Ryukyu Islands in the sixteenth century. This style was later adapted to the puppet theater.

Another chant form called *fushidansekyō* was developed from *sekyō* (sermons or discourses). Such sermons were chanted in singsong tones in order to more easily educate the people. Itinerant chanters and performers also recited *sekyōbushi* (a parable or story of karmic destiny). These popular performers used *sasara* (a scraper), *kane* (a small gong), and *kakko* (a small horizontally-held drum). During the Edo period, itinerant troupes performed *sekyōbushi* with puppets.

During the Heian period (794–1185), *gagaku* and *shōmyō* were adapted to Japanese styles. In the court, *saibara* (folk songs collected from various regions) were performed to the accompaniment of the instruments used in *gagaku*, including *ryūteki* (a bamboo transverse flute), *hichiriki* (a double-reed pipe), *shō* (an wind instrument with seventeen bamboo pipes), *sō* (a long thirteen-stringed zither), *biwa*, and *shakubyōshi* (wooden clappers). The court chant known as *rōei* (chanting a Chinese and Japanese poem) was accompanied by *ryūteki*, *hichiriki*, and *shō* in a free rhythm.

During the Heian period, *imayō* (modern chanting or songs of the present age) were performed by *asobime*. *Asobime* or *asobi* were itinerant female singers and dancers, sometimes associated with prostitution. *Kugutsume* were similar performers who used puppets beginning in the middle of the Heian era. The retired emperor Go Shirakawa (1127–1192) and his vassals were taught *imayō* by *asobime*. This is remarkable in that members of the highest elite apprenticed themselves to gypsy-like women. The *asobime* practice of singing *imayō* was held to be an efficacious means of achieving enlightenment. Go Shirakawa compiled *Ryōjinhishō*, an anthology of *zōgē* (various chants) and oral instructions on *imayō*. There were broadly several kinds of songs: *imayō* in the narrow sense; *hōmonka* (songs influenced by Buddhist chanting); *kamiuta* (songs of the *kami*), *chōka* (long chants), and *koyanagi* (free-form chants). These were sometimes performed to the accompaniment of a fan beat or a hand drum. According to the *Ryōjinhishō*, Go Shirakawa received twelve years of training in *imayō* from Otomae, an *asobime* from Aohaka in Mino province. *Imayō* chanted by monks to the accompaniment of *sō* (the zither used in *gagaku*) in temples were called *etenrakuimayō* or *etenrakuutaimono*.

In the late Muromachi era (mid-sixteenth century), the monk Kenjyun of Zendō temple in northern Kyushu developed *tsukushisō*, a solo chant performed while accompanying oneself on the *sō*. Yatsushashi Kengyo (a high-ranking blind

performer) reformed *tsukushisō* into *sōkyoku* (koto music). In the Edo period, *sōkyoku* consisted of *kumiuta* sung to the accompaniment of *sō*.

During the Kamakura period, the *fukeshakubachi* (a vertical bamboo flute) was played as part of the training of monks called *komusō* of Fukeshū, one of the Chinese Zen sects. In the Edo period the Tokugawa shogunate authorized Fukeshū and made use of *komusō* as secret agents, who toured the country during their training.

Heikyoku was a narrative form of vocal music performed by *biwahōshi*, blind monks who performed with the *biwa*. They chanted the military epic *Heike monogatari*, describing the famous history of the Heike (one of two great political families of twelfth-century Japan). Another group of blind biwa-playing monks were *jijinmōsō* in Kyushu. *Jijinmōsō* performed *mōsōbiwa* (a genre of *biwa* music) as they visited individual houses to calm the violent *dokōjin* (gods of the earth) and pray for bountiful harvests.

Most songs were sung in unison, with occasional use of the intervals of the fourth or fifth separating two voice parts moving in parallel. The scale, consisting of twelve tones, varied according to the period and the genre. Generally, intervallic skips of the fourth and fifth characterize the melodic pattern. The singing could be either melismatic in free rhythm, or it could consist of one tone sung in metric rhythm. Noteworthy is the fact that the melodic structure of *shōmyō* influenced other forms of Japanese music. For example, both *Heikyoku* and the singing in Nō drama were influenced by chant forms.

The notation of Buddhist chants falls into three categories. The oldest is called *ko hakase* (old *hakase*; musical notation), which indicates the melody with marks representing the four Chinese tonal accents. The second system, called *go-on hakase* (five-tone *hakase*), is represented by short vertical and horizontal bars, one for each letter of the text, showing five tones. The newest category of chant notation, *meyasu hakase* (literally, “*hakase* for easy understanding”), presents the melodic line in more detail by drawing curved lines in addition to the marks for tone pitches. This system resembles the neumatic system of medieval Europe. *Meyasu hakase* is preserved in a manuscript dated 1311 written by Ryōnin, the founder of this chant notation.

A comparison between Buddhist music in Japan and other Asian countries reveals both similarities and differences. A chanting style based on one tone and the use of percussion instruments is common to all, but the use of the double-reed pipe and trumpet is not found in Japan. Vocalization in deep voice is also common to many Asian Buddhist societies. The biggest difference is in regard to melody. Chinese chants, more popular in character than Japanese chants, tended to adapt the melodies of folk and popular music. By contrast, Japanese chant has preserved the older style of Buddhist music.

MUSIC: MUSIC AND RELIGION IN GREECE, ROME, AND BYZANTIUM

This survey of the interrelation of religion and music in Western antiquity from the Homeric age to the age of Justinian (c. 1000 BCE–500 CE) will examine the religious dimensions of the music of Greece and Rome, the music of the early church, and the liturgical music of Byzantium.

GREEK MUSIC. The word *music* (*mousikē*) originated in the Greek language. However, to the Greeks it meant more than the art of tones sung or played on instruments. It encompassed education, science, and proper behavior, as well as singing and the playing of instruments. To modern man this ancient music—the very little that has come down to us—sounds simple, unmelodious, and occasionally even dull, but in the broader conception of *mousikē* we may recognize the basis for the magical, ritual, and ethical dimensions that characterize Greek music and relate it to Greek religion. This discussion of Greek music during the period from the Homeric epics (eighth century BCE) to the age of the Roman emperor Augustus (first century BCE) will treat, together with religious function, its theory, and main styles and forms.

Pre-Christian Greek religions. Greek religions were polytheistic and based upon popular mythologies. Followers of Homeric religion adored and feared the Olympian gods, who frequently behaved like humans, possessed of very human virtues and vices. Their cult was sacrificial, and its liturgy proceeded by sacrificial action. Sacrifice served in rituals of atonement, imprecation, and thanksgiving, in ceremonies for the dead, and in the fearful adoration of the chthonic divinities of the netherworld. Its aims were gratification of the gods and apotropaic protection from adversary gods or demonic forces. In the seventh and sixth centuries BCE Orphism arose, a mystic movement taking as founder the fabled musician Orpheus. Closely related to Orphism, and also originating in Thrace, was the cult of Dionysos, which worshiped with wine and song in wild bacchanalia its

god Dionysos-Bacchus. Beginning with the fifth century BCE and thereafter, a more philosophical, less ecstatic type of religion emerged under the impact of Pythagorean, Platonic, Aristotelian, and Stoic philosophies. Connection with ethical principles characterized this conception of religion. We may see it in the still polytheistic context of Sophocles' Oedipus trilogy in Antigone's defense of "the infallible, unwritten eternal laws of heaven, which no mortal can overrule." Socrates, who lived by this doctrine, like Sophocles' heroine, paid with his life. Yet Socrates' teachings were carried on by Plato, whose systematization of Socratic thought wholly reshaped Greek religion.

Musical principles. From earliest times the Greeks took interest in the theory of music, and subsequent to Pythagorean concern with the mathematico-philosophical aspects of music they occupied themselves with it continuously. Their most important achievements were their acoustic discoveries, which were basic to the development of Western music.

From the infinity of tones, sounds, and rhythms with which nature surrounds man, the Greeks selected a limited number of tones, which they ordered, identified, and categorized according to *harmoniai*, or species of scales. In Greek music theory the term *harmony* refers to the various divisions of the octave into scales. The Greeks knew Dorian, Phrygian, Lydian, Mixolydian, and other scales, each of which consisted of two conjunct or disjunct tetrachords. Tetrachords composing the scales were divided into three distinct genera: the harmonic, the chromatic, and the enharmonic. (Greek tetrachords and scales progressed downward from a higher tonic rather than upward as in medieval and modern music.) Scales were precise, mathematically constructed systems. The scope of these *harmoniai*, however, was much greater than that of simple scales. The Doric "harmony" was the yardstick by which all melodies were judged. Its strict simplicity was understood as the ideal of moral straightforwardness, indeed, of Spartan fortitude and austerity. Within their various scales, the Greeks also knew certain tropes (*tropoi*), which characterized the mode of any given melody. The meaning of "mode" in Greek musical theory has been a matter of considerable scholarly debate; I take it to refer to complex melodic types or structures of melodic motives on the order of the Indian *rāgas* or Arabian *maqamat*.

The theory of tone-word relationship is basic to an understanding of Greek music. Poetry and music were closely bound, with the words of the text defining rhythmic structure through the quantities of metrical pattern. The role of stress or accent in relation to meter and music, controversial in late antiquity, remains problematic.

Magic power of music. The Greeks ascribed to music magic and therapeutic powers. It could heal wounds (Homer, *Odyssey* 19.437ff.), and it could move blocks of stone; the singing of Amphion, son of Zeus, was said to have enchanted stones to build of their own accord the walls of

Thebes. The historical figure Thaletas of Gortyn (seventh century BCE) tried to drive the plague from Sparta by singing.

Ritual use of music. I have referred to the rituals of sacrifice in Homeric religion. The first canto of the *Iliad* gives a good description of priestly *thusia*, or sacrifice, made by the priest Chryses to his god Apollo (1.447–473). After Chryses has burned pieces of meat and fat and tasted them, a libation is spent accompanied by song. Only the chthonic deities were adored in strict silence. Several ancient inscriptions, as that from Dodona, speak of the ritual of praying, or more properly "vowing," and sacrificing; on such occasions music, at least a kind of hymnic chant, was obligatory. The dedication of a new temple was always a festivity during which vows and sacrifices were offered and hymns or other music heard. At marriages *thusia*, prayers, and hymns inaugurated a happy espousal, at least in the circles of the nobility, as we read in Apollonius of Rhodes (fl. 222–181 BCE).

The aforementioned tone-word relationship has special significance for the ritual use of music. Lamentations for the dead Hector show clearly certain ritualistic traits (*Iliad* 24.720ff.). The choric odes of Pindar (518–438 BCE) served in official worship. Special reverence was paid the Delphic hymns; according to Plutarch (c. 46–after 120 CE), several were so celebrated that they were repeated every year.

The musical *ēthos*. To the Greeks, *mousikē* meant more than mere music. Hence it was judged not only by its audible beauty but also by its moral effect upon the listener. This principle, which the Greeks shared with many great ancient civilizations, constituted the doctrine of *ēthos*; in Greek music theory this doctrine reached its highest expression.

There was extensive philosophical reflection upon musical *ēthos*, that is, the character, nature, or moral effect of a musical work. Every melody, in each of its aspects, was subject to the postulates of its *ēthos*; the *ēthos* was determined by all components of its respective melody. Each scale, rhythm, and trope, when performed at the "right" spot and at the "just" time, has a concrete, predictable influence on the listener's emotions, behavior, and character.

Plato gave the doctrine of *ēthos* its most radical formulation in his *Republic*. According to his thesis, certain scales turn men into cowards and make women unable to bear healthy children; other scales inspire courage, fear, piety, nobility, and so forth (376d, 398b ff.). In the *Laws*, it is really in terms of the doctrine of *ēthos* that he criticizes the professional music of his day (700a ff.). The *nomos*, literally the "law" or "set," had become the main form used by professional singer-composers in musical contests. Consisting of several movements without strophic repetition, and characterized by its *harmonia* and its specific rhythm as musical representation of meter, it might depict the exploits of some god, such as the famous Pythian *nomos*, which glorified Apollo's battle with the Pythian dragon. Plato decried the musical license that violated the laws (*nomoi*) dividing music into several distinct kinds. The hymn, the lament, the paean,

the dithyramb, and the lyric song, each ought be true to its form. Their admixture could only bring disorder to the society in which such confused and irregular music was heard.

The philosophy of musical *ēthos* did not remain undisputed. Its sharpest opponents were Philodemus of Gadara (first century BCE) and an anonymous rhetorician, a sophist whose arguments have come down to us in the *Papyrus Hibeh*. Even Plutarch, the historian of Greek music, and Aristoxenus (fourth century BCE), its main theorist, speak in rather cautious terms about the doctrine of *ēthos*. Despite these controversies, the *ēthos* doctrine was cultivated by the Neoplatonists and by the church fathers and was championed by as influential a philosopher as Boethius.

Tragedy as musical drama. Attic tragedy originated in ritual, especially in that of Dionysos. The term *tragedy* derives from *tragōidia*, or “song of the goat,” in celebration of a totemistic element in the Dionysian cult. The link between tragedy and ritual is clearly discernible in the tragedies of Aeschylus and Sophocles; it is less intimate in those of Euripides, the poet of the Greek enlightenment.

The ritual origin of tragedy is well known. Less known are the philosophical treatises devoted to its meaning, parts, and effects, and to the music that best represented the *ēthos* of the drama and its protagonists. According to Aristotle’s celebrated *Poetics*, an effective drama has six parts, among which the *melopoia*, or musical composition, was not the least important. In its heyday, the tragedy contained a number of musical forms: the entrance of the choir (*parodos*), the standing song (*stasimon*), the song of the choir’s exit (*exodos*), a song with pantomime (*huporchēma*), a lament (*kommos*), and the chanted recitatives of the main actors. Certain *harmoniai* were preferred for the drama, for example, the Mixolydian, because of its sorrowful *ēthos*, and the Doric, because of its solemn character.

Musical instruments. The musical instruments most significant for Greek religious practice may be named briefly. The main instruments were the lyre and its variants, such as the *kithara*, *barbitos*, *phorminx*, *trigōnon*, and *psaltērion*. They were all stringed instruments, to be plucked with or without a plectrum. The harp was probably imported from Egypt. They served chiefly the highly regulated Apollonian rite or style, which eschewed all ecstatic or orgiastic expression. Their music was strict, even severe; they were used by priests and the nobility. The hymns of Pindar, composed for accompaniment by lyre, were sacred to Apollo.

More appropriate to the unrestrained Dionysian style were such wind instruments as the *aulos*, a shrill-sounding primitive clarinet that was usually played as a double instrument with two mouthpieces. Sacred to Dionysos, it engendered violent merriment, wild breast-beating, or hopeless mourning. The distinction between Apollonian and Dionysian thus marks contrasting currents both musical and religious.

Relics of Greek music. Fifteen pieces of Greek music are known, of which three were carved in stone (two of these

were found in Delphi and one in Tralles, in Asia Minor). Most of these pieces are only fragments. Their transcription into modern notation is, in certain details, controversial. An example of one of those carved in stone is the *skolion*, or libation song, of Seikilos, originating in the first century BCE.

ROMAN MUSIC. No written musical document of the early days of Roman history has come down to us; we must depend upon archaeological evidence. Ancient Rome was built upon three civilizations: Etruscan, Greek, and, finally, Near Eastern. In general Greek music came to Rome as a study to be learned and exercised. Eventually the powerful influence of Hellenistic music began to recede as the influence of Egyptian, Syrian, and Hebrew music increased.

Pre-Christian Roman religions. Roman cultic and popular customs were invariably accompanied by chanted and played music. Thus, according to the first-century historian Livy, the sodalities of the Salian priesthood regularly used chants at their rites. Numa, the legendary second king of Rome, provided the Salii, or “leapers,” with arms and decreed that they chant hymns and dance at the appointed festivals of the martial god Mars. Their heavy-footed dance of arms in triple time was sacred to the god of war. Vergil (70–19 BCE) indicates that the songs of the Salii were executed responsorially (Vergil, *Aeneid* 8.285). The precentor of the priests, the *vates* (“poet” or “seer”), was considered divinely inspired.

Under the leadership of Livius Andronicus, Roman poet of the third century BCE, rites of atonement and consecration sacred to the goddess Juno were celebrated by choirs of virgins. Many of their hymns appear to have had apotropaic functions: to banish death, illness, and danger, and to establish peace between gods and mortals. The poet Horace (first century BCE) refers to the function of the *vates* in such rites, asking, “Where would innocent boys and girls learn their prayers, had not the Muse granted them a poet?” The customarily noisy *nenies*, or lamentations, functioned according to the principle “The greater the noise, the greater the loss”; they were disliked by Horace and later Roman poets, who were inclined to prefer the refinement of Greek poetry.

Music and poetry. Statius, a poet of the first century CE, no less than the poet Catullus a generation before him, took for granted the chanted performance of his poems. The poet Horace was probably the best-trained musician of his day, for he was commissioned by the emperor Augustus to create the words and music of the *Carmen saeculare*. It appears that Horace also taught its melody to the choir. In the first century BCE Greek dominance was as yet unchallenged, as evidenced by the existence of a Roman association, the *Societas Cantorum Graecorum*, yet Horace took pride in “having introduced Aeolian verses” to the culture of Rome.

Musical instruments. Because it had an expansive and militaristic culture, Rome used musical instruments more for its army than for its sanctuaries, although the ancient festivals, the Parilia and the Saturnalia, were certainly not cele-

brated without chants and popular music. The *tibia*, a primitive oboe comparable to the *aulos*; the *tuba*, a kind of trumpet; the Greek *kithara* and lyre; and, later, Asiatic instruments such as the Phrygian *curva tibia*, were heard on many cultic occasions. Wind instrument players were organized into the union of *tibicines*, stringed instrument players into that of the *fidicines*. Noise-making rattles, cymbals, and so forth were played by corybants and priests at Bacchanalian revels and were also heard at funerals.

Musical importations. Mystery cults imported from Asia featured bloody rites of initiation accompanied by the wild sound of noisemaking instruments and the Phrygian *tibia*. From Persia, borne by the legionnaires, came the cult of Mithra, with its ceremony of blood-baptism. The rattling of sistrums and the tinkling of harps accompanied the more peaceful cult of Isis, imported from Egypt. This multitude of foreign sounds was, like the *nenies*, condemned by Horace and later writers.

EARLY CHRISTIAN MUSIC. Foreign musics and mythologies were a horror and an abomination to the early Christians, or, rather, Judeo-Christians of the first two centuries, as were any pagan practices. The question of influence by Roman popular songs upon the chants of the early church has been raised, but all too few facts in favor of such a hypothesis can be adduced. The first Latin Church Fathers were so strongly biased against anything that smacked of paganism that they may well have suppressed any real evidence. Further, the Romans did not invent a musical notation of their own, nor were they interested in musical theory, so that any question of influence is difficult to judge.

The last part of Augustine's philosophical work *De musica* is now lost; it may have contained important views about the music of his contemporaries. Nonetheless, we are in possession of many, often contradictory testimonies of Christian chant in the Roman Empire, as it originated in Greece, Palestine, Italy, and other parts of the empire. Among them is just one piece of notated music, the *Oxyrhynchus hymnus*, and a veritable host of descriptions, speculations, and comparisons, ancient and medieval. Possibly some oral traditions were preserved until the ninth century, during which time a musical notation was developed in Europe. Some insights have resulted from this—rarely authentic—material, mainly in modern studies. A few examples will illustrate the state of this research:

1. *Hosanna filio David*. This antiphon for Palm Sunday is of ancient origin. Amédée Gastoué ascribes its intonation to the resemblance of the word *hosanna* with *hoson zēs*, the beginning words of a libation song.
2. Tropos Spondeiakos. Clement of Alexandria, second-century Church Father, recommended in his work on Christian education, the *Pedagogue*, that Christians should sing psalms before retiring, as the Jews of Alexandria did, and mentioned the Tropos Spondeiakos, or mode of libation, as the most suitable one. Pseudo-

Plutarch, a contemporary of Clement, described this Doric-spondaic mode in his book on music and thus made possible its reconstruction. Years ago, I demonstrated that this mode occurs in some of the oldest Christian chants (in Latin, Greek, and Syriac) and in ancient prayers of the Yemeni Jews (*The Sacred Bridge*, vol. 1, 1959).

3. The tune of the *Te Deum*. This tune belongs to the very same family of melodies as the Tropos Spondeiakos and is equally old.
4. *Oxyrhynchus hymnus*. Written in the third century, this work is a praise of Christ that paraphrases a passage from Psalm 93. It represents a perfect mixture of Greek syllabic chant and Hebrew melismatic elements. This interpenetration of Greek and Hebrew elements was characteristic of most chants before the fourth century, when the Council of Laodicea set certain theological standards, which determined the split between Eastern and Roman Catholic liturgies.

Early Christian music thus preserved Greek and Hebrew sources of influence. Emphasis on the Greek elements in this music was made mainly by Boethius in his *De institutione musica*. Peter Wagner, the great expert on Gregorian chant, submitted a number of explanations for the role of Judeo-Christians as transmitters of Hebrew musical tradition to early Christian chants. The epitaphs of Deusdedit (Jonathan) and Redemptus (Yigael), singers whom Pope Damasus brought to Rome from Jerusalem, contain such remarks as "he sounded his ancient prophet [David] in sweet songs."

BYZANTINE MUSIC. While the Byzantine Empire was a well-defined entity both historically and geographically, its music belongs to its specific liturgy and so must be more closely circumscribed. The music of Byzantium will be sketched here as it developed in its first stage, from its origin in the fourth century during the reign of Constantine the Great until 565, the year of the death of Justinian I, who disbanded the Academy of Athens. The date is significant, for it marks the gradual separation of Byzantine culture from its Greek patrimony.

Music and Byzantine Christianity. We have no traces of early Byzantine secular music aside from reports of the great festivities held in honor of the emperor and his court, and about these noisy occasions we know most details from the tenth-century book of ceremonies by Constantine VII. No Byzantine music antedating the ninth century has come down to us. The term *Byzantine music* is, moreover, limited to liturgical chants. Although Syriac and Hebrew elements were probably integrated, definite evidence of these influences is not available, as the scholarship in this field is barely a hundred years old.

Musical notation. The Byzantine liturgy used two kinds of rhetorical notation. The first, the ancient ekphonic notation, served the priests in reciting the sacred scriptures in a prescribed system of cantillation. Its connection

with Syriac and Hebrew accents is quite obvious, as Egon Wellesz and I have shown. This kind of symbolism did not represent real musical pitches or intervals; instead, it punctuated the sentences and indicated pauses and the rise and fall of the voice. The second kind of notation was not established before the ninth century and so stands outside the scope of this description. This musical notation grew out of ekphonic and rhetoric beginnings, and came to be applied to the chanted parts of the liturgy, especially to the *troparia*, centos of psalm verses and new poetry; the *heirmologia*, containing the models of traditional melodies; and the *kanones*, poetic paraphrases of nine biblical canticles: two songs of Moses, the prayer of Hannah, the prayer of Habakkuk, the hymn of Isaiah, the hymn of Jonah, the prayer of the three youths in the furnace, the apocryphal continuation of this prayer, and the Magnificat. The second ode was usually omitted in order to make a number equal to the eight modes, or *ēchoi* (Octoechos). From each of the original biblical texts, only a number of verses were chanted, and these were interwoven with poems by Byzantine authors.

The Octoechos. The Octoechos is a system of eight modes (originally not scales), whose names were erroneously borrowed from the classic Greek *harmoniai*. The concept of the Octoechos is very ancient; its origin has been linked to the Babylonian-Akkadian calendar. As a musical term, *‘al-ba-sheminit* occurs in the superscriptions to two Hebrew psalms (sixth and twelfth) and, in the Greek literature, in Yohanan Rufos's sixth-century *Plerophoriai*. Under the name "Octoechos" many hymns of the Byzantine and Syrian churches were collected and ordered according to the eight modes and the seven-plus-one Sundays between Easter and Pentecost. Their texts were first published in about 540 by Severus, patriarch of Antioch. This work became the exemplar for many ritual books of the Byzantine Church. These books became repositories of an enormous number of liturgical melodies, whose influence enriched many of the chants of the Near East, even after the collapse of the empire in 1453.

BIBLIOGRAPHY

For a full, mostly reliable study of Greek music, see "Greece, Ancient" by R. P. Winningham-Ingram and others in the *New Grove Dictionary of Music and Musicians*, edited by Stanley Sadie (London, 1980). For the advanced reader, Isobel Henderson's "Ancient Greek Music" in the *New Oxford History of Music* (Oxford, 1957) is recommended, although it neglects the Asiatic elements. Curt Sach's writings, especially his *Rise of Music in the Ancient World, East and West* (New York, 1943), contain the best available scholarship on ancient music, easily readable by the layman. See also Edward A. Lippman's *Musical Thought in Ancient Greece* (New York, 1964). Hermann J. Abert's study of *ēthos* in Greek music, *Die Lehre vom Ethos in der Musik des griechischen Altertums*, 2d ed. (Tutzing, 1968) is still the best presentation of this

difficult subject, but it requires some philosophical background. *Antiquity and the Middle Ages* (New York, 1950), volume 1 of *Source Readings in Music History*, edited by Oliver Strunk, gives several Greek sources in good translation but is somewhat opinionated in its selection. My "The Origin of the Eight Modes in Music (Octoechos)," *Hebrew Union College Annual* 21 (1948): 211–255, presents most of the ancient sources of the system of musical modes.

For data on music in Rome, see "Rome, Ancient" by Günter Heischhauer in the *New Grove Dictionary of Music and Musicians*. J. E. Scott's "Roman Music" in the *New Oxford History of Music* presents a solid and scholarly evaluation.

The first chapter in volume 1 of Karl Gustav Fellerer's *The History of Catholic Music* (Baltimore, 1961) offers discussion of early Christian music. See also my *The Sacred Bridge*, 2 vols. (New York, 1959–1984), which examines the interdependence of liturgy and music in the Jewish and Christian traditions during the first millennium.

For a complete survey of Byzantine music in all its aspects, see "Byzantine Rite, Music of the," by Kenneth Levy in the *New Grove Dictionary of Music and Musicians*. Egon Wellesz's *A History of Byzantine Music and Hymnography*, 2d ed. (Oxford, 1961) is the standard work on the subject. For the more advanced reader, Wellesz's study "Word and Music in Byzantine Liturgy," *Musical Quarterly* 23 (July 1937): 297–310, gives a fine presentation of the most problematic aspects. For the reader familiar with classical literature, Carsten Høeg's profound study "Les rapports de la musique chrétienne et de la musique de l'antiquité classique," *Byzantion* 25–27 (1955–1957): 383–412, is highly recommended. For discussion of ancient musical instruments, Curt Sachs's *The History of Musical Instruments* (New York, 1940) is still the standard reference work.

Revised Bibliography

MUSIC: RELIGIOUS MUSIC IN THE WEST

The religious music that is commonly considered Western had its beginnings in the Middle East and the Mediterranean, as did Western religions themselves. As that music developed over the centuries, it shaped and was shaped by a variety of musical cultures, most notably those of Europe and North America. Primarily Jewish or Christian in character, Western religious music has also been influenced at times by Islamic practices.

Different groups of Jews and Christians have been identified in the West partly by the kinds of music they have cultivated or prohibited. Much music, however, has crossed denominational and religious lines. Furthermore secular and sacred styles have been mutually influential, even if sometimes controversially so. Since the late eighteenth century Western music of a religious or spiritual nature has often appeared in a relatively secular guise.

FROM TEMPLE TO SYNAGOGUE AND CHURCH. Given the importance of the *Book of Psalms* to both Jewish and Christian worship and in view of references in *Psalms* to a variety of musical instruments, laments, and songs of praise, one might suppose that in later times Jews and Christians alike would have felt free to make music with virtually every means imaginable. But in the first few centuries of the common era dramatic changes in the context of worship for both groups made that kind of musical license virtually unthinkable.

In 70 CE the Roman army under Titus destroyed the Second Temple in Jerusalem; shortly thereafter Jews were deprived of their homeland. Accordingly the center of Jewish worship shifted from the Temple (originally the primary locus of *Psalms*) to the synagogue and the home.

Having started out as a Jewish sect, Christians likewise experienced in their first few centuries major, if less traumatic, shifts in the context and content of worship. With the missionary efforts of Paul and others, an ever-increasing percentage of the followers of Jesus were Gentiles. In addition Christians were often, albeit intermittently, targets of Roman persecution and were consequently constrained in their worship. Then in 313 CE the social situation of Christianity changed dramatically with the conversion of Constantine. Christianity became a legal and then privileged religion of the Roman Empire itself.

For both Jews and Christians there was considerable contrast between temple psalmody and their own liturgical practices. It is uncertain when synagogues originated; they may have begun in some form as far back as the exilic period or earlier. In any case, when worship took place in the synagogue, it never entailed sacrifice, as temple worship did. Nor did it make use of priests or a choir or any musical instruments except (later) the shofar, which had always had a limited ritual role—mainly on Ro'sh ha-Shanah. Some scholars believe that, until 70 CE, psalmody itself had no part at all in the synagogue and that psalm singing may not, in fact,

have reappeared until around the fourth century CE. In any case, the synagogue service was essentially a service of the word, with prayers and readings from Scripture.

Consistent with the principles of rabbinic Judaism, which were to remain normative until the eighteenth century, the musical simplicity of the synagogue apparently derived from three sources: rules (*halakhab*) for observing the Sabbath, which would be violated by the tuning and carrying of instruments; mourning over the Temple's destruction, which meant a ban on instrumental music until the coming of the messiah; and concern over the ostensibly sensual qualities of women's voices, with the result that only men were permitted to sing.

None of this is to imply that synagogue worship in its formative stages was unmusical. By the latter part of the first millennium if not before, the synagogue service employed three genres of chant: psalmody (responsorial or antiphonal), cantillation of Scripture, and liturgical chant for prayers. The liturgy in that way was musical through and through.

For their part, Christians during the apostolic age (first century CE) sang "psalms, hymns, and spiritual songs," as stated in *Ephesians* 5:19 and *Colossians* 3:16. While those terms are vague, many scholars believe that the sung texts included the biblical psalms (though that has been disputed), canticles such as those in *Exodus* 15 and *Habakkuk* 3, and hymns written by poets and composers who have not been identified. That the terms for the genres are left imprecise is not surprising; the New Testament spells out few details regarding either music or worship. One is told that Jesus and his disciples sang a hymn at the conclusion of the last supper, but scholars are left to speculate that the supper may have been a Passover seder and that the hymn may have been the Hallel.

It seems to have been a foregone conclusion among early Christians that instruments had no place in public worship. For their service of the word, Christians were still accustomed to the pattern of the synagogue, the music of which was strictly vocal. Whereas it is no longer assumed that there was an extended period of continuity with synagogue practice, Christians must have continued intoning prayers and chanting Scriptures. How and what Christians sang during the Eucharist (Communion) or at common meals is uncertain. The service of the Eucharist was probably indebted to Jewish and pagan traditions surrounding domestic meals and ritual banquets. None of the music survives, however—nor any other music from late antiquity.

Scholars formerly thought that Christians initially approached matters of music in a puritanical spirit that only gradually relaxed over the next several centuries as Christians became more sophisticated. Closer inspection of texts and dates has shown, however, that, whereas concerns over musical propriety and practice were a minor matter at first, they actually increased in the patristic period (roughly the second through the fifth centuries).

It was in response to pagan ritual and entertainment practices, which often combined song, drama, and dance, that church fathers raised objections to licentious singing and the use of instruments—the “senseless sounds” of drums and cymbals and the “clamor” of the trumpets. Clement of Alexandria summoned Christians to struggle against the “music of idols,” especially instrumental music. He admitted that God permitted the Jews to use instruments in former times but insisted that this indulgence was a temporary concession to their weakness. John Chrysostom and others interpreted the instruments of the psalms allegorically, as symbolic of how harmony is produced in the soul. Tertullian, Augustine, and Chrysostom all said that Christian psalmody should serve as an antidote to sensuous excitement and a positive cure. When done moderately and with understanding, singing was said to lay the passions to rest, to still the body, and to calm and order the soul.

In making those claims about music, Christian pastoral theologians during the patristic era set the tone for the church for centuries to come. Yet doubtless aware of similar criticisms within the educated pagan world itself, they were not only recalling the ancient example of the harpist David playing for the fitful Saul. They were also mirroring and aligning themselves with the views of music held by esteemed pagan philosophers from Plato to Plotinus. According to such philosophy, whereas some instruments and modes of music making feed the passions, earthly music of the right kind reflects a divinely beautiful order. The highest music is intellectual and spiritual: inaudible. Hence the ambivalence of Augustine in a famous passage in Book 10 of the *Confessions*. There he admits having been moved to tears by psalms sung in church, and he acknowledges the “ardent piety” to which the singing can give rise. But he repents having in former years been moved more by the singing, the “delights of the ear,” than by the truth of what was sung. And he wavers even as he consents to psalm singing in church.

When the church sang, the congregation as a whole participated, often responsively, guided by some sort of leader or “cantor.” Clement of Alexandria emphasized the unity of many voices, all singing in unison. Women participated—and not in separate choirs, as in pagan rituals. But following a phase in which Christian women were indeed formed into choirs, a reaction set in. In the third and fourth centuries women’s voices began to be silenced altogether in church—a practice that, despite the objections of Ambrose in particular, became prevalent.

MEDIEVAL DEVELOPMENTS. Already by the time of the destruction of the Second Temple, more Jews were living in the Diaspora than in Palestine, with especially large communities to be found in Babylonia and in Alexandria, Egypt. Subsequently the rapid conquests in the Middle East, North Africa, and the Iberian Peninsula by the armies of Islam (seventh to eighth centuries CE) created the framework for the basically uniform character of medieval Judaism. Regarded by Muslims as a “people of the Book” (as were the Chris-

tians), Jews in Muslim lands were permitted to have relative autonomy.

Singing, in the form of chant and cantillation, was vital to synagogue worship as it developed. Scripture, prayer, and words of praise were not merely read but variously intoned or chanted. In synagogues between approximately the seventh and ninth centuries CE, a system of signs (*te’amim*) was created to aid proper accentuation, verse division, and appropriate melodic patterns in chanting the text of Scripture. This process culminated in the Tiberias Massoretic system, the interpretation of which eventually resulted in the eight regional traditions of cantillation that now exist.

As time passed the need for a more or less professional singer, or cantor (*bazzan*), became evident. Traveling from one community to another, cantors shaped melodic patterns of prayer that later were regarded as sacred. Those chants came to be known as *nusach*. Although a lay precentor, then as now, would have presented the chant strictly as preserved and transmitted, the professional cantor rendered the melodic prayer with a greater measure of improvisatory freedom. Thenceforth the singing of the cantor was one of the glories of worship, although also periodically subject to criticisms of excessive virtuosity.

As synagogue services became more standardized from the fifth through the ninth centuries CE, complex poetic additions to, and substitutes for, fixed prayers became popular. Known as *piyyutim*, these liturgical poems included short refrains for congregational singing as well as more intricate refrains that could be given to a choir. The best known *piyyut* of all comes from the sixteenth century: *Lecha Dodi*, “Come, my Beloved, to meet the Bride; let us welcome the Sabbath,” by Solomon Alkabetz (1505–c. 1572).

Two major branches of Judaism developed in Europe: Ashkenazi and Sefardi. Ashkenazic Jews moved outward from Italy to German-speaking lands, Russia, France, and England. They made use of special tunes, thought to be ancient, which were sung on solemn occasions. Those tunes were called *misinai*, which means “from Sinai,” the most famous being the *Alenu* and the *Kol Nidre*.

Sefardic communities thrived in medieval Spain, where, after a golden age under Muslim rulers, they were forced by Muslims and then Christians to retreat to parts of northern Europe or back to North Africa and Palestine. In the Sefardic tradition, cantors paid greater attention to diction than to embellishment. In Spain, Arabic poetry, which was lyrical and characteristically even in meter, influenced both the secular and sacred Hebrew poetry of Yehudah ha-Levi, among others. Sefardic song borrowed Arabic modes and musical phrases, encouraging congregational singing. One form of Andalusian suite called *nuba* became popular, typically employing instruments except on the Sabbath. During the gradual reconquest of Spain by Christians, leading up to the expulsion of the Jews in 1492, Christian and Jewish styles blended, using Ladino dialect. Popular, rhythmic songs were

enjoyed at such informal Jewish functions as Sabbath meals. A number of *cantica* melodies were adapted to hymns such as *Adon Olam* and *Yigdal* and even to the Qaddish doxology.

Christian chants may have developed relatively independently from Jewish practices, after a period of contact. Chant was particularly important to daily prayer in monastic communities. Even before the fall of Rome in 476 CE, which by convention marks the beginning of the early medieval period, the Christian monastic movement provided an alternative to the more worldly forms of Christianity newly ascendant in the Roman world of the fourth century. The Divine Office made extensive use of chant for reciting psalms and other sacred texts, in accordance with the rule established by Benedict of Nursia (c. 480–c. 547). Musically the most important of the eight canonical hours were matins, lauds, and vespers, the last incorporating the *Magnificat* canticle from *Luke* 1:46–55.

Sunday Eucharist in churches everywhere gave rise to a variety of regional “rites,” all of which involved plainchant settings both of the pertinent variable texts (the Proper) for the Mass and invariable, fixed texts (the Ordinary): the Kyrie, Gloria, Credo, Sanctus, Benedictus, Agnus Dei, and *Ite, missa est* (often omitted from musical settings). The responsive psalmody and liturgy from Milan, which took the name Ambrosian, persisted after other local variations such as Gallican and Mozarabic had given way to Rome. By the eighth century CE Rome had a *Schola cantorum* for training church musicians. Tradition has it that Pope Gregory I (c. 540–604 CE) regulated and standardized the various liturgical chants, but that was more likely carried out over the next two centuries. The form of chant that eventually prevailed, which came to be called Gregorian, was imported and codified by Charlemagne (742–814 CE) in Frankish lands, superseding a form of Roman chant known as Old Roman.

Because plainchant evolved orally, it made considerable use of melodic formulas and simple structures. With quiet beauty, it formed a kind of stream on which to float prayer and praise. It served the word but without dramatic gestures or conspicuous attempts to illustrate the meaning of the texts. Chants employed melodic formulas called psalm tones, one for each of eight church scales, called modes, plus a *tonus peregrinus*, or “wandering tone.” The singing was often antiphonal. Long melodies that were given hymn texts in couplets were known as sequences, two of the most famous being the *Dies irae* (heard in the Requiem Mass), and *Veni Sancte Spiritus*. Hildegard of Bingen (1098–1179) composed notable sequences in addition to antiphons and a musical morality play in plainchant, *Ordo virtutum* (The virtues).

Chant notation appeared for the first time in the ninth century CE, at which point it indicated only the rise and fall of pitches; in the eleventh century the use of staff lines finally specified pitch exactly. Probably the invention of notation contributed to the rise of multilinear singing, or polyphony, the earliest form of which was organum—initially a simple parallel motion between two or more vocal parts. In the

twelfth century at Notre Dame Cathedral of Paris, Leonin and Perotin composed rhythmically complex, multilayered forms of organum, which led shortly to motets that employed different sets of words simultaneously. In the fourteenth century there appears the first polyphonic setting of the entire Ordinary of the Mass by a single composer: the *Messe de Notre Dame* by the leading composer of the *Ars nova* in France, Guillaume de Machaut (c. 1300–1377).

If Gregorian chant by the High Middle Ages comprised the most extensive body of religious music in the West (and possibly anywhere on earth), polyphony was to become, over the next few centuries, one of the most intricately artistic achievements in all of sacred art. In the hands of such composers as John Dunstable (c. 1390–1453), Guillaume Dufay (c. 1400–1474), Johannes Ockeghem (c. 1420–1497), and Josquin des Prez (c. 1450–1521), polyphonic music provided a vertically and horizontally ordered, well proportioned, and harmonious world of sound. Polyphony thus fulfilled venerable ideas of how human music could mirror or imitate the divine order of the cosmos—ideas that were adumbrated long before by Boethius (c. 480–524 CE) and still earlier by Augustine in his incomplete treatise *De musica* (c. 409 CE). Although music as studied in the medieval universities was essentially a theoretical branch of mathematics linked to astronomy, the making of polyphonic music itself could be regarded as both rational and theological.

In the meantime in Byzantium—the eastern part of the former Roman Empire that flourished long after the western part of the Empire fell—the plainchant of the liturgy had continued for centuries relatively unchanged. In Constantinople this music was characterized by ancient antiphonal psalmody and by a strophic form of hymnody known as the *kontakion*, a poetic elaboration on a biblical text. Yet in the last phase of the Byzantine Empire a new style of music emerged, the *kalophonic*, or “beautiful sounding.” Whereas monophonic in the manner of plainchant, it was unusually florid. With the fall of Constantinople to the Turks in 1453, the Middle Ages came to a spectacular close.

RENAISSANCE AND BAROQUE. By the dawn of the European Renaissance (1453–1600), which was roughly concurrent in time with the Protestant Reformation, Jews had suffered massively from a wave of expulsions, forced conversions, and persecutions, climaxing in their fateful expulsion from Spain in 1492. Although the primary features of rabbinic Judaism remained relatively unchanged until the middle of the eighteenth century, messianic hopes intensified, along with mystical impulses and practices.

Qabbalistic mysticism, which had its roots in the Middle Ages, entered a new phase under the inspiration of Isaac Luria (1534–1572). He taught that the sparks of the godhead had fallen into captivity. Music was one of the spiritual means by which to liberate imprisoned elements of divinity and to contribute to the anticipated reparation, or *tikkun*, whereby creation could be restored to its intended harmony. An important aspect of *tikkun* was the practice of taking

non-Jewish and secular tunes and transforming them into sacred songs.

In a related development over a century and a half later, eastern European Hasidism, under the leadership of Ba'al Shem Tov (c.1700–1760), emphasized the importance of joyful worship. Drawing on qabbalistic ideas, Hasidic music theory promoted the concept that even a melody without words, called a *niggun*, can contain divine sparks. The highest melodies, created by Hasidic saints, or *tsaddiqim*, were said to be like pure souls, their forms conveying mystical meaning and constituting an elevated form of prayer. The influence of Hasidic music was felt, eventually, in virtually all forms of Judaism. Hasidic-style music, mostly nonliturgical, remains popular in the twenty-first century, as in the central European style known as klezmer (from klezmerim, or “music makers”).

Polyphonic art music did not find a home in the synagogue before around 1600. The polyphony introduced by Salomone Rossi (c. 1570–c. 1628) and published as *The Songs of Solomon* in Mantua, Italy, was remarkable but atypical. In Italian synagogues of the seventeenth century one could sometimes hear baroque cantatas on special occasions. In Amsterdam and Prague certain synagogues likewise introduced instrumental music, including the organ.

No such use of instruments was allowed to invade the more traditional synagogues—nor the churches of Eastern Orthodox Christianity. With the fall of Constantinople, Russian Orthodoxy became the main inheritor of the Byzantine tradition. The sung liturgy, while translated into Russian, continued to be exclusively vocal and remains so. While a wide-ranging, melismatic way of chanting arose in the sixteenth century, along with polyphony in two or three voices, the more decisive change came in the mid-1650s, when the patriarchy and the official Russian Church adopted polyphony on a broad scale. Although schismatic groups led by the Old Believers resisted that development as smacking of Roman Catholicism, the exclusive use of monophonic chant faded into a small minority tradition by the eighteenth century. At that time Dimitry Bortnyansky (1751–1825) set the dominant tone by composing elegant sacred choral concertos.

Within western Europe the Protestant Reformers of the sixteenth century differed considerably among themselves when it came to music. But for virtually all of them, music was a matter of consequence. It was part of what they thought they needed to reform. By their era the Ordinary of the Catholic Mass had been left to the choir and clergy, congregational response had been sharply curtailed, and morning and evening prayer had become choral as well. Because the choir itself was made up of clergy (often minor orders) and was exclusively male, there was little sense of the whole people's involvement in the liturgy and its music.

Martin Luther (1483–1546) emphasized vernacular, congregational hymnody not only as a way of retrieving the

practice of the early church but also as a corollary to the doctrine of the priesthood of all believers. Luther himself wrote numerous metrical psalms and such hymns as the famous “Ein feste Burg” (“A Mighty Fortress”), for which he may also have composed the melody. Luther and his colleagues translated traditional Latin hymns, supplied sacred words for popular songs (as long as they had not been too intimately connected with brothels and inebriation), and took over popular vernacular hymns. Wanting to employ good and memorable tunes, Luther also took art songs of the day as a model. One of the main achievements of Lutheran music was the strophic, congregational hymn, or chorale, which in subsequent centuries became popular in four-part harmonizations. At the same time Luther had a great fondness for polyphony—especially that of Josquin—and envisioned a place for choral polyphony in the Mass, the liturgy of which he retained in modified form, both in Latin and in German. Convinced that, next to theology, music deserves the “highest honor,” Luther considered music a great gift of God to be used as a vehicle of worship, as an aid to piety, and as a means of education.

In contrast to Luther, the Swiss reformer Huldrych Zwingli (1484–1531), although an accomplished musician, banished even congregational singing from the church, arguing that the biblical principle of “making music in your hearts” excluded using the voice itself. In Geneva, John Calvin (1509–1564) oversaw the production of a complete metrical psalter, edited in large part by Louis Bourgeois. Highly influential, the *Genevan Psalter* set the pattern for unaccompanied unison singing of metrical psalms in many different lands and was soon arranged in instrumental and polyphonic versions for domestic use.

In sixteenth-century England the book of metrical psalms compiled by Thomas Sternhold, and subsequently edited and supplemented by John Hopkins, provided the official basis for Anglican hymnody until the early nineteenth century. In the seventeenth century it was supplemented by Anglican chant, which called for singing psalm tones in harmony. In America the New England Puritans used the Scottish *Psalms of David in Meter* (1650) and, to a lesser extent, the *Bay Psalm Book* (1640).

In the eighteenth century Dissenters in England established an alternative hymnody that, besides making use of paraphrases of Scripture, incorporated songs of “human composure.” Isaac Watts (1674–1748) showed the way with hymns such as “When I Survey the Wondrous Cross,” followed by the Charles Wesley (1707–1788), whose five thousand hymns, including “Love Divine, All Loves Excelling,” not only were intended to be a musical practical theology but also an emotional inspiration. Soon those hymns were a beloved feature not only of Methodist hymnody but of Protestant and evangelical hymnody in general.

Whereas hymn singing could claim roots in New Testament practice (without anyone knowing exactly what that had sounded like), other forms of church music during the

Renaissance and baroque eras were far removed from anything early Christians would have recognized. In England choral music within a Catholic orbit often employed a rich texture of five or six voices. Thomas Tallis (c. 1505–1585) went so far as to compose an elaborate motet with forty independent parts, *Spem in alium*. Various European Catholic composers of polyphony, such as Tomas Luis de Victoria (c. 1548–1611) and Orlando di Lasso (1532–1594), treated texts in a highly expressive, even passionate, manner.

Whether polyphonic textures could render sacred texts in a sufficiently intelligible fashion had long been an issue, however, and became so again. Many centuries earlier church leaders such as Pope John XXII (1316–1334) and John of Salisbury (1120–1180) had already complained not only about ostentatious singing but also about the incomprehensibility of texts when sung in multiple, overlapping lines of music, “some taking high and others low parts, some singing in advance, some following in the rear, others with pauses and interludes,” all sounding like a “concert of sirens.” The Protestants of the Reformation era definitely gave priority to the word, both spoken and sung. Thus King Edward VI of England in 1548 prescribed music that, in setting a text, would provide a “playn and distincte note, for every sillable one.” Partly in response to such Protestant attempts at directness and simplicity, the Catholic Counter-Reformation, promoted by the Council of Trent, likewise criticized complicated polyphony for obscuring sacred texts, although the main concern was to discourage everything “impure or lascivious.” Legend has it that the Italian Giovanni Pierluigi da Palestrina (c. 1525–1594) saved the future of polyphonic church music by composing his *Missa Papae Marcelli* in such a way as to demonstrate that restrained polyphony could indeed support the sacred word.

Nevertheless during the following era—commonly known as the baroque (roughly 1600–1750)—church music could be quite theatrical and exuberant. That is immediately apparent from the splendid variety of the *Vespers of the Blessed Virgin* (1610), composed by Claudio Monteverdi (1567–1643), which opens with instrumental fanfares drawn from his opera *L’Orfeo*. Yet the baroque, which saw the beginnings of opera, had its own ways of honoring the text. According to Monteverdi, music in the predominant modern style was meant, in fact, to serve the text. That modern style employed expressive dissonances, angular melodic lines, and rhythmic drive and freedom to dramatize the meaning of the words. It thus appealed directly to the “affections.” Indeed the baroque anticipated the emphasis on the expressive function of music that later pervaded romanticism in a more personal way. Music of the baroque also included new forms of counterpoint, anchored in dramatic and often fast-moving chord progressions.

Church music of the baroque era made much use of newly evolved instruments: strings, woodwinds, trumpets, timpani, and certainly the organ. The organ up until then had mostly been employed modestly. Between the ninth and

the twelfth centuries small organs (portative and positive) had migrated into the church from secular settings, along with a few large and unwieldy ones. Organs during the Reformation period were used extensively to introduce hymns and to alternate with—and eventually to accompany—congregational song as well as to provide preludes and postludes or Communion music. In the baroque era organs became much more complex mechanically and far grander and more versatile, especially in German-speaking lands. By the time of J. S. Bach (1685–1750) organ music included toccatas and fantasies, lengthy preludes and fugues, and numerous other forms that appear to have been designed primarily for concerts or instruction, although influencing sacred style as well.

Musical settings of the Mass grew increasingly varied. In France especially the organ sometimes took for itself parts of the Mass that might otherwise have been sung, elaborating on the pertinent chant tunes. In the Venetian-Viennese tradition of the Mass, instrumental figurations and sectional contrasts became a prominent feature, along with passages for solo voice. Late in this same period the concerted Mass in the so-called Neapolitan style unfolded on a larger scale than ever before, each of the parts of the Ordinary being subdivided into separate movements. Such Masses reflected a strong influence from opera, both in their emotional character and in their musical forms, such as duets and arias. At the same time Palestrina’s works were preserved and imitated as classic models.

New forms of sacred music were born during the baroque: the sacred concerto, which Heinrich Schütz (1585–1672) raised to a high level, and more importantly the oratorio, the cantata, and the passion. Oratorio began in a Catholic place of prayer—the Oratory of Philip Neri in late-sixteenth-century Rome. Soon it became a religious counterpart to opera, adopted widely by Catholics in Italy and by Protestants in Germany, allowing them to present biblical stories in concert form, rather than being staged. Oratorio was particularly popular during Lent, when opera houses were closed. George Frideric Handel (1685–1759) brought oratorio to England, where its combination of narratives (recitatives), solos, and choruses became immensely popular. In England, however, oratorio was usually kept out of church, due to puritanical opposition to anything smacking of the theater. Thus Handel’s many oratorios, including *Samson*, *Jephtha*, and the atypical but extraordinarily popular *Messiah*, were presented mainly in theaters and concert halls.

Although many Protestant composers tried their hands at cantatas or passions, the spiritual depth, intellectual craft, and sheer artistry of the many settings by J. S. Bach were beyond compare. Such cantatas, which were sometimes criticized for sounding too secular, borrowed stylistic features from Italian opera as they offered a musical commentary on the Gospel lesson for a given Sunday. The passion music that Bach composed for Good Friday services was far more extended in scale, lasting between two and three hours com-

pared with the typical twenty minutes of a cantata. The *Saint Matthew Passion* together with Bach's lengthy *Mass in B Minor*—a kind of summa of the genre—can be counted among the greatest classics of Western religious music.

ENLIGHTENMENT ERA TO THE TWENTY-FIRST CENTURY.

For Jewish composers since the European Enlightenment period of the late seventeenth century and eighteenth century (overlapping the artistic baroque), the most salient feature of modernity was the struggle for emancipation and the concomitant question of assimilation—first in German-speaking countries of central Europe and then, a century later, in eastern Europe. In Westphalia, Berlin, and Hamburg in the early nineteenth century the aesthetic norms that guided Reform synagogue worship as it attempted to conform to a predominantly Christian culture were derived from Protestant Christianity: the reading of the Bible, rather than chanting, and the use of organs and Gentile-style hymns. In Vienna the cantor Salomon Sulzer (1804–1890) took a less-extreme approach. He purified the chant of the excess operatic embellishments that had accrued, and he made use of a choir of a dozen voices of men and boys, to the acclaim of visitors such as Franz Liszt and the critic Eduard Hanslick. Sulzer's contemporary Louis Lewandowski (1823–1894) composed and arranged simpler music for congregational singing in smaller synagogues. Choirs were also introduced in eastern Europe but only rarely included mixed voices at a time when men and women in the synagogue were still almost always seated separately. Organs remained controversial, yet many were installed in synagogues by midcentury, sometimes with the stipulation that they could be played only by Gentiles.

In the United States, Reform synagogues made decisive changes in liturgy and music, minimizing the role of the cantor and of chant. The music of the *Union Hymnal* of 1897 was more Protestant in style than identifiably Jewish—albeit intended for use by a professional choir and rabbi rather than the congregation. The 1932 edition, by contrast, reflected a desire to recover a distinctly Jewish sound, as Reform Jews had become more comfortable with their Jewish identity in the American context. By 1950s the Reform, Conservative, and Orthodox movements had all established schools of sacred music to train cantors. Yet the following decades, in which Sefardic Hebrew replaced Ashkenazic as the dominant dialect in liturgy, also saw a more populist and eclectic approach to liturgical music, tapping into the idioms of folk music and dance. Subsequently, within Reform Judaism itself, there has been a call for greater attention to traditional forms as well.

During the modern era numerous “classical” composers produced works of distinctly Jewish provenance whose primary context was intended to be the concert hall. These include such figures as Arnold Schoenberg (1874–1951), Ernest Bloch (1880–1959), Samuel Adler (b. 1928), Alexander Goehr (b. 1932), Leonard Bernstein (1918–1990), and Aaron Jay Kernis (b. 1960).

Russian Orthodox composers in the previous century were similarly active in the secular music world. Some of them, such as Mikhail Glinka (1804–1857), also wrote liturgical music, but there they faced the added challenge that the Russian Church repertoire remained exclusively vocal. Glinka himself, for instance, turned to modal harmonies and simple chordal structures when writing for the liturgy. Pieter Ilyich Tchaikovsky (1840–1893) and Sergei Rachmaninov (1873–1943) made more distinctive contributions, the latter with his choral *Vespers* (properly an “All Night Vigil”), which disturbed traditional church leaders at the time but is often regarded as the apogee of modern Russian liturgical music.

The center of musical life in the modern era clearly moved from liturgical settings (of whatever sort) to secular venues. Accordingly much of the development in Roman Catholic and Protestant music also became a story of interaction with, or reaction to, secular styles. The operatic influence that had been audible even in the case of Bach's cantatas became unmistakable, for example, in the Masses of Franz Joseph Haydn (1732–1809) and of Wolfgang Amadeus Mozart (1756–1791). Haydn's oratorios *The Creation* and *The Seasons*, while incorporating scriptural and religious themes, had a largely genial and buoyant manner, wearing their religious garb lightly. The high seriousness of Ludwig van Beethoven (1770–1827) in his *Missa Solemnis* could not be doubted. But that long and involving work was liturgically impractical, and the music became a virtual Mass in itself.

The trend continued with the gigantic Requiem Masses of Hector Berlioz (1803–1869) and Giuseppe Verdi (1813–1901), two composers who were by no means known as devout Catholics. The works themselves used theatrical means to convey powerful visions of eschatological hopes and fears. Richard Wagner (1813–1883) mined Christian myth in his opera *Parsifal* but without embracing Christian doctrine. Similarly Gustav Mahler (1860–1911) in his *Resurrection Symphony* (Second Symphony) and *Symphony of a Thousand* (Eighth Symphony) evidently found it spiritually empowering not to be restricted, textually, to any one specific religion. The same could be said earlier of the more conservative Johannes Brahms (1833–1897), whose *German Requiem* was essentially a concert work that avoided specifically Christian language while using biblical texts compiled by Brahms himself.

Certain classical composers nonetheless worked for the renewal of church music as such and of music related directly to the church. These included Franz Liszt (1811–1886), whose poetic oratorio *Christus* remains an unduly neglected masterpiece, and Felix Mendelssohn (1809–1847), who revived Bach's music and gathered a popular following with his own oratorios *Saint Paul* and *Elijah*. Anton Bruckner (1824–1896) wrote Masses and motets in addition to his monumental symphonies.

It was also in the nineteenth century, in a movement centered in Germany, that Catholic clergy and musicians promoted a new Cecilian Society, which was dedicated to re-

viving Gregorian chant and polyphony in the style of Palestrina. Other Catholics, led by the Benedictines at Solesmes, France, made efforts to restore the truer and more ancient forms of Gregorian chant. In England the Oxford Movement (1833–1845), emphasizing the broadly Catholic origins of the Church of England, recovered patristic hymnody and revived the medium of chant, usually in the English language.

Such endeavors anticipated the wider liturgical movement of the next century, in which various Roman Catholics and Protestants alike sought to renew worship by attending to its early paradigms as well as by emphasizing greater lay participation. The Second Vatican Council (1962–1965) ratified many of those themes, with the result that much of the music for the Ordinary of the Mass was returned to the congregation, Catholic hymnody came to life, and soon virtually everything was sung in the vernacular. The ensuing outburst of liturgical music in a wide array of popular guises brought both excitement and dismay. The music of the church became diverse and inclusive, yet the quality was uneven. Meanwhile much of the vast treasury of historical sacred music was orphaned, at least for the time being.

Congregational song had already expanded considerably in the nineteenth century and early twentieth century, even as mixed choirs and paid quartets became popular. The Church of England was enriched by two hymnals in particular, *Hymns Ancient and Modern* (1861) and *The English Hymnal* (1906), both of which have contemporary successors. Protestants in nineteenth-century America not only produced indigenous hymnbooks, such as the *Sacred Harp* and *Southern Harmony*, they later thrived on popular urban gospel songs, such as the hymns of Fanny Crosby (1820–1915), and on revival music that entered the evangelical mainstream.

African Americans at first adopted the hymns of the European-American churches. But by the middle of the nineteenth century, after emancipation, they produced their own hymnals. Long before then they had created their own tradition of shouts, spirituals, and “sorrow songs,” often employing call-and-response patterns hearkening back to African idioms. Blending those traditions with many others, black gospel songs later in the century could be either jubilant or prayerfully protracted—as in “Precious Lord, Take My Hand” by Thomas A. Dorsey (1899–1993). The music of African American worshippers has since exhibited, by and large, great improvisatory freedom and rhythmic vitality. Inspired in part by Pentecostal movements, many African American churches have welcomed a variety of instruments, including percussion, and have made special use of the expressive possibilities of the Hammond organ. Whereas African American church music has often existed in tension with the more “worldly” styles of jazz and blues, the interaction between church and secular styles has been conspicuous. Duke Ellington (1899–1974) and John Coltrane (1926–1967) were able to infuse jazz with religious meaning. And

contemporary gospel styles have absorbed elements of rock and rap.

In the last decades of the twentieth century Christian denominations produced an unprecedented number of new hymnals, drawing on music in a wide array of styles and from the worldwide Christian community. Some committees were guided specifically by concerns for social justice and inclusive language. Other groups, exploring alternative worship patterns, abandoned hymnals altogether in favor of projecting onto a screen the words of praise and worship choruses and contemporary Christian music. In the Catholic tradition the Saint Louis Jesuits led the way in the 1970s by providing scripturally based and accessible worship music. Ecumenically the music of the Taizé community in France, composed by Jacques Berthier (1923–1994), spread abroad a more meditative spirituality.

In relation specifically to modern classical music, churches utilized the works of a small number of recognized composers such as Ralph Vaughan Williams (1872–1958), Randall Thompson (1899–1984), and John Rutter (b. 1945). Unbeknownst to most churchgoers, many other modern composers—including Igor Stravinsky (1882–1971), Francis Poulenc (1899–1963), Frank Martin (1890–1974), Benjamin Britten (1913–1976), and Olivier Messiaen (1908–1992)—continued to produce major religious works. Such music typically made exceptional demands on both listener and performer, however. A large gap widened between modernist works, which often bristled with difficulties, and the sensibilities of most churchgoers. That gap only increased as churches turned more and more to the idioms of popular culture and began mixing styles in “blended worship.” With spiritually attuned listeners also being drawn to New Age and world music, the classical establishment often seemed remote.

It is thus noteworthy from a religious perspective that, in the present era, or postmodernity, the differences between Eastern and Western music and between “elite” and “popular” have begun to erode, even in the concert hall. Some of the finest recordings of Bach cantatas have been originating in Japan. And among the latest classical styles are a spiritually centered minimalism and a tonally based (and often multicultural) eclecticism that have both shown considerable “crossover” potential. Works by composers such as Arvo Pärt (b. 1935), John Tavener (b. 1944), James MacMillan (b. 1959), John Adams (b. 1947), Tan Dun (b. 1957), and Osvaldo Golijov (b. 1960) appear to hold out promise for new kinds of artfully wrought religious music that might grow alongside, and interact with, the burgeoning indigenous and popular traditions.

BIBLIOGRAPHY

There is as of 2004 no truly encompassing survey of Western religious music. A comprehensive and virtually indispensable re-

source is Stanley Sadie and John Tyrell, eds., *New Grove Dictionary of Music and Musicians*, 2d ed., 29 vols. (New York, 2001), also available online. More succinct articles representing the new socially and culturally informed musicology are in Alison Latham, ed., *Oxford Companion to Music* (Oxford, U.K., 2002). Useful at a general level are Paul Henry Lang, *Music in Western Civilization* (New York, 1941); and the more up-to-date Donald Jay Grout and Claude V. Palisca, *A History of Western Music*, 6th ed. (New York, 2000). The eight volumes of the series *Music and Society* (Englewood Cliffs, N.J., 1986–1999), Stanley Sadie, general ed., are exceptionally good resources. Two anthologies of readings are pertinent: W. Oliver Strunk's *Source Readings in Music History*, rev. ed., edited by Leo Treitler (New York, 1998); and Piero Weiss and Richard Taruskin, eds., *Music in the Western World: A History in Documents* (New York, 1984).

A volume that represents both Jewish and Christian perspectives is Lawrence A. Hoffman and Janet R. Walton, eds., *Sacred Sound and Social Change: Liturgical Music in Jewish and Christian Experience* (Notre Dame, Ind., 1992), which has been an important resource for this entry. Eric Werner's *The Sacred Bridge: The Interdependence of Liturgy and Music in Synagogue and Church during the First Millennium*, 2 vols. (New York, 1959), is a classic discussion of the liturgical and musical relations between synagogue and church, though often debatable in its conclusions. Uniquely valuable but also dated is Abraham Zvi Idelsohn, *Jewish Music in Its Historical Development* (New York, 1929). On the cantorial tradition, two works stand out: Eric Werner, *A Voice Still Heard: The Sacred Songs of the Ashkenazic Jews* (University Park, Pa., 1976); and Mark Slobin, *Chosen Voices: The Story of the American Cantorate* (Urbana, Ill., 1989). Jeffrey A. Summit provides a rich ethnographic study in *The Lord's Song in a Strange Land: Music and Identity in Contemporary Jewish Worship* (New York, 2000).

For early Christian ideas and uses of music, see Johannes Quasten, *Music and Worship in Pagan and Christian Antiquity*, translated by Boniface Ramsey (Washington, D.C., 1983); and James McKinnon, ed., *Music in Early Christian Literature* (Cambridge, U.K., 1987). A valuable resource for later viewpoints on Catholic Christian music is Robert F. Hayburn, ed., *Papal Legislation on Sacred Music, 95 A.D. to 1977 A.D.* (Collegeville, Minn., 1979). Christian theologies of music are well presented in Quentin Faulkner, *Wiser than Despair: The Evolution of Ideas in the Relationship of Music and the Christian Church* (Westport, Conn., 1996); Joyce L. Irwin, *Neither Voice nor Heart Alone: German Lutheran Theology of Music in the Age of the Baroque* (New York, 1993); Albert L. Blackwell, *The Sacred in Music* (Louisville, Ky., 1999); and Jeremy Begbie, *Theology, Music, and Time* (Cambridge, U.K., 2000).

Karl Gustav Fellerer gives a good account of Catholic music in *The History of Catholic Church Music*, translated by Francis A. Brunner (Baltimore, Md., 1961). A detailed survey of Protestant music is Friedrich Blume, *Protestant Church Music: A History* (New York, 1974). Paul Westermeyer's *Te Deum: The Church and Music* (Minneapolis, Minn., 1998) emphasizes vocal and specifically congregational music. On hymnody, a useful resource is David W. Music, ed., *Hymnology: A Collection of Source Readings* (Lanham, Md., 1996). Richard Arnold's *The English Hymn: Studies in a Genre* (New

York, 1995) is unsurpassed. African American hymnody and religious music is treated in Eileen Southern, *The Music of Black Americans: A History*, 3d ed. (New York, 1997); Jon Michael Spencer, *Protest and Praise: Sacred Music of Black Religion* (Minneapolis, Minn., 1990); and Jon Michael Spencer, *Black Hymnody: A Hymnological History of the African American Church* (Knoxville, Tenn., 1992). For religious music in the United States generally, see Stephen A. Marini, *Sacred Song in America: Religion, Music, and Public Culture* (Urbana, Ill., 2003). The articles in Edward Foley, ed., *Worship Music: A Concise Dictionary* (Collegeville, Minn., 2000), are brief but wide-ranging and reliable. Edward Foley's *Ritual Music: Studies in Liturgical Musicology* (Beltsville, Md., 1995) contains a detailed bibliographical essay on music and liturgy.

FRANK BURCH BROWN (2005)

MUSLIM BROTHERHOOD. Founded in 1928 by Ḥasan al-Bannā' (1906–1949), the Society of Muslim Brothers (al-Ikhwān al-Muslimūn) was created to bring Egyptian Muslims back to an awareness of the objectives of religion within a society that had, in the view of al-Bannā', been corrupted by alien ideologies and a materialist philosophy imported from the West.

HISTORICAL BACKGROUND. The British occupation of Egypt in 1882 had fueled a nationalist movement seeking independence from British rule; these aspirations culminated in the revolt of 1919 under the leadership of the aging politician Sa'd Zaghlūl and the newly formed Wafd ("delegation") party. The decade of the 1920s offered the Egyptians constitutional government and hopes of an impending settlement between Britain and Egypt through a negotiated treaty. When Zaghlūl died in 1927, these hopes were eroded, and a number of movements appeared as alternatives to the liberal notions of government that had not been successful, partly through interference on the part of the king and the British authorities in Egypt and partly through ineptness on the part of the parliamentarians. In addition to the fascists and the communists, these movements included the Society of Muslim Brothers, who believed that the path of reforming the country's social and political problems lay in the islamization of institutions.

Ḥasan al-Bannā', a primary school teacher who was the son of a small-town religious teacher, was early attracted to Sufism, which, along with classical Islamic studies, formed his major intellectual foundations and became the linchpins of his group. He described the Muslim Brotherhood as a "Salafiyah movement [espousing return to the early principles of Islam], a Sunnī [orthodox] way, a Ṣūfī [mystical] truth, a political organization, an athletic group, a cultural and educational union, an economic company, and a social idea." The movement spread rapidly, representing every segment of society from newly urbanized rural immigrants to high government officials. In its heyday in the 1940s, the Muslim Brotherhood claimed to represent one million members; later estimates are difficult to establish.

The structure of the organization was spelled out in the Fundamental Law of the Organization of the Muslim Brothers, promulgated in 1945 and later amended. Leading the organization was the general guide, who chaired the General Guidance Council (the policy-making body) and the Consultative or General Assembly, both of which were elective bodies. A secretary general was in charge of a secretariat linking the council and the rest of the organization. Two further subdivisions dealt with various committees (press, peasants, students, etc.) and with an administrative body supervising branches outside the capital. A chain of command was thus established over the entire membership.

SPREAD OF THE MOVEMENT. Weekly lectures, preaching in mosques, and periodic conferences allowed for popular participation, and the establishment of a press soon spread the message of the Society of Muslim Brothers further. Unconcerned with doctrinal differences, the participants concentrated on growth, action, and organization, and by 1939 they were ready for political activity. The war years were to provide them with a forum.

Nationalist agitation against the British continued with labor strikes and student demonstrations until, in 1942, the British threatened King Fārūq (Farouk) with deposition and forced him to appoint a Wafd government under Muṣṭafā al-Naḥḥās. This incident generated further support for the Muslim Brotherhood, by then the only other grouping with a mass base to rival the Wafd. Even among the Wafd leadership there were many who approved of the society as a bulwark against the spread of communism among the working class. For the next few years the society established links with disaffected officers within the army (who were later to carry out the revolution of 1952), and, unknown to even his closest colleagues, al-Bannā' stockpiled weapons and created a secret apparatus trained in the use of armed violence for tactical operations.

With the end of the war, agitation for the evacuation of British forces from Egypt started once again, with frequent student demonstrations and acts of violence until the British garrison was finally withdrawn to the Canal Zone. The situation in Palestine and the war against Israel in 1948 provided the Muslim Brotherhood with an opportunity to collect more arms as members volunteered during the war and remained in the forefront of the fighting until their organization was dissolved in December 1948. The immediate cause for the government's action against the society was the death of the Egyptian chief of police, Salīm Zakī, who was killed by a bomb thrown at him during student demonstrations protesting the armistice with Israel. Mass arrests followed as the government, fearing the society's growing influence, sought to proscribe it. Three weeks later, the prime minister, Maḥūmud Fahmī al-Nuqrāshī, was assassinated by a Muslim Brother. In February 1949 Ḥasan al-Bannā' was himself assassinated, probably with the complicity, if not the actual participation, of the government of the day.

After the Muslim Brotherhood was proscribed, its property confiscated, and its members put on trial, many of its remaining members fled to other Arab countries, where they founded autonomous branches of the society. In 1951 a Wafd government, seeking a buffer against rising leftist movements, allowed the society to reconvene. A judge with palace connections, Ḥasan Ismā'il al-Huḍaybī, was chosen as new leader. That same year the Wafd government unilaterally abrogated the treaty of 1936 with England, and Egyptian youth, including the Muslim Brothers, were encouraged to harass British camps in the Canal Zone. In January 1952 British forces attacked the Ismailia police station, and forty Egyptian policemen were killed. On the following day Cairo was set on fire in a monstrous riot that gutted the heart of the city. The Muslim Brothers were suspected of planning the riot, which they had not, although some of them were among the many participants. From then on the country was virtually without effective government until July 23, 1952, when the Free Officers movement, which included future Egyptian presidents Jamāl 'Abd al-Nāṣir (Gamal Abdel Nasser) and Anwar al-Sādāt, seized power and three days later sent the king into exile.

There had been strong links between the Muslim Brotherhood and the Free Officers—Nasser and Sadat had both been members of the society. Once all political parties had been disbanded, the only focus for mass support lay with the society. Nasser knew that it represented the lone challenge to his authority and that its leaders expected to share power with the officers; a power struggle was inevitable. In 1954 a member of the Muslim Brotherhood allegedly attempted to shoot Nasser during a public rally, and once again the society was proscribed and its members arrested.

The society remained underground throughout the Nasser era. When Sadat came to power in 1970 all prisoners were released, including the Muslim Brothers, and, to combat the Nasserite current, Sadat allowed the society to reestablish itself under the leadership of an 'ālim (religious scholar), Shaykh al-Tilimsānī, and to publish its own newspapers. Meanwhile newer associations patterned after the society, the Islamic *jamā'āt* ("groups"), had appeared. Some of these were extensions of the Muslim Brotherhood; others regarded the society as retrograde and beholden to the government. It was a member of one of the latter, more extremist groups who assassinated Sadat in 1981.

DOCTRINES AND IMPACT. According to the program of al-Bannā', the Society of Muslim Brothers was given a mission to restore the rule of the *sharī'ah* (Islamic law) to Egypt, and to all other Muslim countries where their missionary activities had set up affiliates. Rule of the *sharī'ah* rendered inadmissible the separation of church and state, for the state, they believed, existed in order to serve religion and to facilitate the fulfillment of Islamic religious duties. The Islamic state had the Qur'ān as its constitution; its government operated through *shūrā*, or consultation, and the executive branch, guided by the will of the people, ruled through Is-

lamic principles. The ruler, chosen by the people, was responsible to them and not above the law, with no special privileges. Should he fail in his duties he was to be ousted. Freedom of thought, of worship, and of expression were vital, as was freedom of education. Finally, freedom of possessions was to be maintained within the limits set by Islamic law, which frowns upon the excessive accumulation of wealth and enjoins *zākāt* (“alms”) as a basic religious duty. Social justice was to be the guiding principle of government.

The significance of the Society of Muslim Brothers and of its modern offshoots, the *jamā'āt*, is that they represent a protest movement couched in a traditional Islamic idiom that expresses the ethos of a people. The society arose in protest against a foreign occupation that threatened the identity of a people and the dissolution of its culture and religion. It spoke to people in the language they understood and appreciated, that of Islam and its historical past, and it did not posit newfangled notions derived from a Western idiom, although the society did use Western techniques of mass communications and of assembly, even ideas of government, which were garbed in Muslim idiom. As such it was comprehensible to the masses who suffered political discrimination and economic exploitation by a government that was largely indifferent to their welfare, especially during periods of economic recession. Those who were disillusioned with Western ideologies and their ability to solve Egypt's problems, or indeed the problems of any Muslim country, turned to the precepts of the society, or to similar movements that they identified with their roots and cultural authenticity (*aṣālah*), for guidance and spiritual consolation. The same phenomenon was reproduced during the Sadat regime (1970–1981) when the “Open Door” (*infitāḥ*) policy disrupted society and led to rampant consumerism, which, exacerbated by the influx of oil money, raised fears of becoming engulfed by westernization.

Organizations such as the Muslim Brotherhood or the *jamā'āt* are regarded by some Muslim regimes as dangerous foci of opposition and have thus met with violent repression. In 1982, under the regime of president Ḥāfiẓ al-Asad, the Syrian army shelled the city of Hama, a Muslim Brotherhood stronghold; portions of the city were leveled and casualties were variously estimated at ten thousand to twenty thousand. Similar attacks were repeated in Aleppo, Homs, and Latakia. In Iraq the regime of Ṣadām Ḥusayn waged a relentless campaign against the Shī'ī group al-Da'wah al-Islāmīyah. In Saudi Arabia Muslim militants seized the Grand Mosque in Mecca for several days in 1979. In Sudan the Muslim Brotherhood forced the regime of Muḥammad Ja'far al-Numayrī (Numeiri) to adopt Islamic policies in 1977. Comparable militant groups have spread to most Muslim countries irrespective of their forms of government.

AFAF LUTFI AL-SAYYUD MARSOT (1987)

MUSŌ SŌSEKI (1275–1351), a monk of the Rinzaï school of Zen Buddhism in medieval Japan. Born into an aristocratic family, he entered the religious life at an early age, rose to become head of some of Japan's most influential Zen monasteries, and left his stamp on Rinzaï Zen and medieval culture.

Musō's earliest Buddhist training was not in Zen, but in esoteric Tendai and Shingon Buddhism. He was drawn to Zen at about the age of twenty and went to study under the Chinese Zen master Yishan Yining at the monastery of Engakuji in Kamakura. Although an able pupil, Musō was unable to convince Yishan that he had attained a valid enlightenment experience. Finally, he left Engakuji to seek his understanding of the buddha-nature in a life of solitary wandering and meditation, and to test his Zen with other masters. He attained his enlightenment one night, deep in a forest, watching the embers of his campfire. This enlightenment experience was formally recognized (*inka*) by the Japanese Zen master Kōhō Kennichi, with whom Musō studied for several years.

After Kōhō's death in 1314, Musō returned to his solitary wanderings, deepening his insight through meditation in mountain hermitages. His spiritual reputation eventually reached Kyoto and Kamakura. In 1325, at the age of fifty-one, he was invited by the emperor Go-Daigo to head the important Kyoto monastery of Nanzenji. Musō also came to the attention of the Hōjō regents in Kamakura and the early Ashikaga shoguns, all of whom were eager to patronize the monk and study Zen under his guidance. After Nanzenji, Musō went on to head several other important Rinzaï *gozan*

monasteries. By the close of his life, he was regarded as the most eminent monk in Japan, had become the leader of a rapidly growing band of disciples, and had seven times been the recipient of the prestigious title of *kokushi*, or National Master.

Musō's considerable contributions to medieval Zen and Japanese culture were made in several areas. As a Zen master, with a large following of monks and laymen, Musō advocated a kind of Zen practice that was readily accessible to the Japanese of his day. Although he studied under Chinese Zen masters, Musō himself never visited China. His Zen incorporated the traditional Rinzai practices of seated meditation and *kōan* study, but its Chinese character was tempered by his own early religious training, his continued devotion to Japanese Esoteric Buddhism, and his strong interest in Japanese poetry and culture. In his book *Muchu mondo* (Dialogues in a dream), Musō tried to explain Zen in straightforward, everyday language as he responded to the questions raised by the warrior Ashikaga Tadayoshi.

Musō also played an important role as a monastic leader and regulator who shaped the character of Rinzai Zen monastic life in medieval Japan. Although his Zen was easily accessible to monks and laymen, he set high standards for his monks. He divided them into three categories: those few who singlemindedly pursued enlightenment, those whose Zen practice was diluted by a taste for scholarship, and those who merely read about Zen and never threw themselves into a search for self-understanding. To help and discipline the practice of all his followers, Musō laid down strict rules for his communities in codes such as the *Rinsen kakun*, a set of regulations for Rinsenji. In this, Musō was setting himself in the tradition of such famous Chinese and Japanese monastic leaders as Baizhang and Dōgen Kigen, both of whom had devoted considerable attention to the proper practice of Zen community life.

Musō was also an intellectual and a man of culture. Schooled in Chinese, he wrote poetry in both Chinese and Japanese. He is also renowned as a garden designer. In addition, Musō was a major political figure in his day. He served as confidant and go-between for the emperor Go-Daigo, the Hōjō, and the Ashikaga, encouraged the sending of trading missions to China and the building of new Zen monasteries, and raised Rinzai Zen to a position of political prominence in medieval Japanese society.

MARTIN COLLCUTT (1987)

MUʿTAZILAH. A religious movement in early Islam, the Muʿtazilah turned into a theological school that became dominant in the third and fourth centuries AH (ninth to tenth century CE) and persisted in certain areas until the Mongol invasion at the beginning of the thirteenth century CE. The history of the movement is comprised of three different phases: (1) an incubation period that lasted roughly through the eighth century; (2) a short period of less than half a century (c. 815–850) when the Muʿtazilī school, after having defined its identity, developed an astonishing variety of individual, sometimes contradictory ideas and permeated the intellectual life at the Abbasid court; and finally (3) several centuries of scholastic systematization channeled into two branches or schools that were named after the towns of Basra and Baghdad respectively.

Each of these phases presents its own problems for the researcher: the first is badly documented and can only be reconstructed on the basis of later reports, which are frequently distorted and tendentious; the second is better attested but needs detailed monographical treatment; and the third has only recently begun to attract scholarly attention. On the whole, knowledge of this movement is still rudimentary. Detailed research is hampered by the lack of original texts. This is due to the fact that, after the middle of the ninth century, the Muʿtazilī movement was gradually driven into the position of a heresy; in the areas where it was considered "unorthodox" its books were no longer copied. Therefore we have to rely, at least up to the third phase, mainly on heresiographical reports. For the later centuries we possess a few texts, some of which reach the size of a *summa theologica*, but they belong to a rather restricted period; outside of this limit, many of the thinkers still remain mere names to us.

HISTORY. The Muʿtazilī movement is usually traced back to the end of the Umayyad period, the years between 740 and 750. But during the first century of its existence the movement was far from the most important factor in the development of Islamic theology.

Origins. The Muʿtazilah began in Iraq, but there the Shīʿah (in Kufa) and the Ibāḍīyah (in Basra and Kufa) initially had the better thinkers, while the school of Abū Hanīfah, which combined juridical competence with an "ecumenical" outlook in theology, enjoyed greater missionary success. We are not even sure whether we can assume—as all of our sources do—that a real continuity existed between the first and second phases: there seems to be almost no doubt that the great thinkers of the second phase did not have any precise knowledge about their spiritual ancestors. When they moved from the old intellectual centers, Basra and Kufa, to the Abbasid court in Baghdad they felt the urge to preserve the memory of their past, but they evidently could not rely on any established historical tradition of the "school." The gap was widened by the fact that they disagreed with certain opinions held in the preceding generation and therefore tried to keep their immediate predecessors out of the picture. Under these circumstances we must reckon

on with the possibility that they constructed a past which never belonged to them or was only partially true. We should also not forget that the historical reports that were transmitted at that time were not collected and written down until some time later, from the middle of the second half of the ninth century onward.

The lack of historical recollection is amply demonstrated by the discovery that no Mu‘tazilī author had any precise information about the original meaning of the name *Mu‘tazilah*. Our sources offer a number of explanations, but all of them are secondary guesses and beside the point; some are blatantly tendentious. Modern scholarship has contributed a few more suggestions, but the question still remains open. All that we can prove is that the movement bore this name when it became involved in an insurrection against the caliph al-Manṣūr in 762. But the name does not seem to have been invented at that time, for it does not fit the situation. It means “those who dissociate themselves” or “those who keep themselves apart” and thus calls for political neutrality rather than revolutionary activism. The name already existed in the first century AH (seventh century CE), with this connotation, as a term designating some renowned companions of the Prophet who abstained from any participation in the first civil war (the Battle of the Camel in 656 and the Battle of Ṣiffīn in 657). It was then probably applied to the first Mu‘tazilī thinkers since they, too, did not side with any political party of their time.

This attitude was distinctive insofar as it was adopted in a period when almost everybody had to make personal alignments clear, namely during the last years of the Umayyad caliphate, which saw the breakdown of the political order in Iraq and elsewhere. The founder of the movement, a cloth merchant from Basra by the name of Wāṣil ibn ‘Aṭā’, intended to create a missionary organization working inside Islam; he sent his disciples, as “propagandists,” to the most remote regions of the Islamic empire—the Arabian Peninsula, Armenia, Iran, India (the Punjab), and the Maghreb—so that they could interpret the Muslim creed and win people over to his own cause. Unfortunately, we do not know what this “cause” really implied. We cannot exclude the possibility that it was originally political, for Wāṣil copied a model that clearly had a political character, that is, the network of agents built up by the Ibāḍīyah, with whom he lived closely in Basra. Most of our information, however, contradicts this hypothesis: Wāṣil wanted reform, not revolution. Islam, was, after all, still the religion of a minority; outside the great centers, the knowledge of what Islam really meant was rather limited, and its definition differed from area to area. In any case, Wāṣil did not live to see the fruit of his efforts; he died in 749, one year before the triumph of the Abbasids.

Wāṣil’s “propagandists” were mostly merchants like himself, and when they traveled, they combined business with missionary zeal. This pattern explains how the movement financed itself but does not say much about its spiritual impetus. The inner motivation of Wāṣil’s circle seems to

have derived from a certain feeling of inferiority: all of the participants were non-Arabs, that is, they did not enjoy the natural prestige of the aristocracy but came, as “clients,” from Iranian or Aramaean families who had been converted to Islam one or two generations before. They possessed considerable wealth and were, as a matter of fact, recognized in their society, but they had to rely on Islam as the basis of their identity. They knew something about Islamic law, for Wāṣil advised them to win the favor of their audience by delivering *fatwās* (“legal opinions”) to demonstrate their juridical expertise. But they also deliberately distinguished themselves from normal, “worldly” people: they clipped their mustaches and wore turbans (which, at that time, were characteristic of certain nomadic tribes but not of the urban population); they also wore special sandals and wide sleeves. This was the attire of ascetics; it gave them a certain “alternative” touch.

The organization was taken over by Wāṣil’s colleague ‘Amr ibn ‘Ubayd (d. 761), a prominent disciple of Ḥasan al-Baṣrī, the great figure of religious life in Basra during the preceding generation. ‘Amr had to cope with the new situation created by the Abbasid seizure of power. He seems to have given up all relations with the cells outside Iraq and in Basra, where he controlled a considerable number of adherents (who possibly formed youth groups), he kept quiet. This position became increasingly precarious at the end of his life as discontent with the Abbasid government mounted in Iraq. After his death the activists among the Mu‘tazilah followed the call of the Shī‘ī pretender Muḥammad ibn ‘Abd Allāh al-Nafs al-Zakīyah (or rather, that of his brother Ibrāhīm) and took part in the revolt of 762. When the attempt failed, the Mu‘tazilah were persecuted and went into hiding; those who had compromised themselves mostly fled to Morocco.

This event seems to be a decisive turning point. We hear that afterward the Mu‘tazilah still possessed a mosque of their own in Basra, but we do not know of any leading personality for at least thirty years. Above all, there is no hint of any specific theological activity. Then, toward the end of the eighth century, two figures emerged: al-Aṣamm in Basra and Ḍirār ibn ‘Amr in Kufa. But neither of them was a typical Mu‘tazilī; as a matter of fact, the later school kept a certain distance from them. Al-Aṣamm was obviously an Ibāḍī, whereas Ḍirār, a judge by profession and one of the most original thinkers of this period, differed from the *communis opinio* of the following generation in his ideas concerning free will and therefore fell victim to a *damnatio memoriae*. The original concept of the Mu‘tazilah as a popular missionary movement seems to have survived best in Baghdad where, during the same period, Bishr ibn al-Mu‘tamir, a slave merchant by profession, exhorted the masses by expressing his theological ideas in simple poetry. That was appropriate for the social climate in the newly founded capital; the town had attracted many people who came to make their fortune and ended up by being uprooted.

The period of success. The Mu‘tazilah were propelled from provinciality to prime importance by the theological in-

terest which emerged at the Abbasid court. The change came in two shifts, first through the influence of the Barmakids, the viziers of Hārūn al-Rashīd (r. 786–802), and then, after a short setback caused by their downfall, thanks to the initiative of the caliph al-Ma‘mūn (813–833). Both the Barmakids and al-Ma‘mūn were not so much interested in theology itself as in listening to disputations: they liked to have representatives of different religions and confessions argue against each other. This predilection may have been stimulated by a non-Iraqi environment: the Barmakids originally came from Balkh, and al-Ma‘mūn first resided in Merv; in Transoxiana, where both towns were situated, Islam co-existed with Zoroastrianism, Buddhism, Christianity, and Judaism.

However, the main stimulus came from the intellectual atmosphere of the capital itself. Islam was no longer the religion of a minority, as in the time of Wāsil, but a creed which had rapidly expanded at the expense of other religions. The conversions to Islam had been prompted mostly by social considerations, but theology had to furnish an *a posteriori* justification: thus the outlook of the new theology was strongly apologetic and its style predominantly dialectical. The Muslims were not entirely unprepared; they had experienced enough internal strife between different “sects” in order to know what methods to use in disputes. Therefore, the Mu‘tazilah were not the only ones to sharpen these weapons for the fight with their pagan adversaries. But besides being skillful dialecticians (*mutakallimūn*) they offered a concept of Islam which, by its rationality, transcended the divisions among the old theologico-political factions (Shī‘ah, Murji‘ah, and others) and therefore had broad appeal, at least among the intellectuals. The Mu‘tazilah thus became the first overall, “orthodox” school of theology.

Their path to success can still be traced. ʿAlī ibn ‘Amr took part in the sessions arranged by the Barmakids, but there he was only one among many. In Merv, one generation later, the situation was different; the Mu‘tazilī Thumāmāh ibn Ashras acted as a kind of counselor to al-Ma‘mūn, and Bishr ibn al-Mu‘tamir was among those who put their signature as witnesses to the document in which the caliph nominated the Shī‘ī imam ‘Alī al-Riḍā as his successor. The real breakthrough came when, in 820, al-Ma‘mūn moved the court back to Baghdad. Two figures dominated the scene there: the Basran theologian Abū al-Hudhayl al-‘Allāf, who was already about seventy (he died a centenarian in about 840), and his nephew al-Nazzām. The latter showed all the features of a courtier: he mocked at asceticism and excelled in light and imaginative poems which celebrated wine and the beauty of youths. He therefore acquired the reputation of being a drunkard and a homosexual. He was not necessarily either, since poetry is not reality, but these characterizations demonstrate that, with their success, the Mu‘tazilah also came under scrutiny. Al-Nazzām’s open identification with the ideals of high society did not tally with Bishr ibn al-Mu‘tamir’s earlier attempt to convert the masses. The split

deepened when those who still understood the Mu‘tazilah as a popular movement and kept to the old ascetic tradition started adopting Ṣūfī tendencies: they dressed in wool and asserted that the Muslim community should abstain from electing a caliph (a merely symbolic viewpoint, for the community did not have any influence in this respect anyway). In their view, however, court life was a scandal and the entire Muslim world corrupt, full of injustice and violence.

For the moment, the court party had the upper hand. But enjoying the favor of the caliph also meant supporting his policies. When al-Ma‘mūn, in a decree sent throughout the empire in 833, asked his governors to enforce the doctrine of the createdness of the Qur‘ān as a kind of state dogma, the Mu‘tazilah were immediately identified with this measure. This evaluation was only partly justified. The caliph had certainly made the decision by himself, as a demonstration of his spiritual leadership of the community, and his main adviser had been a theologian by the name of Bishr al-Marīsī, who, through his belief in determinism, stood apart from the Mu‘tazilah. But the Mu‘tazilah subsequently had to lend their intellectual support to the measure. When the policy of the caliphs led to a persecution (the so-called *mihnah*, or “inquisition”) the chief judge was a Mu‘tazilī: Ibn Abī Duwād. The *mihnah* lasted for fifteen years, and the government succeeded in purging the ranks of the state officials of any opposition. Resistance remained strong, however, among the population of Baghdad who, with a clear anti-intellectual bias, rejected rational theology in favor of the prophetic tradition (*ḥadīth*). Therefore the caliph al-Mutawakkil, the third successor of al-Ma‘mūn, decided to steer another course. In 848 he ordered some traditionists to preach about (spurious) sayings in which the Prophet allegedly condemned the Mu‘tazilah and similar groupings; a few years later, any occupation with dialectical theology was prohibited. The Mu‘tazilah were removed from the court.

But the movement was still very strong. Measures taken in Baghdad did not always have consequences outside the capital, and the Mu‘tazilah had established themselves in almost all parts of the Islamic world: in Upper Mesopotamia and in the Syrian Desert (among the Kalb); in several suburbs of Damascus and in Lebanon (for instance in Baalbek); in Bahrein and even in the Maghreb (again among certain tribes in what is today Morocco and Algeria); in Armenia; above all in western Iran, in the provinces of Kerman, Fārs (for instance in Arradjān and in Sirāf), and Khuzistan (for instance in Shūshtar, Susa, ‘Askar Mukram, and Gundē-shāpūr, at that time the seat of a famous medical academy directed by the Nestorians); and finally in India, in the area along the shore of the Indian Ocean to the west of the Indus Delta. In these centers the trend toward individualistic thinking and dialectical pyrotechnics had certainly not been as predominant as in Baghdad. Many of the Iranian towns mentioned are situated on the main trade routes: it seems that the common theological outlook created an atmosphere of confidence essential for better business.

This extended geographical base helped the Mu‘tazilah to survive. However, it also fostered misunderstandings and tensions which came about through separate regional developments. In Baghdad, the caliph al-Mutawakkil had not only acted against the Mu‘tazilah but also—and even more violently—against the Shī‘ah. Consequently al-Jāhīz (d. 869), a prominent Mu‘tazilī author who had maintained close relations with Ibn Abī Duwād and other high state officials, wrote a book in which he praised the Mu‘tazilah and at the same time attacked the Shī‘ah. This opportunistic turn irritated a colleague of his by the name of Ibn al-Rāwandī (d. about 910), who had just come from the East, where he had acquired a sound reputation within and outside of his school. Iran was governed by the dynasty of the Tahirids, who did not follow al-Mutawakkil’s anti-Shī‘ah policy. Ibn al-Rāwandī therefore joined the Shī‘ah in Baghdad and refuted al-Jāhīz’s book. But he did more than that: in a series of treatises he showed that some of the axioms accepted by the Mu‘tazilah, such as the createdness of the world or the justice of God, that is, theodicy, were not based on solid premises and that the Qur‘ān was full of contradictions. His enemies within the school called him a freethinker for those views, but he apparently wanted only to point out that, with respect to certain positions, the dialectical method allowed for arguments pro and con which simply neutralized each other. Thus the Mu‘tazilah, shortly after being deprived of political power, were also faced with the inadequacy of their intellectual instruments.

The scholastic phase. Ibn al-Rāwandī’s pinpricks produced a shock. His books were refuted by several authors, in Baghdad as well as in Basra. Although these two towns were far from the only strongholds of Mu‘tazilī theology, their names served as labels for the two different schools that took up Ibn al-Rāwandī’s challenge and, going beyond mere refutation, began systematizing the material accumulated in the past. At the beginning of the tenth century their main representatives were Abū al-Qāsim al-Ka‘bī (d. 931), who was identified with Baghdad although he only studied there and then taught in his hometown of Balkh in eastern Iran, and for Basra, al-Jubbā‘ī (d. 915) with his son Abū Hāshim (d. 933). In their efforts to build up a coherent theological framework they had to care more than their predecessors about epistemological and terminological problems; this accounts for their growing interest in precise definitions and questions of logic.

The range of the Basran school, which, like the school of Baghdad, gradually shifted to Iran, is well attested by the work of the *qāḍī* ‘Abd al-Jabbār (d. 1024/5), chief judge at Rayy (near modern Tehran). His *Mughnī* (*[The Book] That Makes [Other Books] Superfluous*), a twenty-volume *summa theologiae*, has recently been edited as far as it is preserved and also subjected to some research. Besides this valuable source, further texts written by his pupils and other theologians who followed his views are also available. For Mu‘tazilī hermeneutics our best source is Abū al-Ḥusayn al-Baṣrī (d. 1044),

with his *Kitāb al-mu‘tamad* (The Reliable Book), although this book is concerned with the criteria of jurisprudence, not those of theology.

For the school of Baghdad, on the contrary, we lack extensive original documentation. But its ideas are relatively clear to us thanks to a development that deeply influenced the later history of the Mu‘tazilah: the winning over of the Shī‘ah. This process took place within two of the three main branches of Shī‘ī theology; the Zaydīyah and the Twelver Shī‘ah. Only the Ismā‘īlīyah preferred to seek support in Neoplatonic philosophy instead. Among the Zaydīyah the door had already been opened to Mu‘tazilī thought by the imam al-Qāsim ibn Ibrāhīm (d. 860), though he did not intend to be a Mu‘tazilī himself. The final decision was taken somewhat later and in two different regions: first by his grandson al-Hādī ilā al-Ḥaqq (d. 911), who founded a Zaydī principality, an imamate, in Yemen; second, though with certain setbacks, by the Zaydī pretenders in northern Iran, in the area near the Caspian Sea. Among the Twelvers, Mu‘tazilī theology was introduced by two members of the Banū Nawbakht, a famous family of state officials and scholars: Abū Sahl Ismā‘īl al-Nawbakhtī (d. 924) and his nephew Ḥasan ibn Mūsā (d. between 912 and 922). The trend originally met strong resistance there, especially from the traditionalist theologian Ibn Bābawayhī (d. 991), but then it prevailed because of the influence of Shaykh al-Mufīd (d. 1022).

The motives for these dogmatic shifts are not altogether clear. The Mu‘tazilah still retained, among their theological principles, the obligation to spread the right belief; this may explain their usefulness for the Zaydī pretenders. The Twelvers had lost their spiritual leader through the disappearance (*ghaybah*) of the twelfth imam in 874 and may have clung to rational theology for new reliable guidance. In Baghdad, Mu‘tazilī theologians had always had moderate Shī‘ī leanings, although they did not normally side with the Rawāfiḍ (i.e., the Twelvers). At the end of the ninth century, even a Basran like al-Jubbā‘ī recognized ‘Alī’s son Ḥusayn as a righteous ruler. Abū al-Qāsim al-Ka‘bī was the secretary of an early Zaydī pretender in Iran. Later on, the crisis of the caliphate revived the hopes for political support. The Mu‘tazilah in Baghdad entertained relations with Sayf al-Dawlah (r. 944–967), the Hamdanid ruler of Aleppo, and then with the Buyids; both dynasties had Shī‘ī leanings. A Buyid vizier, al-Ṣāhib ibn ‘Abbaād (d. 995), promoted the *qāḍī* ‘Abd al-Jabbār in Rayy.

The Baghdad school exerted its strongest influence among the Zaydīyah, though only in its Yemeni wing. The Caspian imams were under Basran influence, but their principality did not survive. However, theological works of the Iranian wing were taken over into the Yemen, for instance the great Qur‘ān commentary written by al-Ḥākim al-Jushamī (d. 1101). Among the Twelvers, al-Mufīd followed the Baghdad school, but in the generation after him a pupil of the *qāḍī* ‘Abd al-Jabbār, Sharīf al-Murtaḍā

(d. 1044), turned to Basran ideas and determined the Twelver outlook for the centuries to come. On the whole, the Zaydiyyah adopted Mu'tazilī doctrine more fully than the Twelvers.

Outside of the Shī'ī areas, the Mu'tazilah were in retreat. But their impact persisted in at least two places. I have mentioned the Berber tribes in the Maghreb; some of them remained Mu'tazilī even after the Fatimid invasion, at least up to the second half of the eleventh century. They called themselves Wāṣilīyah, with reference to Wāṣil ibn 'Aṭā'. In fact, they seem to have lost contact with the Iraqi Mu'tazilah very early and did not participate in the move toward intellectualism instigated by the Abbasid court. We find scarcely any traces of theological activity; the claim to be Wasiliyah merely constituted a symbol of identity, the implications of which we do not know. In addition, Mu'tazilī theology continued to exert a certain attraction in Baghdad and in Iran, among jurists belonging to the school of Abū Hanīfah. In Baghdad, this combination became precarious after the weakening of Buyid power. In 1017, the caliph al-Qadīr forced the Ḥanafī judges and witnesses to make a public disavowal; pressure from traditionist, especially Hanbali, circles increased steadily. Eastern Iran, with its fragmented political landscape, offered better conditions. Mu'tazilī thought flourished under the Khwārizm-shāhs up to the beginning of the thirteenth century. We even know about a Mu'tazilī in the environment of Timur Lenk (Tamerlane, d. 1405). He, however, seems to have been an exception; generally speaking, the end of Mu'tazilī influence on Sunnī circles in Iran came earlier, with the Mongol invasion in the first half of the thirteenth century.

In the contemporary Muslim world, Mu'tazilī ideas are evaluated in different ways. In Iran, they still permeate theological thinking, especially after the revival of Shiism. In Yemen, they belong to the Zaydī heritage, but have lost all reproductive vigor. In certain Sunnī countries undergoing the impact of modernist movements, they have been thought of as giving witness to the essentially rational character of Islam; this has led, especially in Egypt during the last two generations, to a certain scholarly interest which was sometimes hailed as a "renaissance." Modern fundamentalism, however, has proved that view premature. Mu'tazilī ideas are again pushed back into the corner of heresy.

DOCTRINE. That Mu'tazilī doctrine changed over the centuries should go without saying. What is perhaps more important is the fact that its function also changed. During the incubation phase doctrine was less important than group solidarity; at the Abbasid court, Mu'tazilī theology represented the first attempt at a rational and universal description of Sunnī Islam; and in the later centuries certain basic positions, especially the doctrine of free will, served as a label which indicated that a person belonged to the Mu'tazilī "school."

The "five principles." The decisive step toward creating a reliable "dogmatic" framework was apparently taken

rather late, by Abū al-Hudhayl, who defined five principles that he considered indispensable to Mu'tazilī identity. These have determined the structure of Mu'tazilī theological works for centuries, in spite of the fact that two or even three of these principles did not retain much importance in later discussion. One of them was already dated when Abū al-Hudhayl took it up: the principle of "enjoining what is good and forbidding what is evil" (*al-amr bi-al-ma'rūf wa-al-nahy 'an al-munkar*), that is, active admonition to follow the right path and resist impiety. This had been the device of the revolution against al-Manṣūr in 762 and was probably the justification for Wāṣil's missionary projects, but it was rather out of place at the Abbasid court.

The second principle, concerned with the intermediate state of the Muslim sinner, was still valid at that time, but derived its importance from an earlier debate that had its roots in the period before Wāṣil. It was a compromise between two attitudes that had arisen in the seventh century, on the one hand the rigorist belief that every Muslim who commits a grave sin excludes himself or herself from the community, and on the other, an "ecumenical," communitarian position which understood the revelation of the *kerygma* as the decisive event by which every Muslim, whether sinner or not, was ultimately saved. Wāṣil was rigorist enough to abhor any laxity or minimalism, but he lived late enough to realize that the exclusiveness practiced by the rigorists could not serve as the basis of the world religion that Islam had meanwhile become. He wanted the grave sinner to remain a member of the Muslim community, with all the rights that involved (safety of life and property, inheritance from other Muslims, etc.), but he insisted that the sinner would be condemned to eternal punishment in Hell like the pagans if that person did not repent. Thus, the grave sinner is to be treated neither as an unbeliever nor as a true believer. This doctrinal position was apparently not far from that taken by Wāṣil's teacher, Ḥasan al-Baṣrī, but it was Wāṣil who brought it into focus and sharpened it by changing the terminology. Ḥasan had called the Muslim sinner a *munāfiq* ("hypocrite"), using a word taken from the Qur'ān, where it referred to enemies of Muḥammad who had not openly sided with the unbelievers. This led to exegetical problems; the Qur'anic context was not always appropriate for the theological definition wanted. Therefore Wāṣil used the term *fāsiq* ("transgressor") instead. This term was equally Qur'anic but had merely moral and no historical connotations.

The eternal punishment of the "transgressor" was Abū al-Hudhayl's third principle. It turned out to be somewhat flexible. The school sometimes tolerated members who only believed in a kind of prolonged purgatory; the dogma was also mitigated among the Twelvers. This tolerance derived from the fact that the discussion shifted to a related issue that had been Abū al-Hudhayl's fourth (or, according to his own counting, second) principle: God's justice. God does not do wrong; he punishes the sinner and rewards the good. He has the right to do so because he has put human beings under

an obligation; he has revealed the law, and men and women have the choice to obey or to disobey. This choice presupposes two things: freedom of decision and an instrument to grasp this possibility of decision, that is, reason. However, the fact that man is an intelligent being then implies that the obligation already existed before revelation; the prophets are sent to confirm what reason knows, or should have known, beforehand. To a certain extent, revelation is merely a sign of God’s mercy or favoring help which makes insight easier for man. It may, however, add new commandments; there are rational laws (e.g., the interdiction of lying) and revealed laws (e.g., the prohibition of the eating of pork).

Abū al-Hudhayl’s last principle was the unity of God. This had always been an indispensable postulate for Islam, as opposed to the Christian trinitarian beliefs and the dualism of Iranian religions such as Zoroastrianism or Manichaeism. But this unity had been understood in different ways. Early anthropomorphists such as the Qur’ān commentator Muqātil ibn Sulaymān (d. 767 or later) had found it sufficient to assert that God is one and not two or three, which did not exclude his having human shape. They merely held that God’s body is compact, not hollow, for he neither eats nor drinks. He is thus one in number and consistence but he is not one in form, for he has limbs like man. The Mu‘tazilah, on the contrary, understood unity as incorporeity, unity in essence: God is beyond time and place, he is unchangeable. They did not even agree when some Shi‘ī anthropomorphists in Kufa, Hishām ibn al-Ḥakam among others, refined their position so far as to conceive of God as a body of light that radiates like an ingot of silver. For the Mu‘tazilah, God is not a body at all but only “something,” a being that cannot be perceived by the senses but is exclusively known to us through revelation or through reason, by the effect of his creative will in nature. God will therefore not even be seen in Paradise: he is unlike all other beings.

Divine attributes. Unity then also means that the attributes ascribed to God in the Qur’ān are identical with him and not different entities or hypostases. This is true at least for “essential attributes” such as knowledge, power, or life; they are eternal and unchangeable like God himself and merely tell us something about certain aspects of his nature. “When one states that the Creator is knowing,” said Abū al-Hudhayl, “he has asserted the reality of an act of knowing that is God and has denied ignorance in God and has indicated [that there is] some object known [to God] that has been or will be.” However, in addition to “essential attributes” there are also “attributes of action” such as willing, hearing, seeing, or speaking, which describe God’s temporal relationship with his creation; they are other than God and subject to change, for they come into being when God acts and cease when his action ceases. They do not subsist in him. This is why the caliph al-Ma‘mūn declared the Qur’ān to be created: the Qur’ān is God’s “speech” or “discourse” and came into being at a certain historical moment.

This theory presented certain problems. The attributes were inferred from Qur’anic statements, where they normal-

ly took the form of predicates or “names,” in sentences like “God is knowing,” “God is (all) mighty,” and so on. These sentences then had to be reformulated as, for example, “God has knowledge” and “God has power.” How could this be done without reifying the attributes and transforming them into independent entities? And if knowledge really was God, as Abū al-Hudhayl seemed to say, how could it be differentiated from his power and other attributes? Finally, the question of whether there are attributes beyond revelation that have to be deduced rationally must be asked; predicates like “eternal” or “existent” were absent from the Qur’ān.

Since these questions referred to statements contained in the holy text, they were answered by linguistic analysis. The doctrine of attributes is based not on metaphysics but on grammar. Our understanding must therefore proceed from the Arabic language and medieval grammatical theory. The first differentiation can already be found in the translation of Abū al-Hudhayl’s statement mentioned above: instead of “God has knowledge” we have to say “There is an act of knowing belonging to God”; Arabic linguistic feeling and Mu‘tazilī theology insisted that “knowledge” is “knowing,” that is, an infinitive rather than a noun, and as such not necessarily permanent or independent. This was not, however, a definitive solution. One could still, as did certain opponents of the Mu‘tazilah such as Ibn Kullāb (d. 855?), conclude that this formulation referred to a separate entity that subsists in God. Al-Jubbā’ī therefore rephrased Abū al-Hudhayl’s doctrine in the following way: “The meaning of one’s describing God as knowing is (1) the assertion of [God’s] reality, (2) that [God] is contrary to whatever cannot know, (3) that he who says that [God] is ignorant states a false proposition, and (4) an indication that there are things that [God] knows.” Here, the act of knowing is completely excluded: what is asserted is only God’s reality. This was enough to protect God against any plurality, but there was some reason for doubting whether it was enough to affirm his knowledge.

Al-Jubbā’ī’s son Abū Hāshim then established a compromise by going back to the original Qur’anic statements and inserting a copula into them (which is normally absent from nontemporal statements in Arabic): *Allahu ‘ālimun* thus became *kāna Allāhu ‘āliman*, “God is knowing.” The copula was then understood as a “complete verb,” that is, it gained existential meaning: “God is”; the assertion of God’s reality had been made explicit. The participle for “knowing,” however, now put into the accusative instead of the nominative, was no longer interpreted as a predicate but as a *ḥāl*, a “state” of the subject instead of an attribute. In the words of Abū Hāshim himself: “Since it is true that [God] has a state in his being knowing, the knowledge that he is knowing is a knowledge of the thing itself [that is, the subject as] in this state rather than a knowledge of the act of knowing or of the thing itself.” This theory allowed the above statements to be understood univocally of all knowers; a theological problem had been put into the general frame of grammatical analysis.

However, since the purpose of this description was ontological we find the later authors unfolding a whole range of different ways of predication and attribution. There are, for example, besides the “essential attributes” also “attributes of the essence,” that is, attributes which not only make some statement about the essence but denote the essence itself and thus are not shared by anything else (in the case of God, a word like *eternal*). Then there are attributes grounded in the presence of an accident. They were subdivided by the *qāḍī* ‘Abd al-Jabbār into several categories: for example, those that specifically qualify the substrate (or object) and necessitate a state in it as a whole, like motion or rest; and those which specifically qualify the substrate but do not necessitate a state of it as a whole, as, for example, colors (which may inhere in a few single atoms of the substrate, but not the whole of it). From them we may distinguish attributes determined by the agent who causes the existence of the thing, like “well ordered” or “skillfully wrought” (with respect to the creation, for instance); attributes directly derived from his action, like “speaking,” “commanding,” and so on; and finally attributes that are grounded neither in the essence nor in an accident, like “self-sufficient” said with respect to God (since this word which, in Arabic, originally means “rich” is positive only in its form of expression whereas “its strict sense is the denial of need on the part of one who is specifically characterized by a state having which need and self-sufficiency are actually possible”).

The Mu‘tazilī worldview. The way in which the theory of the divine attributes developed shows that the achievement of Mu‘tazilī theology consisted not only in defining basic tenets by which it distinguished itself from other schools but also in the conceptual and systematic framework through which these tenets were expressed. Another case in point is the atomistic model by which the relationship between God and his creation was explained. This model had been conceived as early as the eighth century by Ḍirār ibn ‘Amr, but the theologian who gave it its final form was again apparently Abū al-Hudhayl. He thought of atoms as mathematical points that do not have any spatial extension until they touch each other. Atoms therefore are not three-dimensional; only bodies are. Normally it is only in spatial existence, that is, in combination with each other, that atoms take on accidents: color, for instance, and consequently visibility. Only a few accidents are connected with atoms when they are still isolated, namely those that, in the form of an alternative, make combination possible: composition versus separation and, as the medium through which composition and separation take place, motion versus rest. Motion then means that the atoms join each other and receive extension, or that they part and thus lose their corporeity again; rest means that they retain their status of being isolated and therefore cannot be perceived, or of being composite and therefore remain spatial.

What is decisive, however, is that the atoms do not join by themselves, for their composition is an “accident,” and ac-

cidents, by definition, are created by God. A body exists therefore only as long as God allows this accident of composition to endure. This is Greek atomism turned upside down. Democritus and Epicurus intended to explain nature by the principle of chance (therefore the church fathers abhorred their philosophy). For the Mu‘tazilāh, on the contrary, atomism served as an accomplice of divine omnipotence. As mere conglomerates, things do not possess any essence of their own; this demonstrates their dependence on God. However, although objects are reduced to purely material composites, this was not a materialistic theory. The Greek atomists were searching for the monad: they wanted to explain nature. The Mu‘tazilī atomists were searching for the pivot of God’s will and power: they wanted to explain creation.

That is why, in contrast to the Greeks, the Mu‘tazilāh extended atomism to the realm of human action. The freedom of choice that is necessary for human responsibility is based upon a capacity which the individual receives from God. This capacity is not a permanent quality, an inborn power of acting, but a momentary capability to do one specific act. The Mu‘tazilāh shared this basic assumption with their determinist or predestinarian opponents. What made the difference was merely the fact that they did not think that this capacity was given simultaneously with the act, as the determinists did, but one moment before, leaving an interval of one time atom so that people have the chance to make their decisions, to choose whether to perform the action, to leave it, or to do something else. There were Mu‘tazilāh, especially in the Baghdad school, who believed that the capacity for action was not merely momentary since it was identical with health and the intact functioning of the body, but even they understood this continuum as a mere accumulation of single isolated moments.

Continuity was a factor that never came first in this model. With respect to the physical world, consequences had to be taken into account especially regarding the explanation of movement, for in the context of atomism movement meant only that the atoms of a moving body were, at different moments, opposite to the subsequent atoms of the surface on which this body was moving. Consequently, one had to discuss the problem of when movement takes place at all, whether during the first moment, when it begins, or during the second, when it has already ceased to exist. Movement, it could be said, is only a convention of language; in reality, bodies are always at rest, though at subsequently different places. Continuity is then only an illusion of our senses, as in a film.

With respect to human existence, this lack of continuity comes to the fore in the Mu‘tazilī concept of person. For Abū al-Hudhayl the human being was first a mere complex of atoms and “accidents.” It is true that he or she is alive whereas other bodies are not, but life is again only an “accident,” a quality added to the conglomerate of atoms which form the body. There is something like a soul, but it is conceived of merely as a kind of breath that permeates the body

as long as that body is alive. The soul may leave the body during sleep; this explains the phenomenon of dreaming. But the soul is not immortal: it guarantees life and it disappears together with it. What Abū al-Hudhayl and his colleagues wanted to explain was not the continuity or uniqueness of the human person, but God's power to create human beings anew in the hereafter. God adds the "accident" of life to the atoms that form them when God creates them; God withdraws this accident when he makes them die; and adds it again when he resurrects them.

This concept of a fundamentally disjointed world seems to exclude causality. But the Mu'tazilah usually did not go so far as to deny causality completely. To begin with, they gave it a different name: "production," which they defined as the dependence of one act on another. The examples they adduced show, however, that they thought in terms of human actions alone. They did not want to formulate a law of nature but to bind the human being to the consequences of his or her own behavior. They were mainly interested in man and his responsibility; their approach was juridical rather than metaphysical, for they started from man's obligation toward God. Later on, they recognized that they could not neglect the universe completely and would have to give an explanation for the phenomenon of a world that functions in an orderly and foreseeable way in spite of its being dependent on God's will at each moment. Abū al-Qāsim al-Ka'bī spoke of God's "habit" in this respect, the *coutume de Dieu* that changes only in the case of a miracle.

Abū al-Hudhayl's worldview that I have described so far mainly influenced the Basran school, through al-Jubbā'ī. But during his lifetime he was already contradicted by his nephew al-Nazzām, who did not believe in atomism but proceeded from the infinite divisibility of bodies. Al-Nazzām also reduced God's immediate omnipotence. According to him, inanimate things now have a nature of their own that is independent in its activity, although ultimately created by God. They are still composites of different elements; however, these elements do not simply agglomerate like atoms but mix and grow into organic units. Nor do they depend on God's will at each moment of their existence; they are rather created all at once and then behave according to their own character. The human being, too, is no longer merely unique because of outward form but possesses a soul which, though still material, persists beyond death; al-Nazzām was the first Islamic theologian to take over the Platonic proofs for the immortality of the soul. This soul, a "subtle body," permeates all the limbs and keeps them alive. It can mix with other "bodies" that come to it from outside, such as sounds; this explains sense perception.

For some time, al-Nazzām's alternative approach had enormous success. But there were certain excesses that discredited it. Ultimately it did not supplant atomism. Nevertheless, it was not without influence on the Baghdad school. The Baghdadis continued to believe in atomism, but they held that the atoms have extension and endure by them-

selves, as do their basic accidents. Characteristically enough, it was a Baghdadi like Ka'bī who relied on the concept of the *coutume de Dieu*; like al-Nazzām, he believed in the existence of natural qualities that determine the functioning of bodies and guarantee the preservation of the species. However, his natural philosophy was closer to Greek concepts than was al-Nazzām's; he followed the classical doctrine of the elements. In most of these points he was attacked by the followers of al-Jubbā'ī, who stuck to the Basran system.

Epistemology. Arguments for the existence of God were used within the circle of the Mu'tazilah at least from the time of Abū al-Hudhayl. The cosmological proof was known from Christian sources. But the Mu'tazilah preferred by far the argument *e novitate mundi*; deriving the existence of God from the "accidental" character of creation corresponded to their atomistic worldview. Originally, the notion of God had been considered as *a priori*, "necessary," as one said. Abū al-Hudhayl even believed that the "proof" for God's existence, namely the createdness of the world, was also immediately evident. This insight then implied, as he thought, the obligation to speculate further about God's nature and to look out for his commandments; it had juridical consequences. When later theologians, in an attempt to create an overall rational system, gave up the *a priori* character of the notion of God, they were confronted, just because of the juridical aspect mentioned, with a very typical problem: how can man be obliged to know God if he does not already know him, that is, is it not that the obligation to recognize God's existence presupposes that man already possesses a notion of God? Al-Jubbā'ī then answered this question by assuming that man necessarily feel the obligation to know God because when he reaches intellectual maturity he becomes aware of being constantly exposed to the merciful assistance of an unknown reality and then realizes that in order to be grateful for this anonymous help he should know where it comes from; otherwise his benefactor might become angry at being unduly ignored. Man, as it were, awakens with an existential feeling of fear that only ceases when he has recognized that there is a God who will be just and merciful if his commandments are fulfilled. This cognition then grants that "tranquillity of the soul" that always results from knowing the truth.

Influence and originality. Mu'tazilī theology certainly participated in the process of the hellenization of Arabo-Islamic thought that started in the eighth century. But we should not forget that Abū al-Hudhayl and even al-Nazzām developed their ideas when most Greek texts were not yet available in Arabic or were just being translated. Obviously neither Aristotle nor the Neoplatonists exerted any impact on their thought. Al-Nazzām's system reminds us in some places of the Stoics (especially their theory of *krāsis di holōn*, "total mixture"), but that influence was filtered through Iranian intermediaries and reached him not in the form of a written translation but through his contacts with followers of Bardesanes or Manichaeans who lived in Iraq.

It will not be possible to judge the overall situation adequately until we have further studies of individual Muʿtazilī thinkers and the “dark period” between the great Hellenistic philosophers, up to the time of Proclus (410?–485 CE) and Iamblichus, and the arrival of Islam. What cannot be doubted, however, is the originality of the Muʿtazilī approach: Ḍirār’s and Abū al-Hudhayl’s atomistic theory is a case in point. They took Greek *spolia* but used them for an edifice that was entirely theirs, a theological system that was juridical in its outlook rather than metaphysical. They rarely quoted the Qurʾān because they wanted to rely on reason, but nevertheless they always took the Qurʾān as their guide. They offered a coherent worldview that was different from that of the later Muslim philosophers. These therefore reacted with reticence and, finally, contempt. Al-Kindī still tried to adjust his thinking to Muʿtazilī axioms in certain points, but al-Fārābi treated the Muʿtazilī theologians as “dialecticians” who used the wrong method. The Muʿtazilah, on the other hand, never changed their approach. A few of them, like Abū al-Ḥusayn al-Baṣrī, became interested in Aristotelian philosophy, but ultimately they did not adopt Aristotle’s basic categories in either logic or metaphysics.

BIBLIOGRAPHY

There is no satisfactory work on the Muʿtazilah as a whole. Albert Nasri Nader’s *Le système philosophique des Muʿtazila* (Beirut, 1956) treats the development up to the beginning of the scholastic (third) phase, but this work is marred by philological misunderstandings and gives almost no biographical information. W. Montgomery Watt’s *The Formative Period of Islamic Thought* (Edinburgh, 1973) is an introduction to early Muslim theology where the Muʿtazilah appear in the context of the other theological movements existing during the first three centuries of Islam (until al-Ashʿarī). Harry A. Wolfson’s *The Philosophy of the Kalam* (Cambridge, Mass., 1976) follows the author’s earlier works on Philo and the church fathers: it presents stimulating ideas but ignores some recent editions and secondary literature. My article “Une lecture à rebours de l’histoire du muʿtazilisme,” in *Revue des études islamiques* 46 (1978): 163–240 and 47 (1979): 19–69, gives a biographical and systematic account of the period between Wāṣil and Ibn al-Rāwandī.

For the rest, one has to resort to monographs, of which there are not many. Abū al-Hudhayl’s system has been analyzed in a perceptive way by R. M. Frank in his study *The Metaphysics of Created Being according to abū l-Hudhayl al-ʿAllāf* (Istanbul, 1966) and in an article in *Le Muséon* 82 (1969): 451–506, “The Divine Attributes according to the Teaching of Abū l-Hudhayl al-ʿAllāf.” Hans Daiber’s *Das theologisch-philosophische System des Muʿammar ibn ʿAbbād as-Sulamī* (Beirut, 1975) treats another early thinker but also presents much material about his contemporaries. The *qāḍī* ʿAbd al-Jabbār has been dealt with most extensively in J. R. T. M. Peters’s *God’s Created Speech* (Leiden, 1976). For the Muʿtazilī influence on the Zaydiyyah, see Wilferd Ma-

delung’s *Der Imām al-Qāsim ibn Ibrāhīm und die Glaubenslehre der Zaiditen* (Berlin, 1965). The relationship with the Twelvers is analyzed in detail, at least as far as the beginnings are concerned, by Martin J. McDermott in *The Theology of al-Shaikh al-Mufid* (Beirut, 1978). Much information on individual thinkers is hidden in the relevant articles in *The Encyclopaedia of Islam*, new ed. (Leiden, 1960–), and in the *Encyclopaedia Iranica* (Leiden, 1982–), but it is not easy for the nonspecialist to find this.

Studies of specific problems of Muʿtazilī theology tend to compare the Muʿtazilah with other “schools,” especially the Ashʿariyah. On the doctrine of attributes we have Michel Al-lard’s *Le problème des attributs divins* (Beirut, 1965), which contains a chapter on al-Jubbāʿī, and especially R. M. Frank’s *Beings and Their Attributes* (Albany, N. Y., 1978), which gives a subtle analysis of the teaching of the Basran school. The arguments for and against the doctrine of free will are listed and treated in detail by Daniel Gimaret in *Théories de l’acte humain en théologie musulmane* (Paris, 1980). Gimaret’s interpretation of the Muʿtazilī model is modified by R. M. Frank in his article “The Autonomy of the Human Agent in the Teaching of Abd-al-Djabbar,” *Le Muséon* 95 (1982): 323–355. The consequences for Muʿtazilī ethics are described in George F. Hourani’s *Islamic Rationalism* (Oxford, 1971). The corresponding physical ideas become clear in Judith Katz Hecker’s “Reason and Responsibility: An Explanatory Translation of Kitab al-Tawlid from al-Mughni fi Abwab al-Tawhid wa-l-Adl by Qadi Abd-al-Jabbār al-Hamadhani” (Ph. D. diss., University of California, Berkeley, 1975). For atomism, Salomon Pines’s *Beiträge zur islamischen Atomenlehre* (Berlin, 1936) still retains its value; it has now to be compared with Frank’s book on Abū al-Hudhayl. Carmela Baffioni’s *Atomismo e antiatomismo nel pensiero islamico* (Naples, 1982) attempts a new comparison with Greek atomism, but unfortunately ignores Frank’s study. On epistemology, see Marie Bernard’s *Le problème de la connaissance d’après le Mugni du cadi ʿAbd al-Gabbār* (Algiers, 1982). Muʿtazilī polemics against dualism have been treated by Guy Monnot in *Penseurs musulmans et religions iraniennes* (Paris, 1974).

MUTILATION SEE BODILY MARKS

MYCENAEAN RELIGION SEE AEGEAN RELIGIONS

MYERHOFF, BARBARA G. (1935–1985), American anthropologist and scholar of religion, myth, ritual, and symbolism. Born in Cleveland, Ohio, and raised there and in Los Angeles, Myerhoff received her bachelor’s degree in sociology and her doctorate in anthropology from the University of California at Los Angeles; her master’s degree in human development was awarded by the University of Chicago. Her entire professional career was spent as a member

of the University of Southern California's department of anthropology. Writing and conducting research since the sixties, Myerhoff studied a variety of types of social groups. She distinguished herself through her contributions to the development and application of symbolic anthropology.

Myerhoff's scholarly writings analyze those morphological features of ritual that allow it to be effective in secular as well as sacred settings and in pre- and post-colonial societies, as well as modern and post modern ones. She understood ritual and its constituent symbols to be capable of formulating experience for its participants and of allowing them to transform their daily roles and statuses by encountering alternate social relations and versions of reality. She eventually ascribed the efficacy of ritual to its feature of repetitive action and to its sensory components, which create certainty through performance. Rituals are the medium for enacting the system of meanings—primarily ideological—that constitutes a religion. These ideas found their earliest expression in her doctoral research on the shamanic religion of the Huichol Indians of Mexico's Sierra Madre Occidental, whose results were published as *The Peyote Hunt of the Huichol Indians* (1975).

Following this work, Myerhoff turned to the study of ritual in modern society. She explored the commonalities and differences between rituals in complex and primitive societies, indicating that ritual continues even in modern societies to provide messages of order and predictability as well as to set the stage on which cultures and individuals can create and present themselves to themselves. These themes are explored in *Secular Ritual: Forms and Meanings* (1977), which Myerhoff coedited with Sally Falk Moore (see especially their introduction, "Ritual Work and the Problem of Meaning," pp. 3–24).

Her subsequent ethnographic research on the place of religion in complex society led her to claim that, although most men and women continue to require what religion had traditionally provided them, this cultural system is now lacking and hence they are on their own to seek out such experiences where they may. Thus, she analyzed ritual-like expressive and reflexive genres in contemporary society: journal keeping, storytelling, and autobiography. All are areas in which the religious function of self-presentation and the creation of meaning occur.

Myerhoff's study of elderly California Jews, *Number Our Days* (1979), focused on improvised or "nonce" (i. e., nonrecurring) rituals that wed traditional and secular, and open and closed, features (see also her paper "We Don't Wrap Herring in a Printed Page: Fusions, Fictions and Continuity," in *Secular Ritual*, pp. 199–226). She demonstrated that such rituals provide meaning for people by their evocation of childhood and domesticity, creating an orderly sense of personal as well as cultural continuity in their lives. Myerhoff's work on elderly Jews was the subject of an Academy Award-winning film by Lynn Littman (with whom Myerhoff collaborated), also called *Number Our Days*

(1977). Their second collaboration, *In Her Own Time* (1985), concerned her final fieldwork with Orthodox Jews in the Fairfax community of Los Angeles and focused on her relationship with the community during the last months of her life.

Myerhoff's symbolic anthropology, while always culturally specific, paid an unusual amount of attention to universal problems of meaning in human life. She saw these problems—including the need for self-reflection and the urge to create an orderly world—as the substance of religion across cultures, and along with anthropologist Victor Turner and others, she formulated a dynamic view of religion as a symbolic process in society.

BIBLIOGRAPHY

Other publications by Myerhoff concerning her work among the Huichol Indians are "Return to Wirikuta: Ritual Reversal and Symbolic Continuity in the Peyote Hunt of the Huichol Indians," in *The Reversible World: Symbolic Inversion in Art and Society*, edited by Barbara A. Babcock (Ithaca, N. Y., 1978), pp. 225–239, and "The Huichol and the Quest for Paradise," *Parabola* 1 (Winter 1976): 22–29. Myerhoff's work on autobiography and related genres is represented by an essay she wrote with Deena Metzger, "The Journal as Activity and Genre, or Listening to the Silent Laughter of Mozart," *Semiotica* 30 (1980): 97–114, and by her introduction to *A Crack in the Mirror: Reflexive Studies*, edited by Jay Ruby (Philadelphia, 1982), in which her essay "Life History among the Elderly: Performance, Visibility, and Remembering" also appears (pp. 99–117). A number of Myerhoff's essays were collected posthumously in a volume edited and with an introduction by Marc Kaminsky, *Remembered Lives: The Work of Ritual, Storytelling and Growing Older* (Ann Arbor, Mich., 1992). In 2000 Myerhoff was named a Woman of Valor by the Jewish Women's Archive. The Woman of Valor website about her and her work can be found at www.jwa.org by following the link to exhibits.

RIV-ELLEN PRELL (1987 AND 2005)

MYSTERY PLAYS SEE DRAMA, ARTICLE ON EUROPEAN RELIGIOUS DRAMA

MYSTERY RELIGIONS. Like many other terms that represent concepts in the history of religions, *mysteria*, or *mystery religions*, serves as an umbrella term covering a wide variety of referents. Since the word had its own origin and history, its use needs to be analyzed carefully, especially in the context of comparative studies.

DEFINITION OF TERMS. The Greek word *mustēria* refers initially only to the "mysteries" of Eleusis and signifies a secret celebration or secret worship that is accessible only to initiates (*mustai*), who have had themselves initiated (*muein* or *telein*) into it. Other terms used for the celebration are *teletē* and *orgia*; Latin writers either use the Greek word or translate

it as *initia*. Originally, then, *mysteria* denotes a specific religious manifestation that is essentially different in character from other, official cultic functions; the mysteries are not open to everyone but require a special initiation. But in Greek, *mustēria* is already applied to comparable rituals of initiation (see below) and thus acquires a general meaning. When taken over by philosophy (especially Neoplatonism and Neo-Pythagoreanism) and Christianity, the term increasingly loses its original concrete religious referent and acquires instead the sense of a revealed or mysterious divine wisdom (“mysteriosophy”) that is only available to or attainable by adepts.

The term *mysteria* was familiar, of course, to classical philologists, who knew it from the ancient tradition, but it was not until the nineteenth century that it again became a technical term in the history of religions for secret cults or ceremonies of initiation (owing especially to James G. Frazer). In particular it was much used by the history of religions school, most often by Richard Reitzenstein and Wilhelm Bousset, in their attempt to render comprehensible the multiplicity that marked the history of religions in the Hellenistic period and late antiquity, as well as to demonstrate the connections between that world and early Christianity. In the view of the history of religions school, the mysteries were an expression of popular piety that drew sustenance especially from the so-called Oriental mystery religions of the Roman imperial age; in the long run, it was claimed, even the early church could not escape the influence of those religions. Discussion of the beginnings of Christianity was carried on for a long time under the sign of the mysteries, which were regarded as one of Christianity’s roots; this approach can still be found today.

There can be no objection to a general use of the term *mysteria* provided that its original meaning continues to resonate even as its application is extended. The problem here is the same as with *gnosis* or *gnosticism*. These technical terms have been given a broader meaning, but scholars have not on that account ceased to use them in a restricted regional sense: *gnōsis* as a Greek word meaning “esoteric knowledge” and referring to religious groups of late antiquity. My own inclination is not to detach these terms from the historical context in which they exercised historical influence but to continue to use them primarily in their restricted sense, without, however, forgetting that the history of religions needs such umbrella terms—especially in comparative studies. The danger otherwise is that the terminology will become blurred and cease to be of help in describing original religious phenomena and will serve only for a religious typology that lacks historical depth.

Thus, for example, Buddhism has been explained by Paul Lévy (1957) as a “mystery religion,” simply because of certain ritual factors that play a part in the consecration of Buddhist monks and resemble to some extent ritual elements in the Greek and Oriental mysteries. This demonstration I regard as an unsuccessful venture into dangerous territory.

Certainly, Buddhism (especially Tibetan Mahāyāna or Vajrayāna Buddhism) has its “mysteries” in the sense of esoteric rituals, just as do most of the other great religions (especially Hinduism). But such instances occur during later historical stages that presuppose a developed hierarchy and represent a kind of ritualization of esoteric teachings that can in turn be traced back in part to older foundations. It is possible in the same way to give the name *mysteria* to various disputed early Mesopotamian and early Egyptian rituals.

We really have no choice but to understand the term *mysteria* as a historical category that registers a specific historico-religious content and that relates in particular to the Greco-Roman age. The general, typological use of the word must be measured against that standard. Mysteries, then, are special initiation ceremonies that are esoteric in character and often connected with the yearly agricultural cycle. Usually they involve the destiny of the divine powers being venerated and the communication of religious wisdom that enables the initiates to conquer death. The mysteries are part of the general religious life, but they are to a special degree separated from the public cult that is accessible to all, and on this account they are also called “secret cults.”

THE “PHENOMENOLOGY” OF THE MYSTERIES. *Mysteria*, then, refers primarily to the content as found in the history of Greco-Roman and Near Eastern religions. At the cultic-ritual level, which is the dominant level, the discipline of the *arcanum* (the obligation of strict secrecy) means that we know very little more about the mysteries than the ancient sources—including ancient Roman literature—occasionally pass on as supposedly reliable information. Our historical knowledge is limited because Christian writers (such as Clement of Alexandria and Firmicus Maternus) who reported on the mysteries allowed their own polemical or apologetic interpretations to color their accounts.

We are relatively well informed about the general structure of the ceremonies (Eleusis, Samothrace, Isis, Mithras). Processions and public functions (sacrifices, dances, music) framed the actual celebration, which was held in closed rooms (*telestērion*, *spelunca*, temple) and usually comprised two or three acts: the dramatic action (*drōmenon*) with the “producing and showing” of certain symbols (*deiknumena*) and the interpretation (exegesis), through a communication of the myth (*legomena*) and its attendant formulas, of what had been experienced. The sacred action (*drōmenon*) and the sacred narrative (*legomenon*, *muthos*, *logos*) were closely connected. We are still rather ignorant regarding the central ceremony, that is, the initiation proper. Any interpretation of it can be hypothetical only, never certain. In my opinion, the heart of the celebration was the linking of the initiate with the destiny of the divinity or divinities, as expressed in performance and word, and the resultant bestowal of hope for some kind of survival after death. This interpretation is also suggested by burial gifts for the deceased (e.g., the “Orphic” gold plate from southern Italy). The ancient human problems of suffering, death, and guilt undoubtedly played an im-

portant part in the efficacy of the mysteries. The idea of rebirth can be documented only in later Hellenism. In any case, there is no evidence of a unitary theology of the mysteries that was common to all the mysteries; the origins and historical course of the several mysteries were too discrepant for that. Even the later philosophical explanation of the *logos* of the mysteries was not everywhere the same.

A word must be said here about the connection often made between the mysteries and the idea of “dying and rising divinities,” who are linked to the vegetation cycle. James G. Frazer, who accepted the ideas of Wilhelm Mannhardt on nature myths and folk myths, was the leader and main influence in this area. In addition to an uninhibited use of terminology (e.g., *resurrection* is usually understood in the biblical and Christian sense), the chief defect of this theory is its utter neglect of source criticism. Strictly speaking, the “vegetation theory” is a theory at two removes that, as Carsten Colpe has shown, simply takes a theory at one remove, namely, the ancient *interpretatio Graeca*, and prolongs it in the spirit of nineteenth-century Romanticism. The nineteenth-century scholars did not further analyze the ancient use of symbols and metaphors in which the vegetative processes of withering and blooming (in the myth of Adonis) were already described (especially from the second century on) by such terms as *dying, declining, disappearing, and being renewed, reappearing, rising*. I say nothing of the fact that these same scholars made no distinction between primary, cult-related myth and secondary, literary mythology. A whole series of so-called vegetation divinities, such as Adonis, Attis, and Osiris, or Tammuz, were interpreted according to the same pattern, namely, as dying and rising gods; their cults, with their “mystery” character, supposedly served to communicate to the “initiates” the powers associated with the “fruitfulness” of nature.

As we know today, there is no evidence at all that any of these gods was thought of as “rising” in any proper sense of the term. In actual fact, there were great differences in mythology and ritual; only secondarily (often as early as late antiquity) were the divinities assimilated to one another (e.g., Osiris to Adonis and Attis). The often only fragmentary mythology centering on these divinities told of the disappearance or stay of the god in the lower world, where he lived on (as lord of the lower world or, in the case of Osiris, as judge of the dead) or from which in one or another manner he returned to the light of day (on earth, in the air, or in heaven) and resumed his role as a god (which he had never abandoned). The connection with rituals was also quite diverse; there was by no means always a question of mysteries in the sense of secret cults (see below). We must also allow for the possibility that some of the so-called Oriental mysteries acquired their mystery character only secondarily, under the influence of Greek and especially the Eleusinian mysteries (this was certainly the case with Osiris in relation to Adonis). The interpretation of the mysteries as being, without distinction, ancient vegetation cults should therefore no longer be used as a magic hermeneutical key.

In view of this critique, the historical and phenomenological problem of the origin of the mysteries remains unresolved. Repeated attempts have been made to move beyond the now-outdated nature-myth theory. Ethnologists in particular have repeatedly focused on the mysteries and interpreted them as survivals of ancient “rites of passage” (Arnold van Gennep); in our day this theory has been maintained especially by Mircea Eliade. There is much that is correct in it. The ethnological contributions that play a role in it come in part from the morphology of culture school (Frobenius), in part from the history of culture school of Vienna. The latter, represented by Wilhelm Schmidt and Wilhelm Koppers, sees the initiation of young men or boys and the whole organization of adult male society as one of the important roots of the mysteries. In cultural and historical terminology the mysteries reflect the agrarian, matriarchal stage, in which for the first time the male sector of society, as distinct from the female sector, developed secret societies and initiation ceremonies (as a protest against matriarchal tyranny, according to Koppers). That stage would be located chronologically in the Mesolithic period. The Greek mysteries are not directly linked to that stage and its events, but they are pre-Indo-Germanic and ultimately have their roots in it.

The history of culture theory as developed by Wilhelm Schmidt has been largely abandoned today. It has left behind only the idea—itself not new—that the origin of the mysteries is to be sought in some stage of primitive agricultural development. Even this, however, does not apply to Osiris, who from the beginning was associated with pastoral symbols, thus reflecting a nomadic culture, and had close ties with the Egyptian ideology of kingship; the later Corn Osiris has been assimilated to Adonis, and the Hellenistic mysteries of Osiris, which focus primarily on Isis, have in turn been influenced by the Eleusinian mysteries of Demeter and Persephone (Kore). The role played by female divinities need not be linked to a hypothetical matriarchy; these goddesses are phenomena belonging to an agrarian culture (Mother Earth). Among modern philologists Walter Burkert is the chief proponent of the view that the root of the mysteries is to be looked for in agrarian culture and specifically in secret society ceremonies (with their tests of courage and their sexual, orgiastic traits) and that they originated in the Neolithic age; the dawning Greek individualism of the seventh and sixth centuries BCE took over these ancient cults and turned them into a deliberately adopted religion centered on the conquest of death.

Adolf E. Jensen has suggested a different ethnological approach. He sees behind the Greek mysteries (especially those of Eleusis) a conception of the world proper to the culture of early food growers; this conception centered on the death or possibly the sacrifice of a female prototypical being (or divinity) who was the source of the life-sustaining cultivated vegetation, and thus it thematized for the first time the mystery of death and life (“the slain god”). There has since been occasional criticism of the interpretation of the Melane-

sian starting point (the myth of Hainuwele; see Jonathan Z. Smith's "A Pearl of Great Price and a Cargo of Yams: A Study in Situational Incongruity" in *History of Religions* 16, 1976, pp. 1–19, and his *Imagining Religion*, Chicago, 1982, pp. 90–101); nonetheless it is a legitimate question whether earlier food-cultivation stages are to be glimpsed behind the mysteries. The answer can be found only through cooperative study by ethnologists, prehistorians, philologists, and historians of religion. In any case an answer is not directly required for understanding our historical and philological material, which comes to us primarily from Greek sources. All our ancient informants confirm the view that the mysteries in general took their character primarily from the Greek mysteries and became widespread only as a result of hellenization.

THE HISTORICAL MULTIPLICITY OF MYSTERIES. Within the confines of this article it is necessary to start with the ancient Greek mysteries and move on to related Oriental mysteries.

The Greek mysteries. The Greek mysteries were from the outset cults of clan or tribe. They can in many cases be traced back to the pre-Greek Mycenaean period and were probably ancient rituals of initiation into a clan or an "association." The most important were the mysteries of Eleusis, which in fact provided the pattern for the idea of mysteries. The independent town of Eleusis (there is evidence of a prehistoric settlement there in the third millennium BCE) became an Athenian dependency in the seventh century BCE and thereby acquired, especially from the sixth century on, a pan-Hellenic role that in the Roman imperial age attracted the attention of Rome. Augustus, Hadrian, Marcus Aurelius, Commodus, and Gallienus had themselves initiated into the Eleusinian mysteries. An attempt under Claudius (r. 41–54) to move the celebration to Rome failed. The destruction of the sanctuary came under Alaric's Christian Goths in 395 CE. The mythological background for the Eleusinian mysteries was provided by the story of the goddesses Demeter and Kore, preserved in the Homeric *Hymn to Demeter*. The pair were presented as mother and daughter. Their relationship developed in a gripping manner the theme of loss (death), grief, search, and (re)discovery (life). The interpretation of the story as purely a nature myth and specifically a vegetation myth is actually an old one and can appeal to ancient witnesses for support; nonetheless it is oversimplified precisely because it loses sight of the human and social content of the myth.

The public ceremonies of the annual Eleusinian ritual are well known to us and confirmed from archaeological findings. The director was the hierophant, who from time immemorial had been a member of the Eumolpides, a noble family that had held the kingship of old. The Kerukes family filled the other offices. All classes, including slaves, were admitted to the cult. According to degree of participation, a distinction was made between the *mustēs* ("initiate") and the *epoptēs* ("viewer"); only the latter was regarded as fully initiated. But this distinction was not original and came in when

the Eleusinian mysteries were combined with the mysteries of Agrai on the Ilissos (near Athens) in the seventh century BCE. The Lesser Mysteries at Agrai took place annually in February (the month Anthesterion) and were regarded as a preliminary stage leading to the Greater Mysteries held at Eleusis in September (16–20 Boe-dromion). Sacrifices, libations, baths, ablutions, fasts, processions (especially bringing the "holy things," the cult symbols, to Eleusis), and torches all played an important role in both feasts. The center of all activity was the ceremony that was not open to the public. It was held in the "place of consecration" known as the *telestērion*, which is not to be confused with the temple of Demeter at the same location.

We know that at the ceremonies at Agrai the initiate knelt down with a ram's skin draped around him and held an unlit torch in his hand. The priestess shook a winnowing fan (*liknon*) over him, and he handled a serpent (sacred to Demeter and Kore). Finally water was poured over him. In the Eleusinian ceremony, of which we know less, the initiation took place at night. It included the handling of an object, not identified with certainty, which was taken from a "coffer" (perhaps the instrument—mortar and pestle—used in preparing the sacred potion; other interpretations see the coffer as an image of the womb). In addition, there was a "viewing" (*epopteia*) of the (rescued?) Kore, probably in dramatic form (*drōmenon*). The cry that the hierophant uttered at this point suggests as much: "The Lady bore a holy boy-child: Brimo bore Brimos" (Hippolytus, *Refutations* 5.8.40). The reference is probably to the birth of Ploutos, the personification of wealth, from Demeter; yet it is questionable whether this was intended as a symbol of the new birth of the initiate and not as a symbol of the limited power of the lower world or death. The latter meaning seems to be suggested by the concluding rite: the showing of an ear of grain by the priest (Hippolytus, *ibid.*). This must have signified that life is "Mother" Demeter's gift to human beings. A fragment of Pindar (Bowra 121) says of the initiates: "Happy they who see it and then descend beneath the earth. They know life's end but also a new beginning from the gods." To them alone is life given in the underworld; all others encounter evil (see Sophocles, frag. 837, Pearson).

In addition to the mysteries of Eleusis, there was a series of others about which there is unsatisfactory information. Almost all of them were very ancient. They include the mysteries at Phenae in Arcadia (also mysteries of Demeter); those at Andania in Messenia, in which Demeter and Hermes were venerated as great gods; those at Phyle, dedicated to "Earth, the great mother"; and those on Paros and Thasos, which were again mysteries of Demeter. More important were the mysteries of the great gods, or Kabeiroi, on the island of Samo-thrace, where there was an ancient place of worship until the fourth century CE that attracted many, especially in the second century BCE. The gods in question were probably a pair of Phrygian divinities, father and son (*kabeiros* is a Semitic word). The ceremonies had a pronounced orgiastic and

burlesque character and were probably connected with what had originally been associations of smiths (iron rings played a role). Later, however, the Kabeiroi were regarded as helpers in distress at sea. Practically nothing is known of these mysteries; there are hints of links with Demeter and Orpheus.

More important were the Dionysian mysteries, information on which has come down to us from as early as the fifth century BCE (see Euripides, *The Bacchae*). As is well known, Dionysos was an unusual god who represented a side of Greek life long regarded as un-Greek—a view that has caused interpreters many difficulties. His *thiasos* (“company”) was probably originally an association of women that spread throughout Greece, especially the islands, and carried on a real proselytizing activity by means of itinerant priestesses. There was no one central sanctuary, but there were centers in southern Italy (Cumae), Asia Minor, and Egypt. Ecstatic and orgiastic activity remained characteristic of this cult as late as the second century BCE and only then assumed more strictly regulated, esoteric forms, as can be seen from the laws of the Iobacchant community at Athens, where the cult of Dionysos (Bacchus) had become a kind of club. The myth of Dionysos had for its focus the divine forces hidden in nature and human beings; these forces were thematized and applied chiefly by women. The ecstatic nocturnal celebrations showed traits of promiscuity (Maenads and satyrs) and took place in the open air. It is uncertain to what extent the paintings in the Villa Itern at Pompeii and in the Casa Omerica reproduce the later ritual of the Dionysian mysteries. These paintings are more likely a mysteriosophic interpretation within the framework of a bridal mysticism in which the soul (the immortal element as part of the god Dionysos) presents the pattern of a cycle of purifications. The myth of Dionysos was at an early stage combined with the Orphic mysteries. The hope of another world that was promised and confirmed in the rites is well attested by burial gifts (gold plates) from Greece and southern Italy. Even after death, the initiate remained under the protection of the god.

The Orphic mysteries are a difficult phenomenon to deal with. Often they are not easily distinguished from the Dionysian mysteries. Also, it is not certain whether they were actually mysteries and, if they were, where we should look for their origin. Testimonies do not go back beyond the sixth century BCE and vary widely. It is certain that at an early date Orpheus was turned into the founder of the Eleusinian, Dionysian, and Samo-thracian mysteries. Orphism therefore had no central sanctuary. It seems to have been more of a missionary religion that, unlike the official cults, devoted itself to the theme of the immortal soul (*psuchē*) and its deliverance from the present world. It had an ethical view of the relation between initiation and behavior. A way of life that was shaped by certain rules served to liberate the soul or the divine in human beings. The anthropogonic and cosmogonic myth that provided an explanation of the hybrid human condition also showed the way to redemption; cosmology and soteriology were thus already closely connected. As a result,

Orphism broke away from the religion of the *polis*, not only because it possessed holy books that contained its teachings, but also because the idea of the immortality of the soul made the official cult superfluous. Greek philosophy, beginning with Socrates and Plato, gave a theoretical justification for all this.

The Oriental mysteries. Narrowly understood, the Oriental mysteries comprised only the mysteries of Isis and of Mithras. But since the ancient Alexandrian reporters applied the technical terms *mustēria* and *teletai* in their proper sense to any orgiastic cult or ritual, and especially to the numerous and often quite exotic Oriental cults of the imperial period, a whole series of these religions came to be classified as mysteries; this usage has prevailed down to our own time.

Mysteries of Cybele are attested on the Greek mainland and islands from the third century BCE. Oddly, no mention is made of Attis. Pausanias, in the second century CE, is the first witness to the connection; the mythological relation is attested by Catullus in his “Poem 63” (first century BCE). We know nothing about the structure and content of these mysteries; perhaps they were an imitation of the Eleusinian mysteries. In any case, the Roman cult of Cybele, who was worshiped on the Palatine from 204 BCE on, was not a mystery religion. Beginning in the second century CE and down to the fifth century, the literature speaks of the mysteries of Mater Magna (Mētēr Megalē) but tells us no more about them. On the supposition that we are not dealing simply with a misleading terminology, these mysteries may have focused on the ritual castration of novices (Galli) and its deeper meaning. With regard to Attis, inscriptions in Asia Minor dating from the first century CE speak of the “initiates of Attis” (Attabokaoi). Some formulas, preserved by Clement of Alexandria and Firmicus Maternus, show that the reference is to a participation in the destiny of the divinity whereby the faithful are promised deliverance: “Be consoled, O initiates, for the god is delivered; therefore we too shall have deliverance from our troubles” (Firmicus Maternus, *De erroribus profanarum religionum* 22.1–3).

The initiation involved an anointing; there is also reference to a kind of sacred meal (eating from a tambourine, drinking from a cymbal). The meaning of an accompanying formula is uncertain in the version given by Clement of Alexandria (*Protrepticus* 15): “I have entered the *aduton* [bridal chamber?].” Firmicus Maternus has a simpler version: “I have become an initiate of Attis.” At the end of the fourth century CE, the cult of Cybele and Attis also included baptism in bull’s blood (*taurobolium*). This ceremony had developed out of an older sacrifice of a bull, attested from the middle of the second century on. It was supposed to bring renewal to the initiates; only a single inscription interprets the renewal as a “new birth.” The baptism was a onetime rite and perhaps was intended to compete with Christian baptism.

The Hellenistic cult of Isis in late antiquity undoubtedly involved secret initiatory celebrations. We learn something

about them from Apuleius's famous novel, *Metamorphoses*, or *The Golden Ass* (second century CE). Greek influence is especially clear here: it was only through the identification of Isis with Demeter (attested in Herodotus, 2.59) and the hellenization of the cult of Isis that the latter came to include mysteries (first attested c. 220 BCE on Delos). In this form it spread, despite occasional opposition, throughout the whole civilized world of the time, reaching Rome in the first century BCE. It became one of the most widely disseminated Oriental religions of late antiquity, especially from the second century BCE on. Isis became the great thousand-named, universal goddess (*panthea*) who had conquered destiny and was invoked in numerous hymns and aretologies that display a remarkable Greco-Egyptian atmosphere and tone.

This successful hellenization was probably due to the introduction of the cult of Sarapis under Ptolemy I, son of Lagus (305–283 BCE), when this novel Greco-Egyptian cult (*Sarapis* combines *Osiris* and *Apis*) was celebrated with both an Eleusinian priest (Timothy, a Eumolpid) and an Egyptian priest (Manetho) participating. Isis, Thoth, and Anubis were naturally linked with Sarapis (Osiris). The well-known story of Isis, Osiris, and Horus (Harpocrates) acquired its complete form only in Greek and in this version was probably a product of Hellenism (Osiris being assimilated to Adonis). The ancient Egyptian cult of Osiris was originally connected with the monarchy and displayed the character of a mystery religion only to the extent that the dead pharaoh was looked upon as Osiris and brought to Abydos not simply to be buried but also to be greeted by the people as one restored to life in the form of a new statue in the temple. The hope of survival *as* or *with* or *like* Osiris was the predominant form that the hope of another world took in ancient Egypt, and it continued uninterrupted in the Greco-Roman period; it provided a point of attachment for the mysteries of Isis.

The cult of Isis had its official place in the Roman festal calendar (beginning in the second century CE) and comprised two principal feasts: the Iseia, which was celebrated from October 26 to November 3 and included the *dromenon* of the myth, with the “finding” (*heuresis*, *inventio*) of Osiris as its climax; and the sea-journey feast (Navigium Isidis, Ploiaphesia) on March 5, the beginning of the season for seafaring, of which Isis had become the patron deity. According to Apuleius (*Metamorphoses* 11) the actual mysteries began with preliminary rites such as baptism (sprinkling), a ten-day fast, and being clothed in a linen robe. At sunset the initiates entered the *aduton* for further ceremonies to which only allusions are made: a journey through the lower world and the upper world (the twelve houses of the zodiac, which represented the power of destiny) and a vesting of the initiate as the sun god (*instar solis*); the initiate was *renatus* (“reborn”) and became *sol* (“the sun”), or in other words experienced a deification (*theomorphōsis*). He thereby became a “servant” of Isis and “triumphed over his destiny [*fortuna*].” In addition to a consecration to Isis, there was evidently also a consecration to Osiris, but we know even less about this ceremony.

The cult of Mithras (Mithra) in the Roman imperial age, like that of Isis, was not originally Oriental but was a creation of Hellenistic syncretism. It is true that the name of the god Mithras is Indo-Iranian in origin and originally meant “contract” (*mithra*, *mitra*) and that some Iranian-Zoroastrian elements are recognizable in the iconographic and epigraphic sources; these facts, however, do not point to a Persian origin of the cult. No testimonies to the existence of Mithraea in Iran have as yet been discovered. On the other hand, the vast majority of these sanctuaries have been found in the Roman military provinces of central and eastern Europe, especially in Dalmatia and the Danube Valley. The Mithraeum at Dura-Europos on the Euphrates is the most eastern. It was built by Roman soldiers from Syria in 168 CE, rebuilt in 209 CE, and expanded in 240 CE. It was thus not the creation of a native community. The “Parthian” style is simply a matter of adaptation to local tradition and no proof of an Iranian origin of the mysteries. There is as yet no evidence of Mithraea in Babylonia (Mesopotamia); three Mithraea have been found in Asia Minor, one in Syria. The oldest Mithraea are from the middle of the second century CE; most are from the third and fourth centuries. Thus an Eastern origin for the Mithraic mysteries is most uncertain.

According to Plutarch (*Life of Pompey* 24) they were introduced into the West by Syrian pirates in the first century BCE. This report may have a historical basis because the veneration of Mithras in Syria, Pontus, and Commagene is well attested, though no reference is made to any mysteries of Mithras. It is likely that soldiers from this area, where Greeks and Orientals came in contact, brought the cult of Mithras to the West in the first century CE. In the second century CE, however, the cult was transformed into mysteries in the proper sense and widely disseminated as a soldiers' religion, until finally Mithras was elevated to the position of Sol Invictus, the god of the empire, under Diocletian (r. 284–305). As in the case of the cult of Isis, the Hellenistic worshipers of Mithras transformed the foreign god and his cult along lines inspired by the awakening individualism of the time with its rejection of the traditional official cult and its longing for liberation from death and fate—a longing especially understandable in soldiers. In addition, the exotic elements (Egyptian, Persian) are to be attributed to the contemporary tendency to emphasize and cultivate such traits as being especially efficacious.

We are, once again, poorly informed about the myth and rites of the Mithraic mysteries. We have no account by an Apuleius as we do for the mysteries of Isis. Instead we have a large mass of archaeological documents that are not always easy to interpret. The so-called *Mithraic Liturgy* is a magical text concerned only marginally with the mysteries of Mithras. What Porphyry has to say about these mysteries in his *Cave of the Nymph* is philosophical exegesis in the Neoplatonic vein.

The Mithraic mysteries took place in small cave-like rooms that were usually decorated with the characteristic re-

lief or cult statue of Mithras Tauroctonus (“bull-slayer” or “bull-sacrificer”). In form, this representation and its accompanying astrological symbols is Greco-Roman; its content has some relation to cosmology and soteriology, that is, the sacrifice of a bull is thought of as life-giving. Other iconographic evidence indicates that the god was a model for the faithful and wanted them to share his destiny: birth from a rock, combats like those of Herakles, ascent to the sun, dominion over time and the cosmos. Acceptance into the community of initiates (*consecrati*) or brothers (*fratres*) was achieved through consecratory rites in which baptisms or ablutions, purifications (with honey), meals (bread, water, wine, meat), crownings with garlands, costumes, tests of valor, and blessings played a part. There were seven degrees of initiation (Corax, Nymphus, Miles, Leo, Perses, Heliodromus, Pater), which were connected with the planetary deities and certain symbols or insignia. Surviving inscriptions attest the profound seriousness of the mysteries. Mithras is addressed: “You have rescued us, too, by shedding the blood that makes us immortal.” Since these groups accepted only men (mostly soldiers), they can be considered true religious associations of males. Also worth noting is the close link between Mithras and Saturn (Kronos) as god of the universe and of time (Aion, Saeculum, Aevum); Saturn is the father of Mithras and the one who commissions him, while Mithras is in turn connected with the sun god (Sol, Apollo). (There is still a good deal of obscurity in this area.) Christian apologists (Justin, Tertullian, Jerome, Firmicus Maternus) regarded the mysteries of Mithras as a serious rival of early Christianity; several Christian churches were built over Mithraea.

IMPACT OF THE MYSTERIES. Because the Greek mysteries, especially the Eleusinian and the Dionysian, exerted a growing attraction and influence, Hellenistic literature accepted and developed in varying ways the ideas and representations proper to the mysteries. An effort has been made (Kerényi, 1927; Merkelbach, 1984) to extend our knowledge of the mysteries, and especially of the ritual concealed from us by the discipline of the secret (*arcanum*), by examining the novels of late antiquity. Such fictional themes as loss, search, and recovery, (apparent) death and return to life, the passing of tests, transformations (metamorphoses), hints of “mysteries,” and so on may very well have been reflections of the mysteries. Ambiguity, allegory, and symbolism served as codes that could be broken only by initiates (and in our day by scholars). Reinhold Merkelbach speaks in this context of an “Isis novel” (in Apuleius, Xenophon of Ephesus, Achilles Tatius, the *Historia Apollonii Regis Tyri*, and parts of the pseudo-Clementine literature as reworked by Christian gnostics); a “Mithras novel” (Syrian Iamblichus, *Babylonica*); a Dionysos novel (Longus, *Daphne and Chloe*); and, in the *Aethiopiaca* of Heliodorus, a “syncretistic Helios novel” that combines the mysteries of Isis, Mithras, and Dionysos.

The philosophical and religious literature of the Hellenistic age was also affected by the mysteries. The *Corpus Hermeticum*, for example, is filled with reminiscences of the terminology of the mysteries, and we are quite justified in

assuming that the circles responsible for the corpus had “mysteries” that were given ritual expression. The same holds for some of the gnostic writings, which not only frequently discuss the concept of *mysterion/mysterium* but also adopt in their rituals various aspects of the mysteries and especially the notion of a *disciplina arcani* (see below). Even Hellenistic Judaism, especially in the person of Philo Judaeus (first century CE), underwent the same influence. A work like *Joseph and Aseneth* is unintelligible without a knowledge of the mysteries. Even the Greek translation (the Septuagint) of the Hebrew Bible does not escape their influence, any more than the subsequent writings of the Christian community. The language of Christ’s apostle Paul (especially in *1 Corinthians* and *2 Corinthians*) and of his disciples (in *Ephesians* and *Colossians*) betrays this environment, as does, no doubt, the *First Letter of Peter*.

The impact of the mysteries became more concrete beginning in the second century CE, as the Christian church found itself increasingly in competition with these forms of worship. The cultic area of the church’s life, especially baptism and eucharist, underwent a profound transformation as the sacraments became “mysteries” to which not everyone had immediate access. Preparation (initiation) was now required in the form of fasts, instructions, purifications. The unbaptized and those on the way to baptism (catechumens) were not admitted to the sacred Christian cultic meal, which was regarded as the “remedy bringing immortality” and acquired its efficacy through the epiclesis (invocation) of the priest; in other words, the cultic meal was placed under a kind of discipline of secrecy. As the church became hierarchically organized (especially from the third century on) and as it became an established church under Constantine in the fourth century, it not only won greater publicity to the detriment of the old established religion but at the same time acquired an aspect of mystery whereby it sought to give a Christian direction to a new phenomenon, the religiosity of the masses. *Mystery* now became not only a cultic term but also, following a path blazed by ancient philosophy, made its way into Christian theology, where *mysticism* came to mean a kind of knowledge of God that is not available to everyone.

“MYSTERIOSOPHY.” A typically Hellenic spiritualization of the language of the mysteries had been going on in Greek philosophy since Plato; in the ensuing period, as the mysteries spread, *mysterium* and *sophia* became more and more closely associated, and in late antiquity the distinction between religion and philosophy became ever more tenuous. The parallelism of the two was due to the fact that, according to Greek philosophy, knowledge of God was attainable only by a path resembling the one followed in the mysteries at the ritual and religious level: that is, there was need of preparations, instructions, and even a kind of authorization (*katharsis*). For Plato, knowledge of God is identical with the vision of supreme and utterly pure being; the vision brings a participation in that being and even bestows immortality. For this reason, terms taken from the mysteries were often used in

philosophy: *epopteia*, *teletē*, *mustēria*. Platonic and Stoic philosophers began to impose their own meaning on the available myths connected with the mysteries; they began to “mythologize” them, that is, to link *muthos* and *logos*. Preliminary steps in this direction, or at least parallel manifestations, were already to be found in Orphism, which posited a “hidden” (mystic) link between the cosmos and human beings and made use in addition of the doctrine of the soul (a divine element located in the body). This paraphilosophical explanation has been called “mysteriosophy” (Bianchi, 1979); we met it earlier in the traditions concerned with Eleusis, where it already bore a strong Orphic impress.

Insofar as the philosophy of the Hellenistic age and late antiquity was interested in the mysteries, it took the often bizarre mythical traditions associated with them and sought to extract their rational (logical) nucleus by interpreting them as pieces of natural philosophy or as nature myths (this was especially the case with the Stoics). Unfortunately, we possess only fragmentary examples of such interpretations of the mysteries. Thus Cybele (Magna Mater) was interpreted as Mother Earth (Lucretius, Varro) and as the origin of being, and Attis as the instrument of creation (i.e., of becoming) or as Logos and Savior (Emperor Julian). Isis, understood as mother of the gods and universal goddess (*panthea*), was identified with Demeter (Plutarch). Mithras (the Sun) became principle (“Creator and Father”) of the universe (Porphyry); his identification with Aion (“eternal time”) probably also goes back to a philosophical interpretation.

The influence of this kind of philosophical interpretation on the later theology of the mysteries cannot simply be rejected out of hand. Traditions such as Hermetism, a Greco-Egyptian revelatory religion, show the path followed in this alignment of philosophy and religion, which the Neopythagoreanism and late Platonism (Plotinus) led to philosophy being turned into religion, philosophical knowledge into the vision of God, and the life of the philosopher into a religious *bios* (“life”). At work in this process was the conviction that behind both religion (the mysteries) and philosophy was the “ineffable,” the “mystery,” or “being,” as opposed to everything transient or to “becoming,” and that this ultimate reality was to be approached not simply through thought (*theōria*) but also through one’s way of life (*praxis*); only the two together could lead one to vision, enlightenment, and immortality (see especially Iamblichus, *De mysteriis*).

This current of thought provided the matrix for gnosticism, a movement that not only continued to some extent the ritual practices of the mysteries, such as cultic meals, baptisms, purifications, anointings, and *drōmena* and was organized as a mystery-association (*thiasos*) but also borrowed from the mysteries at the level of ideology (mythology). The so-called Naassene sermon “On Man” (Hippolytus, *Refutatio* 5.6, 4–10, 2) is an instructive example of this borrowing and, at the same time, one of the few sources that preserve authentic citations from the Eleusinian mysteries. Among

other things, Attis is here interpreted as the gnostic Primal Man (Anthropos); his castration by Cybele becomes a deliverance from what is earthly. Osiris, Adonis, and Adam are likewise variants of the perfect human being or of the immortal soul. According to this gnostic sermon, the mysteries of Isis are the root of all nongnostic cults, and Persephone-Kore, in the form of Aphrodite, represents transient becoming. For this reason, all these mysteries are looked upon as the “lesser mysteries,” while the mysteries of gnosticism become the “greater mysteries” or the “heavenly mysteries.” This synoptic view of all mysteries in the service of a mysteriosophic and gnostic interpretation was a path by which the traditions embodied in the ancient mysteries made their way into late antiquity. Thus transformed and preserved, they became part of the heritage left by heathen and Christian antiquity and, to that extent, remained alive even after the cessation of the cultic practices that had once been their true reality.

Translated from German by Matthew J. O'Connell
Revised Bibliography**MYSTICAL UNION IN JUDAISM, CHRISTIANITY, AND ISLAM.**

To describe the nature of mystical union in the three monotheistic faiths is a task fraught with difficulties and ambiguities both conceptual and real. First, the term *unio mystica* is primarily a modern expression; though the phrase does occur in Christian mysticism, its appearance is relatively rare. Various words for and descriptions of union or uniting with God, however, are important in the history of Christian mysticism, and accounts of union with God are also prominent in Judaism and Islam. Second, even the term *mysticism* itself, another modern creation, has come under attack. To what extent, for example, does the use of a term created in the modern Christian West distort the meaning of key figures, movements, and texts from the traditions of Judaism and Islam? The question is a real one, but the position adopted here is that, if mysticism is understood broadly as the preparation for, the consciousness of, and the effect engendered by what mystics describe as a direct and immediate transformative contact with the divine presence, then it is useful to speak of a strong mystical element in each of the three faiths. Third, if one allows that mysticism is a helpful term in the study of religion, is mystical union to be conceived of as its essence? Though some investigators have so claimed, the study of mystical traditions indicates that the language of union is only one of the linguistic strategies used by mystics to try to describe, or at least to point to, what they contend is the ultimately ineffable nature of their contact with God. Unitive mysticism is one of a group of interactive and nonexclusive semantic fields found in the traditions of Judaism, Christianity, and Islam. There are mystics in each tradition who either explicitly avoid union language (e.g., Augustine of Hippo) or else who tend to relegate such language to the margin in favor of other modes of mystical expression, such as those related to the vision of God or to theurgical action in the divine realm.

CHARACTERISTICS OF UNITIVE MYSTICISM. Treatments of mystical union have often employed the terms *pantheism* and *monism* to characterize unitive expressions, but pantheism and monism are not adequate categories for discerning the import of unitive language. God is certainly all things in the monotheistic faiths, in the sense that the world is a manifestation of God; but God is also transcendentally more than the world, so the simple identification between God and world implied in pantheism is not an accurate term. Mo-

nism, understood as the belief that there is one basic principle underlying all reality, is true of most forms of mysticism of the monotheistic religions (though not of Qabbalah). But monism tells little more than this and hence is an empty category for serious investigation of mysticism.

Previous scholarship on mysticism often employed oppositional terminology, such as impersonal versus personal union, absorptive versus nonabsorptive union, habitual versus ecstatic union, essential union versus intentional union, and the like. Such typologizing, however, should not be applied in any crude way, as if mystics could easily be pigeonholed into one or the other category. The comparative dimensions of mystical union emerge from attention to some of the profound issues at work in unitive texts. The persistence across traditions of particular doctrinal and ethical issues concerning union and the employment of certain distinctive forms of language to describe unitive states points to a fruitful realm of comparative dynamics.

Among these issues is the question of what kinds of language are used to present union. Rather than being easily classifiable by opposed types, most mystical texts feature an oscillation and interaction between two poles that need not be seen as expressing opposition. On the one hand, there is what can be called *mystical uniting*, that is, an intentional union of God and human that emphasizes the ongoing distinction of the two; on the other hand, there is a deeper union understood as *mystical identity*, expressing indistinction between God and human, at least at some level of reality. The pole of mystical uniting is more common and doctrinally more acceptable; the pole of mystical identity is daring and debatable, yet many noted mystics in all three faiths have insisted that indistinction is the ultimate goal of the journey to God. Whereas some mystics tend to use only one of these forms of language, many use formulations that reflect subtle variations in the range of expressions between both ways of presenting the divine-human conjunction.

Mystics make use of a variety of images and symbols, as well as distinctive expressions and forms of technical discourse, in their attempts to suggest through language what lies beyond language. Images of erotic love—the kiss, the embrace, the memory of encounter, even sexual intercourse—are favored ways of expressing mystical union. Three images for mixing substances that originated in ancient philosophical writings are also popular among the mystics: the drop of water in a vat of wine, the bar of iron in fire, and air illuminated by the sun. Some images lend themselves more aptly to symbolizing the absorption that leads to mystical identity, such as the ocean, the desert, the mirror, the abyss, cloud and darkness, and the identical eye (Meister Eckhart: “The eye with which I see God is the same eye with which God sees me”). Another powerful image for absorption is eating and being eaten. There are also distinctive linguistic expressions and strategies found across the three traditions: ecstatic identity pronouncements (especially in Islam); forms of dialectical language expressing fusion and indistinc-

tion; the language of the return to the pre-creational state; and reduplication discourses, often involving referential ambiguity, especially in dealing with pronouns signifying God and the human.

Intimately allied with the difference between mystical uniting and mystical identity is the issue of annihilation. Many mystics have insisted that union-identity can only be found through annihilation of the self, but the meaning of annihilation is complex and open to a host of questions. What self is being annihilated: the created self or also a deeper, pre-creational self found in God? Is the ego annihilation total and final or only in certain respects and for particular times and circumstances? Finally, is the annihilation in some way a mutual one in which both God and human lose themselves in some deeper reality? Annihilation is not a simple or univocal category but is, rather, analogical, dialogical, and paradoxical. Furthermore when annihilation language is used in texts that stress mystical identity, it is often accompanied by strategies of qualification that must be taken into account to get the full measure of the meaning of annihilation. Some of these strategies are dialectical in the sense that they insist on the coexistence of indistinction and distinction in the relation between God and human—from one perspective union is total identity; from another, it coexists with an ongoing real difference between the two. Other qualifications are more perspectival, claiming that annihilation is essentially a matter of the consciousness of the mystic and not the structures of reality themselves.

In the monotheistic faiths the God of creation, revelation, and redemption is not a static and indifferent First Principle but a loving and all-knowing God, who creates humans whose likeness to him consists precisely in their ability to know and to love. The various ways of expressing mystical union are intimately connected with the relation between knowing and loving, both in the path to union and in its realization. Here too important comparative issues arise. Most mystics claim that both knowing and loving are necessary in the way to God, but many mystics stress the superiority of love, often expressed in highly erotic ways, whereas others conceive of union as attaining mental identity with the Divine Intellect. In unitive states some mystics contend that one reaches a higher divine way of knowing (*gnōsis*); other mystics see all loving and knowing, at least as most people conceive them, as abrogated when union or identity is attained. The variations found in Judaism, Christianity, and Islam on this essential problematic are too multiple to be easily characterized, but it is difficult to appreciate the dynamics of union unless one addresses the relation between unitive expressions and the roles of love and knowledge.

Among the other persistent issues concerning the comparative dimensions of mystical union is that of the ethical implications of claims of having attained union-identity with God. If mystics think they have become in some sense one with God, what does this mean for their behavior and their relation to the wider community of faith? Does this indicate,

for instance, that the ordinary religious practices, and perhaps even the moral code, no longer are binding on mystics? In both Christianity and Islam mystics, especially those who claimed identity with God, have been suspected of holding such views. These mystics were at times subject to persecution, imprisonment, and even death, as shown by the examples of al-Hallāj and ‘Ayn al-Quḍāt al-Hamadhānī in Islam and Marguerite Porète, Meister Eckhart, and Miguel de Molinos in Christianity. Do these incidents prove that there is always an inherent challenge to institutional and dogmatic religion in the mystical impetus to become one with God? Some have argued this case, but a careful study of even the strongest claims for mystical identity with God across the three traditions demonstrates that few mystics have consciously adopted an antinomian stance or broken with the common religious practices and institutional claims of their tradition, however much they may have come to see these as secondary. There seems to be no inherent conflict between unitive claims and common religious and ethical practice as long as the mystic sees both faith and union as coming from the same divine source.

In a brief essay it is not possible to pursue these issues across the three monotheistic faiths. What follows is a sketch of some of the major unitive mystics in Christianity, Islam, and Judaism, designed to provide a road map for those who wish to investigate unitive mysticism further. Because the language of mysticism and mystical union arose in Christianity, this article looks at Christian expressions first. Strong forms of unitive mysticism appeared as early as the second century of Islam (eighth century CE). Although Judaism was deeply influential on the origins of both Christianity and Islam, because unitive language emerged in Jewish mysticism relatively late, it will be treated last.

UNION IN CHRISTIAN MYSTICISM. The Greek qualifier *mustikos* is derived from the verb *muein*, meaning “to close the mouth or eyes.” Ancient writers used the term in the sense of something hidden, as in the case of the mystery cults, but from the second century CE Christians adopted *mustikos* to signify the inner realities of their beliefs and practices. The word was most often used to describe the hidden spiritual meaning of the Bible, but it was also employed in speaking of the Sacraments and of the vision of God (*thēoria mustikē*). Around the year 500 CE Pseudo-Dionysius coined the term *theologia mustikē* to indicate the knowledge (or better, super-knowledge) by which mystics attain God. The earliest uses of the term *mystical union* (*sunousia mustikē*, *koinōnia mustikē*) are found in the *Spiritual Homilies* ascribed to the Egyptian monk Macarius but actually written in Messalian circles in Syria in the late fourth century CE (see *Hom.* 10.2, 15.2, and 47.17). Pseudo-Dionysius was the first to use the term *henōsis mustikē* (*Divine Names* 2.9). The Latin translators of the Dionysian corpus employed various terms for Dionysius’s *henōsis*, but use of *unio mystica* was rare, despite the many discussions of union found in the medieval and early modern periods. The term did emerge in some of the text-

books on mysticism of the sixteenth and seventeenth centuries (e.g., L. Blosius and M. Sandaeus).

Mystical union in Christianity to 1200. If the term mystical union is rare, the reality of union with God is old in Christianity. The earliest Christian mystical system, that found in the Alexandrian exegete Origen (d. 254 CE), already displays a rich teaching on the union between the loving soul and the Incarnate Logos, especially as found in the spiritual reading of the *Song of Songs*. Commenting on *Song of Songs* 2:10–13, Origen says, “For the Word of God would not otherwise say that the soul was his neighbor, did he not join himself to her and become one spirit with her.” Here Origen is referencing a text from Paul (*1 Cor.* 6:17: “Whoever is joined to the Lord becomes one spirit with him”), a passage that became the leitmotif for those forms of Christian mysticism that emphasize mystical uniting. For Origen and others, the soul burning with love for Christ is divinized by grace to enjoy a union of loving conformity with the Logos that introduces it to the delights of “mystical and ineffable contemplation.”

Origen’s younger contemporary, the pagan philosopher and creator of Neoplatonism Plotinus (d. 270 CE), had a powerful effect on later mysticism in all three traditions. Many of the characteristic ways in which mystics sought to present identity with God are already found in the passages where Plotinus talks about the soul attaining *henōsis*, first with the Supreme Intellect (nous), where some duality still remains, and finally with the ultimate and unknowable One (*to hen*). Throughout his *Enneads*, but especially in *Ennead* 6.9, Plotinus explores with unrivaled subtlety and deep personal concern how the soul must lose or annihilate its present identity to find a transcendent self in the One. “When it [the soul] is not anything else, it is nothing but itself. Yet, when it is itself alone and not in a being, it is in That [the One]” (*Ennead* 6.9.11). Plotinus’s view of mystical union is fundamentally dialectical. The One always is the soul in a transcendental sense, but because the One is also always more than the soul, the two can never be totally identified in an absolute way. Plotinus’s apophatic treatment of the First Principle and his dialectical notion of union were developed by later Neoplatonists, such as Proclus (d. 485 CE), whose philosophy also had an impact on Christian and Islamic mysticism.

Forms of language that explore the possibility of attaining identity with God, especially God conceived of as one and three in the dynamic relationship of Father, Son, and Holy Spirit, begin to appear in Christianity in the late fourth century CE in the writings of Evagrius (d. 399 CE), a learned Origenist who became a desert monk. With Evagrius one finds a variety of forms of language, images, and metaphors, both for loving union with God and for merging into identity with the Trinity. Evagrius appears to be the first Christian to use one of the favored metaphors for mystical identity, that of rivers returning to the sea. In speaking of how created minds return to the Trinity to attain their pre-creational

state, he says: "When minds flow back to him like torrents into the sea, he changes them all completely into his own nature, color, and taste. They will no longer be many but one in his unending and inseparable unity, because they are united and joined with him" (*Letter to Melania* 6). About a century later the anagogic mysticism of Pseudo-Dionysius also uses diverse images and linguistic strategies to present a mysticism of identity that lies beyond all knowing and loving. Describing the ascent of Moses, an archetypal mystic for Jews, Christians, and Muslims, Dionysius says: "Renouncing all that the mind may conceive, wrapped entirely in the intangible and invisible, he belongs completely to Him who is beyond everything. Here, being neither oneself nor someone else, one is united to the wholly Unknown by an inactivity of all knowledge, for the best, knowing beyond the mind in knowing nothing" (*Mystical Theology* 1.3).

The twelfth century was the golden age of speculation on oneness of spirit (*unitas spiritus*), following the Pauline-Origenist tradition. Intense discussion of the modalities of union and the role of love and knowledge in unitive states was carried on by Cistercian authors, such as William of Saint Thierry (d. 1148) and Bernard of Clairvaux (d. 1153), as well as the early scholastic systematizers of mysticism of the school of Saint Victor, such as Hugh (d. 1141) and Richard (d. 1173). Bernard is unrivaled in his subtle expositions of how the love between the soul and the Incarnate Word leads to a complete conformity of wills imaged in spousal union. Nevertheless Bernard insisted that oneness in loving (*unus*) is different from the oneness of essence (*unum*) enjoyed by the three persons of the Trinity (*Sermons on the Song of Songs* 71.6–9). Bernard's friend William of Saint Thierry did not abandon the Pauline language of union of spirit, but his profound treatment of how the Holy Spirit, transcendent Love itself, becomes the love by which one loves God moves in the direction of mystical identity. William was also significant for the ways in which he explored the transformation of the love-knowledge relation in the path to union. Love is more powerful than knowing on the way to God, but the height of love found in mystical union includes a transformed knowledge, what William called the *intelligentia amoris*.

Mystical union in Christianity, 1200–1700. In the thirteenth century new forms of mysticism burst upon the scene in Western Christendom. Attaining God in mystical uniting continued to be widely discussed (e.g., Bonaventure), but what is striking about the new mysticism of the later Middle Ages is the way in which many of its practitioners turned to the language of mystical identity to express their oneness with God. The move is first evident in some of the women mystics of the thirteenth century, especially the beguines Hadewijch, Mechthild of Magdeburg, and Marguerite Porete. Porete's *Mirror of Simple Annihilated Souls*, one of the most striking presentations of mystical identity in the history of Christianity, employs an impressive range of forms of discourse to suggest how God, the "Farnear," takes the

place of the soul that has perfectly annihilated itself: "Now he possesses the will without a why in the same way that he possessed it before she [the soul] was made a lady by it. There is nothing except him. No one loves except him, for nothing is except him, and thus he alone completely loves, and sees himself alone completely, and praises alone completely by his being itself" (*Mirror*, chap. 91).

Whereas the women mystics continued to employ both the language of mystical uniting and that of mystical identity, Meister Eckhart (d. 1327/8) was the foremost spokesperson for a pure mysticism of indistinct, or identical, union in the history of Christianity. Eckhart used the dialectical language of Neoplatonic philosophy to explore the distinct-indistinction of the ground of identity where "God's ground is the soul's ground and the soul's ground is God's ground" (*German Sermon* 6). Some passages even suggest attaining indistinction with the God-beyond-God, as in *German Sermon* 48, which says that the soul is not content with the Trinity of persons or the divine essence, "but it wants to know the source of this essence, it wants to go into the simple ground, into the quiet desert where distinction never gazed, not the Father, nor the Son, nor the Holy Spirit." The teachings of Porete and Eckhart were too daring for the institutional church of the time. Porete was executed for heresy in 1310, and Eckhart was posthumously condemned in 1329.

Eckhart's language of indistinction was always qualified by his dialectical insistence on the continued distinction between God and creature. His followers Henry Suso and John Tauler continued to use the dialectic of distinction-indistinction, but they also introduced qualifications not found in Eckhart. Suso, for example, echoing what can be found in many Šūfī mystics, carefully distinguished between the ongoing ontological difference between God and human and the perception of this difference. One can lose the latter in moments of mystical rapture but never the former, according to Suso. A particularly intricate solution to the problem of mystical union is found in the Dutch mystic Jan van Ruusbroec (d. 1381). According to his *Little Book of Enlightenment*, union with God exists on three interpenetrating levels: union with an intermediary achieved through grace and the ordinary means of salvation; union without an intermediary achieved through the excess of love, the level of *unitas spiritus*; and finally, union without difference or distinction, "where the three Persons [of the Trinity] give way to the essential unity There all the elevated spirits in their superessence are one enjoyment and one beatitude with God without difference." These levels always coexist, here and hereafter.

The debate over mystical union continued. In the fifteenth century Jean Gerson attacked false views of mystical union, not only of the Eckhartian variety but also those found in the writings of Ruusbroec and even some of the formulations of Bernard of Clairvaux. In the sixteenth century some of the radical reformers employed the language of mystical identity taken over from late medieval figures. The great

Spanish mystics Teresa of Avila (d. 1582) and John of the Cross (d. 1591) display a rich teaching on mystical union that cannot be explored here. Though each makes use of expressions that taken out of context might suggest some form of mystical identity, viewed synoptically they insist that the loving union that can be found in this life involves only conformity of the transformed self with God, not indistinction or identity. As John put it in his *Spiritual Canticle* 31.1: “This thread of love binds the two . . . with such firmness and so unites and transforms them and makes them one in love, that, although they differ in substance, yet in glory and appearance the soul seems to be God and God the soul.” In the mysticism of the seventeenth century that led to the condemnations of quietism (1687 and 1699), it was not so much the doctrine of union itself, as the teaching on annihilation and the supposed indifference to sin that resulted from this that was the focus of objections to mystical teaching.

MYSTICAL UNION IN ISLAM. What is striking about Islam is the way in which strong forms of mystical identity emerged quite early in the development of the Šūfī tradition. In part this reflects the impact of the noted union ḥadīth (an extra-Qur’anic divine statement): “I became the hearing with which he hears, the seeing with which he sees, the hand with which he grasps, and the foot with which he walks.” The emphasis on identity coexists along with highly developed forms of erotic union language. Through the absorption and transposition of themes from pre-Qur’anic Arabian love poetry, the Šūfī mystics, in both prose and verse, stand out among the most fervent proponents of the role of absolute, single-minded love in the pursuit of God, as such figures as Rābī’ah al-’Adawīyah (d. 810 CE), Jalāl al-Dīn Rūmī (d. 1273), and Fakhr al-Dīn ‘Irāqī (d. 1289) demonstrate. The Šūfīs also explored the special characteristics of mystical knowing (*ma’rifā*) with subtlety equal to that found in any tradition.

Tawḥīd, “to declare that God is one,” is the central duty of all Muslims. The recognition that God alone is, that he is the sole agent, and that he alone can truly say “I” emphasizes that the absolute unity and simplicity of the transcendent creator also constitutes the immanent reality of all things, as the union ḥadīth indicates. The eleventh-century Iranian mystic Ibn Hawāzin al-Qushayrī, whose *Treatise on Sufism* is among the most popular explanations of Šūfī terms, put it thus: “For the appearance of the real, Most Praised, is the disappearance of the creature” (Sells, 1996, p. 132). Annihilation and identity are central to Islamic belief and the mysticism based upon it.

A variety of special terms with subtle connotations express various aspects of this identity mysticism. Among the most important are the twin terms *fanā’* and *baqā’*, conceived of as two crucial stages (*maqāmat*) in the Šūfī path. *Fanā’*, or passing away, is the annihilation of the ego consciousness, absolute nullification in the presence of the divine. (It has been compared to the Middle High German verb *entwerden*, “unbecoming,” used by Eckhart [Schimmel, 1975, p. 142].) But *fanā’* is inseparable from *baqā’*, or sub-

sisting, because when the human ceases to be, what remains is only the divine reality in which all things subsist. It is in this state that some Šūfī mystics made ecstatic statements that belong properly to God, such as al-Ḥallāj’s “I am the Truth” and al-Biṣṭāmī’s “Glory be to Me.”

Closely related to *fanā’* and *baqā’* are two other sets of terms. The Arabic root *w-j-d* gives rise to a series of words expressing various forms of ecstasy in the sense of being found, or drawn out, by God (*tawājud*, *wajd*, *wujūd*; Sells, 1996, pp. 110–116). These can be described as states of intensification of existence achieved through passing away into pure divine existence. Another set of terms denotes different ways of speaking of union, or oneness (*jam’*). According to Qushayrī’s *Treatise*, both union in the sense of God’s action in humans and separation, what the human does through acts of worship, are necessary. Beyond this duality lies what he and other Šūfīs call the “union of union” (*jam’ al-jam’*), which Qushayrī says is “the utter perishing and passing away of all perception of any other-than-God, Most Glorious and Sublime, through the onslaughts of reality” (Sells, 1996, p. 118). The Šūfīs denied that such expressions of mystical identity were to be thought of as forms of unification (*ittiḥād*), as if God and human were two things mixed together. They also abjured *ḥulūl*, that is, indwelling or incarnationalism, by which God is conceived of as inside the human spirit, coexisting with it. However, in Islam, as in Christianity, some community leaders, and even some moderate Šūfīs, accused other Šūfīs of incarnationalism and improper expressions of union as well as of the antinomianism (*ibahah*) some Christian mystics were said to have propounded. Such Šūfīs as al-Sarrāj (d. 933 CE) and Rūzbihān Baqlī (d. 1209) worked out detailed defenses of the ecstatic statements of identity with God (*shathiyat*) made by mystics like al-Ḥallāj and al-Biṣṭāmī (see Ernst, 1985). Significant to this defense was the distinction between pronouncements made in the state of mystical intoxication (*sukr*) and what could be legitimately said in ordinary consciousness, or the state of sobriety (*ṣaḥw*).

Important Šūfī mystics. Of the host of names of Šūfī mystics it is possible only to mention a few here. Ja’far as-Šādiq (d. 765 CE), the sixth imam of the Shiite tradition, is among the earliest commentators on the Qur’ān. His treatment of the story of Moses (Mūsā) as told in *Surā* 7 treats the patriarch’s experience of God on Sinai as an intimate conversation (*munājāt*) that led to annihilation of the ego and divine self-proclamation: “Mūsā heard words coming forth from his humanity and attributed the words to him [the deity] and he spoke to him from the selfhood of Mūsā and his servanthood. Mūsā was hidden from himself and passed away from his attributes” (Sells, 1996, p. 80). Another early figure is the greatest female mystic of the Islamic tradition, Rābī’ah. The stories and sayings attributed to her in Farīd al-Dīn ‘Aṭṭār’s *Memorial of the Friends of God* testify not only to the power of her longing for God but also to her desire to worship God without intermediary.

The third and fourth centuries of Islam (ninth and tenth centuries CE) witnessed some of the strongest proponents of mystical identity in the history of monotheistic religion. The most famous figure is doubtless Ibn Maṣṣūr al-Ḥallāj, whose martyrdom in 922 CE made him a paradigmatic figure in Islam for debates over mysticism. But from the point of view of the comparative study of mystical union, no less important are two somewhat older contemporaries of Ḥallāj. Abū Yazīd al-Biṣṭāmī (Bāyazīd in the Persian tradition) expressed identity with God in ways that were no less challenging than those of Ḥallāj. His writings contain remarkable forms of reduplicated expressions of total annihilation, the “passing away of passing away” (*fanāʾ al-fanāʾ*). Like Muḥammad, who was credited with a celestial journey (*Miʿrāj*; see *Surā* 17), al-Biṣṭāmī dreamed he underwent an ascent through all the heavenly spheres to attain a vision of God in which he “melted away like lead” into indescribable union. Many of al-Biṣṭāmī’s sayings express the broken forms of discourse that often characterize mystical identity: “My I am is not I am. Because I am he, and I am he is he” (Ernst, 1985, p. 26).

No less daring, and perhaps more theoretically rich in his discussions of union, is the Baghdad Ṣūfī, Abū al-Qāsim al-Junayd (d. 910 CE). In his writings one finds not only a mind of great originality but also a moving personal witness. In discussing *tawḥīd*, for example, he says: “Fear grips me. Hope unfolds me. Reality draws me together. The real sets me apart. When he seizes me with fear, he annihilates me from myself through my existence, then preserves me from myself. . . . From the reality of my annihilation, he annihilated me from both my abiding and my annihilation” (Sells, 1996, p. 254).

In the twelfth century the most famous of Muslim teachers, Abū Ḥāmid al-Ghazālī, a convert to the Ṣūfī path, helped integrate the mystical impetus into the broad stream of tradition through such works as his treatise *The Niche of Lights*, which emphasized the distinction between mystical speech and ordinary discourse. The limits were tested again in the thirteenth century with the writings of three classic mystics, Ibn al-Fāriḍ (d. 1235), Ibn al-ʿArabī (d. 1240), and Rūmī (d. 1273). Al-Fāriḍ and Rūmī, supreme mystical poets, were more easily incorporated into the tradition than Ibn al-ʿArabī. This Spanish Ṣūfī was a philosopher, mystic, and poet who not only synthesized earlier mystical traditions but also raised them to a new level of profundity through his mystical philosophy of the unity of existence (*wahdat al-wujūd*) in such works as his *Bezels of Wisdom* and the vast *Meccan Revelations*. Although Ibn al-ʿArabī was suspicious of divine identity statements made in ecstasy, his use of dialectical language in which references to God and human are inextricably fused was attacked both in his time and in later Islamic history. Each of these three figures, as well as a number of their successors in the later history of Sufism, would deserve extended treatment in a more ample account of the story of mystical union in Islam.

JEWISH CONCEPTIONS OF MYSTICAL UNION. The significance of unitive language in Jewish mystical traditions has been the subject of contention. Scholarly study of Judaism, born in the Enlightenment, relegated mysticism to the margins, seeking to demonstrate that Judaism was a rational form of moral monotheism. Even Gershom Scholem (1941 and 1971), who resurrected mysticism as central to Jewish history, sought to distinguish Jewish mysticism from Christian and Islamic forms, because its strict sense of the gulf between God and human made claims for mystical union, and especially mystical identity, suspect and secondary. Since the 1980s, however, new research by Moshe Idel (1988a, 1988b), Idel and Bernard McGinn (1996), and Rachel Elior (1993) has shown that unitive language, even expressions of mystical identity, is not at all foreign to Jewish mysticism, though it is late.

The earliest stages of Jewish mysticism represented by the Merkavah literature (c. second to tenth centuries CE) do not feature the language of union but concentrate on heavenly ascensions to a vision of the throne of God. Unitive language first appears in the mid-twelfth century in the early stages of Qabbalah. Though Jewish forms of unitive mysticism show important analogies to Christian and Muslim forms, the distinctive practices and linguistic character of Jewish mysticism, both in the various types of Qabbalah and in the later Hasidic mysticism, have their own hermeneutics.

Deuteronomy 4:4 states, “You who cleave to the Lord God are all alive this day” (cf. *Dt.* 10:20 and 13:5). The notion of “cleaving” (*devekut*) provided a biblical warrant for later unitive forms of Jewish mysticism, not only those of mystical uniting but also stronger connotations of mystical identity. Moshe Idel (Idel and McGinn, 1996) has suggested that unitive understandings of *devekut* and related terms, such as *hitabed* (uniting) and *yihud* (union), express two models of mystical union: a universalizing type in which the soul of the mystic becomes all-embracing by cleaving to the Universal Object; and an annihilative-integrative model in which the mystic’s ego is annihilated (as in Ṣūfī *fanāʾ*) in order to be perfectly integrated into the divine realm. The qabbalistic and Hasidic mystics who used strong forms of mystical identity, like their Christian and Muslim counterparts, usually qualified their statements by insisting that identity with God was not total; the ego remains or returns, at least in some way. Similarly even the most powerful proponents of identity language never broke with Jewish *halakhic* practice or lapsed into an antinomian posture. The only real heresy in the past eight centuries of Jewish history, that of Shabbetai Tsevi, was messianic in origin, not mystical.

Jewish unitive mystics. Among the earliest Jewish thinkers who spoke of mystical union was the mid-twelfth-century philosopher Abraham ibn Ezra, who saw Moses’ cleaving to God as a model for the soul’s return to its primordial state of universality. This theme continued on in Qabbalah, for example in ʿEzra of Gerona (c. 1250), who held that the soul of a prophet ascends until it is united to the “su-

pernal soul in a complete union" (Idel, 1988a, p. 42), a formulation that seems to be influenced by Neoplatonic views. The most impressive work of Spanish Qabbalah, the *Zohar*, produced by mystical groups centered around Mosheh de Léon in the late thirteenth century, did not use extensive language of union, though the appearance of some unitive expressions (e.g., *Zohar* III.288a) became a proof text for later mystics. Other theosophical qabbalists, however, did employ considerable unitive language. For example, Isaac of Acre (active c. 1300) understood cleaving as the means for attaining the gift of prophecy in the soul's ascent to union with the hidden godhead of Qabbalah, the Ein Sof. Commenting on *Leviticus* 19:24, he says that the years of the maturation of fruit trees mentioned in the text are to be understood as the advance of the soul through mystical stages until, "'And in the fifth year,' which refers to the 'Einy Sof' which surrounds everything, this soul will cleave to the 'Einy Sof' and will become total and universal, after she had been individual, due to her palace, while she was yet imprisoned in it, and she will become universal, because of her source" (Idel, 1988a, p. 48). This reference to attaining a pre-creational state echoes a theme found in contemporary Christianity and Islam.

The most extreme formulations of identity mysticism in Qabbalah occur in the writing of Abraham Abulafia in the late thirteenth century. Abulafia's ecstatic form of Qabbalah, based upon practices of meditation and number manipulations, was fundamentally intellectualist. Like Plotinus, he envisaged an ascent to union with the Agent Intellect and finally to the Hidden God. Abulafia expresses this last stage in reduplicating language of fused pronouns comparable to some of the most extreme Muslim mystics: "For now he is no longer separated from his Master, and behold he is his Master and his Master is he; for he is so intimately united with him, that he cannot by any means be separated from him, for he is he" (Idel, 1988b, p. 10).

The Safedian qabbalism of the sixteenth and seventeenth centuries also employed unitive language, as the examples of Mosheh Cordovero and Eliyahu de Vidas indicate. Nevertheless it is fair to say that unitive mysticism was at its strongest in some of the forms of Hasidic mysticism that began in eastern Europe in the eighteenth century and that continue to flourish in the twenty-first century. The Hasidic mystics were deeply influenced by Qabbalah, but the qabbalists were generally more concerned with repairing the structures of the divine world, whereas the Hasidic masters stressed personal experiences of union.

Amid a wealth of unitive statements found in Hasidic mysticism, the materials from the Habad movement, founded by Dov Ber, the maggid of Mezhrich (d. 1772), stand out. In a disciple of the maggid, Shne'ur Zalman of Liadi (d. 1813), one finds extreme statements of annihilation and identity with the divine. In explaining the meaning of mystical interpenetration (*hitkalelut*), Shne'ur says: "When man cleaves to God, it is very delightful for Him, and savor-

ous for Him, so much so that He will swallow it into his heart, . . . as the corporeal throat swallows. And this is the true cleaving, as he becomes one substance with God in whom he was swallowed, without being separate [from God] to be considered as a distinct entity at all" (Idel and McGinn, 1996, p. 43). Dov Ber of Lubavitch, Shne'ur's son, wrote *Tract on Ecstasy*, which carefully discriminated five levels of ecstatic progression in which the fourth level, one of annihilation, leads to the fifth form of ecstasy, "actual essential *yehidah*," which is "called 'ecstasy of the whole essence,' that is to say his whole being is so absorbed that nothing remains and he has no self-consciousness whatsoever" (Jacobs, 1963, pp. 136–139). Other Habad mystics, such as Aharon Halevi Horowitz of Staroselye (d. 1828), were even more daring in their claims for attaining mystical identity, but this is not the place to pursue mystical union in Habad, or among other Hasidic leaders, such as the famous Nahman of Bratslav (d. 1810).

CONCLUSION. Union, whether conceived of as the uniting of God and human or in a deeper way as some form of identity with God, has been a key feature of the mystical traditions of Judaism, Christianity, and Islam. Although direct links between the mysticisms of the three faiths have been relatively rare, the common dynamics of monotheistic attempts to express their consciousness of becoming one with God display analogies that invite further investigation and promise important contributions to ecumenical understanding.

BERNARD MCGINN (2005)

MYSTICISM [FIRST EDITION]. No definition could be both meaningful and sufficiently comprehensive to include all experiences that, at some point or other, have been described as "mystical." In 1899 Dean W. R. Inge listed twenty-five definitions. Since then the study of world religions has considerably expanded, and new, allegedly mystical cults have sprung up everywhere. The etymological lineage of the term provides little assistance in formulating an unambiguous definition. In the Greek mystery cults, *muein* ("to remain silent") probably referred to the secrecy of the initiation rites. But later, especially in Neoplatonic theory, the "mystical" silence came to mean wordless contemplation. Even this "contemplation" does not coincide with our own usage of that term, since *theōria* denotes speculative knowledge as well as what we call contemplation.

Nor does the early Christian term *mustikos* correspond to our present understanding, since it referred to the spiritual meaning that Christians, in the light of revelation, detected under the original, literal meaning of the scriptures. Eventually the idea of a meaning hidden underneath surface appearances was extended to all spiritual reality (the sacraments, especially the Eucharist, even nature itself as expressive of God's majesty). Yet the strictly private character that we so readily associate with the term *mystical* was never part of it.

Sometime between the fourth and the fifth centuries, the Christian meaning began to absorb the Greek connotations of silence and secrecy. For Dionysius the Areopagite, the influential Syrian (?) theologian, mystical theory consisted of the spiritual awareness of the ineffable Absolute beyond the theology of divine names. Still, even for him, mystical insight belonged essentially to the Christian community, not to private speculation or subjective experience. Contrary to this objective, communal meaning, Western Christianity, mostly under Augustine's impact, eventually came to understand the mystical as related to a subjective state of mind. Thus Jean de Gerson, the fifteenth-century chancellor of the Sorbonne, described mystical theology as "experimental knowledge of God through the embrace of unitive love." Here we witness the formulation of the modern usage of a state of consciousness that surpasses ordinary experience through the union with a transcendent reality.

CHARACTERISTICS. With such a wide range of meanings, it is not surprising that commentators disagree about the characteristics of the mystical experience. Those mentioned in William James's *The Varieties of Religious Experience* rank among the most commonly accepted. *Ineffability* emphasizes the private, or at least incommunicable, quality of the experience. Mystics have, of course, written quite openly and often abundantly about their experience. But, by their own testimony, words can never capture their full meaning. This raises a delicate problem of interpretation to which we shall return. Secondly, James mentions the *noetic* quality of the experience. To be sure, mystical insight hardly ever augments theoretical knowledge. Nevertheless its insight suffuses a person's knowledge with a unique, all-encompassing sense of integration that definitely belongs to the noetic order. This point deserves emphasis against those who assert that mysticism is the same everywhere and that only the postmystical interpretation accounts for the difference. Distinctions begin with the noetic qualities of the experiences themselves. The *pasivity* of the mystical experience may well be its most distinctive characteristic. Its gratuitous, undeserved nature stands out, however much the privileged subject may have applied himself to ascetic exercises or meditative techniques. Once the higher power takes possession, all voluntary preparation appears to lose its efficacy. *Transiency*, a more controversial characteristic, has, I think justifiably, been challenged, for great mystics have remained for prolonged periods in enhanced states of consciousness. Intermittent intensive experiences figured therein as moments of a more comprehensive

surpassing awareness. Perhaps we should speak of the *rhythmic*, rather than the transient, quality of mystical life.

To James's four characteristics we may add a fifth: *integration*. Expanded beyond its ordinary limits, the mystical consciousness somehow succeeds in overcoming previously existing opposition in its integration with a higher reality. This, however, should not be interpreted to mean that all restrictions cease to exist. Some of them clearly maintain a sense of transcendence within the union. This is precisely what gives them their distinctly religious character.

IDENTITY AND DIFFERENCE. That a "common factor" underlies the most diverse spiritual theologies has been asserted with great emphasis by such writers as René Guénon, Aldous Huxley, Frithjof Schuon, and Alan Watts. Some assumption of identity also seems to direct the thought of several Indian philosophers. In the West at least, the theory rests on the general principle that only subsequent interpretations distinguish one mysticism from another. Each mystic unquestionably tends to interpret his experience in the light of the theological or philosophical universe to which he belongs. Moreover, the nature of his spiritual quest usually shapes the experience. But to conclude therefrom that the interpretation remains extrinsic is to deny the experience a specific, ideal content of its own and to reduce it to mere sensation. Experience itself is distinctly cognitive and intentionally unique. As Gershom Scholem once pointed out, there is no mysticism-in-general; there are only particular mystical systems and individuals, Hindu, Buddhist, Muslim, Jewish, Christian, and so forth.

The specific quality of the experience in mystical individuals or schools does not, of course, exclude a kind of family resemblance in this variety. A denial of similarity has induced traditional interpretations to study mystical schools exclusively from the perspective of their own theological principles. Thus, for example, R. C. Zaehner's controversial *Mysticism* (1957) ranks mystical schools according to their proximity to orthodox Christian love mysticism. Alternatively, the assumption of a genuine similarity of experiences enables us to consider a variety of phenomena under some general categories without reducing them to simple identity. Such a general discussion would include nonreligious as well as religious mysticism, even though basic differences separate them. The present essay focuses only on religious mysticism. But a few words must be said about so-called nature mysticism, a term unrelated to the distinction, current in Roman Catholic theology, between "natural" (or acquired) and "supernatural" (or infused) mysticism. Nature mysticism refers to the kind of intense experience whereby the subject feels himself merging with the cosmic totality. Now, a mystical experience of the cosmos may also be religious. But in the religious experience a sense of transcendence persists throughout the experience of cosmic union either with regard to nature as a whole or to its underlying principle. Some descriptions of romantic writers (John F. Cooper, William Wordsworth, Jean Paul) seem to express such a mystical

awareness of nature. We also find traces of it in Turner and in the nineteenth-century painters of the Hudson River school. The artist most remembered for his mystical descriptions of nature may well be Richard Jeffries. In his case the distinction between the religious and the nonreligious is particularly hard to maintain. In other cases any religious equation of cosmic-mystical experiences with what John of the Cross or the *Bhagavadgītā* expressed would be clearly inappropriate. Nevertheless, to deny any resemblance between the intense, unifying experience of nature and that of a transcendent presence would be absurd.

At this point the problem of narcotically induced states presents itself. Must we dismiss them as not mystical or at least as not religiously mystical because of their chemical origin? Such a simplistic categorization would be a blatant instance of the "genetic" fallacy. Instead of describing the phenomenon itself, we would then be satisfied to evaluate it according to its presumed origin. Of course, any mental state introduced without spiritual preparation is unlikely to foster spiritual development, and, if habitual, the reliance on chemical means may permanently obstruct growth. But however beneficial or detrimental this eventual impact upon personality may be, there can be no doubt that in a religious context chemicals may induce states of undeniably religious-mystical character. Thus the ritual consumption of peyote cactus buttons, dating back to pre-Columbian times, has undoubtedly played a significant role in the religious awareness of native Americans and has since the end of the nineteenth century been instrumental in remythologizing the cult.

Similarly, experiences resulting from pathological psychic conditions (e.g., manic depression, hysteria) should not per se be excluded from the mystical. Nor should these or drug-induced states be considered separately from "nature" or religious mysticism. On the latter alone we shall concentrate. The typology here presented considers only the mystical aspect of various religions: it claims neither adequacy in the general area of religion nor completeness in the classification of mystical religion.

MYSTICISM OF THE SELF. Mysticism belongs to the core of all religion. Those religions that had a historical founder all started with a powerful personal experience of immediate contact. But all religions, regardless of their origin, retain their vitality only as long as their members continue to believe in a transcendent reality with which they can in some way communicate by direct experience. The significance of such an experience, though present in all religion, varies in importance. Christianity, especially in its reformed churches, attaches less significance to the element of experience than other faiths do. In Vedantic and Sāṃkhya Hinduism, on the contrary, religion itself coincides with the kind of insight that can come only from mystical experience. Their particular concept of redemption consists in a liberation from change and from the vicissitudes of birth and death. Their craving for a state of changeless permanence aims not at some sort of unending protraction of the present life but rather at the

extinction of all desire in this life. Hindu spirituality in all its forms displays an uncommonly strong awareness of the sorrowful quality of the human condition. Apart from this common temper and an acceptance of the authority of the Vedas, Hinduism presents such a variety of religious doctrines and practices that a single name hardly applies. Still, a similar, inward-directed mystical tendency warrants discussion under a single title.

The original Vedic religion with its emphasis on sacrifice and rite appears rather remote from what we usually associate with the term *mysticism*. Yet two elements in its development strongly influenced the later, more obviously mystical direction. First, forms of meditation became at some point acceptable substitutes for the performance of the actual sacrifice and were held to yield equally desirable benefits. Though such forms of concentration had little in common with what we understand today by contemplation, they nevertheless initiated an interiorization that Hinduism would pursue further than any other religion (Dasgupta, 1972, p. 19). Second, the term *brahman*, which originally referred to the sacred power present in ritual and sacrifice, gradually came to mean a single, abstractly conceived Absolute. The search for a primal unity is already obvious in some Vedic texts (e.g., the Creation Song, which speaks of “that one thing, breathless, breathed by its own nature”). The subordinate status of the gods (“The gods are later than this world’s production,” *Rgveda* 10.129) may have favored the drive toward unity. Polytheism, though abundantly present, had remained spiritually so undeveloped that it did not obstruct the road toward spiritual unity.

In the Upaniṣads (eighth to fifth century BCE) the unifying and the spiritualizing tendencies eventually merged in the idea of an inner soul (*ātman*), the Absolute at the heart of all reality to which only the mind has access.

The inner Soul of all things, the One Controller, Who makes his one form manifold— The wise who perceive Him as standing in oneself, They, and no others, have eternal happiness! (*Kaṭha Upaniṣad* 5.12)

This is not a metaphysical theory, but a mystical path to liberation. It requires ascetical training and mental discipline to overcome the desires, oppositions, and limitations of individual selfhood. “As a man, when in the embrace of a beloved wife, knows nothing within or without, so this person, when in the embrace of the intelligent Soul, knows nothing within or without” (*Bṛhadāraṇyaka* 4,3.22). Here lies the origin of the *advaita* (nondualist monism that would become dominant in classical Hinduism). The *Māṇḍūkya Upaniṣad* anticipates the later, radical expressions in its description of the highest state of consciousness as one beyond dreamless sleep. Above all, it equated the deeper self (*ātman*) thus discovered with *brahman* itself. This deeper self tolerates no subject-object opposition. If taken literally, this state would eliminate consciousness itself and with it the very possibility of a “mystical” state. Yet such a total elimination of personal consciousness remains an asymptotic ideal never to be

reached but to be approached ever more closely. The three aspects of *brahman* (*sat-cit-ānanda*) that even extreme monists distinguish include two that are clearly conscious. Even if any distinction beyond the One were to be a mere illusion, as in the extreme interpretation of *māyā* (originally, the created world itself) given by Śaṅkara (eighth century CE), it still remains an opposition to indiscriminate Unity. Metaphysical speculation in classical Hinduism may occasionally have surpassed its mystical tendency. But that there *was* a religious experience at the basis of this extreme monism cannot be doubted.

The starting-point of Śaṅkara and the Sāṃkhya-Yoga is the *experience* of the immortality of the soul; and immortality in this case does not mean the infinite prolongation of human life in time: that is *Samsāra* which the Hindus regard rather as a living death; it is death-in-life, not life-in-death. It means rather an unconditioned and absolutely static condition which knows nothing of time and space and upon which death has no hold; and because it is not only pure Being, but also pure consciousness and pure bliss, it must be analogous to life. (Zaehner, 1962, p. 74)

Of course, not all the Upaniṣads were radically monist in their expression (*Śvetāśvatara* is clearly not), nor was the Vedantic theology the only mysticism of the self in India. The Sāṃkhya-Yoga mentioned in the above passage advocates a radical dualism. It recognizes two irreducible principles of reality: *prakṛti*, the material principle and source of energy, cause of both the material world and psychic experience, and *puruṣa*, discrete units of pure consciousness similar to the *ātman* of the Upaniṣads. In contrast to cosmic intellect (*mahat*), ego-consciousness (*ahamkāra*), and mind (*manas*) as the source of perception and action, the multiplicity of individual *puruṣas* exists independently of the cosmic forces altogether. Yet *puruṣa* must be liberated from a confusion with *prakṛti* by means of concentrated effort. Sāṃkhya thought, although it has no place for deity and is specifically atheistic, was assimilated into the age-old tradition of yoga, providing the practice with a soteriological and cosmological framework. This mystical self-isolation recognizes no absolute One (*brahman/ātman*) beyond the individual spirit. Liberation here means the opposite of merging with a transcendent Self. In its pure form, Sāṃkhya-Yoga, far from leaning toward pantheist monism (as Vedantic spirituality does), results in the most extreme individualism. If the idea of God appears at all, it is as that of one *puruṣa* next to all others, their model insofar as God is entirely free of cosmic contamination. But we must avoid tying the Yoga techniques to the later Sāṃkhya theology: they were practiced also in non-dualist or in the so-called qualified-dualistic (*Viśistādvaita*) systems.

What are these qualified-dualistic systems that make up the third school of Hindu mysticism? It seems hazardous to ground them in theological theories. To be sure, each mystical system contains an interpretation as an essential part of the experience, but these interpretations cannot be simply transferred into the kind of logically coherent systems for

which we usually reserve the name *theology*. A mystical theology is less concerned about logical consistency and sharply defined concepts than about adequate translations of the actual experience. This is particularly the case in a tradition wherein the mystical element constitutes most of the core of the religion itself. Hence in describing such later writers as Rāmānuja (eleventh century CE) as “qualified dualists,” we should be aware that we are referring more to a practical-devotional than a speculative-metaphysical attitude. Rāmānuja may never have abandoned the metaphysical assumptions of the monist tradition in which he grew up. But finding absolute monism inadequate for the practice of spiritual life, he reaffirmed the traditional concept of a God endowed with personal attributes (*saguṇa brahman*), instead of the attributeless absolute substance (*nirguṇa brahman*). God thereby is not merely a model but also a redeemer who assists the soul on its path to liberation.

In thus qualifying the monist doctrine, Rāmānuja was inspired by what the *Bhagavadgītā* (c. second century BCE) had assumed throughout. This mystical poem, perhaps the finest spiritual work to come from the East, is hard to classify by Western canons. The narrative assumes a clearly theistic position: the god Viṣṇu incarnated in Kṛṣṇa exhorts the hero Arjuna on the eve of battle with his stepbrother to take heart and fight. But the message he delivers ranges from traditional piety and observance of the ancient rites to the monism of the Vedānta, combined with the dualistic cosmology of Sāṃkhya-Yoga. The work is a synthesis in all respects. Not only does it unite the monist and theistic strands, but it also presents a method of combining the active with the contemplative life. It advises a mental discipline that enables a person to act with total detachment from the fruits of his deed. By itself, the active life (*karman*) weaves its own web of causes and effects, entailing an endless cycle of birth and death—the very essence of what a person seeks to be liberated from. Yet various kinds of yoga detach the mind from this natural determination, while still allowing a person to fulfill the obligations of his station in life. Through equanimity of emotions, holy indifference, and purity of heart, even the active person will come to detect the one presence of *brahman* in all things. The *Gītā* is not a manual of yogic practice. It is a mystical work that culminates in a vision of God. A most powerful theophany completes Kṛṣṇa’s description of God’s presence in the world (chap. 11). Still the poem concludes with the sobering advice to seek God in the ordinary way of piety rather than through self-concentration. The advice was taken up by the *bhakti* movement, which produced some of the finest flowers of Hindu spirituality and which continues to nourish much of Indian piety today.

THE MYSTICISM OF EMPTINESS: BUDDHISM. It seems difficult to conceive of two religious doctrines more different from one another than Hinduism, especially Sāṃkhya, and Buddhism. In one, we find a quest for an absolute self (*ātman, puruṣa*); in the other, the obliteration of the self (anātman/anatta—no soul). Yet upon closer inspection the two appear to have a great deal in common. Both are systems of

salvation, rooted in a profoundly pessimistic attitude about the changing world of everyday existence, and they aim at a condition of changelessness that surpasses that existence. Moreover, their adherents mostly hope to attain this salvation through enlightenment prepared by moral discipline and mental concentration. In the more radical schools the quest for a unified state of mind leads to some form of practical monism and, in Indian Mahayana Buddhism no less than in “classical” Hinduism, a theoretical monism. Any kind of “grace”—which would introduce a new dualism—is thereby excluded. Even those parts of the tradition that deviate from these rigorous principles appear to have some common features. Amida Buddhism advocates a faith in the “saving Buddha” that strongly resembles *bhakti* Hinduism.

Meanwhile, the goal of enlightenment is conceived in very different ways. The Buddhist description both of the experience and of the path that leads to it is characterized by a spare simplicity as well as by a persistent reluctance to use any but negative predicates. For our purposes it is not necessary to enter into the basic tenets of the theory. Their development varies from the Hīnayāna to the Mahāyāna doctrines. But even in the Theravāda tradition, the Eightfold Path of virtue concludes with “right concentration,” which, in turn, must be obtained in eight successive forms of mental discipline (the *dhyānas*). Once again we are confronted with a faith that from its origins is headed in a mystical direction. The three negative terms—nonattainment, nonassertion, nonreliance—define a state of utmost emptiness by which Nāgārjuna’s Mādhyamika school (150 CE) described enlightenment. Emptiness appears, of course, also in Hīnayāna schools, as the principal quality of *nirvāṇa*, the supreme enlightenment. But with the Mahāyāna schools the emphasis on emptiness, even in the preparatory stages, becomes particularly strong. *Nirvāṇa* itself thereby ceases to be an independent realm of being: it becomes a particular vision of the phenomenal world. Nonattainment consists in emptying the self of all personal qualities, desires, and thoughts, indeed of all that might be considered to comprise a “self.” For ultimate reality is unconditioned and void of all defining distinctions. If this concept is understood ontologically, there is no substantial soul; if understood epistemologically, there is no way of knowing reality as long as the notion of subject remains; if understood ethically, there is no expression of ultimate reality as long as one’s desires condition one’s existence. As the late Mahāyāna poet Śāntideva wrote:

The Stillness (*Nirvāṇa*) lies in surrender of all things, and my spirit longs for the Stillness; if I must surrender all, it is best to give it for fellow-creatures. I yield myself to all living creatures to deal with me as they choose; they may smite or revile me for ever, cover me with dust, play with my body, laugh and wanton; I have given them my body, why shall I care. Let them make me do whatever works bring them pleasure; but may mishap never befall any of them by reason of me. (quoted in Ananda Coomaraswamy’s *Buddha and the Gospel of Buddhism*, New York, 1964, p. 321)

Beyond wisdom, then, the Buddhist ideal requires compassion, an attitude rooted in the deep awareness that all beings are interconnected. It is this compassion that inspired the *bo-dhisattva* vocation in Mahāyāna Buddhism.

As Nāgārjuna defined it, nonassertion became the logical counterpart of the emptiness doctrine. The Madhya-mika paradoxes reveal an intense awareness of the ineffable quality of ultimate truth. No expression is definitive, not even the Four Noble Truths on which Buddhism is founded. The entire Dharma itself, the doctrine, is no more than a dream, a vague echo. To be sure, the conception of an ineffable absolute is also present in Hīnayāna Buddhism, as the following *Udāna* statement clearly asserts: “There is, monks, an unborn, not become, not made, uncompounded; and were it not, monks, for this unborn, not become, not made, uncompounded, no escape could be shown here for what is born, has become, is made, is compounded” (*Buddhist Texts through the Ages*, ed. Edward Conze, Oxford, 1954, p. 95).

Yet the Mahāyāna schools drew more radical conclusions. For the Mādhyamika *nirvāṇa* consists mostly of sets of contradictories, both of which are negated. To Nāgārjuna, *nirvāṇa* is logical “nonsense” to which the principle of contradiction does not apply. One may read this as a program of extreme skeptical philosophy. It is, in fact, a powerful assertion of transcendence in which all distinctions vanish. For the Mādhyamika masters, *nirvāṇa* lies beyond the total peace experience: it has become the Absolute *in itself*, the undivided Oneness of the ultimate reality. No longer separated from conditioned existence, the Mahāyāna *nirvāṇa* becomes indistinguishable from the samsaric realm of phenomenal (and therefore illusory) reality. The Buddhist negation, far more radical than a mere declaration of absence, leaves no common space wherein the Absolute could be compared with any positive qualities. It attempts the logically impossible, namely, to overcome the very interconnectedness of all dependent being and, since all that exists is dependent, of existence itself. Nothing remains here but the road to total silence. Salvation comes through wisdom, but clearly the wisdom here is the opposite of cognitive—it consists in mystical silence.

The ways to emptiness vary. Mental training by the confrontation of paradoxes has been mentioned. Other ways, especially Yogācāra Buddhism, emphasize the attainment of “pure thought.” This consists not in thinking *about* something but rather in the insight that thought is not in any object but in a subject free of all objects. Yogācāra pursues the basic truth of emptiness in a practical rather than a logico-metaphysical way.

Of particular importance here is Chan (Jpn., Zen) Buddhism, a doctrine imported into China by the Indian Bodhidharma that later spread to Japan. Most consistent of all in its pursuit of emptiness, it rejected all dependence (non-reliance), including the one based on the Buddha’s own words. Indeed, the very desire for enlightenment must be abandoned, according to the famous Zen master Dōgen. The

name Chan, or Zen, derived from dhyāna (Pali *jhāna*), indicates the importance of mental concentration. But Zen also requires a systematic surpassing of reason. At an early stage in his training the disciple is given a *kōan*, a paradoxical statement that baffles reason and for which he must find a “higher” sense. Once the mind has become cleared of the ordinary apparatus of conscious thought, unconscious elements emerge from its subliminal depths. Zen masters refer to this stage of hallucinations as *makyō*—the demonic universe—and advise the student not to dwell on any extraordinary experiences. Their advice agrees with the attitude recommended by Christian spiritual directors to mystics passing through the so-called “illumination” stage with regard to visions and voices. All this prepares a state of unification in which the mind gradually sheds the patterns of oppositional consciousness present in desire, fear, prejudice, or even objective conceptualization. C. G. Jung once suggestively described it as “a breakthrough by a consciousness limited to the ego-form, into the non-ego-like self.” In the experience of total unity the self becomes reduced to a state of pure perceptiveness. This occurs in the final stage, *satori*, enlightenment itself, often referred to as *kenshō*, the ability to see the essence of things. We might perhaps translate it as “suchness” or “ultimate reality” (the Sanskrit term *tathatā*, used for the one reality that constitutes the entire universe, coincides in Mahāyāna Buddhism with *nirvāṇa* itself).

Most typical of that final state of emptiness as Zen Buddhists conceive of it is that it results not in a withdrawal from the real but in an enhanced ability to see the real as it is and to act in it unhampered by passion and attachment. Thus emptiness creates a new worldliness. Can such a state be called mystical? Not if one reserves the term for a direct contact with an Absolute that can be described by positive attributes. But such a restriction is not warranted. Any form of religious mysticism claims a direct contact with the Absolute. How it defines this Absolute depends on its particular outlook. Judaism and Christianity are religions of the word; Buddhism is a religion of silence that renounces all ways of naming the Absolute. Even to demand the presence of grace as a specific expression of a divine benevolence is to deny Buddhism the right to conceive of the Absolute as lying beyond any form of expression. Meanwhile, the function of what Christians call “grace” does not remain unfulfilled, as appears in the attitude of thanksgiving that shapes the Buddhist monk’s life as much as that of his Western counterpart. In thanking the nameless source of all goodness, the Buddhist professes the presence of a benevolent Absolute.

Of course, here as in other cases the outsider is unable to decide to what extent religion blossoms into actual mystical experience. What counts is the possibility it presents of an intense, direct contact with the Absolute, and the methodic way that a particular religion offers for realizing this encounter. Not every form of Zen may be called mystical or even religious, any more than the practice of yoga in Hindu culture or, for that matter, the study of Neoplatonic theory.

MYSTICISM OF THE IMAGE: EASTERN AND EARLY WESTERN CHRISTIANITY. Unlike some other religions, Christianity has never equated its ideal of holiness with the attainment of mystical states. Nor did it encourage seeking such states for their own sake. Nevertheless, a mystical impulse undeniably propelled it in its origin and determined much of its later development. The synoptic Gospels present Jesus as dwelling in the continuous, intimate presence of God. His public life begins with a prayer and a vision: "While Jesus after his baptism was at prayer, heaven opened and the Holy Spirit descended on him in bodily shape like a dove" (*Lk.* 3:21–22). It ends with a prayer of total abandonment: "Father, into your hands I commend my spirit" (*Lk.* 23:46). Jesus initiates all important public acts with a prayer. He often withdraws from the crowd for long periods of solitary prayer. He interprets his entire existence through its reference to God, whom he calls Father. To himself he applies Isaiah's messianic words: "The Spirit of the Lord is upon me." The same Spirit he promises to those who pray in his name.

The mystical quality of Jesus' life is most clearly stated in the Fourth Gospel. Some of the words attributed to him may have originated in theological reflection rather than in his own expression. But they thereby witness all the more powerfully to the mystical impulse he was able to transmit to his followers. Biblical speculations on the Word of God are reinterpreted as expressions of God's personal revelation in an incarnated divine Logos. The intimate union between the Father and the Word is, through the Holy Spirit, granted to all true believers. Indeed, the presence of the Spirit entitles them to the same love with which God loves his Son. In John's gospel the two principal currents of Christian mysticism have their source: the theology of the divine image that calls the Christian to conformity, and the theology that presents the intimacy with God as a relation of universal love.

The letters of Paul develop the idea of life in the Spirit. "We all reflect as in a mirror the splendor of the Lord; thus we are transfigured into his likeness, from splendor to splendor: such is the influence of the Lord who is Spirit" (*2 Cor.* 3:18). The Spirit's principal gift, in the understanding of Paul, consists in *gnōsis*, that insight into the "mystery of Christ" that enables the believer to understand the scriptures in a deeper, "revealed" sense. This insight into the hidden meaning of the scriptures led to the Alexandrian interpretation of the term *mystical* discussed earlier. Yet the practice long preceded the term. The entire *Letter to the Hebrews* consists of an allegorical reading of the Yom Kippur sacrifice as foreshadowing Christ's definitive sacrifice on the cross.

The tenor of early Christian mysticism was determined by the New Testament and by trends in Hellenistic Judaism (especially Philo Judaeus's scriptural theology and the late Judaic meaning of *gnōsis*). A third factor, usually referred to as Neoplatonism, must be added. Yet that movement, though influential in the development of Christian spirituality, may be too restricted an account of its beginnings; Origen (and, to some extent, even Clement) had already developed

a mystical theology of the image before Plotinus. It might be more accurate, then, to look to the entire philosophically Platonic, religiously syncretic, and generally Gnostic culture of Alexandria at the end of the second century. In that climate Ammonius Saccas himself, Origen's and Plotinus's common master, grew up and taught. But soon Plotinus's philosophy was to provide much of the ideological apparatus for a Christian theology of the image. Though Plotinus's thought leaves no doubts about its Platonic origins, it was profoundly affected by such religious influences as the mystery religions, Gnosticism, Philo's Judaism, and that syncretism of Hellenistic currents and older Egyptian traditions that is usually referred to as Hermetism. Plotinus's philosophy as exposed in his nine treatises (the *Enneads*) is often presented as an emanational process that originates in an undetermined Absolute (the One), becomes intelligible in a realm of mind (the *nous*), and arrives at its final hypostasis in a world soul (the *psuchē*) shared by all individual souls. Such a presentation misses Plotinus's central insight and the source of its mystical fertility, namely, the immanence of the One in all the lower hypostases. The mystical-intellectual process for him consists in a return to that ever-present One, beyond the vision of the intelligible forms. A crucial role in this process is played by the notion of image, so important in early Christian mysticism. For Plotinus each emanation reflects the previous one as an image. Even the world, though steeped in opaque matter that allows no further emanations, reflects the soul and the mind. Clearly, in this context being an image is more than being an external copy. It implies that each sphere of reality refers in its very essence to a higher one. As such, the image presents, rather than represents. Man alone is able to read his world and his own soul as an appeal to turn inward to mind and, beyond mind, to the One. By a process of asceticism and contemplation, he may overcome the dispersion of time and of all that separates him from the total simplicity (the One) of his inner core. The Plotinian union with the One has been called *ecstatic*, but the term *instatic* might be more appropriate for describing a movement of inwardization and simplification. Plotinus's spiritual theology strikes us as decidedly cool: no sensuous feeling, no "visions," and no emotion. Yet more than any other master (outside the scriptures) did this last of the great pagan philosophers influence subsequent Christian mysticism.

The first attempt at a systematic theology of the mystical life in Christ was written by Plotinus's fellow Alexandrian and codisciple, Origen. In his *Twenty-seventh Homily on Numbers* Origen compares spiritual life to the Jews' exodus through the desert of Egypt. Having withdrawn from the pagan idols of vice, the soul crosses the Red Sea in a new baptism of conversion. She passes next through the bitter waters of temptation and the distorted visions of utopia until, fully purged and illuminated, she reaches Terah, the place of union with God. In his commentary on the *Song of Songs*, Origen initiated a long tradition of mystical interpretations that see in the erotic biblical poem just such a divine union. His commentary also presents the first developed theology

of the image: the soul is an image of God because she houses the primal image of God that is the divine Word. Even as that word is an image of the Father through its presence to him, the soul is an image through the word's presence in her, that is, through her (at least partial) identity with it. The entire mystical process thus comes to consist in a conversion to the image, that is, to ever greater identity with the indwelling Word. The emphasis on the ontological character of the image of God in man (as opposed to the external copy) persists throughout the entire Christian tradition and holds the secret of its amazing mystical power.

The privileged place of love distinguishes Origen's theology from Neoplatonic philosophy. This emphasis on love becomes even more pronounced in the writings of Gregory of Nyssa, the fourth-century Cappadocian bishop. Under Neoplatonic influence Gregory describes the mystical life as a process of *gnōsis* initiated by a divine eros, which results in the fulfillment of the soul's natural desire for union with the God of whom she bears the image. Though akin to God from the beginning, the soul's mystical ascent is a slow and painful process that ends in a dark unknowing—the mystical night of love.

This theology of darkness, or "negative theology," would be developed to its extreme limits by a mysterious, Greek-writing Syrian of the sixth century who presented himself as the Dionysius whom Paul converted on the Areopagus. His enormous (though in the West not immediate) impact steered the theology of the image in a wholly new direction. Neoplatonic as no Christian theologian had ever dared to be, he identified God with the nameless One. Even the divine relations of the Trinity were ultimate only in the order of manifestation. Beyond all names and even beyond being itself lies the dark reality of a divine superessence. The mystical ascent moves toward that nameless unity. Throughout this thoroughgoing negation, Dionysius preserves the core of the image theology, for precisely the primordial union of the soul with God serves as the moving principle of the mystical ascent. Through constant negation the soul overcomes the created world, which prevents the mind from reaching its ultimate destiny. Yet Dionysius's *Mystical Theology* is ecstatic rather than introspective in its concept: the soul can achieve her vocation of union with God only by losing herself in the recesses of the divine superessence. In this respect it differs from the Western mysticism that it so deeply influenced.

Augustine (354–430), the towering figure who stands at the beginning of all Western theology (also, and especially, spiritual theology), described the divine image rather in psychological terms. God remains present to the soul as both origin and supreme goal. She is attracted by him and bears his image. But, unlike its definition by the Greek Fathers, that image remains for Augustine mostly the external effect of a divine cause. Augustine's treatise *On the Trinity* abounds with speculations on the soul's similarity to the Trinity, such as her constituting one mind out of the three faculties of in-

tellect, will, and memory. They would amount to no more than superficial analogies were it not that God's presence in that same inner realm invites the soul to turn inward and convert the static resemblance into an ecstatic union. "Now this Trinity of the mind is God's image, not because the mind resembles, understands and loves itself [the superficial analogy], but because it has the power also to remember, understand and love its Maker" (*On the Trinity* 14.12.15). In actualizing the divine potential of its external resemblance, in allowing it to be directed to its archetype, the soul is gradually united with God. While the Greeks assert the initial identity, Augustine starts from a creator-creature analogy, which the divine attraction and man's following of it transform into an identity.

Unfortunately, this rich theology of identity remained largely unexplored by Augustine's spiritual followers until, in the twelfth century, the Cistercians and the Benedictines of Saint Victor Abbey combined it with the mystical theology of the Greeks. This fertile synthesis of Augustinian psychology with Greek spiritual ontology culminated in the two movements of Rhineland mysticism and Flemish spirituality. We shall here consider only their chief representatives: Eckhart and Ruusbroec.

Johannes Eckhart, possibly the most powerful mystical theologian of the Christian Middle Ages, synthesized the Greek and Augustinian theories of the image with a daring negative theology in one grandiose system. His mystical vision became the basis of an entire theology and, indeed, of a metaphysics of being. He was a subtle dialectician in his systematic Latin works and a paradoxical preacher in his vernacular sermons, so that his spiritual identity remains even today a subject of controversy. Few have succeeded in harmonizing the two parts of his prodigious output. Yet they do belong together. For Eckhart's endeavor was precisely to present the mystical union not as a privilege of the few but as the very vocation and ultimate realization of humanity. The mystical theory of the divine image holds the key to his theological ontology.

God is Being, and being in the strict sense is only God. With this bold principle, Eckhart reinterprets a Thomist tradition that "analogously" attributed being to God and finite existence. For Eckhart, the creature *qua* creature does not exist. Whatever being it possesses is not its own, but remains God's property. Both its limited essence (what determines it as this being rather than that) and its contingent existence (that it happens to be) are no more than the negative limits of its capacity to receive God's own being. "Every creature," Eckhart wrote, "radically and positively possesses Being, life and wisdom from and in God, and not in itself." Hence, God is totally immanent in the creature as its very being, while totally transcending it as the *only* being. By this presence God is totally like the creature; yet, lacking any of its determinations, he is totally unlike it. On these productive antinomies Eckhart builds his densely rich concept of image. The entire content of the creaturely image of God consists

in the divine presence, while the fact that the creature's limitation reduces this identity to a likeness (hence including difference) accounts for the image's total directedness toward the divine exemplar: "Every image has two properties. One is that it takes its Being immediately from that of which it is the image. . . . The second property of the image is to be observed in the image's likeness. And here especially note two things; an image is, firstly, not *of* itself and (secondly) not *for* itself" (*Meister Eckhart*, trans. Maurice O. Walshe, London, 1979, vol. 1, pp. 124–125).

Since the finite subject conveys nothing positive to the image but rather obscures it by its limitations, only God's unlimited self-expression in his eternal Word (the Son) is his perfect image. The quality of the creature's image depends on the presence of that divine image in it, or, more correctly, on the degree of its own immanence in that archetype. The mind—specifically the spiritual mind—fully actualizes that immanence. Eckhart appears to join earlier (Greek) theologians who had defined the image through the presence of God's Word in the soul. But he gives it a more radical turn by declaring that divine Word the soul's very being. Rather than presence, Eckhart speaks of identity. Of course, as a creature the soul totally differs from the divine image. But its created nature contains God's own, uncreated being. In that being the soul coincides with God. "There is something in the soul that is so near akin to God that it is one and not united [to him]. . . . If man were wholly thus, he would be wholly uncreated and uncreatable" (*ibid.*, vol. 2, p. 85).

The soul's being is generated in an eternal now with (indeed, within) the divine Word: "The Father bears his Son in eternity like himself. 'The Word was with God, and God was the Word' (*Jn* 1:1): the same in the same nature. I say more: He has borne him in my soul. Not only is she with him and he equally with her, but he is in her: the Father in eternity, and no differently" (*ibid.*, p. 135). The mystical process then consists in a person's becoming conscious of his divine being. But this is far more than a cognitive process. It demands that utmost poverty and total detachment whereby he gives up his entire created existence "as he was when he was not [that is, before his birth]" (*ibid.*, p. 271). Indeed, the spiritual soul no longer prepares a "place" for God, for "God is himself the place where He works." Only through that ultimate detachment, that waylessness in which there are neither names nor methods, does the soul come to resemble the image that she was in God "and between which and God there was no distinction before God created."

Farther than Eckhart the mysticism of the image could not go. Yet the identity that he so powerfully affirmed excluded any positive consideration of difference. Must the creature's difference remain without any spiritual significance? Was this no more than the circle of nothingness drawn around God's own being? Were even the trinitarian distinctions in God destined to be surpassed in a permanent rest in nameless unity? These were the questions that confronted later mystics of the Rhineland and the Low Coun-

tries. No one answered them with more balance and deeper insight than Jan van Ruusbroec (1293–1381), a Brussels parish priest and later a hermit in the wooded solitude of Groenendaal. Unlike Eckhart's theology, Ruusbroec's majestic summa of Christian life in the spirit did not conclude in a darkness beyond distinction. For Ruusbroec also the soul must move into God's nameless unity. But this divine desert is not a terminal resting ground. God's own being, as the mystery of the Trinity discloses, is dynamic, never at rest nor permanently withdrawn into its own darkness. Its silence is pregnant with God's revelatory Word. And so the contemplative, after having reached the divine silence, moves into God's self-revelation in the image of the Son and, with the Son, out into the otherness of creation. For Ruusbroec also, God dwells in darkness. But "in this darkness there shines and is born an incomprehensible light, which is the Son of God, in whom we behold eternal life; and in this light one becomes seeing" (*Spiritual Espousals* 3.1). Ruusbroec postulated no unity beyond the Trinity. The One is the Father—that is, a fertile unity, a silence that must speak, a darkness that yields light. Through its union with God the soul partakes in the movements within God. Once arrived in the empty desert of the Godhead, she is carried by the divine dynamism and moves with the Father into his divine image and into the multiplicity of creation. At that point the creatures appear both in their divine foundation within the image and also in their divinely constituted otherness. Not only their divine core but also their limited creaturehood are to be respected and cherished. Unlike Eckhart, Ruusbroec included in his mysticism of the image a mysticism of creation. Finitude itself, however different, is never separate from the divine image. Thus his theory of contemplation culminates in the ideal of the "common life," a rhythmic balance between withdrawing into interior life and flowing out into charitable practice.

Toward the end of the Middle Ages the mysticism of the image receded in favor of the more personal but also more private mysticism of love. Yet the theology of the image never died. It survived in the theological theories of uncreated grace (e.g., Lessius, De la Taille, Rahner), in patristic studies (Petavius, de Regnon), and in Cistercian spirituality. Today it enjoys a genuine revival, as the success of Thomas Merton's work witnesses.

MYSTICISM OF LOVE: MODERN CHRISTIAN MYSTICISM AND SUFISM. All Western religions have produced mystics of love. Judaism, Christianity, and Islam have known each its own kind of spiritual eros. In singling out love as characteristic of some movements in particular, I restrict the term to those in which personal love of God dominated—namely, Sufism and the spiritual movements that gradually came to prevail in Western Christendom since the late Middle Ages. Chronologically, Sufism precedes Christian love mysticism. Yet I shall discuss the latter first in order to maintain the continuity with the earlier type of Christian spirituality.

Christianity. Some time during the twelfth century, Christian piety underwent a basic change: its approach to

God became more human and affective. Love had, of course, always been an essential ingredient. But now it became the whole thing. At first it appeared in conjunction with the newly recovered trinitarian mysticism. The same Cistercians who reintroduced the Greek theology of the image to the West also initiated love mysticism. Thus in William of Saint-Thierry's influential works, the two currents of contemplation and affection, of image-identity and love-likeness appear simultaneously, occasionally in the same sentence. "When the object of thought is God and the will reaches the stage at which it becomes love, the Holy Spirit at once infuses Himself by way of love. . . . The understanding of the one thinking becomes the contemplation of one loving" (*Golden Epistle* 249–250). The duality persisted for centuries. Ruusbroec brought both trends to a powerful synthesis in his *Spiritual Marriage*, a work that incorporates Greek trinitarian mysticism in the scheme of a treatise on spiritual love by subordinating the more extrinsic assimilation through love to the more intrinsic inhabitation of God in the soul.

The emphasis on love is part of a more general tendency to involve the entire personality in the religious act. The new spiritual humanism (partly influenced by the Spanish Islamic culture) would revive interest in the psychological theory of Augustine and pay an unprecedented spiritual attention to the created world. The first great name to emerge was Bernard of Clairvaux. No Christian mystic has ever surpassed "the mellifluous doctor," as he is called, in the eloquent praise of spiritual love. Still, in many ways he remained a transitional figure: his Christocentric love is directed at the divine person of the Word, rather than at the human nature of the Christ, focus of later medieval spirituality. But the tradition he established clearly differs from that of image mysticism. In a famous sermon on the *Song of Songs*, he defines the unity of the spirit with God as resulting rather "from a concurrence of wills than from a union of essences." Here likeness firmly replaces image-identity. Does it mean that Bernard accepts only an external union with God? Not really, for in his treatise *On Loving God* he describes the highest degree of love as the condition of a drop of water disappearing in a quantity of wine. Experience itself becomes transformed. "To love yourself as if you no longer existed, to cease completely to experience yourself, to reduce yourself to nothing, is not a human sentiment but a divine experience" (10.27). Nevertheless, the transient quality of ecstatic love, its submission to the psychic rhythm of the soul, its affinity with human eros, all herald the advent of a different type of spirituality.

The humanization of man's relation to God transforms man's attitude toward a creation in which God now comes to be more intimately present. An interpersonal, and hence more creaturely, relation to God is ready to accept each creature on its own terms and for its own sake. In this respect its attitude differs essentially from the image mysticism that holds the creature worthy of spiritual love only in its divine core, where it remains rooted in God. The love mystic also

cherishes its finite, imperfect being, which, resulting from a divine act of creation, is endowed with a sacred quality of its own. The mystery of the divine incarnation here attains a more universal level of meaning, as if Christians suddenly understood how much the creation must matter to a God who himself has become flesh. The new awareness gave rise to the powerful humanism that since the thirteenth century has characterized Western Christendom. Francis of Assisi taught his contemporaries to regard nature with a different eye and to love the deformed and the sick as much as the hale and the sound. His attitude found a uniquely poetic expression in the *Canticle of Brother Sun* and in Jacopone da Todi's lyricism. But the discovery of God's presence in creation was capable of systematic treatment, as one of Francis's followers, Bonaventure, demonstrated in *The Journey of the Mind to God*. By now the Christocentric orientation of the new spirituality had moved to Christ's humanity—the perfect creature so intimately united to God that loving could never detract the soul from loving God himself. Soon that humanity came to fulfill an essential mediating function in spiritual life. Teresa of Ávila would accuse herself of having neglected this link with the divine in her early years.

As the incarnational consciousness spread to all creation, divine transcendence ceased to imply a negation of the created world. Thenceforth God's presence has been found *within* rather than *beyond* creation. Precisely this immanentization of the divine accounts for the earthly quality of Christian love mysticism and for its followers' deep involvement with human cares and worldly concerns. Catherine of Siena, Ignatius of Loyola, and Teresa of Ávila, among many others, led extremely active lives and deeply influenced the culture of their age. This orientation toward the creature created new spiritual problems. For it requires uncommon virtue not to become attached to a creature one loves for its own sake. By no coincidence did most love mystics become "saints," that is, persons who, by heroic virtue, learned to love without possessiveness. All mysticism demands mental purity. But for those whose love of God passes through creation, the purifying process proves especially exacting. Besides renouncing the superfluous, an essential condition of spiritual growth, mystics so deeply involved with creation have to move against the grain of their natural inclination in order to establish the precarious balance of love and detachment. What al-Ghazālī writes about Ṣūfī mortification is a task for all love mystics: "The uprooting from the soul of all violent passions, the extirpation from it of vicious desires and evil qualities so that the heart may become detached from all that is not God." But when the mystical state proper begins, spiritual men and women tend to stop or reduce this active mortification.

Significantly, John of the Cross, one of the most articulate mystics of love, describes the entire spiritual process as an increasing purification, a "night" that starts with the senses, spreads to the understanding, and concludes in the total darkness of union with God. Most mystics would, per-

haps more appropriately, refer to the second and third stages as illumination and union. But they equally emphasize the increased need for detachment. Followers of this tradition tend to equate the beginning of the mystical life with a state of passive prayer that excludes the ability to meditate. John of the Cross distinguishes the night of the senses, common to all who enter the mystical life, from the “horrible and awful” passive purgation of the spirit in the advanced. Not all agree with this description, but all stress the need for total passivity with respect to the divine operation. An entire school has taken what Teresa of Ávila calls the prayer of “quiet” to be the goal of spiritual life itself. As practiced by Miguel de Molinos (1628–1696) and Jeanne Guyon (1648–1717), this controversial concept drew upon itself a number of official condemnations. The debate began with the question whether the spiritual person should remain passive with regard to temptations, especially carnal temptations. The quietist attitude, the adversaries claimed, led to gross immorality—as in the case of Molinos. But the discussion then moved toward the more central issue of whether quiet is acquired or infused. The quietists failed to make adequate distinctions and thereby appeared to present mystical graces available to all, while allowing the pious to neglect the pursuit of common virtue and the practice of good works. Finally, with the French bishop Fénelon, both pupil and director of Jeanne Guyon, the dispute turned to the problem of “pure love”: only the love that loves God exclusively because of himself is worthy of a spiritual person. Once the mystic has attained this state of pure love, he or she abandons the methodic pursuit of virtue and, eventually, all control over the spiritual process. None of the charges against the quietists was ever fully substantiated. Yet the entire controversy reveals how sensitive the issue of active or passive quiet had become. The question whether the “higher states of prayer” are available to all could hardly have been raised in an earlier, less psychological age.

The “illumination” that normally follows the period of purgation should not be thought of as a succession of new insights. John of the Cross refers to it as a darkness of the understanding caused by the excessive light of faith (*Ascent of Mount Carmel* 3.3.1). Still, the light is often reflected in unusual cognitive states—hallucinatory perceptions, intensively imagined visions or voices, nonrepresentational intuitions—which in unpredictable ways testify to the profound transformation the mind undergoes in the higher stages of mysticism. They are often hard to interpret, and spiritual masters have traditionally adopted a cautious attitude toward them. Yet we should not place them all on an equal footing. John of the Cross distinguishes concrete visions (either sensational or imaginary) from so-called spiritual apprehensions. While he dismisses the former as a breeding ground of moral illusions, among the latter he finds the most direct expressions of God’s experienced presence. John equates such “intellectual” (nonrepresentational) visions (ibid., 2.24) with revelations of God’s being “in the naked understanding” of the soul that has attained the state of union—“for they are

themselves that union” (ibid., 2.26)—and with the spiritual “feelings” that emerge “in the substance of the soul” (ibid., 2.32). In such states illumination has in fact turned into union.

It is in terms of union that Teresa of Ávila discusses the matter in her *Interior Mansions* (Fifth and Sixth Mansions). What characterizes this final stage of love mysticism—whether defined in cognitive or in affective terms—is its permanence. Hence Teresa refers to it as a “marriage.” Here the distinction between the “likeness” of love mysticism and the “identity” of image mysticism ceases to exist—even in the terminology. In the highest love union, intentional intermediacy yields to substantial presence. The trend from likeness to unity appears even more clearly in Sūfī mysticism.

Sufism. With its stern emphasis on law and orthodoxy, Islam hardly seems to present a fertile soil for intensive personal experience of the love of God. Yet Islam assumes the entire social system, *sharī‘ah* (the way), into a privileged communal relation with God. Moreover, the Qur’ān states that, next to the ordinary believers who serve their creator according to the precepts of the law, there are some to whom God communicates his essential mystery inwardly in peace of the soul and friendship with God (Qur’ān 17:27). Here the Prophet allows for the possibility of a realm of personal religion. The possibility was soon actualized and eventually flowered into unparalleled mystical beauty. Even the unique authority of the Qur’ān has in an indirect way contributed to Islam’s mystical wealth, for precisely because it remains the supreme norm of its interpretation, pious readers may find in it whatever meaning divinely inspired insight (*istinbā‘*) privately reveals to them. Only when personal interpretation openly clashes with established doctrine (especially its rigorous monotheism) could religious authorities interfere. Thus, paradoxically, Islam, the “religion of the book,” allows greater freedom of interpretation than religions that place less emphasis on the written word. Though early Muslim mysticism stayed in close connection with the Islamic community, conflicts arose. Already at the time of Ḥasan al-Baṣrī (d. 728), the patriarch of Islamic mysticism, Sunnī traditionalists objected to his attempt to go beyond the letter of law and doctrine. Thus began the opposition between “internal” and “external” religion that, from the tenth century on, led to increasingly severe confrontations. Nevertheless, a deep personal piety remained an essential element of the Islam that substantially contributed to rendering it a world religion.

Most Islamic mysticism could be characterized as love mysticism. Many texts show an amazing similarity in spirit and even expression with later Christian mysticism. Certain passages in the poetry of Rābī‘ah al-‘Adawīyah (d. 801) appear to throw a bridge across the centuries to Teresa of Ávila, while John of the Cross’s *Dark Night* echoes some of Shaykh al-Junayd’s poems. The similarity becomes somewhat intelligible through the established influence of Syrian monasticism (especially the hesychastic movement) upon the early

Ṣūfīs, and the strong Muslim impact upon Spanish culture as a whole and upon its mystics in particular. The resemblance has often tempted Western scholars to interpret Ṣūfī writings by means of Christian concepts. Yet the difference is substantial and appears with increasing clarity in some later Ṣūfī developments toward monism. Here love no longer represents the highest union with God but is merely a way station on the road to a more total identity. Still, early Ṣūfīs adopted models of asceticism that had closer ties with the spirituality of the Desert Fathers than with the worldly luxury of the expanding Muslim empire. Even the wool dress (*ṣūf*) from which they probably derived their name may well have had a Christian symbolic meaning. At any rate, the passive asceticism of the early Ṣūfīs stood in sharp contrast with the outgoing, active attitude of the Prophet's early followers. Not until the eighth century, however, did the emphasis shift from an asceticism inspired by a fear of judgment to a mysticism of love for which fasting and poverty served as means to a higher end.

The most attractive figure in this early love mysticism is certainly the former slave Rābī'ah. To her we owe some of the purest mystical love poetry of all time, such as her famous prayer at night: "Oh, my Lord, the stars are shining and the eyes of men are closed, and kings have shut their doors, and every lover is alone with his beloved, and here am I alone with Thee" (Margaret Smith, *Rābī'a the Mystic*, Cambridge, 1928, p. 22). Her "pure" love, even as the love of later mystics possessing that quality, refuses to act or pray out of self-interest, "If I worship Thee from fear of hell, burn me in hell; and if I worship Thee in hope of paradise, exclude me from paradise; but if I worship Thee for Thine own sake, then do not withhold from me Thine eternal loveliness." Only repentance inspired by sorrow for having offended the Beloved is worthy of the spiritual person. For all its erotic exuberance, this and similar love mysticism remained doctrinally "sober." It developed elaborate schemes of the stages (*maqāmāt*) of the love of God. Eventually it used Neoplatonic categories, which strengthened it theoretically but may have favored its later development toward monism.

In Shaykh al-Junayd (d. 910), Ṣūfī mystical theology reached full maturity as well as a systematic unity. Though this religious leader went far in adopting Plotinus's theory, his orthodoxy was never questioned. Louis Massignon, the famous student of Islamic mysticism, describes al-Junayd as "clever, prudent and timid, conscious of the danger of heterodoxy which is peculiar to mysticism," and as a wise spiritual director "who suspends his judgment and defers the question so long as experience does not seem to him decisive and crucial" (Massignon, 1954, p. 275). Still, his theory of emanation from a preexistence in God to a separate existence in time daringly reinterpreted the creation doctrine. In *Kitāb al-Fanā'* he writes, "He annihilated me [in my divine preexistence] in creating me even as, in the beginning, He created me [in my separate existence in time] when I was not," and "He was the source of their existence, encompassing them,

calling them to witness when still their eternal life was utterly negated, a state in which they were from all pre-eternity" (Zaehner, 1957, pp. 165–166).

By following this principle of emanation to its ultimate consequences al-Junayd's disciple, al-Ḥallāj, ended up with the allegedly monist theory for which he was executed in the year 922. With al-Ḥallāj begins a wholly new phase in Ṣūfī mysticism that continued to use the language of love, but frequently in a more symbolic sense than had the earlier Ṣūfīs. Meanwhile it remains very doubtful whether al-Ḥallāj, despite his strong expressions, ever considered himself fully identical with God. His claim of divinization refers to a passive, transient state—not to a permanent self-deification. Such ecstatic exclamations as "I am the Truth," by no means unique to him, express a temporary, divinely granted awareness of identity with God. He probably remained a love mystic always longing for a union that was only occasionally attained, as in the following oft-quoted verses: "Between me and Thee lingers an 'it is I' that torments me. Ah, of Thy grace, take this 'I' from between us." Even the supreme expression of union still indicates a remnant of duality. "I am He whom I love, and He whom I love is I. We are two Spirits dwelling in one body" (Nicholson, 1939, p. 218). Elsewhere al-Ḥallāj firmly upholds God's transcendence with respect to his creation, as in the words quoted by al-Qushayrī: "He has bound the whole to contingency, for transcendence is His own. . . . He remains far from the states of his creation, in Him there is no mingling with His creation, His act permits of no amendment, He is withdrawn from them by His transcendence as they are withdrawn from Him in their contingency" (Louis Massignon, *La passion d'al Hossayn-ibn-Mansour al Hallaj*, Paris, 1922, p. 638).

After al-Ḥallāj, Ṣūfī piety reached a temporary truce with orthodox learning in al-Ghazālī (d. 1111), the greatest of the theologians. A learned teacher of law and doctrine, he abandoned his chair to spend eleven years as a wandering Ṣūfī, and at the end of his life retired to a Ṣūfī monastery. Bypassing the antinomian trends that emerged after al-Ḥallāj, he returned to a more traditional attempt to emphasize experience over the letter of the law. With Ibn al-'Arabī (d. 1240) the dependence on Neoplatonism (especially the so-called *Theology of Aristotle*) and, with it, the movement toward monism became more pronounced than ever. He provided the link between Western classical culture and Eastern Islamic mysticism that culminated in Jalāl al-Dīn Rūmī. Ṣūfī mysticism, however much inclined toward monism, never abandoned the language and imagery of love. Ibn al-'Arabī, with al-Ghazālī the most philosophical of all Muslim mystics, never ceases to integrate his Neoplatonic vision with the Qur'ān's dualistic doctrine of man's relation to God. Still one may doubt whether he did more than adapt the terminology of traditional Ṣūfī love mysticism to his own kind of monism. The Absolute for him is an indistinct One that, overcome by the desire to be known, projects itself through creative imagination into apparent

otherness. In this projection the relation of the One to the created world, specifically to man, determines that of the Absolute to the differentiated idea of God, the intellectual pole as opposed to the cosmic pole of finite being. All that the creature is, is divine, yet God always exceeds creation. Through man's mediation the dependent, created world returns to its primordial unity. As the image of God, man imposes that image upon the cosmos and reflects it back to its original. In fulfilling this mediating task he approaches the (Gnostic?) archetype of the Perfect Man, the ideal link that restores the broken oneness. Only the Muslim saint realizes the model in its fullness.

All of this appears far removed from Islamic love mysticism and even from monotheism. But the same Ibn al-'Arabī also wrote a collection of sensual love poetry to which he later added a mystical interpretation. Even his "monist" *Bezels of Wisdom* concludes with a dithyramb on spiritualized sexual love as providing access to the perfect love of God. It states that in woman, man most perfectly contemplates God. "The greatest union is that between man and woman, corresponding as it does to the turning of God toward the one He has created in His own image, to make him His vice regent, so that He might behold Himself in him. . . . If he [man] knew the truth, he would know Whom it is he is enjoying and Who it is Who is the enjoyer; then he would be perfected" (*The Bezels of Wisdom*, in *The Classics of Western Spirituality*, ed. John Farina, New York, 1980, pp. 275–276). However thorough Ibn al-'Arabī doctrinal monism may have been, it never prevented him from attributing to love a primary role in the practical process of reunification with God. His readers, both inside and outside Islam, have always emphasized this dualism of mystical praxis. This explains his impact both on Spanish Catholic (Ramon Lull, John of the Cross) and on Persian Ṣūfī mystics.

In the refined mystical poetry that constitutes the glory of Persian Sufism, the same drift toward monism is frequently expressed in erotic language. Here the undisputed master is Jalāl al-Dīn Rūmī (d. 1273). He himself was influenced by others (such as 'Aṭṭār, and Ibn al-'Arabī's disciple in Konya, al-Qunawī, and especially his strange mentor, al-Tabrīzī), yet sang, with a voice uniquely his own, of the longing for the Beloved.

I am not the kingdom of 'Iraqain, nor of the country of Khorasan, I am not of this world, nor of the next, nor of Paradise, nor of hell. My place is the Placeless, my trace is the Traceless; 'Tis neither body nor soul, for I belong to the soul of the Beloved. I have put duality away, I have seen that the two worlds are one: One I seek, One I know, One I see, One I call. He is the first, He is the last, He is the outward, He is the inward. (*Dīvānī Shamsi Tabrīzī*, trans. R. A. Nicholson, Cambridge, 1898, p. 125)

Persian poets after Rūmī expressed a similar synthesis of monist reality and erotic longing, none with more force and evocative power than 'Abd al-Raḥmān Jāmī (d. 1492):

Beware! Say not, "He is All Beautiful, And we His lovers? Thou art but the glass, And He the face confronting it, which casts Its image on the mirror. He alone Is manifest, and thou in truth art hid, Pure Love, like Beauty, coming but from Him, Reveals itself in thee." (E. G. Brown, *A Year amongst the Persians*, Cambridge, 1926, p. 138)

Yet most important for the later mystical life of Islam in Iran were the flourishing Ṣūfī orders of dervishes (one of them founded by Rūmī himself). As they spread, mystical life reached all layers of the population, and the search for mystical trance reached unprecedented proportions. After the fifteenth century, Persian mysticism produced no more great writers. Generally speaking, the trend of the past three centuries in Islam has been more toward communal piety and law than toward personal devotion. Yet in our own day we witness a revival of Ṣūfī movements.

ESCHATOLOGICAL MYSTICISM: JEWISH MYSTICS. The section headings in this article do not capture the full meaning of the content. At best they approximate a definition of a dominant trend in a particular, more or less unified mystical school. In the case of Jewish mysticism the description may not even serve this minimal purpose: Judaism has produced forms of mysticism so unlike any other and so variant among themselves that no common characteristic marks them all. At most we can say that they "commune" with one another, not that they share an identical spirit. Gershom Scholem wisely embedded this irreducible diversity, reflective of a spiritual Diaspora, in the very title of his authoritative work *Major Trends in Jewish Mysticism* (1941). The closest he comes to a general characteristic is the point at which he draws attention to the persistent presence of eschatological traits in Jewish mysticism: "This eschatological nature of mystical knowledge becomes of paramount importance in the writings of many Jewish mystics, from the anonymous authors of the early He-khaloth tracts to Rabbi Naham of Brazlav" (p. 20). The eschatological element most clearly appears in the earliest trend: the often Gnostically influenced mythical speculation on Ezekiel's vision of the throne-chariot, the *merkavah*. Mysticism around this theme began in the first centuries of the common era. It consisted of an attempt to ascend to the divine throne beyond the various intermediate spheres (the *heikhalot*). Except for its biblical starting point (first developed in the Ethiopic *Apocalypse of Enoch*), the impact of Gnostic *plērōma* mythology dominates this spiritual "throne world." But also the typically Hellenistic connection of mysticism and magic appears to have been strong. *Merkavah* mysticism declined after the seventh century, but enjoyed a steady revival in Italy in the ninth and tenth centuries, which, in turn, may have influenced medieval German Hasidism.

Whereas *merkavah* mysticism had been esoteric, Hasidism (from *hasid*, "pious one") began in the twelfth century as a popular movement closely connected with the *halakhah* (law). The early development has been fixed in the *Sefer Ḥasidim* (Book of the Pious), which contains the spiritual

testaments of the prolific Yehudah the Pious and of two other early writers. The eschatological element, present from the beginning, gradually became more pronounced. Yet various other elements appear as well, among them an almost monastic emphasis on the religious virtues of simplicity, humility, and indifference. While *merkavah* mysticism attained its goal by contemplation, Hasidism did so primarily by prayer and spiritual practice. To pure transcendence it opposes the intensive awareness of an omnipresent creator accessible to the *Hasid* even in his daily activities. Finally, while *merkavah* mysticism displays Gnostic traits, Hasidic “theology” shows a resemblance to Neoplatonism even in its Greek Christian development. God’s glory (*kavod*) is distinct from God’s being as a first manifestation of his presence (*shekhinah*), which mediates between this hidden essence and the fully manifest creation. The Hasidim indulged in elaborate speculation about the inner and outer glory of God, and about the kingdom of his created yet hidden presence.

These daring speculations seldom developed into a coherent theology. In that respect they differed from the spiritual movement that, from the fourteenth century on, would largely replace it—Qabalah. It originated in thirteenth-century Spain as a highly esoteric doctrine, one that its followers were reluctant to divulge. After the expulsion of the Jews from Spain (1492), however, it developed into a theology of exile that spread to large segments of the Jewish world. More speculative than ecstatic (though methods for ecstasy were not absent), it was deeply influenced by Gnostic theologies. Its masterwork, the *Zohar*, by its daring adoption of Gnostic cosmogonies surpassed in this respect even *merkavah* mysticism. In addition, it absorbed the Neoplatonic currents that had swept through the Arabic and Jewish culture of twelfth- and thirteenth-century Spain. Considering the hazardous nature of its thought, its relation to normative tradition and official authority remained, on the whole, remarkably peaceful, if not always amiable. Indeed, the branch that produced the most daring speculation found its expression mostly in traditional rabbinical commentaries on the sacred text. Another trend of Qabalah, culminating in Avraham ben Shemu’el Abulafia (1240–after 1291), is more prophetic. It combines in a highly original way philosophical theory—much of it derived from Maimonides (Mosheh ben Maimon, 1135/8–1204)—with mystical speculations on the divine names. Abulafia left his native Saragossa early in life to travel all over the Near East and to settle down in Sicily, where he wrote most of his many works. They all aim at assisting the soul to untie the “knots” that bind it to this world of multiplicity and to allow it to return to its original unity (surprisingly named after Aristotle’s Agent Intellect). This union may be attained through contemplation of a sufficiently abstract object, such as the letters of the Hebrew alphabet. Any combination of letters results in word figures that in some way refer to the sacred tetragrammaton of the divine name, *YHVH*. In meditating upon them—somewhat as the yogin uses a *mantra*—consciousness moves to a higher state of unity that releases man’s prophetic faculty.

Wholly different is the theophysical mysticism that resulted in that unsurpassed masterpiece of mystical speculation, the *Zohar* (Book of Splendor). Its origin remains mysterious, because the anonymous author has carefully covered his tracks (even to the point of writing in Aramaic rather than Hebrew) and attributed his work to earlier authorities. Yet internal criticism suggests that it was written in Spain in the last third of the thirteenth century, probably by one author. The writer, familiar with the philosophies of Maimonides and of Neoplatonism, has, above all, undergone the influence of unknown Gnostic sources. Synthesizing all qabbalistic writings of the century, he attempts to stem the rationalist trend by giving traditional Judaism a hidden mystical interpretation. Thus this highly esoteric work was, in fact, written for the enlightened Jewish intelligentsia of late-fourteenth-century Spain. Central in the *Zohar* doctrine is the theology of the *sefirot*, the ten “regions” into which the divine emanation extends itself. Importantly, the divine *plērōma* of these *sefirot* does not emanate *from* God: it remains *within* God as his manifest being, in contrast to the “hidden God.” Gershom Scholem writes: “The point to keep in mind is that the *sefirot* are not secondary or intermediary spheres which interpose between God and the universe . . . not steps of a ladder between God and the world, but various planes in the manifestation of the Divinity which proceed from and succeed each other” (Scholem, 1961, pp. 208–209). Here also language fulfills a crucial function: the *sefirot*, the creative names God gives himself, anticipate the faculty of speech in man. The ultimate manifestation consists of God’s simple, immanent presence in the entire creation, the *shekhinah*. In becoming aware of this divine presence, man comes to understand his own deeper self.

Creation takes place *within* God as a transition from the divine *Nothing*, the mathematical point frequently identified with God’s Wisdom (the *hokhmah* of *Proverbs*). Even evil proceeds from a negative principle in God himself that has become isolated from the rest of the divine organism. Man’s reaction consists in restoring creation to its original union within God.

The idea of an immanent creation was taken one step further by some sixteenth-century mystics of Safad in Palestine, exiled from Spain after the expulsion decree. The new Diaspora gave Qabalah a distinctly messianic, eschatological aspect that had been less prominent in the *Zohar*. Thus the mystical return to the aboriginal creation now came to be seen as anticipating the messianic era. According to Isaac Luria (1534–1572), the most important mystic of the school, creation originates through a process of self-emptying whereby God withdraws from a mystical space within himself in order to establish the possibility for a reality other than his own omnipresent being. The concept of *tsimtsum* (withdrawal) allows Luria to distinguish the world of creation from the emanations that occur *within* God’s own being and to prevent creation from collapsing into a pantheistic oneness.

The Gnostic idea of the primordial man, *adam qadmon*, which models God's manifest being on the human organism, provides a transition between the sphere of the *sefirot* and the created world, while, at the same time, explaining the origin of evil. The light of the divine being is refracted through this supreme emanation. The first six *sefirot* receive and reflect the divine light radiated by *adam qadmon*. But the lower six are not powerful enough to retain the light, and it "shatters the vessels" (*shevirat ha-kalim*). Here evil begins to exist as a separate entity. Through the breaking of the vessels, the forces of evil that were mixed with the divine light become segregated from the good. This purgative event, good in itself, would have allowed the total elimination of evil in the final reintegration of the last *sefirah*. But Adam's fall, once again, reintroduced chaos into the cosmos. The Diaspora symbolizes this general disarray in which the *shekhinah* itself is sent into exile.

Luria's mystical theory culminates in his idea of redemption, a redemption, mystically conceived, that coincides with the messianic era. Through prayer, spiritual man plays an active role in restoring the original order of the universe. Mystical piety will recall the *shekhinah* back to the spiritual *plērōma* and prepare the world for the messianic coming. The powerful concept of *tikkun* (reintegration) conveyed meaning to the bitter experience of the exile. Yet, combined with messianic expectations, it also created a tense and potentially explosive sense of anticipation. Luria's mystical theology therefore prepared the terrain for the pseudomessiahs and the antinomian movements of the seventeenth and eighteenth centuries. Thus the unstable Shabbetai Tsevi (1625–1676) was able (largely through the efforts of his "prophet," Natan of Gaza) to render himself accepted as the Messiah and even to retain many of his followers when he himself apostasized to Islam. Was this not part of the Messiah's vocation in a world that had exiled him to the realm of darkness? Large groups of Shabbateans apostasized publicly while secretly preserving their messianic faith—thus repeating voluntarily what Marrano Jews had been compelled to do involuntarily. The exile among the infidels initiated the condition for the final separation of good and evil of the messianic era. At the same time, antinomian behavior inaugurated a reign in which the restrictions of the Law would be abolished and the primordial state of freedom restored.

Qabbalah was not to end in this state of general disintegration. A new Hasidism on the rise in eighteenth-century Poland incorporated much of its mystical piety while rejecting its messianic excesses. It was neither esoteric nor elitist. More emotional than intellectual, it appears more as a revivalist movement than as a theological school. Yet its nonsystematic character has not prevented it from occasionally attaining speculative peaks. It honored the charismatic leader more than the learned rabbi, even though most of its leaders were rabbis and all endeavored to remain within rabbinical orthodoxy. The new Hasidism began with two inspired men: the Besht (Yisra'el ben Eli'ezer, 1700–1760) and his disciple,

Dov Baer, the Maggid of Mezhirich. They, like all their major followers, distinguished themselves more by the striking gesture, the memorable story, than by interpretation of the Torah. It is hard to evaluate the precise "mystical" significance of so popular a movement. Yet the intensive religious experience of its greatest writers leaves no doubt. Here particularly we should restrain ourselves from imposing too narrow limits on the term *mystical*. Hasidism may be more practical and certainly more social than earlier spiritual movements, but its emphasis upon a joyful spirit and moral living derives from a mystical source.

Jewish mysticism shows an unparalleled variety of forms ranging from deep speculation to purely emotional experience. It consistently appeals to scriptural authority, yet no mystical movement ever strayed further from theological orthodoxy than late messianic Qabbalah. And still for all the variety of its forms and of the external influences to which it was exposed, Jewish mysticism unquestionably possesses a powerful unity of its own. In it the word dominates, and the often tragic experience of the present lives in constant expectation of the future.

BIBLIOGRAPHY

A popular edition of many Christian, Muslim, and Jewish mystics with generally good introductions is the series "Classics of Western Spirituality" under the editorship of Richard J. Payne (New York, 1978–).

The best works on mysticism in general remain William James's *The Varieties of Religious Experience* (New York, 1902) and Evelyn Underhill's *Mysticism* (New York, 1911).

Mysticism: Sacred and Profane (Oxford, 1957) by R. C. Zaehner is a biased work, but the author knows the subject well, especially Hindu mysticism. A collection of essays on the mystical experience is *Studies in the Psychology of the Mystics*, edited by Joseph Maréchal (Albany, N. Y., 1964). A sampling of essays on various aspects and schools of mysticism is found in *Understanding Mysticism*, edited by Richard Woods (Garden City, N.Y., 1980).

Two important books on Hindu mysticism are R. C. Zaehner's *Hinduism* (London, 1962) and, older but still valuable, Surendranath Dasgupta's *Hindu Mysticism* (New York, 1927).

A number of good studies on mysticism in Buddhism are available: Edward Conze's *Buddhism: Its Essence and Development* (Oxford, 1951) and D. T. Suzuki's *On Indian Mahāyāna Buddhism*, translated and edited by Edward Conze (New York, 1968), are two. Frederick J. Streng has published a valuable study of Nāgārjuna in his book *Emptiness: A Study in Religious Meaning* (New York, 1967).

For discussions of Christian mysticism, the reader may consult the introductions to many volumes of the "Classics of Western Spirituality" and the three-volume *A History of Christian Spirituality* (New York, 1963–1969) by Louis Bouyer, Jean Leclercq, François Vandenbroucke, and Louis Cognet. An

older history is Pierre Pourrat's *Christian Spirituality* (Westminster, Md., 1953–1955), a four-volume work. On French spirituality of the modern age, Henri Brémond's twelve-volume *Histoire littéraire du sentiment religieux en France*, 2d ed., edited by René Taveneaux (Paris, 1967–1968), remains unsurpassed. On Protestant spirituality, see *The Protestant Mystics*, edited by Anne Fremantle (London, 1964); in addition, volume 3 of the *History of Christian Spirituality* deals with Protestant, Orthodox, and Anglican forms of mysticism. A further discussion of Orthodox mysticism is George P. Fedotov's *A Treasury of Russian Spirituality* (1950; Belmont, Mass., 1975).

For a study of Islamic mysticism, see Annemarie Schimmel's *Mystical Dimensions of Islam* (Chapel Hill, N.C., 1975); Louis Massignon's *Essai sur les origines du lexique technique de la mystique musulmane*, 3d ed. (Paris, 1968); Reynold A. Nicholson's *Legacy of Islam* (London, 1939); and Margaret Smith's *Way of the Mystics: The Early Christian Mystics and the Rise of the Sufis* (London, 1976).

The choice of general works on Jewish mysticism is limited, but the best is a classic by Gershom Scholem, *Major Trends in Jewish Mysticism* (1941; reprint, New York, 1961).

LOUIS DUPRÉ (1987)

MYSTICISM [FURTHER CONSIDERATIONS]. The term *mysticism*, like the term *religion* itself, is a problematic but indispensable one. Identifying a broad spectrum of ideas, experiences, and practices across a diversity of cultures and traditions, it is a generic term rather than the name for any particular doctrine or mode of life. The application of appropriate epithets yields terminology for specific categories of mysticism (theistic mysticism, nature mysticism, and eschatological mysticism) and for distinct cultural or doctrinal traditions (e.g., Hindu mysticism, bhakti mysticism, Jewish mysticism, merkavah mysticism). The term mysticism is also a modern one, serving the purpose of comparative study and theoretical analysis, drawing into a single arena ideas and practices otherwise isolated within their own local names and histories.

Inevitably, however, the term remains colored if not hampered by the complexity of its own history: by its original Greek etymology (meaning “silence, secrecy, initiation, ineffability”), by the early Christian use of the word *mystical* to describe the deeper significance of Scripture and liturgy, by the later Christian definition of *mystical theology* as loving union with God by grace, and by popular uses of mysticism as a label for anything nebulous, esoteric, occult, or supernatural. Although mysticism is now firmly entrenched within the vocabulary of the modern study of religions, its usage overlaps and to some extent competes with its employment in specifically theological contexts. Christian or at least theistic mysticism continues to be given prominence even in studies treating the subject at a more generic or theoretical level (e.g., in much philosophy of religion). Given its persistently Christian associations and the fact that the term has

no real counterpart in other traditions, it is not surprising that the suitability of mysticism as a neutral, global term has been questioned by some scholars. Others, more radically, have challenged the authenticity of the concept itself, viewing it as a product of post-Enlightenment universalism.

SCOPE AND DEFINITION OF THE TERM MYSTICISM. Louis Dupré, in his survey of mysticism in world religions in this encyclopedia, acknowledges the difficulty of any overall definition of mysticism, but some sort of definition must be possible if one is to accept the category of the mystical as coherent and illuminating. By way of a broad definition, one can say that the term mysticism relates to traditions affirming direct knowledge of or communion with the source or ground of ultimate reality, as variously experienced in visionary, ecstatic, contemplative, or unitive states of consciousness and as diversely embodied in doctrines and practices expressing a unitary and compassionate view of the cosmos and human existence. The profound transcendental experiences that empower mystics and inform their ideas and actions are typically characterized by paradox: they are personal yet self-transcending, noetic while in some sense ineffable, striven after but also recognized as independent of human effort.

To move from a general to a more specific definition is either to defer to this or that doctrinal interpretation or historical tradition or to engage creatively in some religiously or metaphysically inspired synthesis or syncretism. The former move tends to obscure cross-cultural insights in the interests of protecting the coherence of a particular cultural or theological tradition; the latter tends to overlook the concrete embodiment within a given culture characteristic of even the most universalistic mysticism. Both moves, though legitimate, lie beyond the agenda of a strictly scientific study of religion. Alternatively, one might allow a definition to become so qualified or all-embracing that mysticism becomes virtually synonymous with *spirituality* (a much vaguer term than mysticism) or even with a selective history of religion in general.

There is no advantage in conflating mysticism, even in its broadest definition, with other types of or currents within religion, such as prophecy, theurgy, divination, mediumship, shamanism, spirit possession, occultism, spiritualism, or charismatic enthusiasm. It is possible to affirm mysticism as a distinctive strand within religion while not denying its multiple connections with other forms of practice and experience. Nor does the distinctive nature of mystical states mean that their investigation should be segregated from that of other traditions of extraordinary experience. In this connection the category of “altered states of consciousness” is a useful one within which to locate mystical states, whether for the sake of making connections or for drawing contrasts. The continuities of the mystical with such varied categories as the aesthetic, the psychic, or the pathological are certainly closer than has been acknowledged in the past. Two areas where mysticism has both illuminated and been illuminated by juxtaposition with other phenomena are shamanism and the near-death experience.

Any modern treatment of mysticism must satisfy two negative and two positive criteria. First, it must avoid reifying mysticism into some kind of uniform system or tradition standing outside the historical traditions of religion. Second, it must avoid making the forms or truths of the mysticism of any one tradition a touchstone for the evaluation of mysticism more generally. Third, it must take into account the global diversity of mysticism; it must embrace Nagarjuna as well as Teresa of Ávila, Isaac Luria as well as Shankara, Mirabai as well as Plotinus. Finally, it must take into account what may be called the four “dimensions” of mysticism: the experiential, the theoretical, the practical, and the social. That is, the varieties of mystical experience are intimately linked with a body of disciplines and techniques, which in turn are informed by a body of ideas expressed in doctrine and philosophy, symbolism and speculation, all of which have social embodiment within particular historical communities and traditions. To these a fifth dimension could be added—even where “bracketed out”—the ontological dimension, covering the transcendental causes or realities implicit in mystical experience. To acknowledge these dimensions and the multiple connections between them enriches but also complicates the study of mysticism, particularly in the case of comparative studies. How can one consider Buddhist enlightenment without reference to Buddhist meditation, the language of Christian mysticism without knowledge of the Bible or liturgy, or Hindu yoga without adverting to Vedic sacrifice and cosmology? Again, how is one to structure a comparison between the stages of contemplative prayer in Spanish Carmelite mysticism and the stages of transic concentration in Theravāda Buddhism or between the language of negation in Meister Eckhart and the language of emptiness in Nagarjuna?

MYSTICAL EXPERIENCE. It is generally accepted that “mystical experience” is a subcategory of the broader category of “religious experience.” But whereas all mystical experience may be “religious,” it is not necessarily religious in the explicit sense of being closely associated with some established doctrine, practice, or tradition. Since Dupré’s survey limits itself to mysticism in religious traditions, it is important to acknowledge the prevalence of what might be termed “natural” mysticism: the fact that mystical experience is often reported as supervening quite suddenly and unexpectedly in the lives of secular individuals not committed to any doctrine or discipline. These “unattached” mystics do not necessarily interpret their experiences in conventional religious terms or indeed possess the language for any systematic interpretation. But the imperative to interpretation is strong, and some individuals make their own experiences (or the experiences of others) the starting point for some new system of belief or practice.

Although it is generally agreed that central to mysticism is some sort of profound religious experience, there are striking differences in how scholars characterize and evaluate such experience. There are broadly three positions here. To begin with there is the view that mysticism involves states of con-

sciousness that while extraordinary are different only in degree from other states of consciousness. Then there is the view that mystical states are not only extraordinary but also completely different from any other kind of human experience. In both views mystical experience lends itself to appropriate scrutiny from the various scholarly disciplines, allowing theologians and metaphysicians to focus on its doctrinal implications, phenomenologists and philosophers on its structure and cognitive significance, psychologists and sociologists on its emotional and behavioral features, scientists on its physiological conditions and correlates, and so on.

A third and more radical view to have emerged in recent years is that it is fundamentally misconceived to think of the mystical life as based upon the cultivation and interpretation of special episodes or states of consciousness, whether or not different in kind from other types of experience. In this view mysticism is not about having extraordinary kinds of experience that, having been reported by mystics, can be studied at one remove by theologians and other scholars in order for their real meaning to be understood. Rather, mysticism is about a transformed and transforming way of experiencing the world as a whole through a life shaped by the intellectual, liturgical, and communal structures of a particular tradition. Mystical states of consciousness do not offer the mystic, let alone the observer, privileged shortcuts to ultimate truth independently of these structures.

The view that one can learn something important about mysticism through a detailed scrutiny of mystical states on the basis of their literary expression goes back to the persistently influential work *The Varieties of Religious Experience* by William James (1902). This view led directly to the work of R. C. Zaehner (*Mysticism Sacred and Profane*, 1957) and W. T. Stace (*Mysticism and Philosophy*, 1960), which fueled debates about the variety or uniformity of mystical experience throughout the 1960s and 1970s. Where Zaehner insisted on a hierarchy of substantially distinct types of mystical experience, Stace emphasized a phenomenological and indeed ontological common core of experience underlying what for him was a relatively superficial doctrinal and literary diversity. With far more mystical texts now available and a wealth of contributions from a wide range of scholarly disciplines, the weaknesses both of the empirical basis and of the methodology of this earlier debate are all too apparent. The complexity of the distinction between the content of an experience and the forms of its interpretation is now approached in a much more sophisticated way, and the diversity of mystical experience is no longer ignored even by those who argue for an underlying unity.

Through the 1980s and 1990s, however, a new debate emerged. In one camp are those who argue that the distinctions between different types of mysticism and mystical experience are largely if not wholly constructed through the ideas, symbols, and practices defining the traditions mystics inhabit. This “constructivist” analysis of mysticism is associated above all with a series of highly influential collections of es-

says edited by Steven Katz. Milder versions of constructivism allow for an unconstructed core of experience (not necessarily Stace's "universal core") as a necessary basis around which the cultural construction of those more accessible features of mystical experience takes place; stronger versions hold, reductionistically, that mystical experience is a construction per se. In the other camp are those who insist that mysticism, beneath its cultural forms, is based on an unmediated experience, a "pure consciousness event" or "zero experience" immune to cultural determination and representing an "innate capacity." This view, to some extent a development of Stace's position, could be called the "purist" view. Leading the way here are the writings of Robert Forman. Where the constructivist emphasis tends to see mystical experience as just another form of human experience, albeit an intense and influential one, the purist view stretches the ordinary notion of human experience to the breaking point, raising the question whether an experience of transcendence is not in effect a transcendence of experience.

Constructivism as a theory of mysticism should not be confused with "contextualism," which usefully names an approach to mysticism (common to most contemporary scholars) that takes full account of the intellectual, practical, and institutional contexts within which mystical experience arises. As a general approach, contextualism is compatible with either a constructivist or a purist reading of mystical traditions. But it is also made the basis for a critique of the emphasis on "mystical experience" that characterizes so much writing on mysticism—an emphasis commonly denigrated as "experientialism." The idea of a "private" or "inner" experience that can somehow become the "object" of scholarly study is, according to antiexperientialist scholars, both conceptually confused and untrue to the mystical traditions themselves—though it is also conceded that some mystical traditions have themselves become "experientialist." The antiexperientialist critique (especially prominent among Christian theologians) has been a useful corrective to an approach to the study of mysticism long dominated by psychological and phenomenological analysis—an approach that frequently relies upon trawling through world religions for insights and experiences thought to be too good to be left imprisoned within alien rituals, doctrines, and institutions. Thus harvested, these insights and experiences are then served up as the "essence" of mysticism.

Antiexperientialism also harmonizes with the warnings given in most mystical traditions that mystics should not crave or become attached to experiences qua psychological states and feelings. Even so, it is impossible to deny that great importance has been attached to the cultivation and interpretation of mystical states of consciousness in the world's religious traditions, albeit within the protective and hermeneutic framework of the beliefs and disciplines of these traditions. One only has to think of the Buddhist techniques of mindfulness, transic concentration, intuitive insight, and visualization, all of which can be traced back to the practices

and enlightenment experience of the Buddha himself. Or again, one might think of the ecstatic and visionary experiences that play a key role within the mysticism of the Qabalah.

MYSTICAL DOCTRINE AND PRACTICE. The contextualist emphasis of modern scholarship focuses attention on the subtle relationships between experience, doctrine, and text in the life of mystical traditions and above all on language as the key to these relationships. Mystical texts are no longer seen merely as vehicles for the expression of ideas but as integral parts of the experiential process—of its initiation, assimilation, and exegesis. An important element in this renewed understanding of the instrumental and performative as distinct from purely descriptive function of mystical texts is a new appreciation of the apophatic, or "unsaying," function of mystical language. Apophatic language is a cross-cultural feature of mysticism. Similarities in the nature and use of mystical language may well turn out to be at least as significant for the comparative study of mysticism as similarities in the phenomenology of mystical states of consciousness.

Mystics, contrary to what is often assumed, have been nourished rather than restricted by the doctrines and disciplines of their traditions. This is not to say that some mystics have not aroused suspicion or hostility as a result of their sayings, speculations, or activities. But many of the world's greatest religious leaders, thinkers, and defenders of tradition have also been mystics. Mysticism has the potential to manifest either a conservative or a revolutionary character.

The varieties of mystical practice tend to receive less scholarly attention than the varieties of experience or doctrine, partly through persistent stereotypes of mysticism as "otherworldly" and indifferent to the body and to the "externals" of religion. Mystical practices cover anything pertaining to the training of body and mind, whether as elements of a mystic's general way of life or as part of the more immediate conditions of the mystical experience; they include prayer and worship, solitude and wandering, chanting and reading, bodily postures and breathing techniques, diet and fasting, ritual dance or disciplined movement, and the use of intoxicants. But of particular interest because of their intimate connection with the cultivation (or at least supervision) of mystical states are the specialized techniques often lumped together as meditation but better differentiated as meditation and contemplation. These terms, notwithstanding their Greek and Christian associations, correspond to a distinction found within many mystical traditions. Meditative techniques are those that engage intellect, emotion, and imagination in the systematic exploration of a doctrinal theme or devotional focus. Contemplative techniques, though often arising out of meditation, involve suspending or transcending all normal mental operations in the development of one-pointed consciousness or intuitive absorption. The term *contemplation* is appropriate even in its ambiguity, connoting as it does both an activity and an experience. Arguably, the varieties of mystical technique offer a better point

of entry to the comparative study of mysticism than abstract ontologies or phenomenologies (monistic, dualistic).

THE SOCIAL DIMENSION OF MYSTICISM. The social dimension of mysticism covers both the institutional embodiment of mysticism in groups and movements and the influence of mysticism upon the wider society and vice versa. Moreover, there are not just social but also political aspects to mysticism. Mystics have played prominent roles in the doctrinal development of their traditions, in reform, in renewal and protest, and sometimes in sectarian, messianic, and millenarian movements.

Issues of gender have become prominent in the study of mysticism since the 1980s. This is only partly a reflection of the attention to such issues within the study of religion as a whole. More significantly it is because, within many mystical traditions, women are better represented and have made more distinctive contributions than in other religious contexts. Leaving aside the unbidden nature of mystical experience, environments and ways of life associated with mysticism (such as asceticism, monasticism, and writing) have also favored women, even in patriarchal societies, because these contexts have been less subject to the restrictive customs of ordinary society. Acknowledging the presence and contributions of women mystics is only part of the story, however. There are also specifically feminist critiques of how the lives, writings, and influence of women mystics continue to be evaluated in ways that fail to do justice to their distinctive contributions. A number of French women thinkers have taken particular interest in how some women mystics have been able to work beyond the restricting oppositions dogging so much of Western culture (male-female, body-soul, reason-emotion).

MYSTICISM IN THE STUDY OF RELIGION. The study of mysticism both benefits and suffers from the specialist nature of modern scholarship. The subject is well represented across the whole range of the humanities and social sciences and also in much scientific and medical literature. But academic specialism, and the theoretical agenda inhabiting it, have encouraged scholars to focus on one dimension of mysticism to the neglect of other dimensions. Thus sociologists not only emphasize the social aspects of mysticism but are also liable to produce sociological explanations of mysticism, and likewise in the case of other disciplines, including those of theology or metaphysics, where theories of mysticism may underestimate social, psychological, and cultural aspects.

Yet because mysticism by its very nature looks toward what is universal or transcendental, it tends to elicit these elements in those who engage with it. Scholars as well as practitioners have recognized mysticism not just as a constant motif within religions but as a key to what is most important in religion. It is at least as common for mysticism to be identified as the heart of religion as for ethics or worship or ritual to be so regarded. As such, mysticism tends to figure prominently in revisionist global theologies, metaphysical system building, New Age thought, debates about the relationship

between world religions, and interdisciplinary approaches to art, language, and human consciousness.

BIBLIOGRAPHY

The literature on mysticism is voluminous. The development of the subject through the years is best tracked through periodical literature. This bibliography restricts itself to a selection of general and comparative studies in book form published since 1978. It excludes studies of individual mystics and editions or anthologies of mystical texts.

MYTH

This entry consists of the following articles:

AN OVERVIEW
MYTH AND HISTORY

MYTH: AN OVERVIEW

The English word *myth* comes from the Greek *muthos*, meaning “word” or “speech.” It owes its significance to its contrast with *logos*, which can also be translated as “word,” but is used especially in the sense of a word that elicits discussion or an argument. The reference to Jesus Christ as the Logos (Word) of God is well known from the Gospel of John; this is a necessary reminder that the lines separating *logos* and *muthos* are not rigid. *Muthos* in its meaning of “myth” describes a story about gods and superhuman beings. A myth is an expression of the sacred in words: it reports realities and events from the origin of the world that remain valid as the basis and purpose of all there is. Consequently, a myth functions as a model for human activity, society, wisdom, and knowledge. The word *mythology* is used for the entire body of myths found in a given tradition. It is also used as a term for the study of myths.

The definition given here contains elements on which not all specialists would agree or place the same emphasis. The use of the word *sacred* might impress some as defining the subject of myth with a word that lacks more clarity than the term being defined. For the historian of religions, however, no confusion occurs. The distinction between the sacred and the profane emphasized by the philosophically inclined French sociologist Émile Durkheim (1858–1917) is based on a sober observation: all human traditions and societies heed the sacred and mark it in one way or another. Its ultimate or metaphysical reality is not the issue.

The most general characteristic of the sacred is not that it is exalted, although in many instances that may be the case, but that it is distinct from ordinary, profane, everyday worldly things. In communicating the sacred, a myth makes available in words what is available by no other means, and its words are different from other words: the words of myth have an extraordinary authority and are in that perceivable manner distinct from common speech. The language of myth does not induce discussion; it does not argue, but presents. The most familiar example in the West, the opening words of Genesis, “In the beginning God created the heavens and the earth,” is very different from the words in any theological chapter on the doctrine of creation, precisely because the latter are meant to analyze, to systematize, or to discuss God’s creative acts, not to present them. The words have to

make a case for their validity, while the myth is its validity. A myth, whether its subject is the acts of deities or other extraordinary events, always takes us back to the beginnings of all things; hence cosmogony, the birth of the world, is a principal theme. In each case, the age to which the myth transports us is very different from our own; it is in fact a time beyond any human being's ken, and hence the events and realities dealt with are literally altogether different from the facts people are concerned with in their everyday human lives. The authority of myth is more than an analogy to authorities on earth.

Myth relies on one of the three forms of religious expression: sacred speech, sacred acts, and sacred places. As such, it occurs side by side in most traditions with sacred places or objects (symbols) and sacred acts (that is, cult, rituals, sacrifices, and ceremonial acts and performances). The chief reason myths attract scholarly attention is their medium: words. They can be expected to elucidate the entire religious life of a community, shedding light especially on the ritual acts and sacred objects that by themselves do not speak at all, or certainly not often, and not as clearly. For instance, a central temple or a sacred pole may be of paramount significance in the religious life of a community, yet it is the recorded myth that is most likely to explain its pivotal role in the community's religious life.

MYTH, SYMBOL, AND RITUAL. The fact that the mode of a mythical expression is words may account, to quite an extent, for the problems the subject has caused for intellectuals from antiquity to the present age. Myths have been looked upon as conscious efforts to veil rational propositions, as allegories for historical events, as poetic imageries, as unconscious verbalizations of inner desires, as mental classificatory schemes, and as social structures. Many scholarly attempts have been helpful in highlighting such relationships, yet each of these attempts has failed to arrive at an overall explanation. Admittedly, none may be possible.

To understand myth, we must do more than accumulate the results of specialized approaches and fragmentary methodological views. Rather, a determined inquiry, and any true science of mythology, should take into serious consideration also the whole of religious expressiveness within which myths function. Of course, myths are language and speech and literature. Of course, myths may reveal something of the society in which they were formulated. Of course, myths may manifest deeper human drives than those displayed in civilized life. Nevertheless, human religious expressiveness in its threefold form of sacred speech, sacred acts, and sacred places remains essentially one, and the three forms we distinguish had best be considered as merely the aspects visible to us; our differentiation of the three forms is external, conceptual, formal. The three always occur together, in any culture. We can only observe that, as a rule, one of the three has a dominant role; some civilizations have a wealth of myths, some of rituals, and some of sacred places.

A sociological, psychological, or other special scholarly view may provide illumination, yet the coherency of a religious tradition should not be allowed to fall between the cracks. As in the case of the computer, where output depends structurally upon the questions asked, each of our sciences and scholarly disciplines can only provide answers in accordance with its own definition of problems. For instance, the semantic problem facing historians of religions is not a mere extension of linguistics. Whatever the definition of religion may be, it must have something to do with the totality of human orientation, hence with the underlying certainties or assumptions concerning each particular activity or creation. The history of religions deals with such totality not in the manner of philosophy, by reflecting on premises for coherent and defensible thought and action, but by studying the evidence of religious documents in human tradition. The principal question is not "What is true?" but "What have societies, civilizations, and communities found necessary to point to and preserve as true?" Here the study of myths becomes the obvious source out of the entire store of religious documentation.

THE UNITY OF MYTH AND THE VARIABILITY OF CULTURE. The variety of cultures, of their languages, means of production, and evaluation of what is essential, is overwhelming. This variety invites us to look for an explanation of myths in the specificity of each society, and certainly many an answer to many a question can be obtained in this manner. Ignoring the specificity of a tradition would be the worst methodological error. Given this, however, it is essential to remember that by our definition myth emphasizes realities and events from the origin and foundation of the world. This presents a certain difficulty that lies hidden just below the surface. "The world" suggests a oneness, but the myths from the world's myriad cultures and ages are manifold. It would be easy to conclude that the oneness of the world depicted by myths is in each case at most a collective fiction peculiar to an isolated tribe, and yet such a conclusion would be questionable. For one thing, there is too much contact, exchange, and mutual understanding between different tribes and nations to permit such a conclusion.

Resolving the issue of the origin of the world, and what it is that remains fundamental to the world, does not call for one immutable formula. The question does not demand an answer that prohibits variety but rather one that includes it. Not only do myths vary from culture to culture; each one is itself open to transformation. Staple foods, basic provisions, and tools are among the topics that occur in cosmogonic myths, but these fundamental elements in human existence vary from the hunting and gathering communities and the early peasant and pastoral societies to the most complex urban centers. How essential are these elements to the cosmogonic myth? The answer is that they are at the same time essential and completely insufficient, because the issue goes far beyond nutrition and tool-making and all the other culturally specific human concerns. Just the same, myths take account of these absolute necessities and can even assign

them a direct role in the origin of the world. The multiplicity of mythologies has immediate and important methodological consequences from the outset of any inquiry: the multiplicity is observed from the beginning and is not merely a methodologically inconsequential by-product of our final conclusions. It concerns the very nature of the primary documents of the object of our discipline. Hence, for instance, the history of religions must take the variety in the very first items of nutrition in origin myths seriously; we cannot disregard the choices made by the narrator.

A most important consequence of the multiplicity of mythologies is that by necessity, the investigator has a particular position vis-à-vis a given mythological tradition; and indeed this orientation is necessary in order to gain any perspective on any myth. There is no such thing as objectivity that amounts to neutrality; there is no understanding where the subject has eliminated herself or himself. This absolutely necessary subjectivity is not a whimsical individual stance or solipsism but the recognition of the only ground from which a religious phenomenon can be traced.

One may also state that the world of religions, spawning its myths, is not as remote from the natural sciences as has been supposed in the humanities and the social studies that developed in the wake of the German philosopher Wilhelm Dilthey's work; furthermore, the world of science may be affected by mythology in spite of the intentions of scientists.

It is noteworthy for the historian of religions that the ancient problem of the unity of nature is eliciting new interest among scientists. There is no reason to jump to conclusions and equate that interest with the expression of age-old myths, yet the revival by itself is fascinating and promises to overcome unnecessary barriers between the humanities and the sciences. Students of subatomic particles theorize on a possible "supersymmetry" in nature. These theoretical considerations are hard to separate altogether from the ancient and universal mythological interest in the mystery of oneness (whether of the world or God or the Ultimate). Still a reservation is in order here. What distinguishes modern scientists is that they search for mathematical formulation, a direction that cannot be applied to the mythical narration and poetry available to us. To scientists, a serious object of study is principally an invitation to a precise, calculable demonstration of relationships.

The topic of symmetry has received much attention in aesthetics, and has deeper roots there than in physics. Here also ties to mythology are visible, even if difficult to define. For the church father Augustine, symmetry was a rational entity, because it does not occur in nature but does occur in human creations. It exists in human reason itself; through it God created humans in his own image. Whether one speaks about Augustine's reasoning as philosophy, science, or mythology will depend on one's intellectual frame of reference.

Myth and politics. In the study of politics, power is a necessary concept. It is, of course, an abstraction. Wielders

of power are not sterile laboratory tubes filled with that element. Religion and hence mythological elements play a great part in the exertion of political control over others; and since the nineteenth century there has been a steady growth of ideological theories affiliated with as well as opposed to religious factors. Religion and myth, like power, never occur in pristine purity, but always in admixtures. The fact that people are religious (as well as political, philosophizing, and knowledge-gathering) beings is not necessarily a pleasant or attractive fact. To say that humans are *Homo religiosus* is not a compliment. The unity of myth in various cultures and human inquiries is accordingly the statement of a problem, rather than of a supposed mysterious, pure, dialogic core of all human existence.

In recent times, serious scholars have turned to political power as to some extent explanatory of myth (as well as sacrifice). Even if some of their reasoning may be open to criticism, it certainly cannot be denied that notions of justice—as well as revenge—not infrequently are rooted in myth. Until this very day, Justice is depicted as a blindfolded goddess, wielding scales. In texts, as in speech, justice and myth are frequently inseparable. The expulsion of the first humans from paradise and Cain's punishment for the first murder as depicted in the book of Genesis are well-known models. True justice seems everywhere most concisely embedded in myth. In Hinduism, Dharma ("justice," and in this context in particular, "the right tradition"), is also a god, and Pāṇḍavas Yudhiṣṭira, who is entitled to the throne in the epic *Mahābhārata*, is said to be Dharma's son. When Buddhism spread through Asia from India to Korea, it was accepted and propagated by the elite, who reformed the juridical system in accordance with the new Buddhist teachings. In ancient Greece, Themis, a consort of Zeus, is called on as the goddess of Justice.

Cosmogonic imagery. Another point should be noted: each society, culture, or historical epoch has nothing but its own vocabulary to tell even its most basic myths. This point is so obvious as to run the risk of being overlooked. A comparison with modern science is illuminating. Twentieth- and twenty-first-century astronomers and physicists have discussed a theory of the origin of the universe they have labeled the big bang, as distinct from the steady state theory. Irrespective of mathematical calculations, the discussion could not very well be carried on without labels taken from the common speech of our age: in the final analysis, these are poetic similes that have taken on a life of their own; they have a pregnant metaphorical significance like the imageries in traditional cosmogonic myths.

One of the many accomplishments of Raffaele Pettazoni, the great Italian historian of religions, is his huge collection of myths and legends from all continents. Included are many cosmogonic myths. Mircea Eliade occupied himself with the supreme significance of cosmogonic myths. That significance is evident in most traditions. Whatever other myths are told—about the origin of animals, plants, institu-

tions, or anything else—they take for granted the basis provided in some myth of the creation of the universe. Even eschatological myths, seemingly positing the end of the world as if in contrast to the beginnings of the world, do not abandon their relationship to the cosmogony. This abiding relation is not paradoxical. All thoroughgoing eschatologies express themselves as renewals of the real, truly intended origin. The reference to Jesus Christ as the new Adam is a well-known example. In the history of Christianity, the Protestant movement saw itself as engaged in reestablishing the pure, original form of the religion. In Marxism (and in the ideas of the young Marx himself) even the most typical eschatological myth of the classless society is expressly concerned with the restoration of the human race as it was originally—without private property.

CHARACTER AND CONTENT OF MYTH. At first sight, myths may seem to have much in common with other forms of folk literature. They deal with supernatural events, as fairy tales do; they deal with extraordinary figures comparable to those in legends and sagas. The authority of myths, however, distinguishes them clearly from other sorts of narratives. Typically, the myth tells of a time altogether different from the time of our experience (“in the beginning . . .” or “before heaven and earth were created . . .”), whereas the typical fairy tale, no matter how wonderful its events, begins “Once upon a time . . .,” which is to say, a time like ours. The saga’s hero and the legend’s sacred protagonist are no doubt superior to all normal human beings, yet their time resembles the historical time of our experience.

Epics present a special case, for they are often a prime source for our knowledge of myths: the *Iliad* and *Odyssey* of Homer are celebrated instances in the Western tradition. Nevertheless, epics as such do not have the authority of myths, no matter how they function as educational tools held in the highest esteem by a society. The myths they narrate in the body of their texts and the mythological references they make can be seen as part of an educational pattern: this is how people should understand the basic, authoritative models in the religious tradition. Moreover, in addition to instruction, epics provide entertainment for their audience. One cannot say this of myths, even though there are good reasons to speak of the narrative style of myths, which can be truly arresting and spellbinding. Raffaele Pettazzoni went so far as to see in epics the first clear signs of a process of secularization.

The themes of myths are innumerable. Often the characters are gods and goddesses, sometimes animals, plants, mountains, rivers. . . . In each case, the myth directly or by implication links its striking presentation of events to an altogether different time and thereby posits its authority. Nevertheless, the astounding variety of myths can best be discussed not in terms of their protagonists or the events they describe, but rather in terms of their various structures and their cultures of origin.

THE FUNCTION OF MYTH IN THE TRADITION OF CITIES AND CIVILIZATIONS. Many a modern city-dweller makes the mistake of thinking that myths belong only to a dim, unsophisticated past. Yet not only is there no religious tradition on earth today without its identifiable myths, but the history of cities and urban life itself, which began thousands of years ago, is steeped in myths and rituals. Ancient temples everywhere are spoken of in terms of the mythical traditions with which they are imbued. To understand this properly we have to divest ourselves of the modern habit of viewing religion as something distinct, separate from the “ordinary” things of life. The duties of elected officials in ancient Athens always involved functions they were expected to perform in rituals. Even earlier, in Mesopotamian civilization, temples served purposes we would immediately identify as religious, such as sacrifice, and for administrative matters we would look upon as by nature secular or bureaucratic.

Additional and abundant evidence comes from civilizations in the New World: the Aztecs in Central America and the Incas in South America. The mythologies at the heart of these civilizations generally support a pronounced class structure and a powerful central ruling elite. Adding to the complexity and fascination of mythological development in Central America and South America is the socio-mythological complexity of the Spanish invaders, who themselves emerged from turbulent centuries of Christian, Muslim, and various ancient local traditions. An example of the new, fascinating mythological interweaving appears in the cult of Our Lady of Guadalupe. The emphasis on the religious roots of authority is most striking in the intertwined myths of the New World, with their roots on both sides of the Atlantic. We should add that in spite of great religious upheavals and reforms, remnants of the ancient traditions still remain.

The function of myth is particularly striking in periods when large-scale religious change occurred. One such case has been studied in an exemplary manner. It occurred with the new retelling of local tribal myths in Central Asia and was instrumental in the area’s conversion to Islam. The retelling by Muslim missionaries was so effective that Islam became fully accepted, indeed rooted in a large part of Central Asia. History makes it clear that myths, whether or not they are clearly cosmogonic, do not merely relate to explanations of the world’s beginnings. They reveal their force and function when history shows their role in renewing life, in a city, a society, a civilization. In each religious tradition such a force of renewal is the most striking manifestation of a myth’s function.

STRUCTURE AND STYLE. What characterizes mythical recitations, and what is their purpose? Contrary to the assumption of much traditional scholarship, myths are not essentially etiological (from Greek *aitia*, “cause”) in the sense of explaining origins or causes. It is true that the word *etiology* could be used, with some caution, but only if one adheres to the sense the Greeks themselves sometimes gave to the term *aitia*: a primeval condition. Hence the term could also refer to pri-

mary states or first principles. This meaning of the term, however, was not usually in the minds of the scholars who thought of myth in terms of etiology. Until recently many students saw in myths a prescientific endeavor to establish causes for the universe, natural phenomena, and everything else that preoccupies modern science, thereby overlooking the fact that this scientific preoccupation with causality is a very precisely determined feature of modern history, as much as the attendant confidence in technological progress. For instance, it is certainly no coincidence that the very influential folklorist and classicist James G. Frazer launched his idea of fertility as the principal explanation for most of the world's myths and rituals shortly after artificial fertilizer was marketed for the first time in the nineteenth century.

The supposed prescientific nature of myths was incongruous with another view sometimes held at the same time by the same theorists, namely that myths contained the texts necessary to accompany rituals, after the manner of a libretto to an opera. Since the latter theory generally entailed the idea that rituals were only magical acts, all these theories, incongruous or not, were really variations on the theoretical theme of a prelogical mentality, one of the most enduring products of cultural evolutionism and best known through its articulation by the French philosopher Lucien Lévy-Bruhl (1857–1939).

Yet myths are not attempts at causality foreshadowing nineteenth-century scientific discussion. Their notion of an origin and basis of all things should be taken quite seriously. If indeed the isolated and desiccated notion of first causes was the central issue in myths—if the myth's only concern was epistemology—one could not very well imagine any need for ritual related to myth. Instead, an academic-style presentation would suffice. Obviously, no myths in that style exist. And that is precisely the issue. A myth does something else, and something more encompassing than presenting a reasonable (or even pre-reasonable) explanation of things. This is the reason Eliade has rightly emphasized cosmogony as the fundamental myth. In whatever cultural or religious tradition a creation myth is recited, it is paradigmatic in a special, one might even say pregnant manner, because of the many things to which its sheer force as a model is able to give birth.

In many instances, creation myths are recited in a special, archaic language, different from the vernacular. One such case is a creation myth in the Ngaju-Dayak tradition (South Kalimantan, Borneo). Its unusual language is not meant to keep it secret but rather serves to underline its significance, preserved by experts in the community. The narrative itself establishes the land, orienting the villages and their mirror-image counterparts in the heavenly realms; it creates the social divisions and their functions, as well as the principles of the legal system. The myth is couched in lyrical poetry, as are many myths in Southeast Asia, including those expressed in the vernacular. Sometimes, a cosmogonic myth is recited on special occasions, as in the ancient Near East on

the enthronement of a king or for the renewal of life and kingship together in the New Year festival. Elsewhere instances occur where the cosmogony functions to cure the sick or renew a poet's inspiration. In all these examples the creation of the world is invoked for its fundamental and founding power.

In simple terms, how does human speech succeed in expressing the underlying reality of existence; how can something so ungraspable be expressed at all? All myths can be seen as coming to terms in their own way, within their culture, within their necessities of life, with this question. The special features of myth, in spite of great cultural diversity, result from the unusual task it sets for speech itself to go beyond the ordinary limits of knowledge and perception.

An archaic language for myth is a feature found throughout the world. The phenomenon occurs in very different civilizations and circumstances: the use of Latin in the liturgy of the Roman Catholic church; the importance of the Church Slavonic liturgical language in the history of the Orthodox church, the use and cultivation of Sanskrit in Hinduism, and the attention given to the study and use of Sumerian in ancient Babylon many centuries after that language had ceased to be spoken. Although far from universal, such eccentricities of language are a feature of myth that indicate an awareness of a tradition deserving special protection.

Another feature in many traditions is the special care taken that myths shall be recited only at specific times and places. This points out clearly that myths are not like other stories. This awareness of the special nature of myths is illustrated in a folk tale of the North American Wichita Indians concerning a contest between Coyote and an opponent. The two contestants tell stories, and the winner will be the one who knows the most stories. Coyote wins because his store of stories is inexhaustible: he can make them up at will. His opponent restricts himself to stories that have not been made up. He tells only true stories, and those are limited in number. True stories, are, of course, what in our study are called myths.

Humor in myth. One feature of myths that is indeed universal can best be indicated by the word *humor*. This does not refer to jokes or quick-wittedness, and least of all is it a spur to uproarious laughter. It is closer perhaps to what the German Romantics, who were intrigued by the experience of humor, seemed to think of as a smile that liberates us from anxieties, and especially from the doldrums, of our existence. If successful, myths, setting out to do what ordinary speech cannot reach, have to break through a barrier that is set for our normal understanding, and hence *liberation* is an apt word for what is envisaged.

An alternative to seeing the humor of myths is to view myth as a primitive form of doctrinal system in the general evolution of the world of thought, as evidence that the primitive ancients could not think like modern people do, or in some other way to force myth into some scheme of logic that

satisfies our contemporary sense of what reason and empirical reality are really all about. In all cases, these distortions neglect the actuality and the immediate presentation of the myths themselves.

A myth of the Brazilian Ge begins by stating that in former times the Indians had neither corn nor fire. It describes how one member of the tribe takes his wife to a distant place in the forest, where they set up a plantation and plant corn and other staple foods. The wife's lover visits her secretly, and later returns with another man from the village. The husband turns into a man-eating snake, and devours the visitor. Thereupon the villagers kill the snake and bring to their village corn and the other cultivated plants, as well as fire. In the course of the story, the wife gives birth twice to a number of snakes, first in the forest, later in the village, and finally goes back into the forest, where she orders her offspring to bite people forevermore.

Whatever one may want to say about the origins of the enmity between humans and snakes, or about hidden logical systems, or about the frequently attested relation between the acquiring of a civilized life and violence, the myth conforms to other myths in that it contains events that strike the listener as strange or contradictory, beginning with the juxtaposition of the people without corn or fire and the departure of one couple to a forest where they run a plantation and suddenly master fire. Not all etiology is discarded, not all logic made superfluous; no less attention should be paid to cultural patterns and conditioning. Nevertheless, something that liberates, something that shakes listeners loose from their customary habits of mind, is given form in myth.

One need not look far to find other examples. In the familiar story in *Genesis*, God creates light on the first day of creation, yet the sun, the moon, and the other heavenly bodies do not come into being until the fourth day. By the end of the chapter, on the sixth day, God gives to the wild animals, to the birds of heaven, the reptiles, to every living creature, all of the green plants for food. Obviously, this is at odds with the knowledge possessed by every listener who is familiar with the eating habits of such animals as lions. One may argue that the narrative is not really a creation story but rather a paradise story. Whether we are convinced by this argument or by the realization that, according to the story, the creator god is something other than a prime mover, we are more shocked than persuaded into that novel idea. The accepted lines of thought are ruptured and replaced by new ones.

Of course, adherents of a tradition develop their own explanations, and it is characteristic that for instance the rabbinical commentaries embroider on puzzling texts not merely by analyzing them logically, but by participating in the same mythical vein in which the texts tell their stories. Thus the ancient rabbis tell us that the light created on the first day was not the ordinary light of the sun that we see. Instead, it was light by which one would have been able to see the entire world in a glance from one end to the other. God, in

his wisdom, foreseeing human wickedness, hid that extraordinary light—and will not reveal it until the new world to come.

The German writer Jean Paul (pseudonym of Johann Paul Friedrich Richter, 1763–1825), known for his literary essays, was thoroughly aware that humor does not deal with trifling matters but, on the contrary, with matters of ultimate importance. The four forms of humor he defined do not need much modification to be applied to mythical literature. All of them are characterized by their defiance of the wooden habits of human minds.

The first, the Dimming of Opposites, is probably present in most myths. Imageries abound such as that of a time before creation when heaven and earth were not yet separated, or of a beginning in which the two were so close that people could not stand up straight, or as in *Genesis*, when it was necessary to separate the waters below from the waters above.

The second variety of humor depicts an Inverse Effect. Somehow, a disastrous event leads to infinite bliss that could not have been anticipated by the listener. Consider the Hindu cosmogonic story of the churning of the ocean. Before all ordinary time, in fact before the creation of the world, the gods and the demons exist in some apparent harmony. Then the gods raise the question of how they may attain immortality. Together with the demons they begin their quest for it by churning the ocean. Completely unexpectedly, instead of immortality a most deadly poison turns up. All variants of the myth state that the great god Śiva rescues the world (which, curiously, has not been born yet) from the poison by swallowing it. The *Rāmāyaṇa* version has the interesting detail that it is the god Viṣṇu who suggests that Śiva drink the poison on the grounds that the first offering is duly his. The accounts and their interpretations vary, but Śiva does drink the poison, and the world is established. The seriousness of the humor involved is evident, as is also the case with the crucifixion of Jesus Christ at the origin of Christianity, followed—without anyone among the human actors and witnesses involved anticipating it—by the resurrection.

A third category of humor, Subjective Reservedness, may be the best formula to denote the awareness in mythic narration of the curious union of the human voice that narrates and the sacred, more-than-human reality narrated. This awareness is expressed in many ways, sometimes elaborately, sometimes matter-of-factly. The standard beginning of a Buddhist sutra, which tells of the wonderful teachings and miracles of the Buddha that make freedom, or *nirvāṇa*, accessible, is the following: “Thus have I heard. . . .” Many myths are interspersed with phrases such as “it is said that,” or “they say.” Part of the tradition of many a Hindu is that he reveres his spiritual teacher, who in turn has his teacher, and so on, until the line finally reaches God. Tradition requires that the entire list of names be recited regularly. Thus, the mere individual quite consciously elaborates on his relationship to the absolute divine ruler.

A fourth category of humor is Grotesque, a term not generally associated with sacred tradition. Yet it describes the most striking form of humor—in any tradition other than one's own. Some myths speak of worlds that were created before the present one, and that were failures. For instance, in the tradition of the Hill Saora in India, the first world was a world made of a resinous substance; in that world some brothers set up a still and made liquor. The liquor was not merely excellent, it was too excellent; when it flowed it burst into flames, and as a result the entire world burned up and sank back into the primordial ocean. We may also recall the snakes of the Ge in Brazil and the Hindu story of the churning of the ocean. Often, the grotesque is a matter of exaggerated attention to detail or measurement. Grotesqueness helps to emphasize the complete otherness of that time at the beginning of the world or that time on which all liberation, salvation, or bliss hinges.

Change and disappearance of mythical traditions?

There is no doubt that myths change in the course of time. In addition, the spread of the great missionary religions, mainly Islam and Christianity, has no doubt contributed to the neglect and disappearance of many a mythological heritage. We are however far from a dependable assessment of the entire globe's mythological state at the present moment. We do know that the role of myths has been important in many periods in which large-scale religious change occurred, as it was in the conversion of Central Asia to Islam. The revision of the old myths by Muslim missionaries was not destructive but fruitful, and led to full acceptance of Islam.

HISTORY OF STUDY. Questions about religion, including the subject of myth, are undoubtedly older than recorded history, and hence a full history of the study of myths would have to begin a very long time ago, in that undatable period hidden from us in which religion originated. Explicit intellectual discussions on the subject are closer to us and have an important beginning with the ancient Greeks. Some of the standard methods of explaining myths owe their first formulation to the Greeks, so a rapid survey of mythology, in the sense of the study of myths, ought to commence with them. The concentrated intellectual discipline of a religio-historical study is, however, much more recent, not coming into its own until the early nineteenth century.

The classical world. Greek thinkers developed three modes of accounting for myth, each of which can be distinguished clearly. Each continued in the scholarship of later centuries. Hence, in Western civilization the Greek ideas on the subject of myth do not merely represent a start but form the roots that nourished systems devised by later scholars.

In the first place, allegorical explanations served to extract the meaning of myths for many thinkers in classical civilization. The text of myths was explained not by what it said literally but as depicting or concealing in poetic images a reality behind the text, if the text could only be properly understood. A good example may be found in the widely accepted interpretation in classical Greece of Homer's *Iliad* as intend-

ing not the physical involvement of the gods in the war that the epic describes but instead the inner human struggle between good and evil.

The allegorizing of myth has occurred all over the world and in many periods, often when texts or customs that could not be summarily dismissed are no longer understood or perhaps have taken on an offensive quality in a new age. Many of the well-known classical thinkers, beginning with Theagenes (seventh century BCE), Heraclitus (c. 540–480 BCE), Parmenides (born c. 515 BCE), Empedocles (c. 490–430 BCE), and including Plato (c. 429–347 BCE), employed allegorical explanations of myths. An interesting feature, not only surviving since the classical period but expanded into an elaborate system in nineteenth-century nature mythology, was the assumption that many myths could be read as allegorical accounts for natural phenomena.

Rational explanations of various sorts also occur throughout the classical texts. One of these which often strikes the modern reader as far ahead of its time is found in a famous fragment from Xenophanes (c. 560–478 BCE):

Mortals suppose that the gods are born, and that they wear men's clothing and have human voice and body, . . . but if cattle or lions had hands, so as to paint with their hands and produce works of art as men do, they would paint their gods and give them bodies in form like their own, horses like horses, cattle like cattle.

We should see this passage in a proper perspective. Xenophanes, though we know him only from some fragments, must have had in common with the majority of classical thinkers the desire not merely to destroy prevalent assumptions by means of some rational analysis but to make room for a philosophy worthy of the name; in the case of Xenophanes this philosophical concern was to create a proper understanding of the idea of transcendence. There were some classical thinkers, nevertheless, who spent great effort to demonstrate the worthlessness of traditional myths. The eclectic Latin writer Cicero (106–43 BCE) is quite critical in this regard; and the Latin didactic poet Lucretius (c. 99–55 BCE) is very sharp in his rational criticism.

A manner of explaining myths called euhemerism is named for the Greek writer Euhemerus (c. 340–260 BCE). Euhemerus was not a philosopher or a scholar, but the author of an imaginative story in which the narrator tells of a voyage to an island in the east whose kings bestowed gifts of lasting cultural value (such as the calendar, granted by Ouranos in the tale) and were elevated to the status of gods by their grateful subjects. Hence *euhemerism* depicts divinities as mortals who came to be venerated because of their contributions to the human race. This interpretation was to have a life which no one could have foreseen, in the classical world and long thereafter.

The Christian world. With regard to mythology, the intellectual world of Christianity was in most respects an immediate continuation of the Greek. Allegorical and rational

explanations as well as euhemeristic reasoning abounded for centuries. Nevertheless, especially in euhemerism, the apologists and church fathers introduced a change. Where the classical world told admiringly of men whose great exploits caused them to be worshipped as deities, the Christian world speaks of the gods of classical myth as mere men remembered because of their excessively evil deeds and vices. This change came about as result of a larger shift in orientation—one that Plato, Aristotle, or any of the ancient thinkers could never have foreseen. The new Christian world makes much of the distinction between true and false religion. For Christian thinkers, true and false religion was not simply a topic for discussion, as it had been for the ancients. The Christians believed that theirs was the true knowledge of God, and other traditions were seen as false and pagan. Thus pagan gods were not gods at all, but demonic beings.

This twist in euhemerism filled an intellectual need and was generally accepted. Nevertheless, during the Middle Ages a narrative tradition of many streams, akin to the euhemerism of the classics, also continued. Thus the Norse gods could be categorized by tracing them through stories of kinship from the heroes in the *Iliad* and ultimately linking them by the same procedure to the creation story in the book of Genesis.

The eighteenth century. The eighteenth century is the prelude to the modern study of myth. For the first time serious efforts were made to assess the discoveries by voyagers of the Renaissance. One very important assemblage of myth was collected by Jesuit missionaries in North America. Questions of revelation and of falsehood and truth raised in the Christian tradition were revived and given new, complex forms. In the work of Bernard Le Bovier de Fontenelle (1657–1757), old and new ideas intermingle. Like other authors of the period, he begins by assuming the factual reality of God's revelation in the Old Testament and speculating on the intellectual inability of other nations to accept that original knowledge. The new age is visible in his effort to show the similarity between myths found among American Indians and those of the ancient Greeks and in his view that the inability of those peoples to accept true religion reflected an intellectual childishness. The childishness of the ancient and so-called savage races becomes a standard image in many of the explanations that follow in the eighteenth and nineteenth centuries.

Fontenelle's most original idea, next to his insistence on comparing different pagans, is his inference that all peoples have the same mental disposition and that, as a result, comparable developments occur in different parts of the world. More clearly than Fontenelle, Charles de Brosses (1709–1777) makes a case for comparative studies and shows an interest in questions of origins that would characterize much of the scholarship of the next century. His studies led him to the conclusion that elements of West African religion in his time could explain Greek mythological conceptions. Hence, in his view, the study of later "savages" can reveal much about earlier traditions.

Besides an expanding knowledge of the world, an even more significant factor marked the eighteenth century and made it a watershed: the rationalism of the Enlightenment. This change within the history of philosophy made it possible to narrow down the narrative euhemeristic expositions into a principle of explanation. For the study of myths this new intellectual direction was of course a mixed blessing. The new mood demanded laws of causation rather than seeking the coherencies present in myths. Although the greatest legacy of the philosopher David Hume (1711–1776) is his critique of overconfidence in reason, his *Dialogues Concerning Natural Religion* (1779) contains many passages that typify the eighteenth-century obsession with definitions. De Brosses, who was certainly a man of the Enlightenment, made extensive use of Hume's ideas in his own work.

The Romantics. The Romantic movement that swept Europe and America had its strongest exponents in Germany, and the movement's influence on the study of myths, historical linguistics, and other related comparative studies such as art, law, and culture, was profound. Indeed, many of these disciplines were initiated under the Romantic influence. While the Enlightenment had sharpened the tools of the intellect in its resistance to the ancien régime politically and to the church religiously, the Romantic movement, without rejecting the Enlightenment's accomplishments, created a very different center of attention that can be captured by such words as *emotion*, *vision*, and *genius*. Emotion came to be seen as at least of equal importance to the rationalism of the previous age.

The theologian Friedrich Schleiermacher (1768–1834), who left his mark on all areas in the study of religion in the nineteenth century and beyond, was of the opinion that the divine, in itself ungraspable, was represented mythically; the mythical he explained as "a historical representation of the supra-historical." As was typical in the Romantic outlook, the emphasis fell on a vision of something eternal, not subject to the vicissitudes of history, yet expressed in history. The age that saw the Faustian creativity of Beethoven, the fully Romantic works of Mendelssohn, Chopin, Schubert, and Schumann, the writings of the young Goethe, Blake, and the German poets Friedrich Hölderlin and Novalis, as well as the paintings of Delacroix, Turner, and Théodore Géricault, saw also the philosophical creations of Georg Wilhelm Friedrich Hegel (1770–1831).

Hegel's thought was the first since late antiquity (most especially, that of the non-Christian Roman thinker Plotinus, 205–270 CE) to develop a system free from the Christian philosophical opposition between true and false religion. Another idealistic, Romantic philosopher, Friedrich Wilhelm Joseph von Schelling (1775–1854), wrote a philosophy of mythology centered on a totality of human vision. Johann Gottfried von Herder (1744–1803) was an important early Romantic, especially for his essays on poetry and mythology. During the Romantic period, many works of scholarly intent were written on symbolism and mythology. A few of these

made a lasting mark, among them the writings of Karl Otfried Müller (1797–1840) and the brothers Jacob (1785–1863) and Wilhelm (1786–1859) Grimm.

Nineteenth-century evolutionism. Without the Romantic impulse, the astounding nineteenth-century scholarly achievements in mythology and religion would be inconceivable. In the nineteenth century much new data became available, through ethnology, archaeology, and the study of ancient and distant civilizations and their languages. Compiling dictionaries, constructing grammars, and investigating Indo-European linguistics all demanded an extraordinary effort, and this effort, whether among government administrators in the colonies acquired by Western powers, in the expansion of newly established missionary societies, in the laboratories of science, or in historians' scrutiny and classification of documents, owed its principal inspiration to the Romantic thinkers. The idea of evolution—of development from low to high, simple to complex—that became so enormously influential in nineteenth-century thought is inseparable from the Romantic movement, predating the influence of Charles Darwin's *On the Origin of Species by Means of Natural Selection* (1859) in the work of Hegel, and also the much more positivistic works of the English social theorist Herbert Spencer (1820–1903) and the French philosopher Auguste Comte (1798–1857).

The cumbersome examination of facts and their compilation united with a Romantic attitude is perhaps nowhere as clearly to be seen as in the person of the Vedic scholar F. Max Müller (1823–1900). In his theories on the origin and development of language and myth, Müller posits as a beginning a pure awe in human experience before nature—especially in viewing the dawn—which he thought he had documented in the Vedic hymns. He marshaled all his knowledge of ancient Indo-European languages and literatures as a basis for a theory that a “disease of language” accounts for the formation of misunderstandings, which are deposited in myths such as those of the Hindu Purāṇas. The finishing touch is provided by the general idea of evolution, according to which religions evolve to ever higher and purer forms.

Modern studies. The nineteenth century saw greater and greater complexity in materials available for study and the methods that could be employed. The achievements in the area of mythology by anthropologists, folklorists, psychologists, philologists, sociologists, and historians of religions were innumerable. Nevertheless, for a general intellectual orientation, it is possible and helpful to speak of variations on the theme which was set with the opposition and complementarity of rationalism and romanticism. And certainly in the study of myths the rationalists and the Romantics gave such a wide view of things that all later labors can sometimes seem like mere embellishments to their discussions. We can definitely speak about a constitutional or structural contrast between scholarly concerns for the problems and scholarly concerns for unity in the study of myths.

The earliest Romantics, in the 1770s, known in German literary history by their association with Sturm und Drang (storm and stress), can be understood in their opposition to the rationalism ushered in by the French philosophers. Even the influential ideas of Johann Gottfried von Herder concerning the origin of language and myths, composed in his ecstatic writings about nature, can be read for their reaction against an intellectualist attitude which prevailed in Herder's day. The growing Romantic movement, however, was not engaged in combating the progress the Enlightenment had brought about and so frequently invoked. The new expressions we find among such Romantics as Schleiermacher point more to a transformation than an opposition, allowing subjects such as myth and history to be approached in fruitful ways.

More extreme Romantic scholarly work, such as that by Georg Friedrich Creuzer (1771–1858), elicited stern criticism from Christian A. Lobeck (1781–1860) because of its speculative features, its lack of evidence. In F. Max Müller's work and, as we must infer, in his personal make-up, the rational and the Romantic existed harmoniously.

Since the late nineteenth century the non-Romantic side has predominated. Scholars such as the classicist Theodor Mommsen (1817–1903), Franz Cumont (1886–1949), and Martin P. Nilsson (1874–1967), who have contributed greatly to our knowledge of mythology, are splendid examples of this type. Fewer in number, scholars with an avowed Romantic outlook have included the German classicist Walter F. Otto (1874–1958) and the Dutch historian and phenomenologist of religion Gerardus van der Leeuw (1890–1950).

Sometimes the two attitudes are openly discussed, yet more often they are not. Whatever names are given to the two sides may not be accepted by one or the other party involved. Mircea Eliade preferred the term *morphology of religion* to *phenomenology*, which was employed by Van der Leeuw. Whichever term one likes, it is easy to see that in Eliade as well as Van der Leeuw the emphasis is on the sacred, and the study of its manifestations. This interest goes back to Rudolf Otto (1869–1937) and to Friedrich Schleiermacher. The reaction to this keen interest in the sacred itself is not difficult to detect, though it is multifarious. Many historians (such as Raffaele Pettazzoni) have been more concerned with a proper understanding of the variety of myths than with what seemed speculation on a unity behind the variety; such scholars have been suspicious of theologically inspired apologetic tendencies as well. Many an anthropologist, especially in the school of Franz Boas (1858–1942), has been too preoccupied with the puzzling coherencies of specific cultures in all their creations to pay much attention to an underlying ultimate significance of myths.

A generalization that can be made, with caution, is that the beginning of the third millennium seems characterized by a longing for unspeculative, concrete results.

An increasing number of studies have come to focus on the social and political aspects of religion and storytelling rather than on ultimate meanings of myths. Together with this focus goes a decreased interest in philosophical aspects of religion. This tendency might make the study of myth in days to come different from what characterized previous eras in mythology and the history of religions.

The occurrence of problems and disagreements in the study of myth and religion is of course nothing to be unduly worried about. What we have referred to as an opposition/complementarity is a natural feature in any discipline concerned with people and their cultures and societies. Next to structural anthropology, historical anthropology makes its voice heard. Whereas the former, if not concerned with an ultimate unity, is at the very least concerned with coherencies in myths and other human creations, the latter spends more time on the specificities and changes in any culture. An issue that has received no profound discussion is the difference, or rather, lack of contact, between the search for unity pursued by phenomenologists (or morphologists) and by structuralist anthropologists. That both are searching for coherencies in myths is clear, yet the nature of a unifying goal is assumed in two very different manners. The choice of rationalism and romanticism as labels may be helpful in this case, yet they are not telling us the whole story.

It is striking, however, that Eliade's conception of the sacred is missing in the work of the field's foremost anthropological structuralist, Claude Lévi-Strauss (born 1908); instead, Lévi-Strauss shows an obvious interest in the very visible yet long overlooked, typically human, ceaseless drive to reconcile empirical knowledge with the equally human drive for control over the world. Translators like to leave the term *bricolage* untranslated; it is the term Lévi-Strauss uses to describe the widespread process at work all over the world in tribal traditions to build up knowledge; the closest equivalent in English is *tinkering*. Lévi-Strauss is a gifted author and wrote several books that present not only his theories, but the living context in which his theories developed. No doubt his early philosophical interest accounts for the fact that his theories on structuralism are so well thought-out. A voracious reader, he was also well aware of the use of the term *structuralism* in other fields of study before he himself adopted it. Its use was common in anthropology, and Lévi-Strauss repeatedly makes reference to the work of the Dutch structuralist anthropologist J. P. B. Josselin de Jong, and contributed to a book in his honor. In his perhaps most autobiographical and certainly most eminently readable book, *Tristes Tropiques: An Anthropological Study of Primitive Societies in Brazil*, he writes most directly about his impatience with the disorder in the still rather recent study of anthropology. In *The Savage Mind* he writes with fervor and with obvious delight about the knowledge fostered in "primitive" societies.

The knowledge that the then-traditional practice in anthropology, with its emphasis on the supposedly primitive or even savage elements it perceived among the natives was

in fact the science of the concrete. It seems likely that Lévi-Strauss sees in the science of the concrete, built up through a tinkering process, something that is not all that far away from the good French scientific, sober, rationalist tradition, not only of Descartes, but also with a taste of Auguste Comte.

The absence of any notion of the sacred in Claude Lévi-Strauss's work cannot be ignored. In *Tristes Tropiques* Lévi-Strauss writes about his youthful experiences during World War I in the house of his grandfather, who was the rabbi in Versailles. The corridor leading from the house to the synagogue had to be negotiated in absolute silence. It seems obvious that for him "the sacred" retained a tone he had difficulty with. At the time, he says, "I was already an unbeliever." An unbeliever at the age of nine or ten? He relates this to the experience of amazement he would have later in Buddhist temples where monks slept in the same room where services were held and did not mind caressing their pupils between lessons in the alphabet. In the same work he refers disdainfully to the philosophy as taught in France in his student years as "mental gymnastics."

Dutch anthropologist J. van Baal, who served as the last governor of Dutch New Guinea, learned much from J. P. B. Josselin de Jong, who was one of his teachers, and was himself a splendid observer of various societies in Southeast Asia and their ceremonial interactions. As an administrator, he was less given to theoretical expositions than Claude Lévi-Strauss. At the same time, like other structuralists, he was hesitant to attribute "reality" to religion, yet was not averse to dealing with great problems in society. In 1972 he published a small, very interesting book, *De boodschap der drie illusies* (The message of the three illusions). The illusions are respectively religion, art, and the element of play in all human culture. No human society exists without these three, van Baal suggests, yet they do not have the reality of a concept like physics.

MYTHS AND THE MODERN WORLD. Myths and myth-making have certainly not disappeared from the modern world. That notion, still rather popular, was fostered by nineteenth-century evolutionists who posited a decline of religion as part of some general world-wide progression. The process of history does not give up its most basic constituents, including its mythological creativity, because prevailing ideas change. The fact that in common parlance the word *myth* has a derogatory meaning has no bearing on the issue. Antiquity was already familiar with that same use of the term. The apostle Paul is among those on record as despisers of mere myths. Two religions of India, Buddhism and Jainism, have expressed strong misgivings about prevailing religious ideas, and these misgivings are another kind of depreciation of myths. Myths have continued to flourish, however, and the misgivings of any given religion, religious grouping, or age do not change that fact today any more than in the past.

In entering upon the study of myths, we should quickly reject the illusion that we are entitled to speak of the mythology, in the sense of the entire body of myths, of any group, whether they be ancient Mesopotamians or an African people or the citizens of the United States of America. In none of these cases are we ever looking objectively at a total belief system. We are never in a position to do so. All we have before us are at best good selections by a scholar or a good sampling by a field worker. The availability of a collection in print between two covers does not make our position that of an objective observer readying himself for complete understanding. We look only at a fragment in time and place. The nature, structure, and style of myths points not merely to the existence of bodies of material, but to living traditions. The humor in myths changes in time, together with everything else in history, but it also indicates a universal human propensity. The erroneous idea that our own world is largely devoid of myths or is rapidly purified of such things rests largely on the assumption that our world, in whatever way that term is defined, is real and does not depend on fiction. Every age, however, and every civilization, rests on a foundation of mythic fictions. The philosopher Alphonse de Waelhens, in Castelli, *Mythe et Foi*, has rightly pointed out that we are able to see quite clearly the outline of a myth only after that myth has ceased to function unassailed and unquestioned, that is to say, as an expression of supposed reality.

In our own world, we lack the distance necessary for clear views of our own myths, and the question of which ones will stand out as central can be discussed seriously only by later generations. These future scholars also will have to make up their minds on the basis of fragmentary information, just as our scholarship must always remain conscious of the inadequacy of our information about mythology in ancient Mesopotamia or present-day Iran, or the nineteenth-century myths of evolutionism, materialism, missionary optimism, colonialism, or Marxism. Our own world with respect to its mythology is completed by the manner in which we orient ourselves not only within our transcendencies, but also vis-à-vis other people in our endeavors to define and interpret their myths. This, one might say, concludes our circle of interpretation.

The Danish thinker Søren Kierkegaard (1813–1855) once conjured up the image of a man with his mouth so full of food that he could not swallow. Kierkegaard raised the question of whether one might better help that man by stuffing more food into his mouth or by taking some out. Obviously, only the latter could be a solution. In the same way, Kierkegaard argued, a man can be so filled with information, which he mistakes for useful knowledge, that even in the face of his own protests and his insistence on adding even more to his store of learning, the only cure is to take some of that knowledge away. This is the task Kierkegaard assigned himself in using the comical to make the overburdened man see the uselessness of what he knew. Kierkegaard's parable is a perfect illustration of the unceasing propensity toward myth-

making in modern times and, at the same time, of the need for the mature intellect to occupy itself with the issue of mythology.

Endeavors to explain religion (or explain it away) have been a by-product of culture since antiquity, if not earlier. In the nineteenth century such endeavors were part of Marxism, and they became part of the educational curriculum in the twentieth-century Soviet Union and People's Republic of China. The trend in this direction is actually part of life in all industrial nations. Claude Lévi-Strauss dismisses religion, and yet he also makes efforts to understand myths scientifically, that is to say, in a way that as objectively as possible makes sense out of them. Several scholars have objected to the dismissal of religion, among them anthropologists such as Adam Kuper and Clifford Geertz. Nevertheless, the modern aversion to scholars like Rudolf Otto, who emphasized the religious experience as the key element in religion, is much more general, and certainly affects notable historians of religions as well.

An adequate assessment of the present-day situation in the study of myths would require extraordinary talent. It is, however, not easy to avoid one impression: the study of religion and religions has not been flourishing in recent times, and—with notable exceptions—no longer has a strong basis in linguistics and philology, the traditional basis of the history of religions.

- Gray, Louis H., and George Foot Moore, eds. *Mythology of All Races*. 13 vols. Boston, 1916–1932. Though dated in some of its discussions, still one of the best collections of myths available in English.
- Griaule, Marcel. *Dieu d'eau. Entretiens avec Ogotemméli*. Paris, 1948. The religious world of the Dogon takes on clear, often unexpectedly philosophical form. Ralph Butler, Audrey I. Richards, and Beatrice Hooke created a very good translation entitled *Conversations with Ogotemméli: An Introduction to Dogon Religious Ideas*. London, 1965.
- Gusdorf, Georges. *Mythe et Métaphysique*. Paris, 1953. This French philosopher deals explicitly with the relationship between philosophy and myth.
- Haber, Howard E., and Gordon L. Kane. "Is Nature Supersymmetric?" *Scientific American* 254 (June 1986). A lucid description of a problem of physics, this essay is also illuminating in its implications for the use of ordinary words, suggesting comparisons with mythological language. For an equally suggestive example from developments in biochemistry, see Marc Lappe's *Broken Code*.
- Jaspers, Karl. *Truth and Symbol*. New York, 1959. Still one of the most concise philosophical discussions of the symbolic nature of language and inquiry.
- Jensen, Adolf E., ed. *Mythe, Mensch, und Umwelt*. New York, 1978. A reprint of a special volume of the journal *Paideuma* (vol. 4, 1950). Contains an important collection of essays by various specialists about myths and their environment in nonliterate and classical traditions. Among the important contributions are essays by the Africanist Hermann Baumann, the ethnologist Martin Gusinde, the classicists Walter F. Otto and Franz Altheim, and, among other students of classical civilizations, the Indologist Hermann Lommel and the Americanists Walter Krickeberg and Hermann Trimborn.
- Jung, Carl G., and Karl Kerényi. *Essays on a Science of Mythology*. Princeton, N.J., 1969. This work is important because of Kerényi's interpretations of classical mythical themes; it presents at the same time an introduction to Jung's psychological approach.
- Kuhn, Thomas S. *The Structure of Scientific Revolutions*. 2d ed. Chicago, 1970. Both this book and his *The Essential Tension* (Chicago, 1979), although without explicit reference to myths, provide insights into the change of science within its historical and social environs.
- Kuper, Adam. *Anthropology and Anthropologists*. London, 1993. A critical assessment of anthropological achievement in England and elsewhere. Critical of Claude Lévi-Strauss.
- Langer, Suzanne K. *Philosophy in a New Key: A Study in the Symbolism of Reason, Rite, and Art*. 3rd ed. Cambridge, Mass., 1957. One of the superb classics in the study of symbolism.
- Lappe, Marc. *Broken Code: The Exploitation of DNA*. San Francisco, 1984.
- Leeuw, Gerardus van der. *Religion in Essence and Manifestation: A Study in Phenomenology*. New York, 1963. This is the best known work by the principal founder of the phenomenology of religion. See also his "Primordial Time and Final Time," in *Man and Time*, edited by Joseph Campbell. New York, 1959.

- Lévi-Strauss, Claude. *Structural Anthropology*, translated by Claire Jacobson and Brooke Grundfest Schoepf. New York, 1963; *Introduction to a Science of Mythology*, translated by John and Doreen Weightman. New York, 1969: vol. 1, *The Raw and the Cooked*; vol. 2, *From Honey to Ashes*; vol. 3, *The Origin of Table Manners*; vol. 4, *The Naked Man*; Claude Lévi-Strauss. *Tristes Tropiques: An Anthropological Study of Primitive Societies in Brazil*, translated by John Russell. New York, 1964.
- Lévi-Strauss, Claude, and Didier Eribon. *Conversations with Claude Lévi-Strauss*, translated by Paula Wissing. Chicago, 1991.
- Lincoln, Bruce. *Priests, Warriors, and Cattle: A Study in the Ecology of Religions*. Berkeley, Calif., 1981; *Emerging from the Chrysalis: Rituals of Women's Initiation*. New York, 1991; *Death, War, and Sacrifice*. Chicago, 1991; *Theorizing Myth: Narrative, Ideology, and Scholarship*. Chicago, 1999; *Holy Terrors: Thinking About Religion After September 11*. Chicago, 2003. Without any harmful intention in mind, I believe one could sum up the strength of Lincoln's work not merely by the solidity of his dealings with sources, the evidence on which all worthwhile study should rest, but also with a term such as *fiery justice*. Hence he does not deal only with matters of the past, but is attracted to great issues of the present. Even if one is not always certain whether he takes religious data wholly seriously, the sense of justice he brings to bear on all issues, especially political ones, is unmistakable.
- Long, Charles H. *Alpha: The Myths of Creation*. New York, 1963. Long was one of the first doctoral students of Eliade. In this work, more than elsewhere, he is also closest to his master. In *Significations: Signs, Symbols, and Images in the Interpretation of Religion* (Philadelphia, 1986), one sees a greater interest in the role of myth and other forms of religious symbolism in their relation to historical and social problems than Eliade ever displayed.
- Maquet, Jacques. *The Aesthetic Experience: An Anthropologist Looks at the Visual Arts*. New Haven, Conn., 1986. Illuminates the evidence of beauty as a universal feature in human existence.
- Maranda, Pierre, ed. *Mythology*. Baltimore, 1972. An anthology of various schools in the study of myths, with special attention to structuralism.
- Merleau-Ponty, Jacques, and Bruno Morando. *The Rebirth of Cosmology*. New York, 1976. A discussion between a philosopher and a scientist; of interest for a modern understanding of the *raison d'être* of mythology.
- Nilsson, Martin P. *Geschichte der griechischen Religion*, 2 vols. 2d ed.; Munich, 1955. Splendid, indeed classical work on ancient Greek religion.
- Orzech, Charles D. *Politics and Transcendent Wisdom: The Scripture for Humane Kings in the Creation of Chinese Buddhism*. University Park, Pa., 1998. Of great significance in understanding the rarely discussed relationship between Buddhism and politics.
- Pettazoni, Raffaele. *Essays on the History of Religions*. Leiden, the Netherlands, 1954. Of special significance for its essays "The Truth of Myth," and "Myths of Beginnings and Creation Myths." See also his four-volume *Miti e Leggende* (Turin, 1948–1959). Geographically organized, it is the most representative collection of myths in nonliterate traditions from the entire world.
- Plessner, Hellmuth. "Elemente menschlichen Verhaltens." *Merkur* 15 (1961): 603–614.
- Schneider, Laurence. *Biology and Revolution in Twentieth Century China*. Lanham, Md., 2003. This work seems almost a companion volume to the work by James T. Andrews mentioned above. Both in Soviet Russia and Communist China religion was imagined to disappear under the evidence and weight of modern science, but it did not happen. It is useful to point out that neither work, in spite of its historical accuracy, tells us very much about the strength of specific religious traditions in Russia or China.
- Sebeok, Thomas A., ed. *Myth: A Symposium*. Bloomington, Ind., 1955. Presents nine scholars' divergent views on myths.
- Smith, Jonathan Z. *Map Is Not Territory: Studies in the History of Religions*. Chicago, 1978; *Imagining Religion: From Babylon to Jonestown*. Chicago, 1982; *Drudgery Divine: On the Comparison of Early Christianities and the Religions of Late Antiquity*. Chicago, 1990. Most of Smith's books are collections of essays, but each has a special theme, and each one is a challenge to the reader, and as a rule sheds a new light on the interpretation of a myth or a specific religious problem. And at the very least, each essay shows a new difficulty to the reader.
- Thompson, Stith. *Motif-Index of Folk-Literature*. 6 vols. Rev. ed.; Helsinki, 1955–1958. In the tradition of folklore studies; it does not make a sharp distinction between myths and other forms of folk literature. For the complexity of differences between genres, see also his *The Folktale* (Berkeley, 1977) and his essay "Myth and Folktales" in *The History of a Myth: Pacariqtambo and the Origin of the Inkas*, edited by Gary Urton (Austin, Tex., 1990).
- Vries, Jan de. *Perspectives in the History of Religions*. Berkeley, 1977. Concentrates on the study of myths in the history of Western thought since classical antiquity.
- Wach, Joachim. *Religionswissenschaft*. Leipzig, 1924. Of no direct interest to the study of myths, but of lasting importance for its discussion of the problem of false objectivity in the study of religious phenomena.

Kees W. Bolle (1987 and 2005)

MYTH: MYTH AND HISTORY

At first glance, myth and history appear to be complete opposites. To be sure, they are both narratives, that is to say, arrangements of events into unified stories, which can then be recounted. But myth is a narrative of origins, taking place in a primordial time, a time other than that of everyday reality; history is a narrative of recent events, extending progressively to include events that are further in the past but that are, nonetheless, situated in human time.

This initial definition, however, calls for a series of qualifying remarks that reveal a network of more complex relations in the place of this stark opposition. Let us first consider the fact that our very model of myth has come down to us from the stories of the gods in ancient Greece. Furthermore, a transition from myth to history can be seen in the

Greek myths themselves, as they extend to include the history of heroes and the histories of ancestors. These are more properly termed legendary narratives, unfolding in a time lying between the time of origins and that of recent events. History will encroach on this legendary time, extending its grasp to include an ever more distant past.

An even more significant intersection between myth and history has been brought to light through the extension, familiar from contemporary anthropology, of the notion of myth to types of narrative that are extremely widespread in contemporary archaic societies. These narratives are characterized by being anonymous, and so without any determinant origin. They are received through tradition and accepted as credible by all the members of the group, with no guarantee of authenticity other than the belief of those who transmit them. History will mark an “epistemological break” with this mode of transmission and reception, but only after an evolution involving many intermediate stages, as we shall see later.

A source of even more serious conflict between myth and history, and therefore also an occasion for more complex forms of transition or compromise, has to do with the object of myth itself, which we temporarily designated as a narrative of origins. The concern with origins extends far beyond the history of gods, heroes, and ancestors. The questions pertaining to the origins of things extend to all the entities of individual and social life. Thus myths can reply to any of the following types of question. How did a particular society come to exist? What is the sense of this institution? Why does this event or that rite exist? Why are certain things forbidden? What legitimizes a particular authority? Why is the human condition so miserable; why do we suffer and die? Myth replies to these questions by recounting how these things began. It recounts the creation of the world and the appearance of humans in their present physical, moral, and social condition. With myth therefore we are dealing with a very particular type of explanation, which will maintain a complex relation to history. This type of explanation essentially consists in myth’s foundational function: the myth recounts founding events. Its tie and subsequent conflict with history result from this function. On the one hand, myth exists only when the founding event has no place in history but is situated in a time before all history: *in illo tempore*, to borrow Mircea Eliade’s now classic expression. On the other hand, what is at stake in any such foundation is to relate our own time to this other time, whether this be in the form of participation, imitation, decadence, or abandonment. It is precisely this relation between our time and the time of the myth that is the essential factor constituting the myth, rather than the types of things founded by it, whether the latter include the whole of reality—the world—or a fragment of reality—an ethical rule, a political institution, or even the existence of man in a particular condition, fallen or innocent.

In the light of this brief phenomenology of myth, it appears that the relation of myth to history can be situated on

three different levels. In a limited, narrow sense, myth and history are two different kinds of narrative. Myth is a narrative concerning the origin of everything that can worry, frighten, or surprise us. History, on the other hand, is a precise literary genre, namely the writing of history or historiography. Taken in this strict sense, history can enter into a variety of relations with myth; history’s own origin from myth is not the only such relation. The genetic point of view must not blind us to other possible viewpoints. If, as we shall see, history does not necessarily take the place of myth but may exist alongside it within the same culture, together with other types of narrative, then the question of the relation between myth and historiography must be approached from the perspective of a classification of the various kinds of narratives that are produced by a particular society at a particular moment. The genetic and taxonomical perspectives must each be allowed both to complement and to limit the exclusive claims of the other.

As a backdrop to this well-defined problem a vaster one arises, related to a second meaning of the term *history*. History is not only a literary product; it is also what men do or suffer. Many languages preserve these two meanings of their word for “history”: history (or story) as the narrative of the events of the past, and history as the whole of these events themselves, as human beings make them or are affected by them. Beyond the question of the writing of history is the question of how a given culture interprets its historical mode of existence. A number of problems arise in this connection. How, for instance, is the stability or change affecting a culture’s mores or institutions perceived? What value is attributed to it? Does change itself have meaning? That is to say, is change at once meaningful and directed toward an end, or is it incoherent, given to disorder, chance, and meaninglessness? And, if there is a sense to it, is it an improvement, a form of progress, or a degeneration, a decadence?

To move from the first sense of *history* to the second is not difficult. The writing of history as an essentially literary activity is after all one of the ways a society accounts for its own past. It inevitably leads to the more general question of the sense that that society ascribes to its own historical development. This interrelationship between history as literary activity and history as lived experience gives a new meaning to the question of the relation between history and myth. Myth, to the extent that it is defined by its foundational role, can function to ascribe a positive or negative value to history in general, to the extent that the latter is understood as a mode of human existence.

When dealing with myth and history at this level, we must avoid the temptation to engage in simplistic oppositions between types of civilizations or to employ genetic interpretations that are overly linear. A single society may in fact have both myths of decadence and myths of progress, whether in different epochs or in the same period. This competition of myths may express the uncertainty that a society experiences concerning the meaning of the changes that it

undergoes. Furthermore, in a given culture, historiography may be intended to provide only partial explanations that make no claim to be comprehensive, while the broader question of the meaning of history is left to legends and myths. As a result, two cultures may differ as to their most fundamental myths and yet present striking similarities in both the techniques and goals of their historiography. This was true of the Greeks and Hebrews, as will be shown below.

Finally, in the background of the question of the meaning of history, we find the question of a society's interpretation of the time in which its history—and all history—unfolds. This third question is implicit in the two preceding ones. In the first place, historiography can be defined as the narrative of human actions in the past. Since this interest in the past is inseparable from an interest in the present and from expectations about the future, historiography necessarily includes in its definition a reference to time. It is knowledge of societies and people in time.

This reference to time cannot help but affect the first and second senses of *history*: both the meaning that a class of literati gives to the act of writing history and the meaning that a particular society gives to its history through narrative activity imply a specific perception of time. The evaluation of time may even become the object of reflection, or it may remain implicit, in much the same way that change may be evaluated positively or negatively. It is at this level that the so-called cyclical and linear conceptions of time oppose one another.

The question of the supposed opposition between cyclical and linear conceptions of time is a thorny one. To begin with, it is not certain that the notion of cyclical time has but one meaning. In addition to the paradigmatic case of the periodical regeneration of time by specific rites, there are many other ways of conceiving the periodical return of the same situations and the same events; a number of periodicities are to be distinguished here. Nor is it certain that the notion of linear time was clearly perceived as a global alternative to that of cyclical time before modern astronomy and cosmology or the even more recent ideologies of progress. Last but not least, a single culture can give rise to contrary myths concerning the cyclical or linear character of time. This is part of the uncertainty that a particular society may foster concerning its own historical condition and that of the human race as a whole. Then too, the culture that produces myths of cyclical time or of linear time may also produce a historiography that is deliberately developed outside of this framework, limiting its scope to restricted temporal segments that can be inserted in either of those versions of time. For these reasons, the problem of the apparent split between cyclical and linear time should not be tackled head-on. Instead, this debate should be carried on within the horizon of the two preceding investigations.

ANCIENT GREECE. To guide us in this problem, it will be helpful to take as our reference the relations between myth and history in ancient Greece. In the cultural sphere of the

ancient Near East and the Mediterranean, they alone—along with ancient Israel—produced a historiography worthy of the name. In addition, the variety of the relations that this production maintained with myth (a Greek term if ever there was one!) permits us to verify the extreme complexity of the problem and the validity of the three-stage model that we have just suggested.

If we adhere to the definition of history as historiography, then history's relation to myth is determined in its essential features by the birth of a type of knowledge and a type of discourse (prose narrative) that make a series of decisive breaks with the mythical mode of thought and with its privileged mode of literary expression, versified poetry. The earliest witness that we have to history's break with myth was provided by Herodotos in the middle of the fifth century BCE, whose work stands as a literary landmark. Its title—*Historiē* in the Ionian dialect—has ever since determined not only the name of the discipline that he inaugurated but also the principal meaning of this term, namely investigation. These "histories" are in fact investigations into the causes of the wars fought between the Greeks and the Persians. Unlike myths of origin and heroic tales situated in distant times, the histories of Herodotos are concerned with recent events. Herodotos was interested in the causal role of antecedent events and in the role of responsible agents in the events that he investigated. His writings are thus far more than mere descriptions. They are expressions of a mode of thinking that characterizes what has been called the Ionic Enlightenment and so take their place within a vaster ensemble of investigations into cosmology, geography, and ethnography. They find their speculative equivalent in philosophy as such, where *phusis*, a term we translate as "nature," constitutes at once the field of exploration and the key word. In Ionian philosophy the notion of *archē* in the sense of "principle" decisively splits off from *arche* in the sense of "beginning." This bifurcation of the notion of origin is of great importance for the understanding of the separation of history from myth.

The epistemological break with myth that marks the emergence of history, geography, ethnology, cosmology, and the philosophy of nature does not entitle us to represent the process as simply genetic and linear, however. This would be to overlook the intermediate stages that exist in the transition from myth to history, as well as the continued dependence of the new mode of thought on the earlier mythical mode. In addition, we would thereby overlook the simultaneous existence of several different types of narrative within the same culture.

In contrast to a simplistic representation of the "Greek miracle," we should be attentive instead to this phenomenon of transition, which preserves a sense of the different elements that went to make up the "event" of the Ionic Enlightenment. Herodotos was in fact preceded by an entire series of prose writers who paved the way for him. The most important of these was certainly Hecataeus of Miletus, whom

we know only through a few surviving quotations. Already in the second half of the sixth century, this prose writer was the author of a *periēgēsis*, a realistic account of a voyage around the world that relates history to geography, cartography, and ethnology, and of the *Genealogies*, which constructed the great family tree of the heroic age. The break between myth and history did not, therefore, take place all at once, but only gradually. Herodotos's *Histories* themselves did not cut every tie with the stories of the heroic age, as can be seen from his attempts at a general chronology dating back to the Trojan War. And if Herodotos was concerned so specifically with the Persian Wars, this was because, in his opinion, they deserved to be reported as much as had the Trojan War. Finally, the epic dimension of Herodotos's work, which allows him to preserve the chronological and analogical ties between heroic and historical times, must be attributed to the influence of the versified epic of Homer.

The twofold relation of break and filiation between myth and history on the level of narrative form becomes clearer when we consider the end or goal assigned to this new kind of literature. Here we move from the first to the second senses of *history*. The end that Herodotos assigned to his investigations can be found in the prologue of the *Histories*: "Here are set forth the researches (*historiē*) of Herodotos of Halicarnassus, that men's actions may not be forgotten, nor things great and wonderful, whether accomplished by Greeks or barbarians, go without report, nor especially the causes (*aitiē*) of the wars between one and another."

Three features of this prefatory remark deserve emphasis. The struggle against forgetfulness is cited first; later we shall discuss the conception of time that is implied here. It is then to the great deeds of the Greeks and the barbarians that this exercise of memory is applied. The very notion of great deeds marks a tie with the epic of the age of heroes, even though it is being applied here to recent times. But, in particular, this cult of memory binds history to the self-understanding that a people acquires by giving an account of its past. The memory that history cultivates is therefore that of a people taken as a single body. In this way, history takes its place within the body of traditions that together constitute what could be called the narrative identity of a culture. To be sure, it does this within a critical mode that is entirely different from mythical traditions, since the latter draw their authority from the very act of transmitting the immemorial. But the opposition between the critical mode of historiography introduced here by Herodotos and the authoritative mode of the reception of myth in Homer occurs within the larger phenomenon of tradition: the poet and the man of letters are united within the single great melting pot of culture.

The third feature of Herodotos's project points in the same direction: the object of his research is to discover the cause of an essentially conflictual event, namely the Persian Wars. These wars not only served to oppose Greek and barbarian but fundamentally threatened a whole configuration

of peoples, just as the Trojan War had done in heroic times. This is the major crisis for which history now seeks a cause. By attributing this cause to a responsible agent, the *Histories* give an ethical coloration to the entire course of events, which at the same time attests to a striking kinship between history and tragedy. It was the *hubris* of Cresus that endangered the harmony of a people, and even the victory of the Greeks appears as a retribution (*tisis*) that reestablishes this lost harmony. In this way, a certain divine justice is effected by the course of events. One cannot help thinking here of a fragment from Anaximander: "for (existing things) pay penalty and retribution to each other for their injustice according to the assessment of Time." This fragment displays a manner of thinking halfway between myth and what, with the Sophists, Socrates, and Plato, will be termed *sophia* ("wisdom").

From this threefold analysis we can see that the passage from myth to history cannot be reduced to the mere substitution of the latter for the former. In competition with this linear evolution, we must make room for an accumulation of literary genres and the modes of thinking related to them: theogonic myths written in the style of scholarly and literary mythology, myths of the heroic age cast in the literary mode of the epic and of tragedy, and, finally, history. So little did history replace myth that Plato still wages war against myths in his dialogues, though not without including here and there some *palaios logos* received from the Orphic tradition or from alleged Egyptian wisdom. What is more, he invents certain myths himself, in the form of philosophical tales.

A third problem now remains. This is the problem of the representation of time that underlies history, a problem that forms the backdrop to the debate between history and myth. If Greek historiography holds some importance in this area, it is less in relation to the so-called opposition between cyclical time and linear time than to the dividing line between the time of the gods and the time of men.

With respect to the debate concerning the Greeks' supposed opposition of cyclical and linear conceptions of time, opened by Thorleif Boman in *Hebrew Thought Compared with Greek* (1960), it is clear that historiography not only does not provide any confirmation of the thesis that holds Hellenism to be massively in favor of a cyclical conception of time but in fact refuses to take either side. As Arnaldo Momigliano stresses, to the extent that Herodotos concentrates his attention on a limited segment of history, he is entirely unaware of an historical cycle, much less an eternal return. Of course, he believes that there are forces operating in history, forces that are ordinarily tied to the intervention of the gods in human life, which become visible only at the end of a long chain of events. Such was the *hubris* against which Solon warned. Nothing, however, indicates that these interventions attest to a cyclical time. Herodotos "attributed to the Persian War a unique, non-cyclical significance, chiefly as a conflict between free men and slaves" (Momigliano, 1977, p. 187).

It is instead to the second problem, that of the split between the time of the gods and the time of men, that the earliest Greek historiography makes the most decisive contribution. The comparison with Homer, Hesiod, and the tragedians is instructive here. In Homer, the little substance that human time takes on is due still to the family tie that unites most of the heroes to the gods. In order to evoke these heroic times ordinary memory is not enough: it is not a mere literary convention when in book 2 of the *Iliad* (lines 484–487), the poet asks the Muses, the daughters of Memory (Mnemosyne), to guide him through the confusion of human time and space. “And now, tell me, Muses, dwelling on Olympus, for you are indeed goddesses: present everywhere, you know all things; we hear only noises, we ourselves know nothing. Tell me who were the guides, the leaders of the Danaans?” It is because time is utter confusion for the human observer that the poet calls upon a Muse to unite him with the higher vision of the gods. In Hesiodic myth, the ages and the races that live in them are inserted between the time of the gods and human time, serving as much to separate them as to connect them. This is a history of decadence, interrupted only by the fourth race, that of heroes. The fate of the race of the last age, the iron age, is to suffer fatigue and hardships and hence to live painfully in time. The only remedy for this is the monotonous repetition of work in the fields. Nevertheless, the cycle of time is already that of a human time.

In the works of the tragedians, man is defined as “ephemeral.” This is not because man’s life is short but because his condition is tied to the accidents of time. The “sovereign time” sung by the chorus can at the same time be the “avenging time” that will reestablish justice. Historiography, on the other hand, by virtue of the task that it sets for itself, introduces a certain consistency into the time of men, relating it to the human time of the “first inventor” (*protos euretēs*). On the one hand, Herodotus recognizes these first inventors in those who first gave offense to the Greeks and thereby brought on the Persian Wars. On the other hand, the historian himself, by naming himself, by giving the reasons he has for recalling the past, and by seeking the sense of past events, establishes himself as a first inventor. It is in this double manner that he gives human time its consistency. Despite its linear framework, however, this human time still leaves room for analogies and correspondences that elevate the characters above and beyond time.

It is only with Thucydides that a logical time will govern the disorder of historical time that stems from the repetition of the same dissensions between cities, which make innumerable and terrible evils “occur and recur unendingly.” The second great Greek historian is then able to define his work as a means of “seeing clearly into events of the past and those yet to come by reason of the human character they possess, offering similarities or analogies” (*History of the Peloponnesian War* 1.22). This is the sense of the famous expression *ktēma eis aei* (“acquisition for all times”): human time will

take on consistency in the face of the time of the gods only when the narrative is anchored to a sort of logic of action.

ANCIENT ISRAEL. Following the majority of exegetes and cultural historians, we have adopted the working hypothesis that only the Greeks and the Hebrews developed a historiography comparable to that of the moderns. It is therefore in reference to the birth of history in Greece that we shall discuss the similar phenomenon in ancient Israel. Obstacles to this sort of comparative undertaking are by no means lacking, however.

The first source of difficulty lies in a difference of literary genre. Literary genres such as epic, tragedy, lyric poetry, and history, which are represented in Greece by distinct works and authors, are found grouped together and often interwoven in the Hebrew Bible, a book that is itself actually a collection of books. Therefore, if we are to find in the Hebrew scriptures a collection of texts comparable to Herodotus’s *Histories*, we will have to ignore the important question of context at the risk of serious distortions. This is the case, for instance, with the story of David’s rise (*1 Sm.* 16:14–2 *Sm.* 5:25) and the succession story (*2 Sm.* 7, 9–20; *1 Kgs.* 1–2).

A second difficulty lies in the complexity of narrative as a genre. The narrative genre is represented by such a wide variety of forms that we cannot restrict our classification merely to an opposition between history and myth. It is necessary to work out a typology of narrative forms, however rudimentary and merely provisional, before we can inquire into the possible filiations between one form and another.

There is still another difficulty. In addition to the variety of literary genres surrounding the narrative core and the diversity of narrative forms themselves, the Hebrew scriptures present a hierarchy of different texts. First-order units that represent the entire range of narrative forms are incorporated into larger ensembles such as the compositions of the Yahvist, which present narrative features that differ from those of the first-order units. In order to account for the difference of level and structure between these larger narratives and their smaller, properly historiographic segments, it is advisable to refer to the former as “history-like *narratives*.”

Finally, concerning the specific problem of myth and history, we must be prepared to confront the paradoxical situation that, in contrast to the evolution that led from myth to history in Greece, in Israel the quasi myths or myth fragments borrowed from neighboring cultures were incorporated into the great narrative ensembles mentioned above in the form of historicized myths, as is the case in *Genesis* 1–11. This reinterpretation of myth on the basis of history appears quite specific to the literary sphere of ancient Israel.

We can navigate our investigation through the reefs of these difficulties by proceeding along the lines of the three levels of inquiry outlined in the first paragraph: namely, a typology of narrative forms, an analysis of the historical mode of understanding of the community that produces these nar-

ratives, and, finally, a brief look at the conception of time that may be implicit either in the literary forms or in the self-understanding revealed in ancient Israel.

With respect to the typology of narrative forms, in which history and myth take their place at the two opposite poles of the spectrum, it is important to note that genetic investigations, stemming principally from the work of Hermann Gunkel and Hugo Gressmann, have employed structural analysis to establish criteria for the identification of narrative forms and then gone on to work out their filiation. Gunkel (1928) himself argued that the historiography illustrated by the two narratives concerning David mentioned above stemmed from legends (*Sagen*), rather than from the myths of the ancient Middle East or from the lists, annals, and chronicles that were widespread among Israel's neighbors. In order to establish this thesis, Gunkel had to work out a brief typology that allowed him to distinguish legends from other types of stories. He first distinguished legends (*Sagen*), which refer to characters in the real world but living in times gone by, both from myths, which are origin narratives, taking place in a time different from that of ordinary experience, and tales (*Märchen*), which are pure fictions intended for amusement. Then, within the *Sagen* themselves, he distinguished between father legends (*Vatersagen*) and hero legends (*Heldensagen*). Father legends are tied to family leaders who are representative of their social group. They are sometimes related in a series, like the stories of Joseph; Gunkel calls these "novellas" (*Novellen*). Hero legends (*Heldensagen*), to the extent that they concern public figures like Moses, Joshua, Saul, and David, can contain a genuinely historical element. According to Gunkel, it is within this subgroup that we can follow the evolution from the pure heroic legend, illustrated by the story of Gideon, to history in a sense similar to that of Herodotus, as in the two narratives of David referred to above. Gressmann (1910) then carried this approach further by calling attention to the prophetic legends, whose purpose is devotional and edifying.

Gressmann's major contribution, however, was his tripartite division of history. First there is the history that concerns recent events (it is assumed that the narratives relating to David were written shortly after the events recounted). Then come legends, concerning distant events, and, finally, myths, relating to primordial times. The advantage of this threefold division is that it brackets the question of the presumed degree of veracity, as measured by our modern notion of documentary proof. Nevertheless, in Gunkel and Gressmann the concern for typology is immediately swallowed up by the interest in genesis: their major interest is in determining how historiography as a scholarly genre arose out of legend.

The same question is considered by Gerhard von Rad (1962), but on the basis of different preoccupations. He too asks about the preconditions for the emergence of historiography, but whereas Gunkel stresses the decisive role of the emergence of a monarchic state, von Rad focuses on the de-

mand for explanation present in the etiological function of legends, on the formation of a prose literature, and especially on the organizing role played by a theological vision of history. It is under the influence of this third and decisive factor that the narrative organization prevails over the paratactic presentation of the heroic legends. By the same token, the relation of filiation between the legend and the myth appears even weaker. And it is an enlightenment similar to that in Ionia that permits the passage from the novella, which itself is already relatively complex, to even larger ensembles, such as the stories of David and the Yahvist document, which are thus placed on the same level as the historiographical core, at least as far as their organization is concerned.

Armed with these sketchy typological criteria for distinguishing between genres, Hebrew exegesis set out to examine the question of their filiation, a question held to be fundamental. It is within this framework that Gunkel's continuist hypothesis has been tested by his successors (Gerhard von Rad, Martin Noth, William F. Albright, Umberto Cassuto, Claus Westermann, and John van Seters). This hypothesis can include a number of different emphases. Emphasis can be placed on the political factor, on the enlightened spirit of the age assumed to be close to the reported events, or on the degree of organization in the legends themselves prior to their literary phase. One can emphasize the possible existence of early Israelite epics influenced by Mesopotamian and Canaanite epics, the constitution of court archives, lists, annals, and other documents similar to those found among Israel's neighbors, and finally and most especially the organizing power exerted by the theological motif. In fact, however, these rival genetic hypotheses have shown themselves to be practically unverifiable in the absence of Israelite sources distinct from the canonical texts of the Hebrew scriptures. It is not even certain that the texts that appear closest to Greek historiography were actually written at a period close to that of the events reported, or even that there was an Israelite literature prior to the writing of *Deuteronomy*.

The responses of scholars to these doubts have taken three forms. Some have sought a renewal of genetic investigations on the basis of new hypotheses. Others have accorded a privilege to a more detailed structural analysis of narrative forms, and still others have undertaken a properly literary study of the narrative art, which is found in all narrative forms.

The first orientation is illustrated in particular by the works of John Van Seters and Hans H. Schmid, who date the first Israelite writings five or six centuries later than previous scholarship did and thereby overthrow all the earlier hypotheses concerning filiation.

The second orientation is illustrated by the taxonomical concern that presides over the works of George W. Coats on *Genesis*. Coats divides the main narrative genres into the saga, the tale, the novella, legends, histories, reports, fables, etiological narratives, and, finally, myths. The term *saga* (not to be confused with the German *Sage*, "legend") here refers to

the Icelandic and Nordic sagas of the Middle Ages, which are long, traditional narratives in prose, subdivided into family sagas and heroic sagas. The tale is characterized by the fact that it has few characters, a single setting, and a simple plot. The novella, in turn, is a complex tale with a plot involving tension and its resolution. Legends are static narratives with no plot in praise of the virtues of a hero. A history is intended to report events that actually took place; a report describes an isolated event. Fables depict a fictional world, while etiological narratives purport to explain a situation, to name a place or a character. Finally, myths are reduced to the sphere that remains, namely the imaginative domain relating to the activity of the gods in the divine world (hence *Genesis* 6:1–4).

A noteworthy example of the third orientation is given by Robert Alter and Adele Berlin. These authors, unhampered by typological concerns, have studied the art of narrative composition, basing their studies on the poetic model applied to the modern novel. So-called primitive and naive narratives suddenly appear to be works of consummate refinement in the use of dialogue and in the handling of events with reticence and understatement. At the same time, the literary analysis enhances the theological import of these texts and suggests that the conflict between the inevitability of the divine plan and human recalcitrance is in itself the source of narrative developments.

The development of structural analysis has tended to obscure the problem of the relations between myth and history behind its more detailed typologies. Nevertheless, the problem reemerges at another level as the problem of the self-understanding of a culture as this is expressed through its traditions. This new line of questioning is called for by the typology itself, to the extent that the aim of any narrative form is to contribute to self-understanding. Here, then, in the context of the Hebrew scriptures, we confront the second sense of *history*: history as it refers to the historical mind of ancient Israel, its manner of conducting itself historically. In this regard, most exegetes agree in characterizing the self-understanding of ancient Israel as globally historical, something that cannot be said of the Greeks. If the latter did indeed produce a historiography that is more clearly set out on the level of its works and more deliberately critical with respect to received traditions, they nevertheless sought their identity—without perhaps ever actually finding it—more in the political sphere of their existence. At the same time, their philosophers developed a cosmological and nonhistorical philosophy of reality as a whole. Israel alone understood itself principally through the traditions of which it was at once the author and recipient. This is essentially what von Rad wanted to stress in his *The Theology of Israel's Historical Traditions* (1962), the first volume of his *Old Testament Theology*. With Israel, the act of narrating had from the outset a theological value, and the theological intention was instilled in the collection of traditions, which the theologian could not help but retell.

This second level of investigation must not be confused with the first; the “historical” understanding of a people

through its literature is not exclusively, nor even principally, expressed in historiographic writings. It may instead be expressed through an entire range of narrative forms and even, little by little, by all the other literary genres inasmuch as they are historicized or, better, “narrativized.” This expansion of the historical mind beyond the narrative form characteristic of historiography finds its expression in the internal hierarchy characteristic of the narrative literature of the Hebrew scriptures, through which the narrative units distinguished by the typology are subordinated to larger ensembles, of which the Yahvist document is a good model. Not only does this vast composition reach back before the monarchy, before the settlement, before the patriarchs, to the very creation of the world; it also encompasses units that represent the entire range of narrative forms distinguished above, as well as vast nonnarrative texts, such as laws, sapiential segments, praises, curses, and blessings—in short, a wide variety of literary forms and “language games.” As noted above, in order to preserve this internal variety and difference of level, it is advisable to reserve the term *history* for those units that display a structural and thematic kinship with early Greek historiography and to refer to other narratives as “history-like,” following Hans W. Frei in his *The Eclipse of Biblical Narrative* (1974).

It is on the level of this vast history-like narrative, and on that of the different narratives superimposed on the great Yahvist narrative, that the theological design of narrative literature itself is revealed. In this regard, there has been noticeable evolution in interpretation since Gunkel sought to save the ancient historiography that he considered to be contemporary with the epoch of Solomon from the regretted influence of the prophets. Von Rad considerably reworked the problem by seeing in the great Yahvist construction the expansion of the confessional recital that can be read in *Deuteronomy* 24:5–9 and *Joshua* 24:2–13. According to von Rad, this “historical credo,” with its own distinctive liturgical roots, governed the history of the settlement, leading the people from Egypt to the Promised Land. It then incorporated into itself the Sinai tradition, which, as a distinct cult-legend with its revealed commandments and its theology of the covenant, had heretofore had a separate existence. Around this core was clustered the history of the patriarchs, prefaced by the majestic history of the creation of the world and the origin of humanity. The Yahvist would then be the writer of genius who, due to the shifting of the myths from their original matrix, used the theological motif inherent in the tradition of the settlement to give coherence to this collection of heterogeneous narratives. With the Yahvist, we are no longer dealing with a storyteller but with a theologian-narrator who expresses his vision of the relations between God and his people by means of a continuous history, in which the history of the chosen people is bound up with the universal history of humankind and with the history of the world itself.

Starting from the historiographic pole, von Rad's successors have asked how the historical recital of the settlement

relates to the narratives of the succession and to those of David's rise to power. What exchanges took place between the sacred and political vision of God's sovereignty over history and the idea of a divine guidance operating throughout the migration and the settlement? Did the former serve as a structural model for the latter, and the latter as a theological model for the former? It is in this connection that Robert Alter's suggestion takes on its full importance: he asks whether the paradox of the inevitability of the divine plan and human recalcitrance is not revealed in even the smallest narrative units when these are examined in the light of the art of biblical narrative. The most significant narratives turn out to be those in which the divine intention is realized, not through divine intervention, but through the very play of human passions, after the fashion of a *nemesis* inherent in human conduct.

We move from the historiographic pole back to the mythical by inquiring into the theology of history that is evinced in the large narrative units, or even in the smaller ones. Actually, we should speak of theologies of history, for it is not certain that what has been called salvation history (*Heilsgeschichte*) covers all the intentions of the biblical writers. We must be careful not to project the biblical theology of today onto the Hebrew scriptures. The interweaving of a number of different theological themes must be respected: the covenant, the promise and its fulfillment, ethical instruction through the narrative, and so forth. Aside from this plurality of the theologies of history, there is the question of the function of the theological plan as a whole. As a kind of counterpart to the historicizing of the origin myths, could it not itself function as a myth, in the sense of the transcendent founding of present history on the basis of a more fundamental history? More precisely, it seems that the theology of traditions has been assimilated into an etiological myth of the settlement in a foreign land, hence of the gift of the soil. After the catastrophe of the exile, this myth was itself capable of being transformed into an etiological myth of the loss of the land. This second etiological use of the myth results in a new theology of history, centered around the theme of retribution—in short, a theodicy. In the Deuteronomic narrative, this new theodicy finds an expression that may be weak historiographically but is strong in its moral resources. Nevertheless, we must admit that by calling salvation history itself a myth, we are stretching the notion of myth beyond its strict sense of a history of origins *in illo tempore*. Salvation history unfolds in the time of men rather than in the time of the gods. This fundamental difference must make us more careful in using the term *myth* to characterize theological interpretations like those of salvation history.

We must reserve for a third level of analysis the controversial question of whether the conception of time in ancient Israel was explicit or merely implicit. James Barr, in *Biblical Words for Time* (2d rev. ed., 1969), warns us of the temptation to seek information on the Hebrew conception of time at the level of the language itself, in its vocabulary and se-

mantics, or in the etymology of individual words. The meaning of words, Barr observes, results from their use in determined contexts. Thus in our attempt to discover a Hebraic conception of time we are led back to the contexts provided by the narrative forms considered above and to the historical mentality discussed earlier.

An initial question arises: is a specific conception of time implicit in the narrative forms used in the Hebrew Bible? The reply would seem to be negative. The various types of narrative taken separately include very different temporal implications. No general view of time can be extracted from the historiography of *Samuel* and *Kings*; it concerns a given segment of time that permits no extrapolation. To be sure, we can admit that the historiography of the Hebrew Bible, like that of the Greeks, assumes a certain familiarity with temporal succession and chronology. But this relation to time is purely pragmatic. In addition, and this is the most important point, other narrative forms, such as the saga and the legend, on the one hand, and the origin myth, on the other, take place in qualitatively different times, which can be usefully described as "recent," "distant," or "primordial." Thus the "days" of creation are incommensurable with the years in which the monarchs reign; the same is true concerning the patriarchs, who are situated, so to speak, "between" primordial times and historical time. It is therefore advisable to respect the specific temporal qualities belonging to the various classes of narrative.

If we now consider the great narrative compositions, like that of the Yahvist, in which the historical mind of ancient Israel is expressed, it cannot be denied that the various traditions with their heterogeneous durations are submitted to a single temporal order that we should probably represent as a rectilinear and irreversible time underlying a universal history that stretches from creation to the end of the monarchy and to the period of the return from the Babylonian exile. However, besides the fact that this representation is never made explicit by the brilliant composer of the Yahvist document, it would be sorely inadequate for the narrative style of this quasi-historical narrative even if it had been made explicit. This is so for several reasons.

First of all, the time unfolded by the great narrative remains a creation of the narrative art itself. The time immanent in the great narrative configuration by no means abolishes the differences between the heterogeneous time-spans that it encompasses. Thus we cannot say that the election of Abraham occurs after the seven days of creation. The mere succession of narratives does not allow us to project along a single time scale the time of origins, that of the patriarchs, that of the settlement in Canaan, and that of the monarchical period. The idea of a single narrative scale common to all the time-spans is a modern idea foreign to the thinking of ancient Israel and even to that of ancient Greece.

In addition, a series of correspondences and analogies are added to the temporal succession in which one event follows another, as for instance between the various covenants

and the various laws, and even the various theophanies. In this regard one could speak of a cumulative aspect of time in the Hebrew Bible rather than of a purely successive one.

Finally, and what is most important, the relation between God's faithfulness and man's recalcitrance, which is illustrated in so many different ways by the special narrative art of the Hebrew storytellers, narrators, and historians, does not lend itself to interpretation in terms of the categories inherited from Platonism and Neoplatonism, where divine immutability is diametrically opposed to the mutability of all things human. God's faithfulness, which marks the history of men, suggests the idea of an omnitemporality rather than that of a supratemporality. This omnitemporality, moreover, is in perfect agreement with the sort of cumulative history we have just mentioned. In order to be able to speak of a biblical time, we would have to take all of the literary genres into account and not only the genre of narrative. There is an immemorial time of the laws, a proleptic time of prophecy, an everyday time of wisdom, a "nowness" of hymnic complaint and praise. Biblical time—if this expression has any meaning—is made up of the interweaving of all the temporal values that are added onto the numerous temporal qualities preserved by the variety of narrative forms. The representation of a linear and irreversible time is wholly inadequate for this chorus of voices.

Would we then be justified in speaking of a return to mythical time by way of a history-like narrative, on the basis of the theologies presiding over the narrative composition itself, as, for example, in the conception of history as salvation history? This could be done only by ascribing to the term *myth* the extremely broad sense of a founding narrative that is related to everyday existence. In fact, it is just as important to stress the historicization of myth as it is to emphasize the mythologization of history. The position of the origin myth in *Genesis* 1–11 attests to this decisive subordination of myth to history. It is only as a broken myth that the archaic myth is reasserted within the gravitational space displayed by the historiography of the monarchic period and by the narrative of the conquest and settlement.

Perhaps it is in this that the hidden kinship between Greek thought and Hebrew thought resides. Each of them in its own way breaks with myth. Each, too, reinvents myth, one as a philosophical tale, as we saw in Plato, and the other as a broken and historicized myth, as in the Yahvist account of creation.

Revised Bibliography

MYTH AND RITUAL SCHOOL. The term *Myth and Ritual school* refers to two movements, one in Great Britain in the second quarter of the twentieth century, connected with the name of S. H. Hooke of the University of London, and the other, less clearly identifiable, appearing at about the same time in Scandinavia. The "school" or movement arose in reaction against an evolutionary approach to the study of ancient religions, although it depended upon data collected by scholars holding to the evolutionary outlook. It arose also as a result of a growing recognition in many circles of the central importance of ritual acts for ancient peoples and of the accompanying texts—the myths. The movement thus was rightly designated the "Myth and Ritual school," for it sought to show how pervasive were the central ritual acts of ancient societies and how inseparable from these acts were the accompanying words. The school gave great prominence to the religions of the ancient Near East; the most weighty applications of the school's findings were made to the study of the Hebrew scriptures and the New Testament.

The pattern of religious activity identified by the school was focused upon the celebration of New Year's Day and upon the place of the king in that celebration. The community was enabled to participate in the actual renewal of the cosmos as the various elements of the ritual were observed. The Myth and Ritual school thus stressed the enormous cultural significance of right observance of the ritual; ritual and its accompanying words were, according to the Myth and Ritual theorists, at the heart of an ancient society's self-understanding.

BACKGROUND. Many elements contributed to the appearance of the Myth and Ritual school. The gathering of data on religious practices by ethnologists and anthropologists such as was carried out, for example, by James G. Frazer and reported in his multivolume work, *The Golden Bough*, 12 vols. (1911–1915), provided vast comparative materials for the school's use. Specialized studies of the social and psychological aspects of the life of ancient Israel, in particular the work of the Danish scholar Johannes Pedersen (*Israel, Its Life*

and Culture, 2 vols., 1926–1940), proved influential in Great Britain and in Scandinavia. And the studies of the great Danish historian of religion and specialist in Germanic religion Vilhelm Grönbech were a highly influential factor in shaping the school's appreciation of the dynamism and power of cultic life, with its many-faceted ritual acts. Also influential were the studies of the German scholar Wilhelm Mannhardt on cultic practices related to agriculture and the agricultural year (see especially his *Wald- und Feldkulte*, 2 vols., 1874–1876, 2d ed., 1904–1905).

BEGINNINGS. Both branches of the school originate in association with the work of the great Hermann Gunkel, founder of the method of form criticism. An Old Testament specialist whose work firmly rooted the study of the Old Testament in the cultic practices of the ancient Near East, Gunkel also saw the connection between ritual and myth, especially in his studies of the myths and legends of *Genesis* (*Genesis*, 1901; 2d ed., 1922). But it was the Norwegian scholar Sigmund Mowinckel who first applied the insights and approach of Gunkel to the cultic materials of the Hebrew Psalter in a series of studies (*Psalmen-Studien*, 4 vols., 1921–1925).

For Mowinckel the early Israelite cult was a living reality, marked by the existence of wonder-workers and mischief makers who had to be dealt with by means of ritual acts and formulas. The New Year's Day celebrations saw the Israelite God Yahveh enthroned afresh as lord of the universe, with whom the earthly king was cultically associated. Details of this celebration would later be worked out by the Myth and Ritual school, but Mowinckel gave the basic structure of the celebration in this early study of the Israelite cult. Mowinckel gave examples from the surrounding religious practices to show that this cult of Yahveh in Israel had very close similarities with those of its neighbors. Many other scholars would join in the search for parallels and for further evidence of the influence of ancient Near Eastern myth and ritual upon the religion and cult of early Israel.

THE BRITISH SCHOOL. The Myth and Ritual school in Great Britain was a remarkable instance of scholarly collaboration in an age in which individual scholars tended to work in relative independence of one another. The moving force within the school was S. H. Hooke, longtime professor of Old Testament studies in the University of London. He edited a series of studies during a twenty-five-year period in which he and his colleagues sought to identify the connection between ritual acts and the words that accompanied them—that is, the myths, the "libretto" of the ritual score. The first study appeared in 1933 under the title *Myth and Ritual*. The second, *The Labyrinth*, was published two years later. These two works covered the rites of the peoples of ancient Mesopotamia, Egypt, Anatolia, and Canaan, and dealt at length with the myth and ritual of ancient Israel and of early Christianity. The third of the volumes came out in 1958: *Myth, Ritual, and Kingship*. It included an essay by H. H. Rowley, "Ritual and the Hebrew Prophets," in which

Rowley indicated reservations about aspects of the school. It also included an important critical assessment of the school by S. G. F. Brandon, which called attention to certain critics of the school and included several points of sharp disagreement by Brandon himself. This chapter in the book is addressed by Hooke in his introductory essay. It was a salutary thing that this open debate on the school's view was furthered by publications in which the school's central positions were espoused.

For the British school, the central undertaking seemed to be to show how many of the cultic practices and the motifs of ancient Near Eastern myths and sagas had their counterpart in texts of the Hebrew scriptures. The reconstruction of the annual festival in ancient Israel produced an amazing richness: recitation of the story of creation; humiliation and ritual murder of the king; descent of the king into the underworld; resurrection from death and restoration to the throne; the sacred marriage of the king and his consort, representing the divine pair; the reestablishment of the cosmos and the historical order; and the recitation of the divine law. The pattern was derived from the New Year ritual text preserved in the Akkadian language and dating to Seleucid times, augmented by many texts from other times and societies.

Critics pointed out that these elements were actually drawn from many places in the Hebrew scriptures, never appearing together, if indeed some of the elements actually appeared at all. Critics also made the point that Israel's earthly king is a latecomer in Israel to the historical scene and is often under the most severe challenge and indictment by the prophets. But for about three decades the British Myth and Ritual school pressed its viewpoint, enlisted scholars of great learning and influence into its ranks, and sought to refine its position.

THE SCANDINAVIAN SCHOOL. Less formally associated with one another than were those of the British group, the Scandinavian specialists dealing with myth and ritual also gained much of their initial perspective from the work of Hermann Gunkel and from the early writings of Sigmund Mowinckel. Other works of special importance for the Scandinavian school included a study of *Exodus* 1–15 by Johannes Pedersen in which the author saw these chapters to be a text that accompanied the celebration of the Passover festival in early Israel. The whole drama of the call of Moses, the move to Egypt to effect deliverance, the plagues, the last dreadful night as the Passover was observed, closing with the legend of the crossing at the Red Sea, the defeat of Egypt's forces, and the triumph song of the Israelites, would have been recited as the libretto of the Exodus celebration. Early stages of the text that accompanied the ritual could to some degree be distinguished from the later stages of the tradition; but the character of *Exodus* 1–15, said Pedersen, was better explained as the Passover ritual text than on the basis of separate literary sources or traditions. Pedersen recognized Passover to be a nature festival of pastoralists that, by means of the annual celebration with its accompanying legend, rooted the natural festivity in Israel's historical consciousness.

The work of the Swedish scholar H. S. Nyberg on the *Book of Hosea* also greatly influenced the Scandinavian school. In *Studien zum Hoseabuche* (1935) Nyberg argued that the text of *Hosea* was probably preserved orally until the time of the Babylonian exile, but he also argued, on the basis of analogies from the ancient Near East, that oral tradition is very reliable indeed. Thus Nyberg spoke for the value of the cultic community of ancient Israel in the preservation of the words of its leaders and for their reuse in the cult, thereby (like Pedersen) expressing mistrust of the "bookish" approach of western European and North American scholars. In addition, the comparisons drawn by Nyberg to early Arabic practices would prove useful in the later work of the Scandinavian Myth and Ritual school.

Other studies followed. Alfred Haldar examined the relations of ancient prophets to the cult and came to the conclusion that although prophets were often critical of the cult, they were themselves usually the product of the cult as well, functionaries who had their regular place in the ceremonies and rituals by means of which the society's life was renewed. Aage Bentzen of Denmark, in one of his very influential writings (*King and Messiah*, 1955), dealt with later eschatological writings, showing that the kingship ritual of early times continued to exercise influence in postexilic times, as Israelite messianism developed. Richard Reitzenstein (1978) did the same for Hellenistic religious rites and practices, bringing to the study and evaluation of the New Testament a wealth of history-of-religions materials reflecting cultic practices believed to illuminate the world of the New Testament. A lengthy commentary on the *First Letter of Peter* by Frank Leslie Cross (1954) presented this New Testament book as the text to accompany the celebration of the Christian "Passover," Easter.

Ivan Engnell and Sigmund Mowinckel, in quite different ways, brought the work of the Myth and Ritual school in Scandinavia to a new level. Engnell was a vigorous exponent of the king's central position in the cult. He probably overstated the case for the accuracy of oral tradition and related too many biblical texts to the royal cult, thus producing a reaction against the entire position of the school. An essay by Martin Noth was considered by many scholars to have offered the definitive refutation of the Scandinavian approach to the place of the king in the Israelite cult ("God, King, and Nation," in *The Laws in the Pentateuch and Other Essays*, 1966). Noth pointed out how late kingship appears on the scene. Israel's very identity as a people is formed in the Israelite traditions long before there is a king. The kings are held under constant surveillance by the ancient prophets, according to the biblical record. And the eschatological pictures of the king of the time of consummation offer such a picture of this "last" king that further judgment is expressed against all incumbents. Mowinckel, in his major work on Israelite messianism and eschatology, *He That Cometh* (1955), provided a seasoned and thoughtful critical assessment of the work of the Myth and Ritual school in both its British and

its Scandinavian forms. At the same time, Geo Widengren continued his specialized studies dealing with the relation of myth and ritual, refining the outlook of the Myth and Ritual school and making it evident that in most particulars the school's outlook had stood the test of time.

CONTINUING INFLUENCE. Despite the weaknesses of the school, as pointed out by Henri Frankfort (*Kingship and the Gods*, 1948), Martin Noth, and many others, the result of the work of these scholars has been on the whole very positive. The Myth and Ritual school presented a forceful critique of evolutionistic schemes employed in the study of religion. It kept critical scholarship continually alerted to the need to take the actual practices of a religion at least as seriously as it took that religion's ideas and its literary heritage. It underscored the significance of the king for the entire life of ancient societies. Moreover, the comparative approach of the school has endured and become characteristic of the study of religion. Historical, comparative, structural, and systematic studies of religion all have their place in the study of religion, and the Myth and Ritual school contributed much to the enlargement of the vision of scholars engaged in the study of religion.

The school was able to bring together specialists from many backgrounds, linguistic interests, skills, and schools of interpretation, forging a working team (as in Great Britain) or furthering collaboration on several interlocking problems (as in Scandinavia), offering creative and comprehensive interpretations of central features of religion, especially the religions of the eastern Mediterranean area and Mesopotamia.

The school claimed too much for the pervasiveness of the pattern of ritual observance in the societies studied. It did not sufficiently allow for the differences in the understanding of kingship in the different lands. It seems also to have reconstructed patterns that turned out to be not nearly so widespread as its members thought, such as ritual marriage and the death and resurrection motif. But the school also brought to prominence several features of religious understanding and cultic practice that are unmistakable as the study of religion and religions continues.

Some of the critics of the Myth and Ritual school also went too far in their contentions. The differences between the historical consciousness of ancient Israel and that of Israel's neighbors were exaggerated by Martin Noth and others. And if the chief festival in the life of ancient Israel was centered upon the covenant rite or upon Jerusalem, rather than upon the king as representative of the deity, even so the role of the king in the cult of ancient Israel was very prominent indeed.

Two aspects of scholarship characterize the study of myth and ritual in the early twenty-first century. The first is the extent of collaborative work on myth and ritual by scholars in many fields: philologists, historians, anthropologists, ethnologists, sociologists, philosophers, archaeologists, along with specialists in religion. Indeed, the study of reli-

gion today is unthinkable without such collaborative work. It is important to remember, however, that the Myth and Ritual school did much to further this collaboration and to display its fruitfulness.

The second aspect is the comparison of texts in religious studies. Not only does the comparison of texts help to clarify the varied meanings of ritual acts; it also helps scholars to see the strength and meaning of the texts as literature. Here the interest of the Myth and Ritual school was too narrow. The story of creation does belong in association with ritual acts, but it also has a life outside its ritual use. The great prayers and hymns of the ancient world and of Israel are cultic texts to be used as the community participates in the recreation and reestablishment of its world and of the cosmos, but they too have a life of their own. These cultic texts offer perspectives, a worldview, an understanding of certain fundamental realities upon which the social existence of the peoples depended. Nevertheless, the school's insistence that these cultic texts were to be seen as actual parts of the ritual life of the people was an invaluable recognition.

NABATEAN RELIGION. The scholarly consensus is that the Nabateans, whose kingdom flourished from about 400 BCE to 106 CE and whose capital was Petra in Jordan, were in part the descendants of the earlier inhabitants of southern Jordan, though apparently ruled by a dynasty of north Arabian background. At its most extensive, the Nabatean kingdom also incorporated other populations, including many of Aramean descent in southern Syria. In discussing Nabatean religion, therefore, one needs to take account of the fact that some peoples under Nabatean rule may only have adopted the traditions of Petra superficially, while basically retaining their own traditional cults. A “new” deity could be assimilated into or merged with a well-established local deity. Also, distinct Nabatean regions can be detected in which the deities worshiped vary along with other cultural markers (such as language and personal names).

NABATEAN HISTORY. The history of the Nabatean kingdom can only be traced in part, the sources being principally epigraphic, literary, and numismatic. Archaeology and iconography provide some evidence in relation to religion but add little to Nabatean history.

The epigraphic corpus consists of thousands of inscriptions and a few papyri written in the Nabatean version of the Aramaic language (widely used from the Achaemenid era) and in a distinctive local variety of the Achaemenid Aramaic script. Although the number of Nabatean inscriptions is large (over five thousand), many come from regions well outside the Nabatean heartland and were probably written by people who had only a tenuous connection with the Nabatean state (and its religion). Also, many were written after the fall of the Nabatean kingdom in 106 CE and thus provide only secondary evidence for the period of the kingdom itself.

Although the prestigious literary language, Aramaic, was used for inscriptions, it is generally agreed that the Petran élite, and probably large swathes of the populations of the southern and eastern parts of the kingdom, used some early form of Arabic as a vernacular. The evidence for this is provided by Arabic loanwords in Nabatean Aramaic and by the fact that many of the peoples in eastern Jordan used a form of early Arabic (Safaitic).

CLOCKWISE FROM TOP LEFT CORNER. Thai bronze Buddha in meditation under a *nāga*. Literary evidence for Nabatean history is entirely non-native and mostly in Greek. Still, little historical detail is recorded, though Diodorus Siculus includes important anecdotes on the Nabatean contact with the Seleucids, and Josephus makes passing comment on Judaean dealings with the Nabateans. Other authors, writing in Greek (Strabo) and Latin (Pliny), confine themselves largely to describing aspects of Nabatean society (including religious aspects). These various sources make it clear that the basis of Nabatean prosperity was control of the overland routes of the Arabian incense trade: the trade was heavily taxed.

The Nabateans first appear in a historical context in 312 BCE in conflict with the Seleucids (Diodorus). Thereafter their independent kingdom is mentioned in the books of Maccabees, mostly in conflict with, though sometimes in alliance with, the Judaeans. From c. 100 BCE we have a tolerably clear king list, reconstructed in part on the basis of Nabatean inscriptions and coins and in part on the basis of authors like Josephus, who detailed ongoing relations with the Judaeans. On the wider stage, the involvement of the Nabatean Syllaeus (later pretender to the Nabatean throne) in Aelius Gallus's largely abortive campaign in 24 BCE against southern Arabia is recorded by Strabo (blaming Syllaeus). After a dispute over the throne, Aretas IV ruled from 9 BCE to 40 CE, and it was under this king that Petra and Nabataea enjoyed a period of evident success, with most of the great buildings of Petra being built at this time. Aretas appears to have had a nationalistic policy, and he took the title "lover of his own people." Rabel II (from 70 CE) is the last of the kings. Nabatean control over the trade routes was in decline and there was a (peaceful?) Roman takeover in 106 CE, at which point Nabataea was incorporated into the Province of Arabia with its center at Boşrā.

NABATEAN SITES. The main Nabatean sites have yielded evidence of religious architecture that throws some light on practice. Petra and Madā'in Šāliḥ in Saudi Arabia (ancient Ḥegra) are also notable for their visible monuments that did not require excavation, being carved into rock faces. For reasons of space, the concentration here is on the main sites: there is a full gazetteer in Wenning (1987) and a survey in Healey (2001).

At Petra, even the rock defile, the so-called Sīq, which is the most usual access point to the city, was at least in part religious, as is suggested by religious carvings in it, some with inscriptions, and it may have been used for processions connecting Petra itself with Gaya (later named al-Jī, Wādī Mūsā), which is known to have had at least one important temple.

At the other end of the Sīq, the narrow defile opens out in front of the Khazneh, a monumental façade carved out of the rock. There has long been ambiguity about the original purpose of the Khazneh, but it is most likely a tomb of a king, though no inscription exists to confirm its function. The Khazneh's baroque decoration is the result of Alexandrian influence.

After the Khazneh, the space in which Petra itself is located opens out and the city is dominated by two principal features: monumental tombs (some probably royal) carved out of the steep rock faces, and a main street that terminates at the gateway of a major temple, passing other religious and nonreligious monuments on its way. The only inscribed tomb in the central area, Qabr al-Turkmān, does not name the person for whom it was carved. Some have seen the absence of inscribed tombs at Petra (by contrast with Ḥegra) as arising from a taboo against names on tombs at Petra. A more likely explanation is that some impermanent material like wood was used for the inscriptions on Petran tombs (and a tomb outside the Sīq does have a name).

The temple at the end of the main street is surrounded by a *temenos*. The sanctuary itself, to the left of the axis of the main street, is square and has an inner sanctum in which the object of worship was placed on a podium against the rear wall. The front was open, and directly opposite the entrance stood an altar surrounded by a large enclosure suitable for the gathering of crowds.

Only fragmentary inscriptions from the immediate area give any clue to the deity to whom the temple was dedicated. There are two hypotheses. As the probable main temple of the city, it is often assumed to be dedicated to the main god, Dushara (below), and in support of this we may note a fragmentary post-Nabatean inscription with a dedication to Zeus: Dushara came to be identified with Zeus. The other hypothesis notes that the traditional Arabic name of the temple, Qaṣr al-Bint, "castle of the girl," might be an echo of the temple of Aphrodite, which existed later at Petra (as we know from one of the documents in the "Babatha" archive found to the west of the Dead Sea [papyrus Yadin 12]) and suggests the temple was dedicated to a Nabatean goddess (on Allāt/al-ʿUzzā, see below).

Just outside the *temenos* gate, to the north, lies the Temple of the Winged Lions (so named because of decorative features discovered there). This is a complex structure at the center of which is a *cella* of a very different type than that of the Qaṣr al-Bint, one that allowed movement *around* the podium on which the cult object stood. Hammond suggested that this central podium was surrounded by curtains and elaborated this suggestion in terms of a "mystery" cult similar to that of Isis (as described in Apuleius's *Golden Ass*). In support of the Isis link is a beautiful votive figure with Isiac iconography. The inscription on the figure does not, however, name the goddess, only the dedicator of the offering involved, and while we know that Isis *was* worshiped at Petra, this cult seems to have been practiced in remote rock sanctuaries around the city. In any case, all the goddesses of the Roman world and adjacent areas were susceptible to Isis influences because of her extreme popularity. It seems most likely, therefore, that the Temple of the Winged Lions was dedicated to Allāt/al-ʿUzzā in Isis mode. Unfortunately, the one extensive inscription from the temple deals with tithes for priests but throws no light on the identity of the goddess.

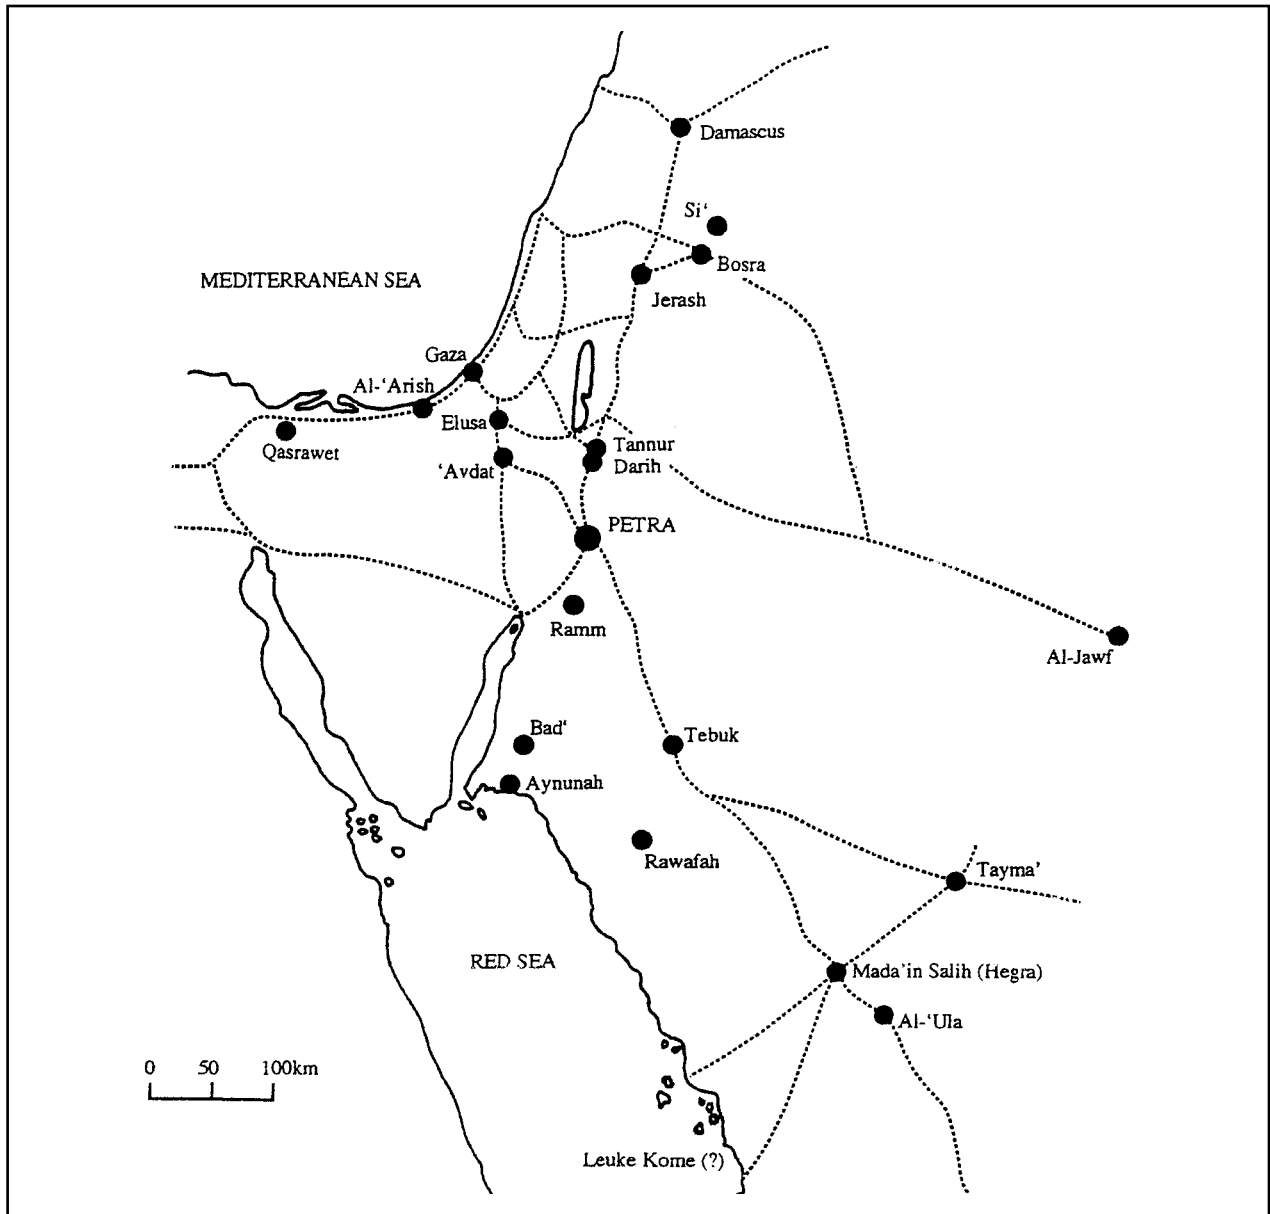

FIGURE 1. Nabatean Sites. *Illustration courtesy of the author.*

The third building to note here is the so-called “Great Temple” or “Large Temple” to the south. Again we have an elaborate building that *may* have been a temple, but the presence in its midst of a theater suggests it was used for some other purpose.

RELIGIOUS INSTALLATIONS. Temples ascribed to the Nabateans are found at a number of neighboring sites, the most important of which are Dhariḥ and Tannūr to the north and in Wādī Ramm to the south. It is not easy to be sure that others, for example, in southern Syria, are Nabatean in design: the Nabatean colonization of southern Syria was culturally superficial. Of the Nabatean temples proper there are two types. One (Qaṣr al-Bint) has a podium against the rear

wall. The other type has a pillared gallery around the podium (Winged Lions, Dhariḥ, Ramm). The suggestion has been made that this latter arrangement would have allowed circumambulation, but there is no direct evidence of such a ritual, and the space available would not allow for more than a few cult officials.

Apart from built temples, the Nabateans were also fond of open-air sanctuaries on the tops of mountains. The most striking of these is the so-called High Place on the Maḍbah outcrop at Petra. Here we find an elaborate installation involving podia, steps, reservoirs, and drainage channels. Arabic *maḍbah* means “altar” or “place of sacrifice,” and the installation, which overlooks the center of the city, is usually

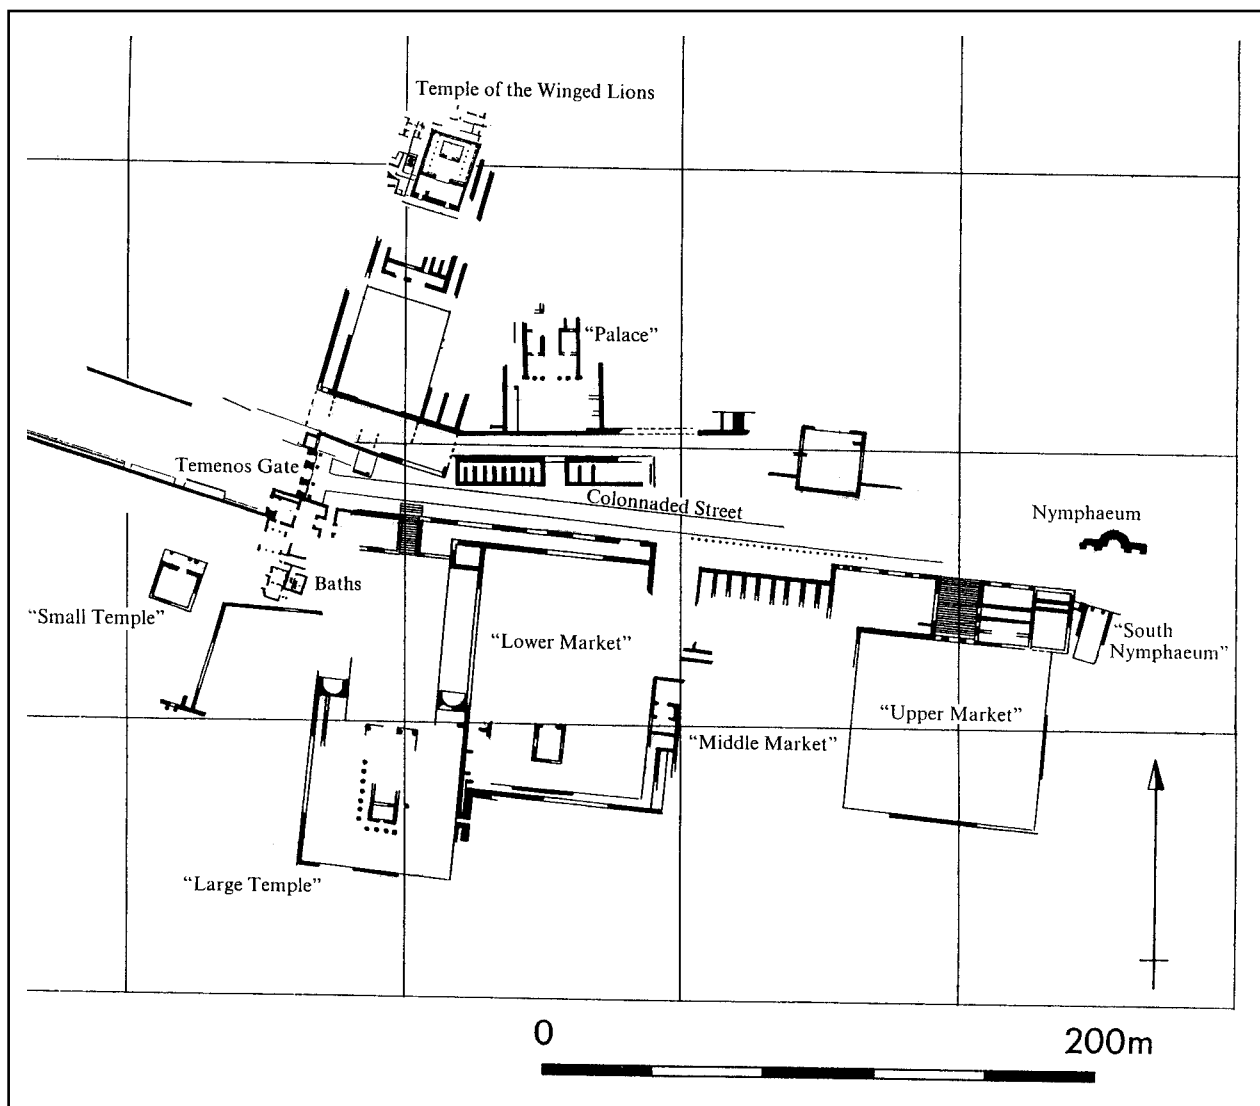

FIGURE 2. Plan of Petra. (from J. McKenzie, *The Architecture of Petra*).

interpreted in this light. Its religious significance is confirmed by the monumental stairway that leads to it and by the religious niches, some with inscriptions and distinctive religious iconography, that surround it. One niche carved nearby has crescent moons and was probably dedicated to a moon deity, while another, farther away, has a remarkable dual representation (probably) of Dushara both as a bearded "classical" god and as a plain *betyl* or stone pillar.

Cult niches are a common religious artifact of the Nabatean tradition. They were often podiums for *betyls* (cult-stones). The latter are usually plain and unmarked, but some have minimalist representations of a face. Some were movable, while others were carved *in situ* out of the rock face, with up to three *betyls* of different sizes, apparently representing a "divine family."

That the Nabateans believed in an afterlife is suggested by hundreds of monumental tombs. In some cases these are provided with *triclinia*, ritual banqueting rooms, suggestive of a commemorative ceremony. Some *triclinia* are not related to the dead but were the locus of special cults (*mrzhy*) adhered to by guilds or sodalities.

THE DEITIES. Dushara appears to be the main Nabatean god, his primacy being evident in the phrase "Dushara and all the gods" in several inscriptions and in the fact that wherever gods are listed he appears first. His name (*dwšr*) is in origin an epithet meaning "the One of (Mount) Shara" (located in southern Jordan). The same analysis of the name appears in Islamic sources, which call him *Dū al-Šarā(t)*. The name's structure is paralleled in northern and southern Arabia. Dushara's close link with the Petra area is clear from his

epithet “god of Gaya,” this being an old name of the village at the entrance to Petra.

Of the few indications of specific characteristics of Dushara, we may note the title “the one who separates night from day” in an inscription, which suggests an astral character. Scholars have favored the planet Venus (male in southern Arabia), Mercury (the Arabian god Ruḏā) or the sun (Strabo hints at such a cult in Nabataea, and a solstice aspect of Dushara is suggested later by Epiphanius). Roman identifications of Dushara, for example, with Zeus and Dionysos, are secondary.

Names of other male deities occur, such as Baalshamin (an import from Nabatean Syria), Qōs (Edomite and worshiped at Tannūr) and Hubal (only in northern Arabia), but there is such a concentration on Dushara that it can be argued that he was, in practice, the supreme Nabatean deity. Certainly he was the dynastic deity of the royal house, “the god of our lord (the king),” and because of this his cult spread wherever Nabatean rule extended. In the different localities he was connected with established local gods, such as Baalshamin in Syria.

On the female side, there is evidence of worship of a number of goddesses: Allāt, al-‘Uzzā, and Isis and Atargatis (these last two being foreign). There are also some goddesses who appear only in particular localities within the Nabatean realm (for example, Manōtu only in Ḥegra; specific manifestations of Allāt localized in Boṣrā, the Ḥawrān and Ramm).

The two principal female divine names that occur (though never together) are Allāt and al-‘Uzzā. The distribution of these in the inscriptions suggests that they were never worshiped side by side. There is no explicit evidence of Allāt at Petra and little of al-‘Uzzā at Ramm and in southern Syria. When account is taken, therefore, of the fact that al-‘Uzzā is in fact an epithet, not a personal name, meaning in Arabic “the Mighty One,” it is possible to conclude tentatively that al-‘Uzzā was for the Nabateans an epithet of Allāt. The latter enjoyed much wider popularity in Syria and Jordan, while the title al-‘Uzzā is more restricted in use and of Arabian background. The two were, however, distinguished in later tradition in northern Arabia. A final resolution of this may be provided in the future by further epigraphic evidence identifying or distinguishing the two.

Little can be said of characteristics of Allāt and al-‘Uzzā. The former is described in inscriptions as “mother of the gods” (reading uncertain) and “the great goddess.” Herodotus identified her with Aphrodite, though in the Ḥawrān she was identified with Athena. al-‘Uzzā is the northern Arabian goddess of the planet Venus and is identified with Aphrodite in a Nabatean inscription from the island of Cos.

Of the various other deities who have some degree of prominence, note may be made of: (1) al-Kutbā, a deity in the Thoth/Nabu tradition, but apparently worshiped in both male and female forms; (2) other deities with north Arabian affiliations such as Shay‘al-Qawm and Hubal; and (3) the

FIGURE 3. The Qasr al-Bint Temple, Petra. (from J. McKenzie, *The Architecture of Petra* [after Gibson]).

god ‘Obodat, apparently the divinization of one of the kings of Petra, whose tomb was reportedly located at ‘Avdat in the Negev (Uranus).

ANICONISM AND ARABIA. Reference has already been made to a Nabatean (and wider northern Arabian) tradition of representing deities not as human beings but as *betyls*. This is part of the Nabateans’ northern Arabian heritage, but it was not in itself a matter of rigid religious principle, as can be seen from the fact that under Greek and Roman influence the Nabateans soon got used to making statues. Reference has been made earlier to the combined representation of Dushara both as a plain *betyl* and as a bearded male figure.

Aniconism (reluctance about or rejection of images) constitutes one of the cultural links between the Nabateans and their contemporary Judaeans neighbors on the one hand and the later Muslims on the other, though in the case of Judaism and Islam, aniconism became a central part of religious ideology. There are other points of contact with Jewish practice (such as the probable use of secondary burial), but the northern Arabian coloring of Nabatean religion is much stronger. Apart from the use of *betyls*, major deities such as Dushara and al-‘Uzzā /Allāt, as well as the minor deities such as Hubal and Manōtu (= Manāt), have a clear north Arabian background and they re-emerge later as the pre-Islamic idols

destroyed by order of Muḥammad. The most likely explanation of this phenomenon of Arabianism is that at least the higher strata of Nabatean society were of northern Arabian origin: this would also explain the probable use of a form of Arabic as a vernacular and the predominance of Arabian-type personal names.

Because of the sparsity of the evidence, there are few aspects of Nabatean religiosity on a personal level that can be teased out in any detail. A certain fondness among a minority for devotional cults associated with particular gods (Isis and others) may reflect personal religion. The repeated use in graffiti of the religious formula “Remembered be . . .” envisages a pious passer-by bringing blessing on himself by mentioning the name of the inscriber “before the god.”

Nabatean religious tradition was heavily influenced by northern Arabian religion, both in the particular gods venerated and in some of the forms that veneration took: the reluctance to depict deities in human form is a good example.

Historically more important, perhaps, is the distinct tendency to restrict attention and worship to the main deities, Dushara and Allāt/al-‘Uzzā (if the latter is a single deity, as argued above). Other gods were worshiped by specialist groups (special ethnically, geographically, socially), but Dushara and Allāt formed a divine pair par excellence, and the cult of these two appears to be the official cult of the state. This is a modified form of monotheism, though involving a pair of deities rather than just one. This type of “dyotheism” was not new—even the Old Testament Yahweh was regarded by many Israelites as having a spouse.

JOHN F. HEALEY (2005)

NABU was a god, possibly of West Semitic origin, who became a major divine figure in Babylonia and Assyria of the first millennium BCE. He is first mentioned in official Babylonian documents of the time of Hammurabi (c. 1760 BCE) and may have been brought to Babylonia by the West Semites, who migrated there in large numbers in 2000–1800 BCE. Nabu was closely aligned with Marduk, whose minister, scribe, and ultimately son he was considered to be. The cult of Nabu began to spread in the Old Babylonian period. He grew in importance, becoming the god of the Ezida temple and the city of Borsippa by the beginning of the first millennium BCE. Nabu and Marduk are frequently mentioned together as the major pair of gods in Babylonia. *Nabu* appears in many personal names, including *Nabu-Kudurri-usur* (the biblical Nebuchadnezzar), which means “Nabu protect our boundaries.” In Assyria, Nabu was revered as one of the most important gods, and his popularity was still increasing at the end of the Assyrian empire.

Nabu appeared in several important cultic festivals of the first millennium BCE. The most important was the Akitu, the spring New Year festival, which began when Nabu came in solemn procession from Borsippa to Babylon. The festival celebrated the reign of Marduk, but Nabu’s participation was important enough that the absence of the festival during a period of political disturbance was referred to as “when Nabu did not come from Borsippa.” He also appeared in the Babylonian celebration of his marriage to Nana and the Assyrian celebration of his marriage to Tashmetum.

Nabu is best known as the god of writing. He was the patron of scribes, displacing Nisaba, who played this role until the Old Babylonian period (1800–1590 BCE). As Marduk’s scribe, Nabu was the writer of the tablets of destiny. He was associated with Marduk and Ea and consequently was considered a god of wisdom. By the end of Assyrian history Nabu was also assuming some of the characteristics of the hero figure Ninurta.

TIKVA FRYMER-KENSKY (1987)
Revised Bibliography

NĀGĀRJUNA, best known as the first Mahāyāna philosopher in India, is a highly complex figure whose philosophical works, iconic image, and esoteric meditations are studied, honored, and practiced in many Mahāyāna traditions to this day. He developed his systematic philosophy of

“emptiness” (*śūnyatā*) some time during the second century CE. According to most hagiographic traditions, however, he attained the alchemical ability to extend his life, and the esoteric texts that some traditions attribute to him were apparently composed several generations after his philosophical works. In Tibet, where his philosophical texts were widely studied, these esoteric writings also became revered and widespread. Whatever the historical reality of Nāgārjuna’s life and authorship may be, the great span of his life and the great breadth of his alleged corpus stand as metaphors for his prominence within Mahāyāna Buddhism.

Many of Nāgārjuna’s hagiographies, all of which come from China and Tibet, recount an episode that illustrates Nāgārjuna’s importance for the Mahāyāna. Probably the earliest texts of the Mahāyāna were in a style that came to be known as Perfection of Wisdom (*prajñāpāramitā*). These texts teach a challenging theory: addressing much of what early Buddhists held to be ultimately true and real, Perfection of Wisdom claims that such things actually are not ultimately true or real at all. According to Mahāyāna accounts, these texts were taught by the Buddha himself, but they were so challenging that they were kept secret for several centuries after the Buddha’s passing; otherwise, their radical doctrines might have led some disciples astray. For their safekeeping, the Perfection of Wisdom texts were conveyed to the land of the *nāgas*, usually depicted as serpent-spirits, who secretly guarded the texts until the world was ready to receive the Perfection of Wisdom. Eventually, Nāgārjuna’s fame became known to the *nāga* king, and he invited Nāgārjuna to come teach his philosophy to his subjects. Having traveled magically to the *nāga* kingdom, Nāgārjuna taught the king and his subjects the philosophy of emptiness, and his hosts were so delighted that they conferred on him the long hidden texts. With Nāgārjuna on hand to explain the text’s meaning, it was clear that the world was ready to receive these difficult teachings.

While Nāgārjuna’s journey to the *nāga* world may be difficult to confirm, there is no doubt that he did indeed champion the Perfection of Wisdom by explaining and defending the notion of emptiness (*śūnyatā*), the central theme of those texts. His philosophy of emptiness is one of Nāgārjuna’s main contributions to the Mahāyāna, and to understand that philosophy, one must see how it is rooted in the previous Buddhist theories that emptiness challenges.

PHILOSOPHY OF EMPTINESS (*ŚŪNYATĀ*). From its earliest period, Buddhist thought rested on the notion that humans seek above all to eliminate suffering, and that the only way to eliminate suffering is to eliminate its causes. According to the strand of Buddhist thought that most concerns Nāgārjuna, suffering is caused by “ignorance” (*avidyā*), a way of seeing the world that distorts all of one’s cognitions. Centered on an erroneous view of one’s personal identity as fixed and absolute, ignorance is said to afflict all of the mental states of all ordinary persons. And since one’s actions are therefore guided by erroneous and distorted mental states,

they cannot fully succeed; hence, all attempts to eliminate suffering end in frustration.

To resolve this problem, one must eliminate ignorance, that is, the pervasive error about one’s personal identity that distorts one’s experiences. In conceptual terms, this error is the belief that, in some fashion or another, one has an essentially real and immutable identity, a personal “self” or *ātman*. One way to eliminate that belief is to demonstrate convincingly that its object, the alleged self, does not truly exist. And to negate the self, early Buddhist thinkers used a type of reductive analysis: one exhaustively categorizes all of the constituents of mind and body so as to leave no item unexamined, and one then carefully examines those constituents or “elements” (*dharmas*) in order to determine whether any—singly or in combination—could be the self. Using various contemplative techniques, one’s thorough search demonstrates that no such self is to be found anywhere in body and mind, and knowing that nothing other than the constituents of mind and body could be a self, one is convinced that no such self exists. One proceeds to deepen this realization of “no-self” (*anātman*) in meditation, and eventually, ignorance is completely overcome. One thus attains *nirvāṇa*, utter freedom from suffering.

Nāgārjuna accepts this model, and he is also familiar with the early Buddhist style of reductive analysis. To put it simply, one analyzes an entity by attempting to break it into its component parts, and if it cannot be broken down further, the entity is ultimately real. The traditional example, a water-jug, is not ultimately real because it can be broken down into more fundamental parts existing at discrete moments of time. Eventually, the analytical process reaches its conclusion: one discovers the irreducible elements that are the stuff of the mental and physical universe. Only these elements are ultimately or truly real.

It is important to note that, while a reductive analysis of this kind leads to the conclusion that entities such as water-jugs are not ultimately real, it does not totally deny the reality of such entities. That is, in ultimate terms a water-jug is actually just irreducible bits of matter; only those irreducible elements are *ultimately* real (*paramārthasat*); the water-jug is not. Nevertheless, in practical and linguistic terms, one can still use the term *water-jug* successfully. Hence, a water-jug is *conventionally* real (*saṃvṛtisat*).

This notion of the two realities—the ultimate and the conventional—is crucial for Nāgārjuna’s thought, and he readily accepts it as well. He is not satisfied, however, with simple reduction as a way to discover what is ultimately real. His main critique focuses on the notion of “essence” (*svabhāva*) that the aforementioned reductive analysis assumes. Essence is implicated in the reductive analysis because, in order to truly know that there is no self in mind and body, one must be able to say what mind and body truly are. Since mind and body are just a bundle of elements, this comes down to knowing what the elements truly are. And in order to know what each element truly is, one must know

what kind of thing it is—that is, one must recognize its true nature or essence (*svabhāva*).

Nāgārjuna responds to this emphasis on essence by redefining the notion of ultimate reality. He appears to draw on an intuition about parts and wholes in the reductive approach. In order for that analysis to succeed, one must call into question the relation between, for example, the water-jug as a whole and the irreducible particles of matter that are its parts. The analysis concludes that such a whole-part relation cannot be rationally defended; hence, since wholes clearly cannot exist without parts, they must be unreal. The intuition here is that, rather than directly critiquing the notion of a whole such as a water-jug, the analysis attacks the reality of the relation that allegedly ties the whole to its parts. Whether or not this intuition directly inspires Nāgārjuna, it is clear that he supplants the reductive approach with a relational analysis that, moving beyond just the whole-part relation, critiques all forms of relationality and ends in the denial of all essences.

Nāgārjuna's relational analysis begins by admitting that, if an entity were ultimately real, it would indeed need to have an essence or *svabhāva*, but he argues that for an entity to have an essence, it is not sufficient that it be irreducible. Instead, when one says that an entity has an essence, one actually means that the entity's identity is utterly devoid of any dependence on other entities. Thus, to have an essence, the entity must have an utterly independent or nonrelational identity. Since only an entity with such an essence can be ultimately real, to know whether an entity ultimately exists, one need only determine whether its identity is in any way dependent; in other words, can one know what this thing truly is without referring to something other than that thing? If one can know that entity's identity without referring to other entities, then that entity is indeed utterly independent and, hence, ultimately real. But if the entity's identity is inextricably linked to other entities, then that entity is dependent, and as such, the entity has no essence. Hence, that entity is not ultimately real; it can only be conventionally real, at best.

Nāgārjuna applies this relational analysis especially to all those allegedly elemental things that are the mental and physical stuff of the universe according to most early Buddhist thinkers. And he finds that all those things, even the most cherished elements of the Buddhist path, are utterly lacking in essence because none exist independently. Even *nirvāṇa* itself lacks any essential, nonrelational identity, for it depends upon its opposition to *samsāra*, the world of suffering. And since *nirvāṇa*, as with all things, lacks essence, it is not ultimately true or real.

For Nāgārjuna, the realization that all things lack essence is the cure for ignorance, which he construes as any “grasping” (*grāha*) to essential, fixed identities, whether of persons or things. The realization that counteracts ignorance comes in the meditation on “emptiness,” the metaphor that he uses to evoke this utter lack of essence. His detailed argu-

ments for emptiness examine many forms of relationality. His best known text, for example, begins with an analysis of causality which demonstrates that any entity produced by causes cannot be ultimately real because its existence depends on its causes. These arguments, however, are not themselves sufficient to eliminate ignorance because, as a deeply ingrained cognitive state, ignorance requires more than just argumentation for its elimination. Instead, the conclusion of the arguments—namely, that all entities are utterly empty of any essence—must be cultivated in a contemplative experience through which one becomes fully absorbed in that emptiness.

Nāgārjuna never clearly specifies the way in which one must meditate on emptiness; this and other thorny details are left to later Mahāyāna thinkers. One issue, however, is clear: whether in meditation or in argument, emptiness itself must not be essentialized, for in that case, one would fall into an incurable nihilism. In other words, emptiness is the conclusion to the question, “What is this entity really or truly?” It is the discovery that there is no ultimately real or true identity to be discovered. But if that discovery (i.e., the emptiness of essence) is itself thought to be ultimately or essentially real, then one will have interpreted it as a kind of absolute nothingness at the core of all things. To do so would be to contradict Nāgārjuna; he specifies that no entity has any essence, but if emptiness is interpreted as an absolute nothingness, then one has made emptiness into every entity's essence, albeit in an utterly nihilistic way. Nāgārjuna sees the danger of such an interpretation, and he therefore speaks of emptiness itself as not really being emptiness. In other words, just as a person, being empty of any essence, is not really or ultimately a person, so too emptiness, lacking any essence, is not truly or ultimately emptiness. In this way, Nāgārjuna avoids the nihilism that would ensue from construing emptiness as an absolute nothingness that is the essence of all things.

Using his relational analysis, Nāgārjuna argues that all entities are empty of essence and, thus, that no entity (not even emptiness) is ultimately real. Following, however, the paradigm of the two realities mentioned above, Nāgārjuna does accept that we can speak intelligibly of many things as *conventionally* real. Thus, even though the stuff of the universe does not ultimately exist, it most certainly does exist conventionally in terms of our practical actions and our use of language. A key issue for Nāgārjuna is seeing that the *way* in which entities exist conventionally is deeply linked to his notion of emptiness. In short, emptiness describes things' ultimate mode of existence: they are not ultimately real because they are empty of any fixed, nonrelational identity. Things' conventional mode of existence must be the inverse: they *are* conventionally real because they are filled with fluid, relational identities. Speaking of this fluid relationality that characterizes conventional reality, Nāgārjuna calls it “interdependence” or *pratītya-samutpāda*.

The relationship between emptiness and interdependence is central to Nāgārjuna's thought, as is exemplified by

an exchange in Nāgārjuna's best known text, the *Mūlamadhyamaka-kārikā* (Fundamental wisdom of the Middle Way). Raising an objection to the philosophy of emptiness, an opponent asks, if everything is empty of essence, then how is reality possible? That is, if no entity is ultimately real because every entity is empty of essence, then how can a seed produce a sprout? Or, more significantly, how can the practice of the Buddhist path lead to *nirvāṇa*? According to Nāgārjuna, seeds are not truly real, but how then could they produce anything? And if the Buddhist path is also not truly real, how could it lead one to spiritual freedom?

Nāgārjuna's response is to turn the question on its head: if everything were *not* empty of essence, then how could reality be possible? If a cause had an essence, then being ultimately real, it would have an utterly nonrelational identity: what it is in and of itself could in no way be dependent on anything else. But an entity is a cause only in relation to an effect; if the effect were irrelevant to the cause's identity, then clearly anything would be a cause for anything. In short, identities such as "seed" or "path" are clearly relational, and as such, they cannot be ultimate. If they were ultimate, then they would be nonrelational, and a nonrelational world is an utterly inert, unchanging world. Seeds would never produce sprouts, and the path would never lead to *nirvāṇa*.

NĪRVĀNA AND COMPASSION. Nāgārjuna's philosophy of emptiness correlates with a significant change in the conception of *nirvāṇa* as it becomes articulated in Mahāyāna Buddhism. In early Buddhism, *nirvāṇa* stands in strict opposition to *saṃsāra*, the world of suffering. As Mahāyāna develops, however, this duality is called into question, such that Perfection of Wisdom texts include episodes in which *saṃsāra* itself is transformed into *nirvāṇa*. Thus, as Nāgārjuna puts it, in ultimate terms there is no distinction between *saṃsāra* and *nirvāṇa*.

Two prerequisites for this shift in the alterity of *nirvāṇa* are found in Nāgārjuna's work. The first is the combination of emptiness and interdependence discussed above. If *saṃsāra* itself is to be the locus of *nirvāṇa*, then *saṃsāra* cannot be composed of irreducible elements that are immutable in their fixed and ultimate essences. They must instead be capable of radical transformation, and this possibility is expressed in philosophical terms through Nāgārjuna's notions of emptiness and interdependence: being empty, things are not fixed in any particular essence, and being interdependent, they can assume new identities in accord with the new, interdependent context in which they are located. The second prerequisite is that there must be some means to achieve that transformation, or to put it more accurately, there must be some principle that guides the transformative process such that it ends in *nirvāṇa*. For Nāgārjuna, that principle is great compassion (*mahākaruṇā*).

Nāgārjuna does not treat compassion as a philosophical concept for which one must argue; instead, it is an indispensable ethical principle that, on his view, distinguishes

Mahāyāna Buddhism. Although he never provides a precise definition, later commentators specify that great compassion is an overwhelming need to eliminate the suffering of all beings. Nāgārjuna maintains that, for the Mahāyāna path to be effective, it must combine the philosophy of emptiness with that type of powerful motivation, in part because without such an intense driving force, one could not attain the final goal of the Mahāyāna, namely, the state of buddhahood itself.

In stressing the cultivation of compassion, Nāgārjuna carefully links it with early Buddhist ethical practices, such as adherence to monastic discipline. In this way, Nāgārjuna's radical denial of the ultimate reality of Buddhist notions is accompanied by a consistent, even vigorous defense of Buddhist ethical norms. If one were to examine only Nāgārjuna's best known philosophical texts, one might not get this impression, and it is therefore important to recall that, even if one examines only the works of Nāgārjuna the philosopher (and not the esoteric adept), one still encounters a wide range of writings.

LITERARY CONTRIBUTIONS AND ESOTERIC WRITINGS. Putting aside the question of Nāgārjuna's Tantric esoterica, the philosopher Nāgārjuna, who was active during the second century CE, wrote a large number of texts, some philosophical, some ethical and prescriptive, and others poetic. These texts are all composed in Sanskrit, and this itself is unusual. Prior to Nāgārjuna, Buddhist thinkers wrote in languages such as Pāli that were most likely rooted in earlier, regional dialects. Nāgārjuna may have been the first Buddhist thinker to compose a philosophical text in Sanskrit, and all Mahāyāna thinkers follow his example.

Stylistically, Nāgārjuna's works were also original, in that he composed nearly all of his works in verse and chapter. Buddhists prior to Nāgārjuna certainly employed verse to compose philosophical texts, but Nāgārjuna generally divided his texts into chapters, each of which generally contains a sustained argument in verse. This style, which Nāgārjuna may have borrowed from non-Buddhist authors, also becomes the norm for later Mahāyāna philosophers.

Although neither ornate nor metrically sophisticated, Nāgārjuna's poems are also influential for later thinkers. Cast as "praises" (*stotra*) to the Buddha, his poetical works convey his philosophy in a manner that is not possible through systematic argument. Using various tropes, such as antithesis and paradox, Nāgārjuna's praises become a model for Mahāyāna philosophers, many of whom follow his lead in writing both systematic philosophy and poetical praises.

In later Indian Buddhism and especially in Tibet, the image of Nāgārjuna as poet-philosopher expands to include Nāgārjuna the Tantric adept. From an historical standpoint, it is difficult to accept that the author of Nāgārjuna's philosophical texts is also the author of the much later Tantric texts. Nevertheless, the Tibetan Buddhist traditions do see the authors as identical, and as a result, Nāgārjuna becomes

an awesome figure whose philosophical prowess is easily matched by his magical powers. The esoteric texts in question are especially important for the forms of Tibetan Tantra that developed after the eleventh century CE. In detailed but highly abstruse language, Nāgārjuna the adept recounts the means to reproduce the death process so as to enter into the subtlest state of mind, namely, the form of mind that transfers from one life to the next. While in that subtle state, one is to realize the emptiness of even this most basic form of consciousness, thus greatly accelerating the process of eliminating ignorance. In this way, the image of Nāgārjuna combines for Tibetans the most advanced meditative practices with the most sublime form of Buddhist thought.

JOHN D. DUNNE (2005)

NĀGAS AND YAKṢAS and their female counterparts, *nāgīs* and *yakṣīs*, are pre-Aryan fertility deities of the Indian subcontinent whose fundamental relationship with agricultural pursuits has led to their incorporation into the Hindu and Buddhist pantheons as low-level *devas* (gods), or as a separate category of deities between *devas* and demons and ghosts. In addition, *nāgas* and *yakṣas*, often likened to the guardian *nats* of Thailand and *phi* of Burma, are intimately related with kingship symbolism and play a significant role in the myths and rituals of the Buddhists of South and Southeast Asia.

Early Hindu and Buddhist texts state that *nāgas* and *yakṣas* reside in *caityas*, ancient places of worship marked by a tree, stone altar, pool, or stream, and a railing to designate sacred territory. From these sacred sites, *nāgas* and *yakṣas* are believed to determine the fertility and wealth of a bounded territory as small as a paddy field or as large as a state. If properly worshiped, these deities can guarantee abundance and health to a region through their control over water and its essences, such as semen and sap. They can also bestow gems and the wealth of the underworld, which they are believed to protect. If, however, these territorial fertility deities are slighted, they can withdraw their gifts, bringing famine and spreading disease. This ambivalent power over life and death is revealed in many sculptures in which a *nāga* or *yakṣa* in human form wields in the right hand a sword to protect or chastise and in the left a jar of fertilizing liquids.

In myths and art, *nāgas* are represented as living among the roots of trees or on anthills—entrances to the underworld. They appear as cobras with one or many hoods or can metamorphose into humanlike creatures with dilated cobra hoods springing from the neck and spreading over the head. *Yakṣas*, who are said to live in tree trunks, can also take human forms that may disguise a demonic side. The female *yakṣīs* are often portrayed as voluptuous maidens, with large breasts and hips, clinging to trees in full bloom—an important fertility motif in India.

As guardians of a region's abundance, *nāgas* and *yakṣas* have come to be intimately associated with kingship in South Asia. In ancient India the *caitya* altar was used as a place of coronation, a practice suggesting that the king's authority was guaranteed or enhanced by deities such as *nāgas* and *yakṣas*. This thesis is supported by *Jātaka* tales and many dynastic myths in which kings are granted rule over a region by forming an agreement with a *nāgarāja* (*nāga* king) or a liaison with a *nāgī* or *yakṣī*. If the king fails in his duties, these deities withdraw their fertilizing powers and bring an end to the king's reign.

The portrayal of *nāgas* and *yakṣas* in the Theravada canon and in the Buddhist myths and rituals of Southeast Asia suggests the incorporation of the symbolism of kingship into the figure of the Buddha and the taming of the powers of nature through the Buddha's *dharma*. These themes reveal an interesting relationship between the otherworldly thrust of Buddhism and the importance of Buddhism for this-worldly existence. In widespread myths the Buddha confronts evil *nāgas* and *yakṣas* who are ravishing a region, reveals his greater command of the forces of nature in combat with these deities, converts the deities with the force of his virtues, and leaves behind a relic as a symbol of the contract that guarantees the good behavior of the deities. These myths, which parallel the Buddha's confrontation with the *yakṣa*-like Māra, seem to emphasize the chaotic powers of *nāgas* and *yakṣas* in order to reveal the Buddha's virtues and assert his continuing rule over a region. It appears that very early in Buddhism worshipers honored the Buddha's relics placed

in stupas and then went to nearby shrines of *nāgas* and *yakṣas*, to remind these deities of their obligations. Such contracts are recalled in Sri Lankan exorcism rituals in the early twenty-first century, to assure that *yakṣas* leave the person they are possessing. In this manner the Buddha, while withdrawn, remains a lord or ruler of this existence through the power of his *dharmā*.

The incorporation of kingship symbolism by the figure of the Buddha can also be seen in his association with the *nāgarāja* Mucilinda. In myth and art, after the Buddha attains *nirvāṇa* he is protected from the weather by the coils and hoods of Mucilinda. Such protection designates kingship in South Asia. These myths help to explain why *nāgas* and *yakṣas* become guardians of the Buddha's relics. They are offering not only their protection but their powers over nature to the Buddha and his followers.

The relationship of the this-worldly powers of the *nāga* and the world-denying view of Buddhism is also revealed in the fascinating figure of Upagupta and in the ordination ceremony. In Burma and Thailand, the monk Upagupta is said to have been born of a *nāgī* maiden. This association allows the fertility powers of the *nāga* to be controlled by the rigorous meditative discipline of the monk, and Upagupta is called upon in rituals to tame the forces of nature. It also can be speculated that the reason a candidate for ordination into the monkhood is called a *nāg* is that he is about to tame his physical desires for the good of society and for the higher goal of Buddhism.

The best single work on *yakṣas* is Ananda K. Coomaraswamy's *Yakṣas*, 2 pts. (Washington, D.C., 1928–1931). Jean P. Vogel's *Indian Serpent-Lore, or the Nāgas in Hindu Legend and Art* (London, 1926) gives a wealth of information on the *nāga*. My article "The Buddha and the Nāga: A Study in Buddhist Folk Religiosity," *History of Religion* 13 (August 1973): 36–53, surveys the symbolism of the *nāga* and *yakṣa* in Buddhist literature. My article, "The Taming of Māra: Witnessing to the Buddha's Virtues," *History of Religion* 15 (November 1978), speaks of the monk Upagupta and his relationship with a *nāgī*, Māra, and the Buddha.

LOWELL W. BLOSS (1987 AND 2005)

NAG HAMMADI. Unearthed in 1945 by a group of Egyptians digging for fertilizer, the so-called Nag Hammadi codices were one of the most important manuscript discoveries of the twentieth century for the study of religion in the late ancient Mediterranean world, particularly formative Christianity and Judaism. The forty-six different tractates that the codices contain have provided scholars with a wealth of new data for understanding the development of early Christian traditions about Jesus; Gnostic, Valentinian, and other streams of Christian thought later considered to be he-

retical; and Coptic grammar, orthography, and codicology. For the most part, however, these sources have not resulted in settled opinions or certain knowledge, but in sharpened debate and new avenues of investigation. Many questions about the codices and their contents remain unanswered.

THE DISCOVERY AND PUBLICATION OF THE CODICES. A group of Egyptian peasants discovered a jar containing the codices in December 1945 at the base of the Jabal al-Tarīf on the east bank of the Nile, across the river from the town of Nag Hammadi. One of the group, Muhammad 'Alī, broke the jar and found within it thirteen leather-bound codices, which he brought home. There his mother used some of the leaves as fuel for an oven. The codices then passed into the hands of different antiquities dealers. Most famously, Codex I ended up at the Jung Institute in Zurich; also known as the Jung Codex, it was one of the first codices whose tractates were published. Eventually all the codices (except for a fragment) were deposited in the Coptic Museum in Old Cairo, where they are now preserved. Although 'Alī reports that he found thirteen codices in the jar, the present "Codex XIII" consists actually of leaves that had been removed from a codex in antiquity and placed into the cover of Codex VI. The fate of the thirteenth codex seen by 'Alī remains unknown.

Especially in comparison to the fate of the Dead Sea Scrolls, the publication of the Nag Hammadi codices was efficient and a model of international cooperation. The political circumstances of Egypt in the 1950s delayed some early publication efforts, but during the 1950s and 1960s some of the texts, especially from Codex I, were published, among which was the *Gospel of Thomas* from Codex II. With the support of UNESCO, a complete facsimile edition was published over the course of the 1970s and completed with an introduction in 1984. James M. Robinson, the American New Testament scholar, organized an international team of scholars to produce an English-language edition and translation. The first English translation appeared in 1977, and volumes of editions of the Coptic texts, with extensive introductions and notes appeared gradually, until the so-called Coptic Gnostic Library was complete; the entire set was reissued in five large paperback volumes in 2000.

As they did their work, most of the editors generously circulated photocopied transcriptions of the texts, so that interested scholars could read them even before the official edition appeared. Meanwhile, two other publishing projects have contributed significantly to the study of the codices. The Berliner Arbeitskreis für koptische-gnostische Schriften, founded and directed by the late Hans-Martin Schenke, has produced a series of important translations, monographs, and commentaries in German. The Bibliothèque copte de Nag Hammadi, based at the University of Laval in Québec and directed by Louis Painchaud, continues to issue high-quality editions of the Coptic texts with translations and commentary in French. Other scholars have published editions and translations independently. Today many of the

Nag Hammadi works can be studied in multiple critical editions and modern translations. In 1971 David Scholer published a comprehensive bibliography of scholarship on Nag Hammadi and Gnosticism, which he updates annually in the journal *Novum Testamentum*.

THE CODICES AND THEIR ORIGINS. Although the hoard of manuscripts is often referred to as a “library,” scholars have no definitive evidence for the context of the manuscripts’ creation and collection. The scripts, writing materials, and dialects of the manuscripts are diverse. It has been estimated that the handwriting of as many as fourteen different scribes can be detected in the codices. Although all the texts are in Coptic, some are in the Sahidic dialect and others in Subakhmimic, with great variation even within these two broad categories. It seems likely, therefore, that the manuscripts were copied at different locations and subsequently collected by a person or group. In addition to their importance for the history of religions, the codices have contributed to a revival in the study of Coptic philology and codicology. Several of the leather covers contain *cartonnage*, scraps of discarded papyrus glued together to make the cover firm: the latest of the scraps can be dated to 348 CE, and thus it is believed that the codices were constructed around 350 CE and buried sometime in the following decades.

Scholars continue to debate who might have ordered the copying of the manuscripts, collected them, and buried them. Most have suggested Christian monks. The discovery was made near the site of ancient Pbou, the location of a major Pachomian monastery during the fourth century; the *cartonnage* of Codex VII contains scraps of letters written by solitary (not Pachomian) monks; some of the manuscripts contain scribal notes with Christian prayers or blessings; and at least some of the tractates can be understood to support an ascetic lifestyle. Some scholars have suggested that the order of the tractates in individual codices reflects interests in liturgy, eschatology, and contemplative ascent that are characteristic of Egyptian monks. On the other hand, monks were not the only religiously interested persons in fourth-century Egypt with the wherewithal to finance the production and collection of such books: literate and well-off persons, Christians and not, clerical and lay, could be found in many of the cities and towns along the Nile. Since *cartonnage* could have been simply gathered from a local trash heap by the makers of the covers, it provides no evidence for the identity of the person or persons who paid for their creation. It is not clear that the original owner(s), the collector(s), and the burier(s) of the codices were identical. Some scholars have speculated that the codices were buried in the wake of Bishop Athanasius of Alexandria’s declaration of an official canon of the Bible for the Egyptian church in a letter of 367 CE. Despite these theories, the social context of the codices and the circumstances of their burial remain unknown.

THE CONTENTS OF THE CODICES. The forty-six different tractates contained in the Nag Hammadi codices vary widely in their genres and theologies. Although most can be consid-

ered Jewish or Christian in the sense that they draw on the Hebrew Bible, the New Testament, and other Jewish and Christian literature, others, such as a fragment of Plato’s *Republic*, certainly did not derive from a Jewish or Christian milieu. All of the texts were originally composed in Greek and subsequently translated into Coptic; thus, they could have originated in locations throughout the eastern Mediterranean or among Greek-speaking communities in the West. Many of the tractates are apocalypses or revelations, in which a divine figure (e.g., Jesus) or authoritative human being (e.g., Adam) reveals future events, cosmological secrets, or theological doctrines to an elect person or group. In the *Apocryphon of James*, for example, Jesus appears after his resurrection and teaches a small group of disciples, and in the *Apocalypse of Adam*, Adam reveals to his son Seth the true story of his origin and predicts future events. Other works are or include theological treatises (e.g., *Tripartite Tractate*), sermons (e.g., *Gospel of Truth*), prayers (*Prayer of the Apostle Paul*), hymns (e.g., *The Three Tablets of Seth*), wisdom books (e.g., *Teachings of Silvanus*), a philosophical epistle (*Treatise on Resurrection*), and an anthology of excerpts from theological works (*Gospel of Philip*). Several tractates call themselves “gospels,” but none resemble the Gospels of the New Testament, which present a narrative of Jesus’ ministry emphasizing his passion and death. The *Gospel of Thomas*, for example, presents a collection of Jesus’ sayings, in the manner of the biblical book of *Proverbs*, without any narrative.

Like other manuscripts from antiquity, the codices contain works that appealed to the collector(s), but that also represent diverse theologies and original social and religious contexts. Scholars have only begun the task of categorizing the tractates and attempting to reconstruct their original milieus, and certainty in these areas is probably impossible. Nonetheless, a scholarly consensus appears to have emerged that at least four corpora of literature can be identified. First, scholars call a set of approximately twelve Nag Hammadi tractates “Sethian Gnostic.” Although the precise contents of this grouping is debated, it usually includes *The Apocryphon of John*, *The Hypostasis of the Archons*, *The Egyptian Gospel*, *The Apocalypse of Adam*, *The Three Steles of Seth*, *Zostrianos*, *Allogenes*, *Melchizedek*, *The Thought of Norea*, *Marsanes*, *Trimorphic Protennoia*, and sometimes *Thunder—Perfect Intellect*. Although these treatises differ from one another in genre and some mythic and theological details, they share an underlying myth of origins, in which Adam’s son Seth, four divine caregivers called luminaries, and the (according to the myth) ignorant and foolish God of *Genesis* (sometimes called Ialdabaoth) play prominent roles. In his anti-heretical work *Detection and Overthrow of Gnosis, Falsely So-Called* (*Haer.*, c. 180 CE), Bishop Irenaeus of Lyons attributes this same myth to “the gnostic school of thought” and to “the gnostics” (*Haer.* 1.11, 29). For this reason, some scholars believe that these works originated in the only ancient religious group that should be called “Gnostic.”

Related to the (Sethian) Gnostic text group is another set of treatises that scholars assign to the Valentinian school

of thought, an important Christian theological tradition of the second through fourth centuries. According to Irenaeus, the Christian teacher Valentinus, who died around 175, adapted the Gnostic myth in creating his own system of thought. In the decades following Valentinus's death, Christian theologians teaching in his tradition formed study circles of interested Christians alongside and sometimes in competition with Christian churches. Like its (Sethian) Gnostic counterpart, the Valentinian myth was open to creative revision and elaboration, but it generally took a less negative attitude toward the God of *Genesis* and emphasized themes of integration and recovery of original cosmic and psychic unity; Valentinian theologians devoted considerable attention to such traditional Christian topics as sin and salvation, the resurrection of the dead, and the sacraments. Valentinian works found at Nag Hammadi include *Prayer of the Apostle Paul*, *The Gospel of Truth*, *Treatise on Resurrection*, *Tripartite Tractate*, and *The Gospel of Philip*, among others. Some argue that Valentinus himself is the author of *The Gospel of Truth*.

Two tractates, *The Gospel of Thomas* and *The Book of Thomas the Contender*, grant special authority to the apostle Didymus Judas Thomas, whom Christian tradition credits with bringing Christianity to Mesopotamia and India and sometimes identifies as Jesus' twin brother. Since these works share literary connections and theological affinities with each other and with *The Acts of Thomas*, a text that survives in Greek and Syriac and was not found in the Nag Hammadi cache, some scholars consider them evidence for a "Thomas Christianity," similar to the Pauline Christianity and Johannine Christianity associated with other sets of early Christian literature. Thomas Christianity is believed to have been centered in Edessa, a city in northern Mesopotamia, and to have run from the first century down to the third and perhaps fourth. Thomas theology was highly ascetic, emphasizing the divine origin of the soul, its fall into matter and the body, and its return to its origin and reunion with its true self. Other scholars, however, doubt this reconstruction of an organized Thomas branch of Christianity. Although it is often referred to as the most prominent of the "Gnostic gospels," *The Gospel of Thomas* lacks evidence of the kind of elaborate myth found in the (Sethian) Gnostic works, and thus scholars are increasingly reluctant to refer to it as "Gnostic."

In three tractates from Codex VI—*The Discourse on the Eighth and Ninth*, *The Prayer of Thanksgiving*, and *Asclepius*—the divine revealer is "thrice great Hermes" or Hermes Trismegistus, a composite of the native Egyptian god Thoth and the Greek god Hermes. These tractates belong, therefore, to a body of pseudepigraphic literature composed in Greek centered around Hermes, now called the Corpus Hermeticum, which may have originated in religious and philosophical circles active in Greco-Roman and late ancient Egypt. Both *The Prayer of Thanksgiving* and *Asclepius* were known before the Nag Hammadi discovery, while *The Discourse on the Eighth and Ninth* is a new addition to the corpus.

Most of the remaining Nag Hammadi tractates are simply miscellaneous Christian literature, the precise doctrinal, sectarian, or theological affiliations of which are unclear or debated. To be sure, some are not Christian in their origin at all (e.g., the fragment of Plato's *Republic* in Codex VI), and some scholars question the "Christian" character of others (e.g., *Authoritative Teaching*). But most are Christian works of an astonishing variety, underlining the impressive diversity of early Christianity in the centuries before Constantine.

THE SIGNIFICANCE OF THE DISCOVERY. The Nag Hammadi discovery has made an enormous impact on several areas of the religious history of the ancient Mediterranean world, even if the results of the impact are not entirely clear. After decades of editing and translating the tractates, scholars are still engaged in sorting out the implications of the new data for such fields as Gnosticism, Jesus traditions and the New Testament, early church history, and late ancient Platonism.

Certainly the codices have contributed the most to the study of Gnosticism. Before the discovery, except for a handful of other recently published texts in Coptic, scholars' knowledge of "Gnosticism" was limited to the statements made by Christian heresiologists, such as Irenaeus. The parallel between *The Apocryphon of John* and Irenaeus's description of the myth of "the gnostics" (*Haer.* 1.29) showed that this work (which is found also in a previously known Coptic manuscript) and the texts closely related to it came from a circle that was known as Gnostic. At last scholars could read (in Coptic translation) works composed by the presumed Gnostics themselves, rather than depend solely on the reports of their "orthodox" opponents, and thus several clichéd charges against the Gnostics (e.g., their lack of interest in ethics) could be evaluated more fully. On the other hand, scholars have found few other correspondences between the Nag Hammadi tractates and the myths and sects described by such anti-Gnostic authors as Irenaeus, Hippolytus of Rome, and Epiphanius of Salamis, and so they have increasingly questioned the value of the heresiological reports, which still provide the only evidence for the social history of such groups.

The tractates have not resolved the protracted debate over the definition of *Gnostic* and *Gnosticism*. Impressed by the variety of the texts and their mismatch with the heresiologists, some scholars argue that these terms should be abandoned altogether and the surviving texts analyzed individually and on their own terms, apart from these categories. Others point to the correspondence between the myth found in *The Apocryphon of John* and that in Irenaeus's account of "the gnostics" (*Haer.* 1.29) and suggest that the term *Gnostic* be applied only to the group responsible for the texts belonging to the "Sethian Gnostic" group; perhaps the Valentinians can be called "Gnostic," but only in a derivative sense, because they adapted the myth of the Gnostics. Still other scholars believe that, despite their variety on several points, many (if not most) of the Nag Hammadi tractates exhibit

a set of characteristics that are usefully gathered under the category “Gnosticism.” In this case, the Nag Hammadi tractates have not led to a scholarly consensus, but the terms of the debate are perhaps clearer than they were before.

Debate also surrounds the significance of Nag Hammadi works that include sayings attributed to Jesus or that parallel writings of the New Testament. One question is whether such works as *The Gospel of Thomas*, *The Dialogue of the Savior*, and *The Apocryphon of James* preserve oral or written traditions of Jesus’ sayings that are independent of the New Testament Gospels, and thus provide additional information about the historical Jesus and the development of early Christian gospels. Of the relevant tractates, *The Gospel of Thomas* has received the most attention and seems most likely to contain traditions independent of the canonical Gospels, and perhaps even sayings that can be attributed to the historical Jesus. Passages in *Trimorphic Protennoia* and *The Apocryphon of John* parallel sections of the *Gospel of John*, especially the prologue, and some scholars have suggested that they can be used to reconstruct earlier written sources that were available to the author of the Fourth Gospel. The Nag Hammadi texts also have provided new material for the discussion of whether Gnosticism, however it is defined, existed during the first century CE and thus may stand behind the opponents criticized by New Testament authors like Paul. Most scholars now reject the identification of Paul’s opponents as Gnostics.

The codices have raised or affected numerous other issues in the study of early church history. These include the development of a Christian canon of scripture. What status did these writings have for the Christians who produced and read them? Were they considered scriptural, equivalent in authority to the texts that were emerging in some churches as “the New Testament”? The tractates’ extensive use and revision of the Hebrew Bible (in the form of its Greek translation, the Septuagint) have provided new insights into conflicts among early Christians over the interpretation of the Bible and have suggested links between early Christian and Jewish exegeses of the same biblical texts. Scholars have discovered connections also between certain Nag Hammadi works—especially some Valentinian writings and “wisdom texts” like *The Teachings of Silvanus*—and the literature of early Egyptian monasticism, particularly those letters attributed to Antony the Great and Paul of Tamma.

It appears that Plotinus, the great Neoplatonist philosopher (d. 269/270), knew *Zostrianos* and *Allogenes* or at least persons in the circles in which these works circulated. These two tractates, along with *Marsanes* and others, show contact with the issues and terminology that characterized Platonist philosophical discussions in the second and third centuries. Scholars have now been able to construct a fuller and more detailed narrative of the development of Platonism in this period, one that more extensively documents the interchanges between “Christian” and “pagan” circles and the centrality of “mystical” or “esoteric” themes that scholars once saw as marginal.

The study of the Nag Hammadi codices is still an emerging and relatively new field in comparison to the study of most other sources for ancient Mediterranean religions. In the sixty years since their discovery, scholars have edited and translated the texts, making them available to a wide range of interested readers. Although many questions remain open, especially about the authors of the tractates and the collector(s) of the codices, the thirteen books found by Muhammad ‘Alī and his friends have already creatively unsettled traditional ways of understanding the religious history of the first four centuries after Jesus Christ.

DAVID BRAKKE (2005)

NAHMANIDES, MOSES (c. 1194–c. 1270), also known by the acronym RaMBaM (Rabbi Mosheh ben Naḥman); Spanish name, Bonastrug da Porta; Talmudist, biblical exegete, mystic, and polemicist. Born in Gerona, Catalonia, in a period of cultural transition and controversy, Nahmanides confronted the traditions and attitudes of Spanish, Provençal, and northern Ashkenazic Jewry in a wide range of intellectual pursuits.

His Talmudic education with Yehudah ben Yaqar in Barcelona and with Me'ir ben Yitshaq of Trinquetaille exposed him to the dialectical methodology of the Tosafists of northern France, which had penetrated into Languedoc and was revolutionizing the study of the Babylonian Talmud, the central text in the Jewish curriculum. Nahmanides adopted this methodology, which he enriched with the Talmudic studies of Provençal scholars and the textual traditions of Spanish Jewry, to produce *novellae* and legal monographs that would establish the dominant school of rabbinics in Spain until the expulsion of 1492. Aside from his *novellae*, Talmudic commentaries that served as standard texts in medieval Spain, Nahmanides' works in this field include *Milḥamot ha-Shem*, a defense of Yitshaq Alfasi's code against the strictures of Zerahiah ha-Levi, in which Nahmanides presented what is essentially a complex commentary on selected portions of the Talmud; a critique of Maimonides' *Book of the Commandments* which was also a defense of the Geonic *Halakhot gedolot*; *Torat ha-adam*, a lengthy monograph on the laws of mourning; a series of studies on other aspects of Talmudic law such as vows, menstrual impurity, and indirect causation of damages, some of which were modeled after Alfasi's code; and, of course, *responsa*.

Although Nahmanides is a towering figure in the history of Talmudic study, his greatest direct impact on the masses of Jews probably came through his wide-ranging and enormously influential commentary on the Pentateuch, which was to become one of the first printed Hebrew books. Nahmanides was persuaded that all knowledge could be found in the Torah, and his efforts to explicate the text touched upon all the areas of his intellectual interest. He was, first of

all, deeply concerned with the plain meaning of the text. This concern went beyond questions of philology and syntax; Nahmanides was extraordinarily interested in the structure and order of biblical narrative, which he perceived, despite an apparent rabbinic statement to the contrary, as carefully chronological. The commentary contains nuanced and richly textured observations about the morality, motivations, and personalities of biblical characters; Nahmanides did not hesitate, for example, to question the moral legitimacy of Abraham's apologia to Abimelech that Sarah was indeed his half sister (*Gn.* 20:12). Though he provided an ongoing critique of the commentary of Avraham ibn 'Ezra,' often accusing him of insufficient respect for rabbinic exegesis, Nahmanides allowed himself considerable independence in areas that do not touch upon legal norms, and his frequent deviations from Rashi's interpretations can involve a rejection of their rabbinic sources as well.

Nevertheless, for Nahmanides, the straightforward meaning of the Bible, however complex, does not begin to plumb its depths. He stressed the typological understanding of scripture, which, despite Midrashic precedent, was rather unusual among medieval Jews. Thus, the patriarchal settlement of the Land of Israel is taken to foreshadow the later conquest and remains a source of assurance that Jewish rule will be restored at the end of days.

The profoundest level of meaning in scripture, however, is not typological but mystical. This layer of meaning is the one that Nahmanides discusses at the very beginning of his commentary, where he asserts that the Torah consists entirely of esoteric names of God. Nevertheless, neither this extreme esotericism nor his conviction that mystical doctrines could be known only through tradition prevented him from finding these doctrines in the "plain" meaning of scripture as well, so that straightforward exegesis and what Nahmanides called "hidden wisdom" intersected in a fashion that legitimated the teachings of the Gerona qabbalists by an appeal to the biblical text itself. Although Nahmanides' allusions to esoteric lore remained brief, elusive, and inaccessible to the uninitiated, these doctrines move toward center stage in his commentary to *Job*, where belief in transmigration of souls emerges as the only satisfactory resolution of the problem of evil. This problem and its qabbalistic solution are also at the heart of the theological monograph *Sha'ar ha-gemul*, which Nahmanides appended to *Torat ha-adam* and which treats theodicy both exoterically and esoterically.

In the final analysis, Nahmanides' crucial role in the history of Qabbalah does not lie primarily in the content of these passages and similar, sometimes more elaborate discussions in his sermons (*The Law of the Lord Is Perfect*, *Sermon for a Wedding*, *Sermon on Ecclesiastes*, *Sermon for Ro'sh ha-Shanah*), nor is it to be sought in his partially preserved commentary on *Sefer yetzirah* (Book of creation). His key contribution was the legitimation of Qabbalah by the very fact that he advocated it; the problems raised by this system for Jewish theology could not readily be pressed if the critic would

thereby be raising questions about the orthodoxy of so unimpeachable a figure as Nahmanides. Consequently, the mere fact that Nahmanides was a mystic was a significant factor in the triumphant progress of Qabbalah in late medieval and Renaissance Jewish history.

Aside from his mystical, exegetical, and homiletical writings, Nahmanides produced two other influential works on non-halakhic topics. *Sefer ha-ge'ullah* (Book of the redemption) was prompted by some signs of messianic skepticism among Spanish Jews. Although Nahmanides did not consider the redemption to be in the first rank of Jewish dogmas—one could, after all, expect greater heavenly rewards for observing the Torah under James I of Aragon than under the much more benevolent messianic king—defense of the belief in redemption was important theologically and crucial for the collective psyche of medieval Jewry. Nahmanides insisted on the continuing relevance of eschatological passages in the Bible, which, he said, are both unfulfilled and unconditional. Finally, he joined the ranks of messianic calculators, arguing eloquently that a straightforward reading of the end of *Daniel* points to the arrival of the ultimate redeemer in 1403, a date sufficiently close to buttress Jewish morale yet sufficiently removed to discourage messianic hysteria.

Any discussion of exile and redemption inevitably had polemical implications for Jews in Christian Europe, but Nahmanides' major polemical work was thrust upon him late in life under extraordinary circumstances. A Jewish convert to Christianity began to engage in vigorous missionary activity utilizing the relatively new argument that Talmudic passages demonstrate the truth of Christianity. In 1263 in Barcelona, Nahmanides was forced to defend the Jewish position in a disputation witnessed by James I. Despite the reservations of some scholars, there is every reason to believe that Nahmanides, who received an award from the king after the debate, acquitted himself with distinction; he later recorded his version of the proceedings in a work that lifted Jewish spirits and influenced subsequent polemicists through the medieval period and beyond.

His boldest and most controversial argument, which was probably sincere, maintained that rabbinic *midrash* was not dogmatically binding; hence, the Jewish polemicist was free to reject some uncongenial statements of the rabbis. The reaction of later Jews to this approach was profoundly ambivalent, and they wondered both about Nahmanides' sincerity and about the ultimate utility of an approach that undercut Christian arguments and respect for the rabbis at the same time. Nahmanides' own reverence for the rabbis even while differing from them is illustrated in his one other foray into Jewish-Christian polemic—a brief commentary on *Isaiah* 53 in which he asserted his conviction that the suffering servant is the Jewish people, but devoted the work to explaining how the Talmud could have understood the figure messianically without drawing Christian conclusions.

The disputation at Barcelona was not Nahmanides' first encounter with controversy of significant historical dimen-

sions. In 1232, he had played a major role in the dispute over the writings of Maimonides and the legitimacy of philosophical inquiry. Some rabbis in northern France, responding to complaints by Provençal antirationalists, had proclaimed a ban against the study of Maimonides' *Guide of the Perplexed* and the first section of his code, while Maimonists had reacted by placing the Provençal anti-Maimonists under the ban. Nahmanides, who admired Maimonides but had deep reservations about the standard form of philosophical study, proposed a compromise to the rabbis of northern France that may well have persuaded them to withdraw from further involvement in this dispute. The code, including its first section, should be studied with enthusiasm; public study of the *Guide* should be banned; private study of both the *Guide* and philosophy in general should gently be discouraged.

Modern scholarly views of Nahmanides' position in this controversy as well as of his overall philosophical posture reflect considerable disagreement. Many scholars perceive him as a thoroughgoing antirationalist who despised philosophy and saw a world of omnipresent miracles in which no natural order existed; others, with greater justice, see a far more complex figure who absorbed much of the medieval philosophical legacy, made his living as a physician, saw a naturalistic world punctuated by miracles, and espoused disciplined theological inquiry within carefully delineated limits.

The Land of Israel had always played a particularly significant role in Nahmanides' thought, and when he found himself under pressure in the wake of the Barcelona disputation, he went there to spend his remaining years. This was no placid retirement. Nahmanides revived the Jewish community of Jerusalem, which had been decimated by the invasion of the Khwarazan Turks in 1244. He became the head of the Jewish community in Acre, and it was in Israel that he put the finishing touches on his *magnum opus* on the Pentateuch.

BIBLIOGRAPHY

Works by Nahmanides

The standard edition of Nahmanides' novellae is *Hiddushei ha-Ramban*, 2 vols. (Jerusalem, 1928). Charles B. Chavel has edited *Perushei ha-Torah le-Rabbenu Mosheh ben Nahman (Ramban)*, 2 vols. (Jerusalem, 1962), and *Kitvei Rabbenu Mosheh ben Nahman*, 2 vols. (Jerusalem, 1963), and is the editor and translator of *Ramban (Nahmanides): Commentary on the Torah*, 5 vols. (New York, 1971–1976), and *Writings and Discourses*, 2 vols. (New York, 1978). Despite drawbacks, Chavel's are the standard editions of these novellae and also contain commentary by the editor.

Works about Nahmanides

The best of several short books on Nahmanides that contain both biographical information and analysis of his thought is Heymann Chone's German work, *Nachmanides* (Nuremberg, 1930), while Chavel's *Ramban: His Life and Teachings* (New York, 1960) is the only such work in English. The characterization in Solomon Schechter's *Studies in Judaism*, vol. 1

(1896; reprint, Cleveland, 1958), remains useful. The most elaborate volume on aspects of Nahmanides' thought is Chayim Henoch's *Ha-Ramban ke-hoqer ve-khi-mequbbal* (Jerusalem, 1978). For an important collection of new studies, see *Rabbi Moses Nahmanides*, edited by Isadore Twersky (Cambridge, Mass., 1983).

Revised Bibliography

NAḤMAN OF BRATSLAV (1772–1810), Hasidic master and founder of the Bratslav sect, born in Medzhibozh, Ukraine. A great-grandson of Yisra'el ben Eli'ezer (1700–1760), the BeSHT, the first central figure of Hasidism, Nahman proclaimed a path that stood in direct opposition to that of his esteemed forebear. Nahman's complex and tortuous struggle for faith stood in sharp contrast to the BeSHT's ideal of simplicity and wholeness: theologically, Hasidism's earlier enthusiastic proclamation of the all-pervasive presence of God is replaced in Bratslav Hasidism by a painful awareness of his absence. The relative "neutralization" of messianic energies, characteristic especially of the Mezhrich school, is also reversed in Bratslav, where Nahman, whom Bratslavers consider the only true *tsaddiq* ("righteous man"), is clearly depicted at least as a proto-messianic figure.

Given the family into which he was born, it was probably expected of Nahman that he lead a Hasidic following in a movement that was becoming firmly entrenched in a pattern of dynastic succession. In his early years he refused this role, feeling himself inadequate to it and perhaps disdaining Hasidism as it was popularly practiced in his surroundings.

In 1798 Nahman undertook a pilgrimage from the Ukraine to the Holy Land. Arriving in the Galilee right in the midst of Napoleon's battle with the Turks, he suffered numerous hardships and was at times close to death. He saw this journey as a private rite of passage, and later in life often looked back on it as a source of inspiration. Only on his return from the Land of Israel was he ready to assume the mantle of leadership, and this he did in a highly selective manner. Gathering around himself an elite cadre of disciples dedicated to a revitalization of the Hasidic movement, Nahman issued an open challenge to such popular figures as Aryeh Leib

of Shpola and his own uncle, Baruch of Medzhibozh. He saw Hasidism as having grown self-satisfied, compromised by the shallow assurances of blessing such self-proclaimed *tsaddiqim* would offer in exchange for the rather considerable gifts they were receiving. In Nahman's community poverty was the ideal, miracles were disdained, and the master was not to be bothered with such small matters as material blessings. The disciples were to devote themselves to an intense regimen of private devotion and penitence. In the early years of his leadership, Nahman insisted that each new disciple confess all of his sins to him. Sin was taken quite seriously in Bratslav, where earlier Hasidic warnings against excessive guilt were set aside.

The essential practice that Nahman demanded of his disciples was *hitbodedut*, which in Bratslav meant a daily "conversation" that each Hasid was to have with God. *Hitbodedut* had to be practiced for an hour each day, spoken aloud in one's native tongue, and performed by each Hasid in private, preferably outdoors. During this hour the disciple was instructed to "break his heart" and confess before God his most secret thoughts. While the Bratslav sect remained fully within Jewish orthodoxy, including full observance of the law and recital of daily liturgy, it was this new practice of *hitbodedut* that was the true focus of its spiritual attention.

Nahman was filled with ambivalence about his role as leader. Some of his statements exude an exaggerated sense of self-importance, a claim that he is the only true *tsaddiq* of his generation, and an air of megalomania. Others reflect just the opposite: an acute sense of unworthiness, a feeling of personal emptiness, and a regret at having allowed himself to accept a mantle of which he was unworthy. These alternating attitudes fit in with Nahman's well-documented alternating states of elation and melancholy, a pattern that would today probably be diagnosed as manic-depression. It was in the course of his recurrent bouts with depression and guilt that Nahman came to articulate his distinctive theological position.

The absence of God from human life is a reality that must be treated seriously. The religious person must come to terms with the fact that he lives in a world from which God has absented himself. Moments of doubt, inevitable in such a situation, must be treated as recording a valid aspect of human experience, and the notion of faith must be so expanded as to dialectically encompass doubt and denial within it. The seeker must struggle constantly with the eternal questions; one who does so will ascend through a constant spiral of doubt, denial, longing, faith, renewed challenge, doubt and denial, a higher rung of faith, and so forth. The great danger to such a quest is complacency; its highest ideal, that of constant growth. The nature of faith becomes ever more complex as it seeks to contain within itself ever more serious questions and conflicts.

Faith, a term more prevalent in Bratslav than in any other premodern Jewish ideology, is defined as a constant longing for God, an outcry of the broken heart aware of his

distance. Such faith can only be cultivated, Nahman taught, in a world where God's absence is real and where no easy answers are available to fill the painful void. Thus the absence of God is paradoxically God's greatest gift, allowing people the psychological room in which to build up the reservoir of faith that is the most important human asset. The awareness that this self-absenting (*tsimtsum*, as the older qabbalistic term is read in Bratslav) is itself a divine gift allows one to suffer life in the void, but does not alter its reality.

The sharp inner tensions that drove Nahman to seek a path of redemption for himself, his disciples, and the Hasidic movement as a whole culminated in a brief messianic attempt in the year 1806. Once that attempt had failed (Nahman saw the death of his infant son as a sure sign from heaven), a new and more subtle way to deliver the message of redemption was sought. This led Nahman to the telling of his tales, now collected, symbolic fantasies that give fresh and vital expression to the mythic themes of qabbalistic thought. Redemption is the central underlying motif in most of these tales, the purpose of which seems to have been the preparing of his hearers' minds for the great events to come. Published in 1815, the tales take their place alongside Nahman's collected teachings, *Liqqutei Moharan* (1809, 1811), as unique classics in the Hasidic corpus.

Nahman died tragically of tuberculosis at the age of thirty-eight, leaving no male heir. His faithful disciple, Natan of Nemirov, led the community after him but always acted as the master's surrogate rather than his successor. Bratslav is unique in surviving as a Hasidic community that has no living master; in later times, when they were much persecuted within the Hasidic world, they were referred to by others as the "dead Hasidim." The small but hardy band of Bratslavers treated this as a badge of honor, however, as they remained true to the memory of the one master who had been theirs and who, according to some Bratslav sources, was yet to come again.

BIBLIOGRAPHY

Nahman's *Tales* exist in several English translations, the most useful that by Arnold J. Band (New York, 1978), which also contains introductions and notes to each tale. Arthur Green's *Tormented Master: A Life of Rabbi Nahman of Bratslav* (University, Ala., 1979) is the first full-length critical biography. Hebrew readers will also want to consult Joseph G. Weiss's *Mehqarim ba-Hasidut Bratslav* (Jerusalem, 1974) and Mendel Piekarz's *Hasidut Bratslav* (Jerusalem, 1972).

NAHUATL RELIGION. The speakers of Nahuatl dialects compose the largest group of indigenous people in Mexico. Numbering about 800,000, they live primarily in the Federal District and the states of México, Morelos, Puebla, Tlaxcala, Guerrero, Veracruz, and San Luis Potosí. Smaller populations can be found in Jalisco, Nayarit, Oaxaca, and Tabasco. The proportion of Nahuatl speakers in central Mexico is declining, but their absolute number is fairly stable and is augmented by millions of Spanish-speaking villagers who preserve elements of Nahuatl heritage. Among both these groups, remnants of pre-Hispanic Nahuatl religion persist in combination with a Catholicism that retains much of the character of its sixteenth-century Hispanic origins.

Folk Catholicism in most Nahuatl villages is more than a superficial veneer on a pre-Hispanic substratum; it constitutes the very meaning of village life. Social solidarity is expressed in terms of spiritual kinship, that is, as godparenthood and ritual commensality. Godparenthood is associated not only with the sacraments of baptism, first communion, confirmation, and marriage but also with many nonsacramental events ranging from the blessing of dwellings, stores, tractors, and trucks to curing ceremonies and graduation from sixth grade. Baptism, the other sacraments, and blessings sanctify persons and objects and so recruit them into the spiritual family (i.e., the village or neighborhood conceptualized as a sacred community).

Life within the spiritual family is symbolized by the fiesta, which bears an obvious similarity to the Eucharist and the agape (love feast) of early Christians. The fiesta, or ritual meal, consists of three courses—rice, turkey in mole sauce, and beans—accompanied by alcoholic beverages. Fiestas honor the patron saints of neighborhoods and villages and mark the sacramental rites of passage. The festivities occasion momentary conviviality, and their preparation promotes enduring amity by requiring villagers to give generously of their time and resources for the benefit of others. The familial symbolism and sentiments associated with the fiesta system come into sharp focus during the Christmas-Candlemas season, at which time festivities center on the Holy Family—the Christ Child, Mary, and Joseph.

On or about the third of May, fiestas are held to honor mountainside crosses that protect communities and neighborhoods during the rainy season. In a weather-working cult in northern Morelos, crosses are associated with San Miguel Arcángel, four lightning-hurling saints, and groups of "rain dwarfs" (*awaque*). The weather-working shamans hold their own ceremonies at mountainside shrines at the beginning of May and again in early November, or roughly at the start and the end of the rainy season.

In contrast to the saints and members of the Holy Family are many evil and Adamic beings who threaten the villagers. Some of these beings are satirized by dancers at carnivals and fairs, where the Devil may be represented by a figure in a red suit with horns. In apparitions, the Devil may appear as a Spanish gentleman, or *hacendado*, mounted on horseback. Other sinister beings include Death; goblins (the spirits of unbaptized children) who offer women bribes for sexual favors; were-animals called *naguales*, who molest drunkards and women on unlit paths after nightfall; La Llorona, also known as La Malinche, a sirenlike apparition who aborted or murdered her children after being abandoned by a lover who is sometimes identified as the Spanish conqueror Cortés; witches who cause illness and poverty, and who suck blood from children's necks; Water Snake and Little Bull, two supernatural animals that bring forth crop-damaging winds and rain; and harmful spirits called *ehesame* ("winds") or *los aires*. *Ehesame* cause paralysis, tics and twitches, neuralgia, loss of sensation, skin disorders, and other afflictions. Witches use a technique called *aire echado* ("thrown air") in which dirt from a grave containing a *tonalli*, or shadow-soul, is mixed with other ingredients and hurled against the victim's house.

Ehesame can also cause *susto* ("fright"), an emotional reaction that affects the shadow-soul of a living person and results in depression, insomnia, and loss of appetite. The parts of the shadow-soul are dispersed throughout the bloodstream, but in response to fright they retreat toward the heart or leave the body. In some communities the shadow-soul fragments are likened to animals or are said to take animal form when outside the body. Persons with weak natures are more vulnerable than others to fright-illness.

Fright-illness and various other beliefs indicate that persons having strong—even tainted—natures enjoy more protection against evil than do persons with weak or sensitive natures. Indeed, nature as well as spirit is seen as a necessary and inevitable part of a person's total makeup. Thus Nahuatl rituals repeatedly express the place of evil and nature in the overall scheme of things. Ritual impersonations of La Malinche, Cortés, Huehuenches ("old ones"), Tenanchis (the grandmothers of the Christ Child), and the figures of the bull and the deer testify to the importance of the Adamic. In mock bull slayings and deer hunts, the killer/hunter assumes a role analogous to that of the serpent who tempts Adam and Eve. The Tenanchis appear during the Christmas-Candlemas season as enticing, tempting figures suggestive of Eve. Huehuenches dance during Carnival, also evoking the Adamic, but in more sinister fashion: as Herod's agents they are enemies of the Christ Child. In some communities the struggle between the forces of good and evil is dramatized during local fairs by mock battles between "Christians" and "Moors."

The Nahuatl ritual complex thus includes various vestiges of the pre-Hispanic pantheon, but its basic armature is nonetheless recognizably Catholic: Eve and, through her,

Adam are deceived by the serpent and so denied immortality, but they generate natural life; by contrast, Christ is killed by the agents of the devil, yet his death offers spiritual immortality. The appeal of these conceptual polarities for Nahuatl villagers may be grounded in the realities and contradictions of peasant existence. The villagers subscribe to spiritual values, but the exigencies of daily life continually remind them of the importance of nature and the ever-present problem of evil.

BIBLIOGRAPHY

For a classic ethnographic monograph on a Nahuatl community with information on religion, see William Madsen's *The Virgin's Children* (Austin, 1960). Hugo G. Nutini and Betty Bell provide a comprehensive description of godparenthood in *Ritual Kinship: The Structure and Historical Development of the Compadrazgo System in Rural Tlaxcala* (Princeton, 1980). An authoritative treatment of ancient and contemporary Nahuatl conceptions of the soul and related issues can be found in Alfredo López Austin's *Cuerpo humano e ideología: Las concepciones de los antiguos nahuas* (Mexico City, 1980). Donald Cordry's *Mexican Masks* (Austin, 1980) illustrates and interprets ritual masks and costumes from various areas, including the Nahuatl region.

Revised Bibliography

NAKAE TÔJU (1608–1648), Japanese Neo-Confucian thinker. Tōju, often called the Sage of Ōmi, was born in Ogawa in Ōmi Province on Lake Biwa in central Japan. With the exception of sixteen years spent in Ōzu on the island of Shikoku, he passed his life in Ōmi engaged in studying, teaching, and writing. His grandfather, who had adopted him at the age of nine, took him to Shikoku and encouraged his early education. After his grandfather's death, when Tōju was fifteen, he attended lectures on the *Analec*s by a visiting Zen priest. After this he began serious study of the Four Books (*Analec*s, *Great Learning*, *Doctrine of the Mean*, *Mencius*) and of Zhu Xi's commentaries on them. In 1634, citing as motives his own ill health and his desire to be with his widowed mother, he returned to Ōmi. Although

some sources indicate that another motive may have been the desire to escape political entanglements, most accounts mark this as the beginning of his focus on the virtue of filial piety.

In 1636 he set up a school called the Tōju Shoin and accepted pupils of all classes and backgrounds. The Four Books and Zhu Xi's commentaries were the core of the curriculum, but Tōju wished to avoid the behavioral formalism sometimes associated with the transmission of Zhu Xi's thought. Instead, he stressed the need to adapt Neo-Confucianism to time, place, and rank. It was during this period that he studied the Five Classics (*History, Odes, Rites, Changes, Spring and Autumn Annals*). Inspired by them, he wrote two works on moral cultivation, both in 1638: *Jikei zusetsu* (The diagram of holding fast to reverence, explained) and *Genjin* (Inquiry into man). In the following year he wrote *Rongo kyotō keimō iden* (Resolving obscurities concerning the Hsiang-tang chapter of the *Analects*), in which he discussed the reverential attitude displayed by Confucius in daily activities and in religious rituals.

Tōju had been moved by this aspect of Confucius's character and wished to return to the religious spirit he saw in Confucius and in the Five Classics. He began to recite each morning the *Hsiao ching* (Classic of filial piety), and he subsequently became increasingly convinced of its profound implications. In 1641 he wrote *Kōkyō keimō* (The true meaning of the classic of filial piety). His other major work, written a year earlier and continually revised until his death, was *Okina mondō* (Dialogues with an old man). Here, in addition to discussing filiality, Tōju noted how Confucian morality was essential for the samurai class.

Tōju has been considered the founder of the Wang Yang-ming school in Japan, but it was not until three years before his death that he acquired Wang's complete works. Although deeply affected by them, he had already been exposed to the writings of late Ming thinkers such as Wangji, who some scholars feel may have had an even stronger influence on him. It is clear that his doubts about Zhu Xi's thought arose from his aversion to its formalistic interpreters. The appeal of the Ming Confucians was their emphasis on interiority, innate knowledge, universal sagehood, and a religious sense of reverence.

Tōju's principal religious ideas can be summarized as a profound reverence for the Supreme Being (*jōten*), manifested in an optimistic doctrine of moral self-cultivation based on the innate knowledge of the good. Tōju taught that the heart of self-cultivation was filiality, for it was the "root of the human" and an intricate part of the transformative processes of nature itself. As the dynamic reciprocity between all created things, he saw filiality as the basis of social relations and as a nurturing principle in the natural order. Thus Tōju's distinctive religiosity drew on various strains of Confucian and Neo-Confucian thought, and combined a reverent theism, interior cultivation, and filial devotion.

SEE ALSO Confucianism in Japan.

BIBLIOGRAPHY

Works by Nakae Tōju are collected in three sources: *Tōju sensei zenshū*, 5 vols. (Shiga-ken, 1928–1929), edited by the Tōju Jinga Sōritsu Kyōsankai; *Nakae Tōju bunshū* (Tokyo, 1926), edited by Mukasa San and others; and *Nakae Tōju* (Tokyo, 1974), edited by Yamanoi Yū as volume 29 of "Nihon shisō taikai." Tōju thought is the subject of a recent study by Yamamoto Makoto, *Nakae Tōju no jugaku* (Tokyo, 1977).

MARY EVELYN TUCKER (1987)
Revised Bibliography

NAKAYAMA MIKI (1798–1887) was the founder of Tenrikyō ("The Teaching of Divine Wisdom"), which is one of Japan's best known "new religions" (*shin shūkyō*), with over two million members at the beginning of the twenty-first century. Miki's story is important not only for understanding Tenrikyō, but also for understanding what is novel about the many new religious movements that arose and flourished in Japan since the end of the nineteenth century.

The church's sacred biographies present a sanctified image of Miki as a shrine of God who was also a divine model for all who sought salvation. She was born into a wealthy farming family in the small village of Sanmaiden in what is now Nara prefecture on April 18, 1798. As a child she showed a remarkable generosity of spirit as well as unusual devotion to the *nembutsu* faith of Pure Land (Jōdo) Buddhism. Miki was a spiritual seeker whose quest for the truth almost led her to become a Buddhist nun.

In 1810, however, her family forced her to marry Zenbei Nakayama (1788–1853), the eldest son of the prosperous village chief of Shoyashiki village, now known as Tenri City near Nara, Tenrikyō's headquarters. According to Miki's revelations, Shoyashiki was also the sacred center where humanity was first created (*jiba*) by God. She was put in charge of Nakayama family affairs at the age of sixteen. She became a paragon of virtue through obedience and hard work—the "good wife and wise mother" according to the contemporary Confucian feminine ideal.

Nevertheless, Miki endured intense personal suffering. Her mother-in-law constantly bullied her, while her husband Zenbei led a dissolute life that almost led to her death when his lover Okano, the family maid, tried to poison her. In 1828 yet another tragedy occurred when a neighbor's child she was caring for became ill with smallpox. Miki vowed to the gods that she would sacrifice her own life as well as her children's to save him. Indeed, two of her own children died after the neighbor's child miraculously recovered.

Miki's turning point occurred on October 23, 1838, when she was forty years old. Life was uncertain after one of the worst famines to affect Japan in the nineteenth century.

ry, followed by an unsuccessful political revolt by the samurai Oshio Heihachirō. Miki, who was physically and emotionally drained after the birth of her last child, Kokan, faced further misery when her eldest son Shūji (1821–1881) was afflicted with unbearable pain in his left leg. His condition gradually worsened in spite of consultations with physicians. As a last resort, a mountain ascetic (*yamabushi*) was called to perform an exorcism (*yosekaji*) on Shūji. The normal procedure for an exorcism required the ascetic to recite incantations that forced the evil spirit to enter a female medium. There it would announce its identity and its reasons for afflicting the child. In Shūji's case, however, something extraordinary happened. Because the ascetic's normal medium was not available, he asked Miki to serve in her stead. When Miki went into a trance, however, instead of an evil spirit, an august voice spoke through her, saying, "I am the general of heaven. I am the true and original God. . . . I have descended from heaven to save all human beings, and I want Miki to be the shrine of God." Despite initial opposition, Miki's family acceded to the god's demand, and Miki embarked on her career as a living *kami* (*ikigami*), or deity. In 1841 her god, whom she addressed as Tenri-Ō-no-Mikoto, commanded her to live a life of poverty as the first stage of her mission to relieve human suffering. She gave the family treasures to those in need, even going so far as to tear down the Nakayama mansion. After Zenbei died in 1853, she began to proclaim her new faith by reciting the simple prayer *Namu Tenri-Ō-no-Mikoto* ("Honor to the Lord of Divine Wisdom") on the street corners of Osaka. She also began to attract many converts because of her miraculous healing powers, especially her ability to grant a painless passage through childbirth (*obiya yurushi*). In 1863 she met Izō Iburi, a master carpenter who became her most devoted disciple and built the first worship hall on the Nakayama estate. Following the roof raising, however, an incident at a local shrine led to Miki's disciples being arrested for disturbing the peace. This episode began a long period of persecution by the Shintō priests, Buddhist authorities, and local police who feared the new religion.

From 1866 to 1882, Miki wrote down the two major scriptures of Tenrikyō containing the revelations of God, the *Ofudesaki* (The tip of the divine writing brush), and the *Mikagura Uta* (The songs of the *Tsutome* service), followed by a third scripture known as *Osashizu* (Divine instructions). *Osashizu* was written down by Izō as Miki's spiritual intermediary after her death. Miki also taught a ritual dance called *Teodori*, which is still performed as a regular part of Tenrikyō services.

Miki's revelations and her sacred dance were intended to convey the central doctrines of Tenrikyō. Miki believed that voluntary poverty is necessary to achieve salvation, and that true happiness is found only through consecrated labor when a devotee acts with no thought of reward. Unhappiness is caused by dust settling on the heart from past evil *karma*. A joyful life (*yōki gurashi*) can be attained by having true faith

in God the parent (*oyagami*), who has the power to sweep away the evil dust. The laughter, songs, and *Teodori* dance are concrete realizations of this joy in ritual form. Miki ardently believed that the entire world could be renewed (*yo naoshi*) by following her method of salvation. Although her son Shūji won official recognition from the Shintō authorities in 1867, government persecution of Tenrikyō continued throughout the Meiji period (1868–1912). The Meiji authorities tried to stamp out "evil religions" in order to promote "enlightenment and progress" (*bunmei kaika*) through modern rational principles. They also saw Tenrikyō, which was popular among the peasantry, as a direct threat to Shintō and its nationalistic faith in the emperor. Miki was arrested over eighteen times for her heretical beliefs until her death in 1887 at the age of eighty-nine.

Miki's biography is significant to contemporary students of religion for three reasons. First, it shows the typical features associated with the rise of Japanese new religions. Tenrikyō arose outside the priestly establishment in a time of social unrest. It is also a syncretic mix of Shintō, Buddhist and folk religious elements that reflects the religious dynamism of Japanese religions. Moreover, Miki's belief system is typical in its claim to reveal a previously hidden truth from a hitherto unknown god for the spiritual benefit of humankind and the renewal of the world (*yo naoshi*).

Second, Tenrikyō, like many other new religions, was founded by a charismatic woman who fit the ancient Japanese pattern of the female shamanic medium (*miko*). Shimazono Susumu has noted, however, that Nakayama Miki and other charismatic founders like her displayed a new trait. Rather than simply filling the traditional role of a spirit medium as an assistant to a Buddhist ascetic, Miki acted on her own behalf throughout her life. After her death, she still continued to serve as a mouthpiece for God through her male assistant Izō. Moreover, the *kami* who possessed Miki was not an ordinary malevolent fox or snake spirit but an all-powerful and benevolent parent god. Tenri-Ō-no-Mikoto not only created the world and humanity but was also a caring deity promising universal salvation. Miki also differed from the traditional spirit medium in another respect, according to Shimazono. As a "shrine of God," Miki was a vehicle for the divine in every aspect of her life, not only when she was in a trance state. She thus became a model of human fellowship with the divine for the faithful to emulate. Founders who were living *kami* like Miki played an important role in emerging nineteenth-century Japanese religious movements.

Third, several scholars have called attention to Miki's special role as a savior of poor and oppressed women. Traditional Buddhist teachings denigrated women as polluted and spiritually inferior beings. Tenri-Ō-no-Mikoto, however, taught that men and women are spiritual equals. Indeed, the god's other names, "parent god" (*oyagami*) and Sun-Moon (*tsuki-hi*), convey Miki's revelation that the sacred is both male and female. Miki also taught women that childbirth is

not polluting, but rather a joyful experience protected by God's power—a controversial teaching given the old restrictive Japanese customs surrounding childbirth.

MARK W. MACWILLIAMS (2005)

NAMĀZ SEE ṢALĀT

NAMES AND NAMING activities are central to human symbolic and communicative processes. To be human is to name, and be named, and thereby to possess full being and the ability to relate to the world in meaningful ways. In the Bible, God is said to have brought all the newly created animals to the first human, “to see what he would call them” (*Gn.* 2:19). In all human communities there is thought to be a close relationship between the name of a person or other phenomenon and its character, status, and very being.

Names often have a mysterious quality, whether they refer to sacred beings of a transcendent nature or to humans and other concrete entities. There is power in names, because

they both participate in the reality named and give definition and identity to that reality. That is, name and named exist in a mutual relationship in which the power of the former is shared with the being of the latter. Being without name has a very marginal status in the world of phenomena. For example, traditional Christian teaching holds that unbaptized children who die go to limbo. They have no clearly defined status because they have been given no name by the proper ceremonial means. The act of christening during baptism renders a new life human in the religio-cultural sense, which is more significant than mere biological humanness. Similarly, among the Netsilik, in a traditional Inuit (Eskimo) context, once a female infant had received a name it was absolutely forbidden to kill her, though female children were often considered superfluous.

Persons have often been thought to persist after death through the remembrance of their names. In ancient Egypt, children had the solemn duty to preserve the names of their parents through ritual means. The Old Kingdom Pyramid Text of Pharaoh Pepi I refers to his continued existence by means of the repetition of his name: “Thy name which is on earth lives; thy name which is on earth lasts; thou wilt not disappear; thou wilt not be destroyed in all eternity” (cited by Henri Frankfort, *Kingship and the Gods*, Chicago, 1948, p. 113).

Not only humans, whether of high or low degree, but also gods exist and express their power, presence, and will by means of their names. In ancient Israel, God was believed to dwell in his Temple through his name (*shem*), while he himself dwelt in heaven. That is, by his name, *YHVH* (probably then pronounced as *Yahveh*), God resided in revealed form among his creatures. In this case, *Yahveh*'s inner being was not coterminous with his name; but his power, will, and presence were made manifest in his sanctuary through it. Islamic belief holds that Allāh likes to be called upon by his names, which provide vehicles for communication and even union between Allāh and his human servants. In Hinduism, the mention of a god's name has soteriological value. One view even holds that the name of God is greater than its referent, because sound (*śroṭa*) is absolute. But not all traditions have a name for God, nor is it always considered proper, because of their holiness, to utter those names that are associated with divinity.

NAMES OF GODS AND OTHER SACRED ENTITIES. It is common to nearly all religious practices that in order to communicate with a deity one must know its name. Knowledge of a divine name gives the knower both power and an avenue of communication with its source. This intimate relationship between knowing a name and participating in its power has both religious and magical aspects.

Ancient Israel and Judaism. Moses asked the voice from the burning bush, identified as “the god of your fathers,” what his name was, and was answered “I am” (*ehyeh*), which, in a different Hebrew grammatical form, is rendered *Yahveh* (approximately, “He causes to be”; *Ex.* 3:13–14). In

keeping with this most mysterious and potent of God's names in the Hebrew tradition is the conviction that God's names are, generally speaking, according to his acts. Causing to be is the greatest of acts and thus the name *Yahveh* is the most sublime name. Yahveh, as name and as theological concept, affirms both God's eternal reality and his reliable presence with his covenant people, Israel.

There are many names for God in the Hebrew scriptures; some of them appear to be very archaic, and some were shared by other Semitic peoples in antiquity. Other names came into being during the long covenant history of Israel, both through contact with neighboring peoples and through the deepening insights of Hebrew prophets and poets. *Baal* ("lord"), a term common to Canaanite religion and Hebrew faith, came to be associated with Yahveh for a time, only to be repudiated later. *Adon*, which also means "lord," did not earn the opprobrium of *Baal* and continues to the present to be an honorific substitution for *Yahveh*, the name that postexilic Jews considered too holy to utter. *Adonai* ("my lord") came to be a potent religious term because of its referent, whose real name was different. Here sacred names can be seen operating on different levels, with one gracious name serving as a protective shield for another, more sacred name. Certain other divine titles and names emerged from Israel's cumulative experiences and convictions: political ones meaning "king," "judge," "shepherd"; kinship terms meaning "father," "brother," "kinsman"; and metaphors from nature with such meanings as "rock."

Christianity. The New Testament community inherited most of the Israelite names and convictions associated with God but never developed the strong sense of taboo connected with the holiest name, *Yahveh*. Jesus took the Hebrew name of God as "father" but rendered it in the familiar form *Abba* ("daddy"), which astonished people because it is ordinarily used only between an actual begotten child and its father. *Father* has remained the most characteristic Christian appellation for God, used especially when the speaker draws near to him in prayer, worship, and praise. All other names for God, whether inherited from the biblical tradition of the Jews or generated within the Christian movement, have been tempered by the intimate personal dimension that Jesus emphasized.

The Christians accepted the older Hebraic custom of speaking or acting "in the name of" someone, whether God or a human, as a representative or witness. The New Testament sometimes uses the names of God and Jesus almost interchangeably as the ultimate divine authority, while never suggesting directly that Jesus is other than the mediator between God and humankind, and not to be worshiped himself. The identification between Father and Son, however, becomes almost total in later christological developments, when Christians came increasingly to conceive of God in terms of Jesus' incarnation. "At the name of Jesus, every knee should bow" (*Phil.* 2:10) is one way in which the New Testament expresses the exalted nature of Christ, whose name is holy.

Islam. In characteristic Abrahamic fashion, the religion of Muhammad and the Qur'an places heavy emphasis on the name of God. All utterances, written or spoken, should be prefaced by the phrase "In the name of Allāh, the merciful, the compassionate" (Arab., "Bismillāh al-raḥmān al-raḥīm"). The word *Allāh* is probably an archaic contraction of the Arabic definite article *al-* and *'ilāh*, "deity" (cf. Heb. *el*, *eloh*, "god"). Allāh, "the god," or God, was central in the pre-Islamic pantheon but as the highest and not the sole divinity. The ancient Arabs believed that Allāh had three daughters, but this as well as other views of Allāh's relatedness and contingency were swept away by the prophetic activity of Muhammad and the message of the Qur'an. The Islamic scripture emphasizes Allāh's incomparable uniqueness. It also provides many names and titles of Allāh, sometimes outright but often in the sense of derivations of divine attributes and activities (e.g., *Knower*, *Provider*, *Relenting*). Later Islam developed out of the Qur'an a list of the "most beautiful names of Allāh" (*al-asma'*, *al-ḥusnā*), which are traditionally believed to number ninety-nine. The names are recited by Muslims, often with the aid of a string of beads called a *subḥa*. Each name has a particular power and should be recited according to the spiritual station of the seeker.

In addition to *Allāh*, two other names figure prominently in the Qur'an. The first is *Rabb* ("lord"), a term that occurs most frequently in passages containing material about Jews and Christians. The message of Allāh's uniqueness and sovereignty is often declared with the use of *Rabb*, beginning with what is commonly considered to be the first passage to have been revealed: "Recite: In the name of thy Lord [*rabbika*], who created man of a blood clot" (surah 96:1-2). The second frequent Qur'anic name besides *Allāh* is *al-Raḥmān* ("the merciful"), which is the same as the old South Arabian Jewish name for God. The Qur'an commands the believers to "call upon Allāh, or call upon al-Raḥmān; whichever you call upon, to him belong the names most beautiful" (17:110).

Muslims have never observed a taboo respecting the name of God. Instead, they have preferred to utter their praises with as many divine names and attributes as possible, following the Qur'anic command: "O believers, remember God oft [by means of *dhikr*, "mentioning" his names], and give him glory at the dawn and in the evening" (33:41).

Sikhism. The Indian combination of devotional Hindu and Ṣūfī Islamic doctrines founded by Gurū Nānak (d. 1539) emphasizes the magnification of God by his name in a special form of devotion known as *nām mārga* ("the path of the name"). A variety of names for God are recognized and uttered by Sikhs, including both Muslim and Hindu ones, but the most common is *Sat Nām* ("the true name"). Although Sikhs believe that it is beyond humankind's capacity to describe and define God, people can become purified and free of their egos by means of the veneration of his names, with intelligent awareness and detachment from the world.

Hinduism. There is a persistent conviction within the rich and complex Hindu worldview that the mysterious, unknowable ultimate reality, *brahman* (which literally means “expansion, swelling, growth”), transcends and undergirds all. *Brahman* is the holiest of beings, the most real being, and the source and goal of all being. Hindus have developed highly abstract pantheistic and theistic philosophical doctrines of *brahman*. At bottom, the name *brahman* means “prayer,” in the sense of sacred utterance, so that by speaking the word one participates in its reality as power and speech. The believer is able to meditate on divine themes by means of *mantras*, special patterns and techniques of oral utterance that center on the name of a deity, or on a sacred syllable or sound. A *mantra* is not limited to divine names as words only but may be rooted in the whole realm of sound and breath. *Mantras* are recited under the guidance of a guru, or preceptor, who knows the correct pronunciation of the formulas and other aspects of ritual performance, such as posture and breath control.

It is of the utmost importance in Hinduism that the correct name for a deity be used, depending on the purpose and status of the worshiper. The many named divinities of Hinduism, although never universally regarded as belonging to a single system, nevertheless can be identified as components of a comprehensive and balanced worldview, with prominent social and cultural dimensions.

The invocation of names of gods is especially prominent in devotional (*bhakti*) Hinduism. Singing and recitation of the divine names, especially that of *Kṛṣṇa*, is believed to bring release (*mokṣa*) from the round of rebirth (*saṃsāra*). Some Hindus meet regularly to perform *nāma vali*, a “necklace of names” in which an emotionally charged congregation and its leader sing the name of a deity, beginning slowly, and building up to a spirited climax. The *Purāṇas* contain much on name praise, such as the following passage: “Hari’s Name, Hari’s Name, and Hari’s Name alone is my vocation. In the Kali age there is no other, no other, indeed no other course [for *mokṣa*]” (cited in Singer, 1966, pp. 143–144).

Mahāyāna Buddhism. Mahāyāna Buddhism places considerable emphasis upon the soteriological efficacy of invoking the Buddha’s name. The Pure Land schools of East Asia stress faith in Amitābha (called Amida in Japan), focusing on the simple ritual of reciting the name of the Buddha in order to be saved and enter paradise.

Nembutsu. The devout repetition of the phrase “Namu Amida Butsu” (“Homage to Amida Buddha”) is believed to deliver one from sins and, if uttered on the threshold of death, will effect one’s rebirth in the Pure Land of Amida. There are different schools of the ritual remembrance of the Buddha’s name, called *nembutsu* in Japanese and *nien-fo* in Chinese. The Japanese monk Hōnen (1133–1212) taught that one should repeat the name of Amida with faith, a practice open to practically anyone, not requiring long apprenticeship in meditation. Hōnen and some of his disciples insisted that the *nembutsu* formula should be repeated

continuously, as many as seventy thousand times in one day. Shinran (1173–1262), who followed his master Hōnen in *nembutsu*, considered a single recitation of the ritual invocation, “with faith,” as sufficient for salvation. In Japan, the name is a key dimension, whereas in China and India, invoking the name of Amitābha Buddha has been associated with the less central contemplation of the gigantic features of the Buddha’s cosmic body.

The Lotus Sūtra. Another ritual naming practice in Mahāyāna Buddhism is the invocation of the *Lotus Sūtra*, a major book in the Buddhist canon that became a central scripture of Tendai Buddhism in China and Japan. Nichiren (1232–1282), a Japanese seeker who studied Tendai, Zen, and Pure Land Buddhism, concluded his spiritual training with the discovery that enlightenment could be achieved by anyone who has sincere faith in the teaching of the *Lotus Sūtra*. This faith was then to be expressed in the formula “Namu Myōhōrengekyō” (“Homage to the *Sūtra of the Lotus of the Wonderful Law*”). Implicit in this Japanese statement of affirmation is the sense of humble submission to the power of what is named, which is also somehow the name itself. Nichiren chanted the name of the *Lotus Sūtra* to the accompaniment of a drum.

China. The Chinese have traditionally stressed the importance of names, whether in the Confucian doctrine of the “rectification of names,” a philosophy of balance, propriety, and equity in the universe, or at the practical level of naming gods, humans, and other beings. Confucianism has always emphasized the veneration of ancestors, but the Way of Heaven (*t’ien-dao*) has traditionally been ultimate. *T’ien* (“heaven”) is sometimes a name for the impersonal sky that overarches all things; at other times *t’ien* has taken on a somewhat more personal meaning, as the divine ruler of events on earth. A variant is *shang-ti* (“supreme ruler,” or God). But *t’ien*, even when it means “deity,” is subordinate to *dao*, the universally acknowledged ultimate reality in Chinese religious thought. *Dao* cannot be named, nor can it be translated. To characterize the term as the impersonal, creative, and regulating power of the universe is to approach its essence, which in any case is mysterious and transcendent. But, paradoxically, *dao* is also immanent and natural. Lao-tzu’s classic treatise, *Dao-te ching*, opens: “The way [*dao*] that can be spoken of is not the constant way; the name that can be named is not the constant name. The nameless was the beginning of heaven and earth; the named was the mother of the myriad creatures” (trans. D. C. Lau, Baltimore, 1963).

Nonliterate and archaic traditions. The appellations for divinity and humankind alike among nonliterate peoples are often extremely varied and complex. Names and naming are frequently surrounded by taboos and employed only with specified ritual procedures, including considerations of status, relationship, season, age, place, and power.

Australia. Among the Aborigines of southeastern Australia, before Europeans arrived, there was a fully developed belief in a “high god,” as scholars have named the category

of supreme being in archaic religion. In Australia, the high god's names, myths, activities, and associated rituals were closely guarded secrets, known only to the initiated males of high status. *Baiame* is one of the names for the Australian high god, who is believed to have created the world, given moral laws, and established the initiation rites by means of which humans attain their full being and come into contact with ultimate reality. The Australian high god is a sky divinity who performed his greatest labors at the beginning of things, but who nevertheless continues to live and have influence. *Baiame*, *Daramulun*, *Nurunderi*, *Bunjil*, and *Biral* are some of the names for the "sky-hero," as A. P. Elkin (1954) calls the Australian high god. The secret name of this deity was divulged during initiation rites, when his voice was heard in the sound of the bull-roarer.

Africa. Celestial supreme beings are also known in traditional African religions. Some are distant and uninvolved in human affairs, as in Australia. But others are active and engaged in the world, especially on the moral plane. The Yoruba believe in a high god called *Ọlọrun* ("lord of the sky"). *Ọlọrun* is not directly involved in historical existence, but rules through intermediaries. Among the Dinka, on the other hand, *Nhialac*, whose name means "above," is honored as both creator and sustainer of the world. The Dinka tend to identify all other gods and sacred forces with *Nhialac*, who thus becomes a sort of only god, in the monotheistic sense, as well as supreme being. The Nuer have no special name for God, but simply use the term *kwoth* ("spirit"), together with appropriate qualifying words or clauses.

Ancient Egypt. The celestial type of deity is clearly discernible in ancient Egyptian religion, where the pharaoh was believed to be the divine embodiment of Horus, the falcon god, and Re, the sun god. Celestial names and attributes are always reserved for royalty in such traditions as that of Egypt, in which the close relationship, even identification, of the divine and human realms is bound up with rule and cosmic order. Ancient Egyptian sources indicate a great concern for names and their power. The most powerful name for a god was his or her unknown name, as is evident in the famous story of how Isis tricked the supreme god Re into revealing his secret name, which resulted in the goddess's appropriation of his power. Name magic became highly developed in ancient Egypt, especially with respect to deities, who exercised direct power over humans for good or ill.

Ancient Rome. The naming of deities in Roman times was a highly complex and carefully regulated affair. The Romans kept long lists of divinities, both known and unknown; and they also preserved secret lists of divine names. Hermann Usener wrote a celebrated book called *Götternamen* (Names of Gods; 1896) in which he argued that the Romans distinguished both "momentary" and "functional" deities, who received names according to their times and kinds of activities. Every time, place, thing, and event had its own deity, according to this theory, and the myriad deities that inevitably resulted from such a view were arranged hierarchically.

Usener's thesis that momentary and functional gods gave rise to more pervasive, overarching gods, and finally to God, has not fared well in recent times, although his researches still provide a detailed review of the naming systems employed by the ancient Romans.

HUMAN NAMES AND NAMING PROCESSES. Human names and naming practices are often as important ritually and symbolically as those connected with deities. For example, in ancient Egypt, the name of a god, person, or object was equivalent to its inner being; without *ren*, "name," there was no existence. In the case of humans, *ren* came to be equal in importance to the *ka*, the individual's "spirit" or "vital force." Likewise, in traditional China the name and its owner were identical. In Confucian ancestral rites, the deceased had a "spirit tablet" or a gravestone engraved with his or her name. If the name were omitted or effaced, then there was thought to be no spirit in the grave, and the person utterly ceased to exist. Similar ideas, with different specific rites and behavior patterns, can be found in other traditions (e.g., in Africa, Oceania, and the Americas).

Judaism. Jews have traditionally employed biblical names, which in turn were derived from many sources: kinship (e.g., *Yehoshu'a ben Nun*, "Joshua the son of Nun"), animals (e.g., *Rahel* or *Rachel*, "ewe"), plants (e.g., *Tamar*, "palm"), personal characteristics (e.g., *Esav* or *Esau*, "hairy"), circumstances of birth (e.g., *Ya'aqov* or *Jacob*, "he who takes by the heel"), and relationship to God (e.g., *Ovadyah* or *Obadiah*, "servant of Yahveh"). In biblical times, the Hebrews practiced name changing because of status changes or special circumstances and experiences. *Ya'aqov's* (Jacob's) name was changed to *Yisra'el* (*Israel*, "let God contend" or "he who strives with God") after his struggle with the angel (*Gn.* 32:29). *Avram's* (Abram's) name was changed to *Avraham* (*Abraham*) and *Sarai's* to *Sarah* when they were commissioned with their auspicious roles as parents of multitudes (*Gn.* 17:5, 17:15). Jews have also adopted foreign names in certain periods. In medieval Europe, they adopted both sacred and secular names, a practice that endures.

Christianity. Christians have sometimes insisted on specifically Christian names for their children, but they have often also adopted names current in the countries where they have lived. Where Christians have constituted a minority, for example in Islamic regions, "Christian" names (like *Peter*, *George*, *Paul*, *Mark*, and *Thomas*) have been important factors in preserving religious and social identity. Although it has rarely been required that children take biblical names, it has often been done. More common has been the practice of giving a child the name of a saint. Persons entering holy orders or elevated to high ecclesiastical office have also taken saints' names. During the Reformation, Protestants began using Old Testament names for their children, to distinguish themselves from Roman Catholics. The Council of Trent decreed that all baptized infants must be given a saint's name.

Islam. The conversion to Islam is accompanied by a change of name. Muslim names are partly based on ancient

Arabic or other (Persian, Turkish, or Indian) usages, partly upon the sayings of Muḥammad reported in the body of traditions known as *ḥadīth*. Muḥammad taught that the best names are ‘*Abd Allāh* (“God’s servant”) and ‘*Abd ar-Raḥmān* (“servant of the merciful”). From this basis, the use of ‘*abd* with any of the ninety-nine “most beautiful names” of God became very common. The name *Muḥammad* and its parallels are widely used for males, for according to tradition every man with the name of Muḥammad will go to paradise. The Muslims developed a list of ninety-nine names of the Prophet (*asmā’ sharīfah*) to parallel the ninety-nine names of God. Among them are *Aḥmad* (“most praised”), *Tāhā* (the first word of surah 20), *Mudaththir* (“wrapped,” the opening word of surah 74), *Munīr* (“radiant,” surah 33:45), and so forth. Also popular are the names of the Prophet’s family and his companions, although in Shī‘ī circles one will never find the names of the first three caliphs or of ‘*Ā*’ishah but will very frequently find those of Fāṭimah and the imams, from ‘*Alī* to Taqī or Riḍā. Names of the Qur’anic prophets are widely used, including those of Mūsā (Moses) and ‘*Īsā* (Jesus).

Traditionally, a Muslim name has several different parts, among them the *ism*, the *nisbah*, and the *kun-yah*. The *ism* is the religious name, like those mentioned above. The *nisbah* shows the relation to one’s birthplace, tribe, or line of thought; in Arabic, it ends in *ī*, as in *Makkī* (“from Mecca”), *Thaqafī* (“from the Thaqif tribe”), and *Ḥanafī* (“belonging to the Ḥanafī school of law”). The *kunyah* indicates the relation of a parent to a child; either *Abū* (“father of”) or *Umm* (“mother of”) is given to a firstborn child, as in *Abū ‘Alī*, or is used in a more general sense, as in *Abū al-Fawāris* (“father of the riders”). The *kunyah* is the name of honor by which one ought to be addressed.

A Muslim name is often complemented by a *laqab*, a nickname pointing to some special quality, as in *al-A‘raj* (“the lame one”). Often, composites with *al-dīn* (“of the religion”) are added to the *ism*, as in *Jalal al-Dīn* (“majesty of religion”). To people in political positions compounds with *al-dawlah* (“of the state”) may be given as honorific titles, as in *Sayf al-Dawlah* (“sword of the state”). Rulers surrounded themselves with long chains of honorific names, the central one pointing to their relation with God, as in *al-Mutawakkil ‘alā Allāh* (“who trusts in God”). Male children were sometimes given repellent names to avert the evil eye, but slaves were often given such delightful names as *Marjān* (“coral”) and *Kāfir* (“camphor”).

Non-Arab Muslims traditionally continued using their inherited names, complemented by Muslim names; in countries under Persian cultural influence, such as Turkey and India, Persian names were often used among the upper classes. Indo-Pakistan has produced unusually colorful names, which are often incompatible with Arabic grammar.

Names are often given by an elder member of the family or a venerated master. If a child is born on an auspicious day or in a sacred month, he or she may be named accordingly: by *Ramaḍān*, for instance, or *Mawlidīyah* (for a girl born on

the birthday, *mawlid*, of the Prophet). If the child is the result of a special prayer he may be given the name *Nabi-Bakhsh* (“gift of the Prophet”), *Dād-‘Alī* (“Ali’s gift”), or *Ghauth-Bakhsh* (“given by Ghauth,” i.e., ‘*Abd al-Qādir Jīlānā*). Often, especially in India, the Qur’ān is opened and the first meaningful word found is taken for a name. Family names were long unknown in some parts of the Muslim world, or have only recently been introduced, as in Turkey; in such cases the *nisbah* or the *laqab* may develop into a family name.

Hinduism. Hindu names are extremely varied and numerous. They often include the names of deities, as in *Devadatta* (“given by God”). A Hindu name should reflect the bearer’s place within the caste hierarchy. Sometimes a secret name is given to a boy and will remain as part of what survives of him after his death. A close relationship exists between name and personality, and so one’s name must be guarded and respected. A traditional Hindu wife never calls out the name of her husband or utters it to others, nor will her husband use her name aloud. The more names a person has, the more secure he or she is from evil and harm. A change of name occurs when status is altered, as when a person becomes a ruler or is recognized as a great spiritual leader.

The ritual of name giving is an important family event, requiring new clothes, an auspicious spatial orientation for the ceremony, the bestowing of a consecrated gold object on the child, and anointing. The name is selected by a family priest or astrologer. Careful attention is given to the number of syllables in the selected name (an even number for boys, odd for girls), its source, and other similar matters.

China. There is an intimate relationship in Chinese tradition between a person’s name and his essential being. After a person’s death, if no spirit tablet is attached to the grave, there is no continuing inhabitant of the grave in the sense of a distinct personality. The spirit tablet, or “soul silk,” is inscribed with the taboo name of the deceased and receives the prayers and veneration of his family. Although names are maintained for generations, the real name of the deceased is never uttered aloud; rather, another name or title is used. This applies also to living persons, who are commonly referred to by inferior names, which are often apotropaic, considered capable of warding off evil because of their unattractive associations. A demon is unlikely to take an interest in a child with a name meaning “stupid dog” or “sweet potato.” Inferior names are known in other cultures, too, such as those of Africa and of ancient Greece. Paired with the inferior name is a “fate name” (*ta ming*), which bears an auspicious meaning (prosperity, happiness, success). The fate name is also never uttered. In traditional China, each name was thought to require an adequate portion of each of the five elements of the universe, which were symbolized by certain Chinese characters. The precise determination of a new name was made by consulting the horoscope.

The naming of persons, especially males, has been a complex matter in China. The “milk name,” given a month

after birth, remains with the person for life. It is used by relatives and others close to the person. Additional names include a "book name," bestowed upon starting school; a "great name," received at marriage; a name to be used by friends outside the family circle; a "studio name," for scholars; and a posthumous, or taboo, name, inscribed on the spirit tablet. Females receive fewer names than males, but they, too, have a milk name, a surname, a marriage name, and nicknames.

Chinese emperors had many names, some connected with their years of rule and any favorable factors connected with them. A ruler's personal name was taboo during his lifetime. At the domestic level, a child was forbidden to utter the name of his father, and wives avoided using their husbands' names, as in India.

Nonliterate traditions. The use of secret names has been widespread among otherwise very distinct and dispersed cultures. In Aboriginal Australia, name taboos were associated with secret rituals featuring the names of sacred and totemic beings. A person's secret name was never uttered beyond the ritual setting, when the *tjurunga* was being examined, and it was not known beyond the circle of initiated males of his local totem group. Even when the secret name was spoken, it was whispered, lest an enemy learn it and work evil magic by it. The secret name among Aboriginals represented the real self, linked with the past, present, and future in the timeless Dreaming.

Among the Inuit (Eskimo) of North America, the Netsilik distinguished between a personal soul and a name soul. The former was the source of health and energy but was vulnerable to attacks by evil spirits and wicked shamans. A name soul was an actual name, with life and power of its own, and it could protect the person who bore it. Therefore, people acquired as many names as possible, because they served as guardians. Males and females bore names without regard to sex, and the names often came from nonhuman categories such as animals, natural objects, and activities. Hunters liked to have additional names for greater strength, and women obtained them in order to have healthier children. When giving birth, a mother would often call out various names; if the birth was made easier after the mention of a particular name, then it was believed that a name soul had already entered the baby's body, and that would be its name.

In Native American cultures, names were thought to shape and influence the personalities and characters of individuals. Names might serve as an ideal or goal if they were auspicious or represented some virtue. Or names were given that reflected failings and character flaws. It was common for a person to earn a series of names during his lifetime. Among the Blackfeet, a man normally had at least three names: he received the first at birth and used it until he went to war for the first time. The second was a nickname given to him in boyhood by his playmates. It was often unflattering and would sometimes remain attached to its bearer for life. The third was the tribal name, bestowed after the young man had

fought his first enemy. The tribal name was based on the outcome of that fateful experience and he bore it for life, whether it reflected honor or dishonor. If a person earned an unflattering name because of his first battle, he could possibly redeem himself through later exploits and then be awarded a meritorious name by the tribe. An individual might earn as many as a dozen names during his lifetime, all of which were his exclusive possessions, forbidden to others. It has also been traditional among Native Americans not to divulge their own names when asked. Someone else must utter the name, because it would be boastful as well as inauspicious to speak one's own name aloud. In many Native American cultures, names were drawn from the totemic and animal worlds, as well as from incidents in life. Names of deities were rarely used in connection with human names.

BIBLIOGRAPHY

The articles collected under the general title "Names" in the *Encyclopaedia of Religion and Ethics*, edited by James Hastings, vol. 9 (Edinburgh, 1917), continue to be useful, although not all of them provide much information on the religious and magical significance of names. A balanced and informative collection of interpretive articles on several traditions is *Der Name Gottes*, edited by Heinrich von Stietencron (Düsseldorf, 1975). There are a number of penetrating observations on the religious dimensions of names in volume 1 of Gerardus van der Leeuw's *Religion in Essence and Manifestation* (1938; Gloucester, Mass., 1967), pp. 148–149, 152, 155–170, 184, 198–199, 287, 422.

Names from Hebrew scriptures have received much attention in modern scholarship. A suggestive historical and cultural survey is contained in Johannes Pedersen's *Israel: Its Life and Culture* (1926–1947; Oxford, 1959), pp. 245–259. Philological and theological analyses are considered in Edmund Jacob's *Theology of the Old Testament* (New York, 1958), in which see especially pages 43–63 and 82–85. The articles "God, Names of," by Bernhard W. Anderson, and "Name," by Raymond Abba, in the *Interpreter's Dictionary of the Bible*, 4 vols. (Nashville, 1962), are thorough, technical summaries with good bibliographies. They treat both Old and New Testaments. A more specialized study is Vincent Taylor's *The Names of Jesus* (New York, 1953).

Arabic and Islamic names and titles are defined and explained in the erudite but accessible article "Names (Arabic)," by David S. Margoliouth, in the *Encyclopaedia of Religion and Ethics*, vol. 9. The "most beautiful names" of Allāh are listed and discussed under their Qur'anic Arabic title, "Al-asmā' al-ḥusnā," by Louis Gardet, in *The Encyclopaedia of Islam*, new ed. (Leiden, 1960–). Other relevant articles in the new edition include "Ism," "Kunya," and "Laḳab," which contain valuable material for further study of Islamic nomenclature and titlature, especially the comprehensive entry "Laḳab." August Fischer's "Vergöttlichung und Tabuisierung der Namen Muhammads," in *Studien zur Arabistik, Semitistik und Islam-kunde*, edited by Richard Hartmann and Helmuth Scheel (Leipzig, 1943), provides a good survey of the use of

the name *Muhammad* and the changes introduced in its pronunciation so that its purity would not be compromised by too frequent use. See also Annemarie Schimmel's *And Muhammad Is His Messenger* (Chapel Hill, N.C., 1985), chapter 5, for the names of the Prophet and their application.

The vast field of Hindu names has not been studied as much as it deserves. A good brief survey is found under the entry "Names" in Benjamin Walker's *The Hindu World: An Encyclopedic Survey of Hinduism*, vol. 2 (New York, 1968), pp. 116–121. See also the article "Nāman," in Margaret Stutley and James Stutley's *A Dictionary of Hinduism* (London, 1977), pp. 201–203. There are highly significant data and discussions pertaining to name veneration in *bhakti* Hinduism in the articles by Milton Singer and T. K. Venkateswaran in *Krishna: Myths, Rites, and Attitudes*, edited by Milton Singer (Chicago, 1966), pp. 91, 143–144, 166, 169, 170. Most of the article "Names (Indo-European)," by Louis H. Gray, in the *Encyclopaedia of Religion and Ethics*, vol. 9, deals with Hindu sources and examples.

For the significance of the Buddha's name in Mahāyāna Buddhism, see Hajime Nakamura's *Ways of Thinking of Eastern Peoples* (Honolulu, 1964), pp. 444, 461, 558–559, 566–567. Original texts in translation can be found in *The Buddhist Tradition in India, China and Japan*, edited by William Theodore de Bary, Yoshito S. Hakeda, and Philip B. Yampolski (New York, 1969), pp. 345–348, and in *The Buddhist Experience: Sources and Interpretations*, translated and edited by Stephan Beyer (Encino, Calif., 1974), p. 124.

Chinese traditional naming is surveyed in the absorbing entry "Names," in J. Dyer Ball's *Things Chinese, or Notes Connected with China*, 5th ed., revised by E. Chalmers Werner (1926; Detroit, 1971), pp. 413–418. See also Ball's article "Names (Chinese)," in the *Encyclopaedia of Religion and Ethics*, vol. 9. The religious and magical aspects of names are surveyed, with generous quotation from original sources, in the classic of J. J. M. de Groot, *The Religious System of China*, 6 vols. (1892–1910; Taipei, 1974), especially the chapters in volume 6, book 2, part 4, "The War against Spectres" and "Use and Disuse of Names," pp. 1109–1142. The role of the name in the veneration of ancestors is described in Laurence G. Thompson's *Chinese Religion: An Introduction*, 3d ed. (Belmont, Calif., 1979), pp. 48, 52.

A classification of types and uses of names was attempted by George B. Foucart in his article "Names (Primitive)," in the *Encyclopaedia of Religion and Ethics*, vol. 9. Much research on names has appeared since in the anthropological literature. See, for example, Claude Lévi-Strauss's stimulating analysis of primitive naming in his *The Savage Mind* (London, 1966), pp. 172–216. See also the collection of papers titled *Naming Systems*, 1980 Proceedings of the American Ethnological Society, edited by Elisabeth Tooker (Washington, D.C., 1984).

Australian name taboos are described in A. P. Elkin's book *The Australian Aborigines*, 3d ed. (Sydney, 1954), pp. 129–130, and in Baldwin Spencer and F. J. Gillen's classic, *The Native Tribes of Central Australia* (1899; London, 1938), p. 139. Names and naming in selected African contexts are treated in Benjamin C. Ray's *African Religions: Symbol, Ritual, and Community* (Englewood Cliffs, N.J., 1976). Ancient Egyptian texts in which names are featured have been translated by E. A. Wallis Budge in *The Book of the Dead*, 2d ed. (Lon-

don, 1960), in which see especially chapter 28. Inuit naming is described in Asen Balikci's *The Netsilik Eskimo* (New York, 1970), pp. 199–200. American Indian naming practices are discussed in original sources collected by Sam D. Gill in his *Native American Traditions: Sources and Interpretations* (Belmont, Calif., 1983), pp. 82–90.

FREDERICK MATHEWSON DENNY (1987)

NĀNAK, Gurū (1469–1539), was the founder of the Sikh religion and the first of a succession of ten gurūs or spiritual prophets.

LIFE. Born in 1469, in Talwandi, a small village in northern India (now in Pakistan), Nānak grew up in a religiously diverse atmosphere. A plurality of Hindu, Muslim, Buddhist, and Jain philosophies and practices circulated in the Punjab of his time. During Nānak's lifetime Babur defeated the Lodi dynasty in the Battle of Panipat (1526) and established the Mughal Empire. Nānak was born into a Bedi family of *ḷṣatriya* Hindus. His father, Kalyan Chand, worked as an accountant for the local Muslim landlord. His mother, Tripta, was a pious woman. The parents named him after their older daughter Nānaki. The love and understanding Nānak received from his sister during his formative years were vital to his consciousness. Later he went to live with Nānaki and her husband Jairam in Sultanpur and worked at the local grocery shop. He married Sulakhni, and they had two sons, Sri Chand (b. 1494) and Lakhmi Das (b. 1497).

In Sultanpur, Nānak had a revelation of the oneness of reality. With his proclamation, "There is no Hindu; there is no Musalman," Nānak began his religious mission. Thereafter for twenty-four years he traveled throughout India and beyond spreading his message of divine unity. During most of his travels, his Muslim companion Mardana played on the rebec, while Gurū Nānak sang songs of intense love addressing the ultimate One in everyday Punjabi. The direct and simple style of Gurū Nānak's teaching drew people from different religious and social backgrounds. Those who accepted him as their "gurū" and followed his teachings came to be known as Sikhs, a Punjabi word that means "disciple" or "seeker" (Sanskrit, *śiṣya*; Pali, *sikha*).

At the end of his travels, Gurū Nānak settled in Kartarpur, a village he founded by the river Ravi. A community of disciples grew around him here. Engaged in ordinary occupations of life, they denied monastic practices and affirmed a new sense of family. Their pattern of *sevā* (voluntary service), *langar* (cooking and eating irrespective of caste, religion, or sex), and *sangat* (congregation) created the blueprint for Sikh doctrine and practice. In his own lifetime Nānak appointed his disciple Lahina as his successor, renaming him Angad (my limb). Gurū Nānak died in Kartarpur in 1539.

Though there is little historical documentation dating from Nānak's lifetime, his own hymns in the *Gurū Granth* have survived. He is vividly remembered in the *janamsākhīs* and the ballads of Bhai Gurdas.

JANAMSĀKHĪS. These “birth stories” are short narratives depicting the birth and life of Gurū Nānak. Combining myth, legend, and history, they portray the divine dispensation of Nānak, his concern for kindness and social cohesiveness, and his stress on divine unity and the consequent unity of humanity. The *janamsākhīs* disclose the illustrious advent of Nānak’s birth. In their central concern and luminous descriptions, the accounts of Nānak’s birth have a great deal in common with those of Christ, Buddha, and Kṛṣṇa. Just as baby Jesus’ stable was lit up by the bright Star of Bethlehem, the humble mud hut in which Nānak was born was flooded with light at the moment of his birth. But Mata Tripta goes through a normal pregnancy, and her Muslim midwife, Daultan, is struck by the extraordinary qualities of the child she delivers.

The *janamsākhīs* continue to provide fabulous details of Gurū Nānak’s entire life. They depict scenes in which dreadful and dangerous elements of nature either protect him (like the cobra offering his shade to a sleeping Nānak) or are controlled by him (with his outstretched palm Nānak stops a huge rock hurled at him). They depict Nānak’s divine configuration. At his death, the shroud is left without the body and flowers are found in its place; both Hindus and Muslims carry away the fragrant flowers to cremate or bury according to their respective customs. The quick and vigorous style of the *janamsākhīs* lent itself easily to oral circulation, and they became popular. The *janamsākhīs* have also been painted and brightly illustrated. The *janamsākhīs* provide Sikhs with their first literary and visual introduction to their heritage, and the stories continue to nurture them for the rest of their lives.

BHAI GURDAS. The ballads of Bhai Gurdas celebrate Gurū Nānak as the axial point between the human and the divine and as the founder of a unique ethical and spiritual legacy. Bhai Gurdas (1551–1636), born twelve years after the death of Nānak, is the first theologian of the Sikh religion. His depiction of Nānak’s advent holds special significance in the communal memory of the Sikhs. As Gurū Nānak made his appearance, mist lifted, “light filling the world / Like the stars vanish and darkness recedes as the sun rises.” Bhai Gurdas powerfully portrays Nānak as the medium of divine revelation whose inspired utterances (*bani*) radically changed the world. He focuses on the transcendent aspect of Nānak’s personality and his liberating message for his stratified society. Nānak’s critique of asceticism, macho behavior, and superstitious observances comes out effectively through Bhai Gurdas’s wit and lively meters.

THE GURŪ GRANTH. The Sikh scripture compiled in 1604 contains 974 hymns by Nānak on a wide range of themes. The opening hymn is Nānak’s *Japu*, which is the quintessence of Sikh philosophy. Nānak’s metaphysical vision of the divine, his ethical stress on social equality, and his aesthetic approach form the basis for the entire Sikh scripture.

Metaphysics. The *Gurū Granth* begins with Nānak’s formulation, “*Ik Oankār*” (literally, “1 Being Is”). Without

using any terms, Nānak designates the divine as the numeral 1. *Oan* is the primal syllable of Indian thought. Nānak’s character for the word *oan* has an arc flying off, as though it were a geometric symbol for the infinity of the numeral 1. In a milieu seething with Hindu-Muslim conflict, the realization of the divine One was critical for Nānak. But his view differed from Hinduism in which the singular reality can be incarnated in myriad ways. Nānak explicitly qualifies that the One cannot be installed (*thapia na jae*), cannot be made (*kita na hoe*). Nānak’s “Oneness” did not correspond with the Islamic notion of one God either, because his vision of the One includes a plurality of approaches to the divine. In his Baburvani hymns, Nānak specifically criticizes the narrow religious worldview that was imposed by Babur’s Mughal regime on the people of India.

Ethics. More than a theological belief, “Oneness” is an active and dynamic awareness of the infinite within the human self. Such a consciousness gets rid of dualities (*dubida*) and petty selfishness (*huamai*). The One pervades each being, says Nānak: “there is a light in all and that Light is That One.” How then could there be hegemonies of caste, race, religion, or gender? Nānak’s metaphysical insight aimed to reproduce an egalitarian ethical system. He rejected the fourfold caste system in which a *sūdra* was below the *brāhman*. He rejected notions and practices that relegated women below men. He spoke against beliefs concerning the pollution associated with menstruation and childbirth and against the sexist practices of sati and purdah. Nānak’s fivefold spiritual journey (in the finale of his *Japu*) urges men and women to:

1. live morally in this diverse and variegated planet earth—*dharam*;
2. expand their knowledge—*gian*;
3. refine psychological and intellectual faculties—*saram*;
4. work vigorously—*karam*;
5. bring into their daily activities the truth (*sach*) that is present in all the continents and constellations alike.

Nānak boldly affirms life on earth and makes personal, economic, social, and political concerns a part of his religious worldview.

Aesthetics. Nānak provides no proofs, arguments, rules, theories, or prescriptions. In order to bring about a real change in his divisive society, he wanted to reach into the very consciousness of his people. Inspired poetry (*bani* or *shabad*) was his means. Aesthetics was his approach. “Only the relisher of fragrance can recognize the flower,” he claimed (*Gurū Granth* 725). His passionate utterances celebrate the singular creator and exult in wonder at the beauty and vastness of the cosmos. Through his aesthetic discourse, Nānak tried to awaken his followers and revitalize their senses, psyche, imagination, and spirit.

LEGACY. For the twenty million Sikhs living around the globe, Nānak is a continuing reality. Their day begins by re-

citing his sublime poetry. Sikh homes, places of business, and sacred spots display his images. Wearing an outfit combining Hindu and Muslim styles, his eyes rapt in divine contemplation, and his right palm imprinted with the symbol of the singular reality, Gurū Nānak inspires his viewers to discover “That One” for themselves.

NIKKY-GUNINDER KAUR SINGH (2005)

NANJŌ BUNYŪ (1849–1927), also transliterated Nanjio Bunyiu; Japanese Buddhist scholar who first introduced Sanskrit into Japan from Europe and laid the foundation for Western-style Sanskrit and Buddhist studies in Japan. Nanjō was born in Gifu prefecture on May 12, 1849, and was educated in a school run by the Higashi-Honganji. In 1876 he was selected by the abbot Gennyō to study Sanskrit and Sanskrit Buddhist texts in England. F. Max Müller, whom he visited at Oxford in 1879, advised him to study Sanskrit there under A. A. Macdonell, one of Müller’s students. Nanjō returned to Japan with an M.A. degree in 1884, and the following year he began to teach Sanskrit at the University of Tokyo.

During his stay in England Nanjō helped Müller to publish Buddhist Sanskrit manuscripts that had been preserved in such Japanese temples as the Hōryūji and the Kōkiji. Their collaboration resulted in the publication of *Buddhist Texts from Japan* (Oxford, 1881), published under Müller’s name, and the two other volumes published jointly by Müller and Nanjō: *Sukhāvati-vyūha, Description of Sukhāvati, the Land of Bliss* (Oxford, 1883) and *The Ancient Palm-Leaves Containing the Praṅgāpāramitā-hridaya-sūtra and the Ushniṣha-vigaya-dhāranī* (Oxford, 1884). These were the first contributions Japanese scholars had made to the international field of Sanskrit studies.

Nanjō’s most significant contribution to Sanskrit and Buddhist studies was *A Catalogue of the Chinese Translation of the Buddhist Tripiṭaka, the Sacred Canon of the Buddhists in China and Japan* (Oxford, 1883), which has long served

as the only guide to the Chinese version of the Buddhist Tripiṭaka for European and American scholars who do not read Asian languages. Nanjō also rendered valuable service to the study of Buddhist Hybrid Sanskrit. His work here includes publication, with H. Kern, of the text of the *Saddharmapuṇḍarīka Sūtra* (Saint Petersburg, 1908–1912), the *Laṅkāvatāra Sūtra* (Kyoto, 1923), and the *Suvarṇaprabhāsa Sūtra* (Kyoto, 1931), with Izumi Hokei.

In 1888 Nanjō received the D.Litt. degree from the University of Tokyo; he was appointed a member of the Imperial Academy of Japan in 1906. In 1914 he became president of Ōtani University and in 1923 professor emeritus at the same university. He devoted himself to research, education, and administrative duties and the propagation of Jōdo Shinshū until he passed away at the age of seventy-eight on November 9, 1927.

BIBLIOGRAPHY

Miyamoto Shōson’s *Meihi Bukkyōno schichō—Inoue Enryōno jiseki* (Tokyo, 1975), an interesting essay on the leading Buddhist thinkers of the Meiji era, contains a discussion of Nanjō and his work on pages 100–123. Nanjō’s autobiography, written at the age of seventy-five, has been published as *Nanjō Bunyū jijoden* (Kyoto, 1924).

MAYEDA SENGAKU (1987)

NANNA is the Sumerian name of the Mesopotamian moon god; his Akkadian name is Sin. Depending on different theologies, he was considered either the son of An (Anu), the nominal head of the pantheon, or of Enlil, the pantheon’s real head. In cuneiform, Nanna’s name was commonly represented by his sacred number, thirty, corresponding to the number of days in the lunar month. The Sumerian myth *Enlil and Ninlil* explains how the moon god came to have his dwelling in the sky. Originally he was to be born in the netherworld, but Enlil worked out an ingenious scheme whereby three other gods would be substituted in Nanna’s place. Hence he was free to inhabit the sky.

Nanna’s consort was Ningal (“great queen”), called Nikkal in Aramaic and Phoenician. Their children were the two other great astral deities, Inanna (Ishtar) and the sun god, Utu (Shamash). In southern Babylonia Nanna’s principal cultic place of worship was Ur, while in northwestern Mesopotamia his center was Haran. It is curious that both these cities are associated with traditions about the patriarch Abraham before he entered Canaan (*Gn.* 11:27–32).

Although the moon cult rose with the political fortunes of Ur, particularly during its third dynasty, founded by Naram Sin (“beloved of Sin”) circa 2000 BCE, Nanna maintained his popularity throughout the entire history of Mesopotamian civilization. The great diffusion of the moon religion in Mesopotamia is attested by the frequent occurrence

of Nanna's name in theophoric personal names in all periods and by the numerous hymns and prayers praising him as a friendly and beloved god. Notwithstanding Nanna's popularity, the attempt of the last Neo-Babylonian king, Nabonidus, to place Nanna at the head of the pantheon in place of Marduk did not gain acceptance and indeed met with strong opposition.

Nanna's cosmic function intimately concerned mankind. The moon god lit up the night and measured time. Hence he was viewed as the controller of the night, the month, and the entire lunar calendar. Similarly, observations of the moon and, in particular, reports of the moon's appearances and disappearances constituted the basis for many omens that directly affected the land, the king, and the people. The enigmatic phenomenon of the constant rising and setting of the moon found its echo in the Akkadian epithet of the moon god as "a fruit that arises from itself and produces itself."

A cause for considerable anxiety was the occasional occurrence of an eclipse, which was considered a bad prognosis and spelled nothing but trouble. In the so-called eclipse myth, the phenomenon is explained as resulting from an attack on the moon by seven evil demons. The moon's capture by these demons causes its light to become cloudy. Prayers and sacrifices are therefore necessary to strengthen the moon and keep it free from future attack (i.e., from another eclipse).

In the hymns and prayers there is a tendency to ascribe to Nanna nearly all the qualities attributed to the other celestial deities. He is unfathomably wise, the organizer of life, guardian and leader of mankind, judge of heaven and earth, master of destinies, helper of the destitute and the lonely, and so forth. He is also associated with royalty. Nanna has the ability to confer royalty on kings by means of a divine halo, the same luminous halo that was observed to surround the moon. Furthermore, kings often expressed the wish that the great gods would confer on them a life renewable every month like the moon.

In the moon god's honor a special month of the year, Siwan (the summer solstice month), was dedicated to him. During the third dynasty of Ur, festivals called *eshesh* ("all-temple" or "general" festivals) were celebrated on the first, seventh, and fifteenth days of the month, corresponding to the phases of the moon.

The symbol of Nanna on cylinder seals and boundary stones was the crescent moon. Because the crescent moon appeared in Mesopotamia with its convexity at the bottom, the idea arose that the crescent was a boat carrying the moon god across the skies. This idea was furthered by the fact that the crescent shape was similar to the shape of the long, graceful boats which were—and are today—the chief means of transportation in the Mesopotamian (modern-day Iraqi) marshes (Jacobsen, 1976). Not surprisingly, then, another of Nanna's common epithets was "the shining boat of heaven."

BIBLIOGRAPHY

There is to date no full-length treatment of Nanna. Åke Sjöberg's *Der Mondgott Nanna-Suen in der sumerischen Überlieferung* (Stockholm, 1960) deals primarily with texts of Sumerian prayers to the moon god up till the end of the Old Babylonian period. The best surveys are still those by Édouard Dhorme, *Les religions de Babylonie et d'Assyrie* (Paris, 1945), pp. 54–60, 83–86; by D. O. Edzard, "Mondgott," in *Wörterbuch der Mythologie*, edited by Hans Wilhelm Haussig, vol. 1, *Götter und Mythen im Vorderen Orient* (Stuttgart, 1965), pp. 101–103; and by Thorkild Jacobsen, *The Treasures of Darkness: A History of Mesopotamian Religion* (New Haven, 1976), pp. 121–127.

NARCOTICS SEE PSYCHEDELIC DRUGS

NĀ RO PA (1016–1100), also known as Nāḍapāda and Nāroṭapa; one of the eighty-four Indian Vajrayāna *mahāsiddhas* ("completely perfected ones"). Nā ro pa was the chief disciple of the *siddha* Ti lo pa (988–1069) and the second human member of the Vajrayāna lineage. This lineage runs from the celestial Buddha Vajradhāra to Ti lo pa, thence to Nā ro pa and his Tibetan disciple Mar pa (1012–1096), and then to the Tibetan Mi la ras pa (1040–1123), with whom the Bka' brgyud pa, one of the four major schools of Tibetan Buddhism, properly begins. Although the Bka' brgyud pa lays special claim to Nā ro pa, he is highly regarded throughout Tibet; in fact, most of the major Tibetan schools have over the course of time integrated his major transmissions and teachings into their own doctrinal formulations.

The earliest and one of the most important biographies of Nā ro pa (approximately twelfth century) outlines the major movements of his life. This biography is a typical example of Vajrayāna hagiography in its intermingling of the ordinary and tangible with the cosmic, magical, and supernatural. Within the genre, however, this biography of Nā ro pa emphasizes the spiritual development of its subject, concentrating on the earlier phases of his career where he is presented as an ordinary, struggling human being seeking spiritual awakening. Only toward the end of his biography do we find Nā ro pa emerging as a fully enlightened *siddha*, majestic in demeanor and surrounded by miracles.

According to his biography Nā ro pa was born in Bengal of the *kṣatriya*, or royal caste. At the age of eleven he went to Kashmir for three years of formal study of Buddhism, a study that continued with tutors upon his return to Bengal. His Buddhist education was cut short when, at the age of sixteen, he was forced by his father to marry a brahman girl named Ni gu ma. The marriage lasted eight years, and was then dissolved by mutual agreement so that Nā ro pa could further his religious training. Ni gu ma was also spiritually inclined, took up Buddhist training herself, and in due course became the founder of an important Vajrayāna and Tibetan lineage.

After the divorce, Nā ro pa returned to his Buddhist training, taking ordination and continuing his study for nine more years, becoming accomplished in the various major areas of Buddhist learning. In 1049 Nā ro pa went to the famous Buddhist monastic university of Nālandā in northeast India and successfully participated in a religio-philosophical debate. As a result, he was elected to the powerful and prestigious position of abbot or gate-keeper, thus fulfilling the ideals of conventional monastic Buddhism and receiving his recognition within that world.

Eight years later a shift occurred in Nā ro pa's spiritual development, from satisfaction with a predominantly intellectual understanding of Buddhism to the search for greater depth of comprehension, and from the monastic life of conventional Buddhism to the nonmonastic form of the Tantric yogin. Such a shift is described in the lives of several other of the eighty-four *siddhas* and we may suppose that it was not entirely uncommon in those days. Nā ro pa's biography tells us that one day while studying a Buddhist philosophical text he suddenly had a vision of an ugly old hag. She made it clear to him that while he understood the text he was reading on a conceptual level, he had no inner understanding of it at all. She further revealed that if he wanted to attain genuine understanding, Nā ro pa should seek one Ti lo pa, who alone could help him.

Nā ro pa was devastated by the vision, and was unable to discount the truth it revealed. His response to the hag's revelation was to give up his position at Nālandā and to abandon the monastic life, wandering forth in search of the *siddha* Ti lo pa. He experienced eleven further visions, which he dismissed as worthless because they contradicted his preconceptions about spirituality, but which in retrospect were revealed to him to have been manifestations of Ti lo pa himself. In despair over his failure to find his teacher, Nā ro pa came to the brink of suicide; at just this moment, he met Ti lo pa.

As depicted in Nā ro pa's biography, Ti lo pa is a strange, enigmatic figure, anonymous in his context and unnoticed by others, but recognized by Nā ro pa as a powerful and uncompromising teacher and, most important, as his authentic *guru*. However, as Guenther rightly comments, Ti lo pa "is more than the individual who happened to become Nā ro pa's Guru. In a certain sense, Tilopa is Nā ro pa's total

self which summons him to find himself" (Guenther, 1963, p. iv). Nā ro pa committed himself unreservedly to serve Ti lo pa, and attended him for twelve years, until the latter's death in 1069. During this time Nā ro pa underwent a rigorous training marked by much hardship and ordeal, and was put through twelve major trials by his teacher. These trials, depicted as external, literal events, no doubt epitomize moments in Nā ro pa's inner spiritual journey: at Ti lo pa's behest, he hurls himself from the top of a three-story temple roof; he leaps into a blazing fire; he is beaten senseless on several occasions by people he deliberately provokes at his master's command; he offers his body to leeches; and so on. Finally, he cuts off his own head and limbs and offers them as a fit offering to his master. At each offering Ti lo pa restores his disciple and instructs him in the next stage of his Tantric training.

By the time of Ti lo pa's death, Nā ro pa had purified his being and achieved realization, possessing a rich array of Tantric teachings to pass to his disciples. These teachings included the "six *yogas* of Nā ro pa" (*Nā ro chos drug*), practices particularly associated with the Bka' brgyud pa lineage but which subsequently became known and practiced among the other Tibetan schools. Nā ro pa had seven chief disciples among the many he trained, including Maitri pa, Ḍombhi pa, and Mar pa. His chief legacy is his consolidation of the teachings received from Ti lo pa, which he then passed on to his chief disciple, the Tibetan Mar pa, thus enabling their flowering within Tibet in the Bka' brgyud lineage and other Tibetan traditions. Nineteen works in the Tibetan Bstan 'gyur (Tanjur) are attributed to Nā ro pa, including several Tantric *sādhana*s (liturgical meditations) on the Vajrayāna deities Vajrayoginī, Hevajra, and others particularly important to the Bka' brgyud tradition, two collections of Tantric realization songs (*vajragīti*), and a number of commentaries on Vajrayāna topics.

NASI' SEE PATRIARCHATE

NĀṢIR-I KHUSRAW is best known as a Persian poet, philosopher, and traveler, as well as for his efforts in spreading the *Ismā'īlī* form of Islam in Central Asia. Born in 1004 in Qubadiyan in present-day Tajikistan, he is buried in the Yumgan Valley of Afghan Badakhshan, where he spent the most creative period of his life in exile.

Educated in the major sciences of the day, Khusraw served as an official in the Ghaznavid Court. In his autobiography he describes a life of indulgence and social rounds. In 1045 he dramatically resigned from his post and set out on a pilgrimage to Mecca. He describes his travels along the Silk Road, the performance of his pilgrimage, and his journey to Cairo, the capital of the Fāṭimid *Ismā'īlī* empire, after leaving Mecca. He writes admiringly of the civic, administrative, and cultural achievements of Egypt, and during his stay he became immersed in the study of *Ismā'īlī* philosophy.

Khusraw benefited from the presence of many of the scholars who studied and taught at the institutions of learning, such as Al-Azhar and *Dār al Hikmah*, and joined the *da'wa*, the organization responsible for the spread and preaching of Islam among the Fāṭimids. After more travels, including two pilgrimages, he was appointed to be in charge of the *da'wa* in Khurāsān. Successful in his mission, Khusraw nonetheless became the target of intense hostility and was forced to find refuge in the Pamir mountains, where he spent the rest of his life.

Khusraw's writings reflect the broad range of his intellectual interests and abilities. His *Dīwān* contains his best poems, which draw on the imagery of the place and the encompassing themes of quest, ethics, the foibles of daily life, and even the anguish of exile. The poems are coloured by a strong sense of devotion to the cause of the Prophet and his heirs, the Imams. There are other, more philosophical, writings that reflect Khusraw's primary interests: intellectual exposition of Islamic thought, esoteric hermeneutic of the *Qur'ān*, and the inner quest for spirituality and personal enlightenment. His *Safer nama*, an account of his travels, is a classic of detailed and trenchant observations of places, persons, and society.

Perhaps Khusraw's most important contribution was the commitment to developing and sustaining the use of the Persian language. He ranks among the foremost writers of his generation in preserving writing in Persian prose and poetry, and his writings have had a significant impact on Persian-speaking peoples across the region.

Khusraw's teaching and works have been preserved by the *Ismā'īlīs* of the region who remember and commemorate him in their literature, music, and practices as the founder of their community. More recently his works have become widely available through new editions and translations.

BIBLIOGRAPHY

The most recent general study is Alice Hunsberger's *Nasir Khusraw: Ruby of Badakhshan* (London, 2000). Portions of his *Dīwān* have been translated in A. Schimmel's *Make a Shield from Wisdom* (London, 1993). The *Safar nama* has been translated as *Naser-e-Khosraw's Book of Travels*, by W. M. Thackston, (Albany, N.Y., 1986). See also H. Corbin, "Nasir-i-Khusran and Iranian Ismailism," in the *Cambridge History of Iran*, Vol. 4, (Cambridge, U.K., 1975), pp. 520–542. An increasing number of studies have been undertaken recently in Iran and Tajikistan, including newer editions of many of his works.

NĀṬARĀJĪ SEE ICONOGRAPHY, *ARTICLE ON HINDU ICONOGRAPHY*; ŚIVA

NATHAN (tenth century BCE), or, in Hebrew, Natan; a prophet in the court of King David. Nathan is presented in the Hebrew scriptures as a prophet and intimate of David's court, appearing in three different scenes. In the first scene (*2 Sm.* 7:1–17), Nathan is consulted by David about the king's plans to build a temple for Yahveh. Nathan approves of the plan, which will be carried out by David's son, and also promises David by divine oracle the establishment of a perpetual dynasty. This scene constitutes the climax of the Deuteronomist's account of David's reign, in which Nathan acts as the spokesman for the historian's royal ideology.

In the second scene (*2 Sm.* 12:1–15), Nathan presents to David the divine reprimand for his adultery with Bathsheba and his murder of Uriah. By means of a parable about an unjust rich man who robbed a poor man of his only lamb he is able to get David to condemn himself. He also predicts future troubles for David's household.

In the third story (*1 Kgs.* 1), Nathan is part of a court conspiracy in which he advises Bathsheba of a plan to persuade the senile David to make Solomon king instead of his older brother Adonijah. The plan is successful, and Nathan and Zadok anoint Solomon even before David's death. Here divine guidance plays no part in the events, only human ambition.

These last two scenes are part of a literary work known to modern scholars as the succession story, which some would date to the time of Solomon and thus have it reflect a historical memory of these events. But there are reasons to believe that the succession story is a late fiction and tells nothing about the nature of prophecy in the time of David. Also suspect is the Chronicler's attribution to Nathan of historical chronicles that he suggests are his sources for the reigns of David and Solomon (*1 Chr.* 29:29, *2 Chr.* 9:29).

NATIONALISM SEE CIVIL RELIGION

NATION OF ISLAM. The first several decades of the twentieth century marked a continuing challenge for African Americans. Attempting to carve out a viable socioeconomic, political, and cultural space was difficult in light of disenfranchisement, mob violence, and the scarcity of good jobs. Hearing rumors of increased opportunities, many African Americans participated in the "Great Migration" that marked the movement of African Americans into northern and southern cities in search of better life options. However, in places like Chicago and Detroit, African Americans quickly came to realize that racial discrimination could not be escaped through migration.

MASTER FARD AND THE BEGINNING OF A MOVEMENT. W. D. Fard (Master Fard Muhammad; 1891?–1934?) appeared in Detroit in 1930, selling scarves and other goods, and engaging eager listeners in conversations that involved a history lesson concerning their true status as Asiatics, originally from Mecca. His teachings perplexed and intrigued listeners and, while his theories seemed fantastic, his audience grew as blacks in Detroit gained from his teachings a new sense of self-worth and a way to critique oppression encountered during the course of daily existence.

To secure the greatness blacks were meant to exhibit, it was necessary to reject the teachings, or "tricknology," of whites, and embrace Islam—the black community's true religion. Black Americans were lost within the wilderness of the United States, but Master Fard had been sent to restore them to their former glory through his teachings and written materials—the Supreme Lessons—a blending of basic educational skills and metaphysics.

This, of course, was not the first time an articulation of Islamic teachings was expressed within the context of African American communities. Scholars have recently recognized an early Muslim presence in North America that might represent roughly 10 percent of the African population in North America during slavery. Diary accounts, autobiographies, and Works Progress Administration (WPA) documents all attest to such Islamic practices as prayer while facing east, dietary restrictions, and Islamic names given to children in

early African American communities. This early Islamic presence serves as a cultural memory upon which more recent practices developed. For example, the Moorish Science Temple, developed roughly a decade before the Nation of Islam, espoused doctrines that combined Islamic teachings with other theological orientations. Members of the Moorish Science Temple believe Noble Drew Ali (1886–1929), the organization's founder, is reincarnated in subsequent leaders. Some suggest that Master Fard was Noble Drew Ali reincarnated, an argument rejected by the Nation of Islam. Master Fard maintained a degree of mystery by suggesting that he was from the East, sent on a special mission, with more information to be revealed in time.

Some estimates suggest that Master Fard's temple grew to roughly eight thousand members, one of the most important being Elijah Muhammad (born Elijah Poole; 1897–1975). As part of the Great Migration, Poole came to Detroit from the South. But with a limited education, Poole found it difficult to secure employment that met the needs of his growing family. This economic situation, combined with his unfulfilled interest in church ministry, left him frustrated but open to the inspiring teachings of Master Fard. Upon first hearing Master Fard, there was a quick connection between the two that culminated in Poole's name change to Elijah Muhammad and his being called to minister in Fard's movement. With the mysterious disappearance of Master Fard in 1934, a power struggle emerged, centered on Elijah Muhammad. Forced to leave Detroit for a period, he traveled to cities such as Chicago, presenting the teachings of Master Fard.

ELIJAH MUHAMMAD'S TEACHINGS. The conversion of new members did not involve an emotional response as happened in so many black churches. It entailed an intellectual and psychologically deliberate acceptance of the teachings of the Honorable Elijah Muhammad. The completion of this transformation, this acceptance of the black person's true nature and destiny, was presented by the convert in a letter to Elijah Muhammad's headquarters in Chicago. In this letter, the person seeking membership indicated participation in several meetings and a firm belief in the doctrines. The letter included a request for full participation in the life of the Nation and asked the Honorable Elijah Muhammad to provide the writer with the person's original name. Until a new name was given, members made use of *X*, which represented the unknown. The old name represented the white race and the damaging effects of slavery (and a slave mentality) on the identity of black Americans. The *X* involved a rejection of the former self and the embrace of a new identity associated with a new relationship with Allah and his messenger, Elijah Muhammad.

Self-sufficiency was one of the Nation of Islam's mantras, and it was expressed practically through the organization's various business ventures, which included restaurants, bakeries, and a farm. This attention to economic self-determination as a step toward complete knowledge of self is in keeping with the organization's push for separation

from whites through the development of an independent black nation comprised of several states with rich farming land. In order to finance this new nation, the Honorable Elijah Muhammad called for the U. S. government to provide enough funds to sustain the black nation for twenty to twenty-five years. From the Nation's perspective this was neither a loan nor a handout. It was overdue wages for centuries of uncompensated slave labor. According to the Nation of Islam, it was a small price to pay when one considered the institutions and accumulated wealth that resulted from centuries of chattel slavery.

In lectures Elijah Muhammad proclaimed that Fard was God (Allah) incarnate and that he, Elijah Muhammad, was the messenger of God commissioned to teach black Americans about their true nature as the original people of the earth, godlike and destined to rule the universe. The most troubling dimension of this teaching was the reference to white people as devils who were made by a wise, yet mad, scientist named Mr. Yakub as a predestined part of the 25,000-year cycle of history in which we currently live. This actual and historical devil race, the story goes, will rule blacks for a set number of years. Such a period of domination and destruction, the Nation taught, serves as a pedagogical tool by which blacks, who strayed from their original religion of Islam, are corrected and prepared for their future glory. The Nation of Islam would ultimately soften the more harsh dimensions of its theology, arguing that the devil doctrine entailed a metaphorical attack on white supremacy and discrimination as opposed to an attack on white Americans. While remaining controversial, this rethinking of the Nation of Islam's more charged view is most notable as of the 1990s.

The Nation of Islam's task entailed enlightenment, the presentation of the true nature of blacks and whites, and the tools necessary for blacks to transform themselves. Once blacks in America—the Lost/Found Nation—gained knowledge of self and accepted the teachings of the Honorable Elijah Muhammad as the “Spiritual Head of the Muslims in the West,” judgment would occur through which whites would be punished and the earth purged by fire, and blacks would then regain control over the universe. The faithful of God (i.e., the Nation's members) would construct a new civilization guided by principles of truth, freedom, justice, and equality.

Nation of Islam doctrine fluctuates between the complete destruction of whites and a measure of hope for the redemption of whites. The Nation's concern with issues of justice begs the question concerning an inherent contradiction: Should a community be punished for fulfilling its destiny, even when this involves the oppression of other groups? Is it proper, as a matter of justice, to condemn a community for its actions when it has no choice but to behave in a certain way because it has no free will?

Inconsistencies in the Nation's theology and rhetoric did not prevent growth and the alteration of the organizational framework to accommodate new members of various

economic classes. For example, each local temple contained a minister who spread the Honorable Elijah Muhammad's teachings. To facilitate increased work and opportunities, the local minister was assisted by the captains of the Fruit of Islam (the collective of men who handed down discipline and provided security) and the Muslim Girl's Training and General Civilization Class, and so on. In addition, Elijah Muhammad expanded his network of ministers to maximize national exposure made available through television, including documentaries such as *The Hate That Hate Produced* (broadcast in 1959), and also the Nation's radio broadcasts and newspaper.

Aggressively seeking out members of the black community and the prison system, a process called “fishing,” provided the Nation with its greatest source of growth and visibility. Through personal contact with black prisoners, the Nation gained one of its best-known leaders—Malcolm X (1925–1965)—whose charisma and media appeal benefited the Nation of Islam as both its national and international profile increased in importance and prominence within popular imagination. The Honorable Elijah Muhammad's personal moral failures, combined with the Nation of Islam's lack of participation in the civil rights movement, resulted in Malcolm's break with the Nation and his conversion to Sunnī Islam in 1964. Malcolm X embraced racial equality as a basic element of Islam in light of his encounter with Muslims from various ethnic and racial groups during his pilgrimage to Mecca. This perspective would result in new strategies for the obtainment of social justice as a dimension of human rights discourse. He established the Organization of Afro-American Unity and Muslim Mosque Incorporated shortly before his death in 1965.

THE NATION OF ISLAM TRANSFORMED. After the Honorable Elijah Muhammad's death in 1975, his son, Wallace Deen Muhammad (Imam Warith Deen Muhammad, b. 1933), was named head of the Nation of Islam. Attempting to bring the Nation into line with the larger, worldwide Islamic community, he rethought the aesthetics of the temples. He removed the Christian church trappings, such as pews (or chairs), and he replaced framed sayings by Elijah Muhammad with more Islamic ornamentation. Of more significance, the organization's practices were altered radically through a quick effort to enforce the five pillars of Islamic faith, the practices and attitudes embraced by all orthodox Muslims. In keeping with this shift, the presentation of Master Fard as Allah and Elijah Muhammad as the final Messenger was removed because of conflict with the orthodox understanding of Allah and the role of the prophet Muhammad as the final prophet. In place of his more exalted role, Elijah Muhammad was presented as someone who, although misguided at points, sought to help black Americans achieve better life options. As a symbol of theological and aesthetic change, the name of the organization was changed to the World Community of Islam in the West, and changed again in 1982 to the American Muslim Mission. Imam Warith Deen Muhammad ultimately established a council of reli-

gious leaders, known as imams, to assist with religious and organizational questions, and members were told to consider themselves as simply members of the world community of Islam.

The Nation of Islam had been prone to schism. Notable among these various organizations is the Five Percent Nation (also known as the Nation of Gods and Earths), founded by Clarence 13X (1928–1969) in 1964 among young New Yorkers and based on a radical interpretation of the Nation's theology that presented blacks as gods with special knowledge based upon divine wisdom, often revealed through mathematics. However, the most visible and perhaps important of these splinter groups developed in 1978, when Minister Louis Farrakhan (b. 1933) formed a new organization named the Nation of Islam. Farrakhan affirmed the doctrines presented by Elijah Muhammad, including the teaching that Fard was Allah, and that the Honorable Elijah Muhammad was the messiah, with one significant addition. Farrakhan argued, based on a vision, that he himself was the prophet carrying on the work until the return of the messiah and judgment.

With time, the theology of the Nation of Islam under Minister Farrakhan would again change to include the institution of fasting during the month of Ramaḍān, as opposed to the more limited restriction instituted by the Honorable Elijah Muhammad. Furthermore, members of the Nation are currently encouraged to play a role in politics. Farrakhan modeled this through his participation in the Reverend Jesse Jackson's first run for the U.S. presidency in 1988, as well as his encouragement of Nation of Islam members to run for political office. This is clearly a break with the Honorable Elijah Muhammad's rejections of political involvement in a society that is marked for destruction.

While relations with the Jewish community remain tense at best, Farrakhan has worked to improve connections to the larger Islamic world. For example, his participation in the *ḥājj* (the pilgrimage to Mecca made by all financial and able-bodied Muslims) in 1985, as well as the availability of membership in the Nation without regard to race and ethnicity, speak to important shifts that make possible a repositioning of the Nation of Islam within the religious and political landscape of the United States and the world. However, this repositioning is not without significant tensions, as expressed, for example, through the Nation of Islam's sympathetic relationship with Libya's Muammar Qadhafi and the Libyan leader's efforts to provide the Nation with financial assistance.

Periods of tension and questionable allegiances have been mixed with more productive moments. Minister Farrakhan and the Nation of Islam, for instance, have sought to maintain a high level of viability through efforts such as the Million Man March in 1995. This was a gathering in Washington, D.C., of black men from various religious, social, and economic backgrounds. The purpose behind the gathering was repentance for misdeeds that have damaged

the unity and vitality of black America, and a commitment to restoring themselves to their proper role as black men within the black community. While this event was successful, with participation estimated by some to have reached well over one million, the Nation of Islam has not been able to sustain positive attention. To some extent it remains a marginal religious tradition with a membership that is difficult to state with accuracy. Membership estimates typically range between thirty thousand and seventy thousand. By contrast, there are roughly four million African American Sunnī Muslims in the United States.

ANTHONY B. PINN (2005)

NATIVE AMERICAN CHRISTIANITIES.

Heretofore scholars have not fully appreciated the rich variety and complex textures of Christian beliefs and practices among Native Americans. Specialists of indigenous religions largely have left the study of Native Christianity to missions historians. Historians of missions, in turn, lacking the linguistic and ethnographic training to otherwise interpret the subtleties, have understood Native Christianity largely as the straightforward outcome of missionary intentions and efforts. But a broader examination of the range of ways that different Native communities have variously engaged the missionaries' message and a more focused examination of how Native people have improvised locally on the missionary tradition suggest that the Christian tradition thus engaged

bears consideration not simply as a subset of missiology or church history but as a Native American religious tradition among other Native American religions. The attempt here will be to briefly remark on the circumstances of the missions if only to underscore the ironic nature of the outcome: the transformations and improvisations through which various Native peoples have made the beliefs and practices of the tradition their own. A range of contemporary concerns facing Native Christians will also be surveyed.

The variousness of Native Christianities is due, in part, to the great diversity of aboriginal Native religions. The United States has recognized within its borders more than five hundred distinct Native tribes, speaking more than two hundred different first languages. Generalizations across the diversity of these traditions are often more facile than they are helpful, for each tribal religion has been tied to a variety of traditional lifeways on a variety of landscapes and invokes a variety of symbols of the sacred, each with a complexity and sophistication of its own.

That said, one can be sure of one commonality: along with the shared experience of colonization and Christian missionization, each Native community has shared the consequent burden of balancing continuity of tradition with the cultural and religious changes necessary to adapt to those colonizing realities. Whether such religious changes are best encapsulated as conversion, consolidated resistance, revitalization, or hybridity, they were all shaped by social, political, economic, and environmental realities even as they were formed by internal factors, such as visions, beliefs, and a need for meaning making.

Even these colonial realities, however, are diverse in themselves. Native communities in what became the United States have operated under nearly three hundred different treaties and have been missionized by nearly every institutional branch of Roman Catholic, Protestant, and Orthodox Christianity. The meeting of a diverse group of aboriginal religions with a diverse group of Christian missionaries produced a bewildering range of idiosyncratic Native Christianities, but as Bonnie Sue Lewis has observed, this is not simply due to the diverse missionary encounters that missions historians have long noted; it also results from what indigenous Americans variously did with the Christian beliefs and practices exchanged in missionary encounters. And here one finds the key pattern that gives shape to the range of idiosyncratic Native Christianities. To varying degrees, depending on relative levels of autonomy, all Native Christians have been active agents in their religious histories. In paying attention to how they made the Christian tradition their own, one finds that these communities often have drawn resourcefully on their indigenous traditions and idioms not so much to translate Christianity but to transpose the narratives and practices of the Christian tradition into distinctive idioms and structures of Native religions, oftentimes in ironic relation to the intentions of European American missionaries. For this reason, consideration of the fuller diversity and tex-

ture of Native Christianities cannot content itself with the history of missions proper, though of course it must begin there.

ROOTS IN MISSIONARY CONTACT. From the sixteenth century on, European economic, geopolitical, and colonial designs on North America were often conjoined with missionary designs. Missionaries were often in full complicity with other colonizing interests; sometimes they were in considerable tension. Similarly some missionaries were more invested than others in yoking cultural revolution to adherence to Christian practices, beliefs, and communities. Still, as George Tinker has importantly observed, whatever their intentions, missionaries of all denominations were “partners” in cultural “genocide,” complicit in, if not directly responsible for, “the effective destruction of a people by systematically or systemically (intentionally or unintentionally in order to achieve other goals) destroying, eroding, or undermining the integrity of the culture and system of values that defines a people and gives them life” (Tinker, 1993, pp. 4, 6). Several examples, though by no means exhaustive, will perhaps be suggestive of the range of possibilities.

In the high Valley of Mexico claimed as New Spain in the 1520s, while some Spaniards questioned to what degree Indians were human, Dominican friars with millennial expectations imagined the promise of ideal Christian communities among peoples they took to be innocent noble savages as yet untainted by Europe’s vices. By the early seventeenth century, Franciscan friars associated with explorers in what would become the American Southwest had established a network of mission stations in and around Santa Fe on the upper Rio Grande and later along the California coast, baptizing many and making often-divisive inroads in Native communities, even as European disease and compulsory labor were fragmenting them. In 1680 a movement known as the Pueblo Revolt gathered people of various eastern Pueblos under the direction of Popé, a visionary prophet, killed many of the missionaries and drove the Spaniards from the region for a time. Diminishing attention to the North by Spanish authorities and later those of Mexico, from the mid-eighteenth century to its absorption into the United States in 1848, meant that Christians in the various Pueblos were left relatively free of clerical control and thus could articulate Christian practices and beliefs in their own idiom.

In the fur-trading region claimed as New France, Catholic missionaries worked among communities speaking Algonkian and Iroquoian languages from the 1630s on. Jesuits certainly carried European assumptions about savagery and civilization, but they also studied Native languages and ceremonial customs assiduously and accommodated many Native practices in their effort to extend the Sacraments. In important respects, celibate priests identified themselves, and were so identified, with the healers and shamanic ritual specialists in Native communities with whom they consciously competed in ceremonial displays. With time, Jesuits came to view such aboriginal traditions more as obstacles than as con-

duits to the Christian faith. After the expulsion of Jesuits from North America in 1763, however, these Native communities, like the Native peoples of New Spain, were largely free of clerical control and enjoyed considerable autonomy in the shaping of their faith (Vecsey, 1997, pp. 23–26).

In the Pacific fur-trading region claimed as New Russia, from the late eighteenth century on, Orthodox priests with even more pronounced liturgical proclivities promoted the faith among Tlingit and other coastal peoples, less concerned with fomenting a complete cultural revolution than with incorporating Native peoples into the sacramental community.

In New England missionaries took a more Protestant view—and one more consistent with settler colonies—that the process of becoming Christian necessitated a demonstrable inner conversion that would be manifested not only in professed Christian belief but also in demonstrable radical cultural conversion. To be sure, even Protestant missionaries took a variety of positions on the precise relationship between Christianity and culture and did not uniformly preach the “gospel of soap.” Moravians, Mennonites, and Quakers could point to considerable continuities between Native communal commitments and the Christian life. Still, with the Protestant insistence on a rigorous inner religious life, becoming Christian for some bespoke radical change away from aboriginal custom.

NATIVE TRANSFORMATIONS OF BELIEF AND PRACTICE. If the degree to which Native Christians could shape missionary Christianity varied, depending on missionaries’ commitments to other colonizing interests, to wedding the faith with cultural change, and to developing a Native clergy, amid varying circumstances of dispossession and disease, Native Christianities as a whole developed at a considerable, often ironic, distance from the missionaries’ intentions. Catholic, Protestant, and Orthodox missionaries alike were left to scrutinize the sincerity of professed conversions; although prone to welcome any signs that their efforts were bearing fruit, they remained conspicuously uneasy with hybrid practices, which they often considered to be evidence of backsliding.

In any case, one ought to question, following Kenneth Morrison, the worth of “conversion” as an analytical term in any discussion of Native Christianities. In the seventeenth century, for example, Montagnais/Naskapi, Micmac, and Huron/Wendat peoples were surely changed by their encounters with Jesuits in New France, and Native Americans affiliated with the missions stood in no small tension with fellow tribes people. But the Sacraments, especially baptism and extreme unction, that Jesuits proffered and the notion of God that Jesuits preached were transformed in Native religious idioms that focused on the cosmological centrality of sacred power, where the workings of power mattered more than the orthodoxies of abstract theology. Here “religious change” rather than conversion better describes the way the power accessed through Christianity was embraced by those left with “religious uncertainty” in light of disease and concomitant social chaos (Morrison, 2002, pp. 131, 145).

Having developed largely outside the discipline of Euro-American clergy, Catholicism in the upper Rio Grande Pueblos has brought traditional seasonal corn dances and ceremonials into hybrid forms intermingled with devotion to Christian saints. In Cochiti Pueblo, for example, on the feast day of its patron saint, deer heads and conifer boughs adorn an arbor at one end of the Pueblo's plaza housing an image of the saint along with the Franciscan brother and village elders, as the brother and the elders preside over drummers, dancers, Kiva society members, and "sacred clowns" performing ancient indigenous dances of thanksgiving for corn.

Among Native people missionized by Protestants, such transformations are typically subtler, sprouting between the cracks of missionary discipline concerning the congruence of the Christian gospel and Euro-American culture. Still, they are significant for their indication that even here Native Christians could assert some degree of agency in the creation of their own traditions. Given the intentions of Baptist and Methodist missionaries among the Mississippi Choctaw, the historian Clara Sue Kidwell finds it ironic that mission churches and schools became havens for the sustained public practice of distinctive Choctaw traditions and core values. "Choctaws took advantage of mission churches," she writes, "as places where they could congregate and be themselves, where they could speak their own language and visit and play stickball, with its attendant gambling and drinking" (Kidwell, 2001, p. 183).

Among the Ojibwas (known to some scholars as Ojibwe), missionaries of various Protestant persuasions in the western Great Lakes began in the 1830s to vigorously promote the singing of hymns translated into the Native tongue. The Ojibwas, they learned, were more interested in the singing of songs than in the reading of translated Scripture or listening to unwieldy sermons through a translator. But pedagogical theory of the era understood hymnody to be a particularly useful tool in the moral education of children, and missionaries, having construed their Ojibwa charges to be like children, promoted and disciplined Native hymnody as a tool for eradicating Ojibwa culture and planting the seeds of Christian civilization. For their part, Ojibwas who affiliated with the Episcopalian mission—or more precisely with the Native clergy and lay sodalities (religious associations) nurtured in part by the mission itself—sang hymns in ways that betokened an indigenized Christianity shaped but not determined by the mission.

While there are occasional references in the missionary record to hymnody in worship, the ritualized singing of which missionaries frequently wrote belonged far from the mission church in the semiautonomous spaces of Ojibwa homes, in all-night prayer meetings and funeral wakes. Missionaries hastened to applaud this development, but they also noted that the ritualized nature of this singing placed it, along with other funerary practices, quite outside their discipline. Hymn singing was ritualized, the province of sodalities

of men and women respectively, led by elders, in deathbed scenes or in all-night funeral wakes. By the late twentieth century, on certain Minnesota reservations, such ritualized hymn singing by groups of elders was considered by many—even many non-Christian Ojibwas—as a "traditional" rite of mourning, fully Christian but also fully Ojibwa (McNally).

The Tlingit communities of Southeast Alaska also sing Native-language hymns associated with Presbyterian missionaries of the late nineteenth century and early twentieth century. But before the Presbyterians came, most Tlingits had become incorporated into the Christian faith by Russian Orthodox priests whose liturgical tradition, especially after the U.S. purchase of Alaska from Russia, paid far less attention to repressing any continuities of Tlingit culture within Tlingit Christian practice, particularly elements of the elaborate funerary ritual complex known commonly as the potlatch. Indeed as Sergei Kan finds in *Memory Eternal*, the Orthodox emphasis on the ongoing relations between the living and the dead and the elaborate ritualizing around death and mourning allowed Tlingits to assign "their own meanings to Orthodox symbols" and to make Orthodoxy "meaningful to them without deviating in any major way . . . [from] Orthodox ritual practice" (Kan, 1999, p. 419). By the late twentieth century, even non-Orthodox Tlingits would categorize the elaborate Orthodox ceremonies of the forty-day funerary feast as "traditional" Tlingit activities.

One should also note a wide range of important religious transformations that drew on and improvised on Christian practices and beliefs (especially those concerning heaven and hell) in light of indigenous traditions but distinctively through the authority of visionary prophets—such as Handsome Lake (1735–1815) among the Seneca or Smohalla (c. 1815–1895) among the peoples of the Plateau in Washington Territory, whose Indian Shaker religion continues to the early twenty-first century—and the peyotist traditions of the Native American Church. These movements ought to be classified as new religious movements rather than as Native Christianity, given that their center of gravity lay not in Christian narratives and institutions but in the charismatic authority of prophets or in the transformative power of ritual as in the Native American Church.

Surely one can find many examples of more straightforward conversions among Native people that represent an utter discontinuity between traditional and Christian beliefs and practices, but the previous examples suggest that a consideration of Native Christianity cannot content itself with the history of missionaries and their intentions.

ISSUES OF INTERPRETATION. Scholarly reappraisals of Native Christianity in the late twentieth century and early twenty-first century have focused on what Native peoples did with the beliefs and practices that missionaries introduced. But they interpret the nature of those transformations in a variety of ways. Perhaps the idiosyncrasies of various Native Christianities themselves account for the range of interpretive frameworks. But by 2004 older models based on the concept

of acculturation, through which Native culture systems, static and unified prior to contact, were seen to collide with Euro-American Christian ones and gradually to erode and acculturate, had yielded to more fluid models based on processual notions of culture. Interpretations based on the notion of acculturation could effectively account for the frequent violence and dispossession associated with culture change generally and Christianization in particular. But they could not account for the puzzling ways traditional practices and beliefs became woven tightly into the fabric of Native Christianity. At best these were seen as evidence of “syncretism,” cultural aggregates pressed together by external circumstances but lacking stability or a logic of their own. Or alternatively they were seen as only nominally Christian, evidence really of disingenuous Native uses of Christian forms to promote an indigenous agenda.

By 2000 the literature had come to appreciate cultural change as something other than an oxymoron and had begun to attend seriously to the hybridity of Native Christianities. More importantly, this literature also may have begun to appreciate how at least some Native Christians remarkably have made their own a tradition whose missionary legacy had meant “continued bondage to a culture that is both alien and alienating, and even genocidal” (Tinker, 1993, p. 5). Building on Victor Turner’s notion of the multivocality of religious symbols (see Kan) or Pierre Bourdieu’s concept of the logic of practice as distinct from the logic of discursive thought (see McNally), some observers have noted that the indigenization of Christianity happens less through the more conventional discursive media of theology and creed and more in and through ritual practices that can more deftly address the potential contradictions of embracing a tradition associated with a colonizing history. For affirming an identity at once “Native” and “Christian” has posed considerable problems, social and existential, to Native Christians (see Treat).

CONTEMPORARY NATIVE CHRISTIANITIES. Even if, as the Cherokee theologian William Baldrige has put it, “doing theology, thinking theologically, is a decidedly non-Indian thing to do,” Native thinkers have begun in earnest to develop a Christian theology that incorporates distinctively Native religious idioms, just as indigenized Christian liturgical practices have incorporated traditional Native religious elements (Treat, 1996, p. 12). But these efforts often did not resemble formal theology; they were often local, collaborative endeavors, found in dialogues between Christian and “traditional” spiritual leaders or rooted in indigenous theological institutions (Vecsey, 1999). In 2001, however, Clara Sue Kidwell, Homer Noley, and George Tinker published *A Native American Theology*, revisiting the themes of systematic theology, such as creation, Christology, sin, and eschatology, and proposing new ones, like “land” and “trickster,” in order to “create a dialogue in which Indian people can speak as equals to Christians,” encouraging them to “recognize the uniqueness of their practices with regard to Christianity” and to challenge “Indian people to examine their beliefs” whereby

“some may reaffirm their faith” and “others may decide to abandon churches in order to maintain their national ceremonial traditions in lieu of participation even in Indian Christianity” (Kidwell, Noley, and Tinker, 2001, pp. 3–4).

Implicit here is an observation that many Native Christians have not squared their Christianity with their traditional “Native” identities. To be sure, some Christian denominations, perhaps especially Evangelical and Pentecostal traditions growing quickly among Natives as among Americans as a whole, do not emphasize continuity between indigenous traditions and the Christian faith. Other denominations with missionary legacies, and notably the Roman Catholic Church since the theological and liturgical sea changes of the Second Vatican Council in the 1960s, have emphasized the “inculturation” of the gospel into the theological and ceremonial vernaculars of various Native traditions, have staged interreligious dialogues with non-Christian spiritual leaders, and have promoted indigenous leadership (see Vecsey; Peelman; Treat). Still, since the broad rekindling of traditional Native American religions from the 1970s on, many Native people, even the baptized, have imagined the terms *Native* and *Christian* to be mutually exclusive and have decidedly chosen not to affiliate with the beliefs, practices, and institutions of Native Christianity. Thus just as it was in the missionary heyday of the nineteenth century but even more fully as a result of Native peoples’ improvisation on and transformation of the missionary tradition, a wide range of Native Christianities obtains in the early twenty-first century.

MICHAEL D. McNALLY (2005)

NATIVE AMERICAN SCIENCE. A comprehensive understanding of Native American science presents a challenge because it is difficult to draw meaningful conclusions from the ideas, practices, and observations of hundreds of separate societies. Adding to the challenge is that Native American traditions were oral.

THE VALIDITY OF ORAL TRADITIONS. The oral histories of American Indians are knowledge systems about the natural environment and how they sustain a social structure of mutual dependence that ensures the survival of future generations. These oral narratives lay out a background on which further descriptions weave a picture that originated in the minds of the ancients. The ability to visualize the narrative provides a sturdy framework on which to build an age-old lesson of ideologies and conceptual understanding. In this way Native Americans passed on a culture that sustained life for thousands of years. These narratives were not passed on by rote. Rather, they provided knowledge that was experienced and became embedded in the conscience. Often, skillfully articulated Native American knowledge was associated in complex ways with ritual or ceremony. The inhabitants of the Americas before European contact, in hundreds of distinct societies, maintained knowledge banks of such sophistication that modern scholars who study human antiquity are mystified as to the origin of such a keen understanding of nature.

Confidence in the historical authenticity of ancient narratives is seen to be weak because of a lack of written evidence, sanctioned genocide, and removal of children to missionary and government boarding schools thereby distorting American Indian cultural traditions. Yet faulting oral traditions because they are not set in stone is applying too high a standard. Even in contemporary interpretations of translated ancient texts there are frequent conceptual misunderstandings. Misconceptions arise from struggles with foreign

vernaculars expressing foreign worldviews and are compounded by provincial colloquialisms lacking modern equivalents.

TWO WAYS OF UNDERSTANDING THE NATURAL WORLD. The scientific method provides its practitioners with the authority to validate knowledge as objective truth. Objectivity, based on the absence of personal bias, is the foundation for the integrity of Western science. Some would argue, however, that objectivity is not a strength of the scientific enterprise; rather, it is its greatest weakness because it allows the experimenter to do "science for the sake of science," unencumbered by a subjective personal bias consisting of ethical and moral considerations. Advocates of science use the preemptive disclaimer that benefits outweigh risks to justify profit-driven research even where there are negative outcomes. As long as "objectivity" is equated with integrity, one can justify anything with equal impartiality, even making a nuclear bomb to destroy evil. The western scientific mind, in just a few hundred years, leaves behind the most imposing legacy of all time, a world full of side effects that generations to come will be forced to cope with, not the least of which is environmental degradation on a global scale.

Native Americans for thousands of years maintained a completely different worldview of ancient systems of subjective knowledge, orally transmitted. In these traditions, respect for life and caring for the land was and is a cultural imperative to insure the survival of future generations. Despite bloody conflicts and the loss of land, integral to the survival of a society and its customs, many groups maintained some semblance of their ancient knowledge systems by means of their traditions of oral history. Skilled orators have preserved ancient knowledge to the present. Now Native American scholars convey knowledge in images using the written word, despite the difficulty of precisely illustrating a concept. The orator, who has many visual props at hand, can be sure of precisely illustrating a concept for an audience, whereas the writer most likely will never know this about the reader.

In the spirit of the scientific method, the following hypothesis offers a tangible approach to begin piecing together an understanding of how oral history might work at the physiological level. Modern cognitive neuroscientists, using functional magnetic resonance imaging (fMRI), map brain activities associated with the movement of limbs, the five major senses, thought, perception, and memory. Ancient wisdom endures as thoughts and perceptions of the mind, not as squiggles of a pen. The physical manifestations of thought and even perception remain elusive (we cannot put either in a petri dish), but fMRI at least reveals the location in the brain of the activity of mental imagery or visualization. One might intuitively associate such activity with the visual cortex, but this is not the case. The fMRI data indicate that mental imagery and visualization are more closely associated with the seat of memory in the brain.

It is tempting to conclude that using imagery and visualization enhances the memory of details. The evidence seems

to confirm that the mental image relays specific knowledge in the telling of a story. By letting an image do the talking rather than a narrative memorized by rote, orators, when called upon to relay the knowledge, are free to pass on the tradition in their own words. The Western scientific mind is uncomfortable with this practice because the orator has freedom of expression to embellish or omit key features of the knowledge. However, the trained orator knows that if the person on the receiving end has not grasped the idea to the fullest, if an exact copy of the image has not transferred from one mind to the next, it could compromise the very survival of the tribe. Even if the information that the orator learned in one day took several days to paint for the mind's eye of the receiver, the transfer was precise.

Humans within a community are drawn down different life paths. As an example, one person might be an excellent astronomer and will hone that skill, while another might have a talent to heal and will pursue that career path. Celebration of each milestone in life, from the time of birth, through childhood, adolescence, adulthood, and old age, is ceremonially guided, thus maintaining the continuity of knowledge and a sense of community. Ultimately, community members serve the needs of the community not solely for purposes of that day or season but rather because they operate within a framework designed to insure the survival of generations into the future.

ANCIENT WISDOM AND THE SCIENTIFIC REVOLUTION. Education in the Western tradition convinces its audience that it is risky to commit a story to memory, say nothing of the workings of a whole society, because it will inevitably suffer corruption. So memory cannot be trusted to represent the truth, whole and entire. Yet Native Americans have devised and orally transmitted superior innovations and inventions that persist to the present day.

Emory Keoke and Kay Porterfield (2002) document hundreds of Native American innovations and inventions demonstrating the superiority of the American Indian intellect at the time of European contact. Old World explorers reaped many inventions and innovations from the highly intelligent inhabitants of the New World. The gifts fostered a greed that, within twenty years, set the stage of a betrayal that spanned five centuries, remnants of which persist today. The dehumanizing stereotype of "savage wild heathens" rationalized European expropriation from the New World of intellectual property in the form of inventions, processes, philosophies, and political or religious social systems. Europeans returned to the Old World and often claimed that innovations were accidental discoveries, thus relieving themselves of the burden of crediting ancient intellectual property as a source. There is evidence of appropriated knowledge in the areas of agriculture, medicine, transportation, architecture, psychology, military strategy, government, and language.

Keoke and Porterfield claim, "A case can be made that contact with American Indians actually served as one of the

catalysts for the Scientific Revolution in Europe [during the sixteenth century]" (2002, p. xi). In view of this historical relationship between the Scientific Revolution and ancient Native American knowledge, the modern Western mind is naturally tempted to locate ancient knowledge of natural phenomena squarely in the domain of modern science. Were it otherwise, our tradition would have to teach that the Scientific Revolution is an outgrowth of ancient knowledge—a concept that the contemporary scientific community is not likely to embrace. Regardless, at the point of European contact, American Natives had in place meaningful understandings of the function and utility of the natural environment.

TRANSFERRING BETWEEN THE SYSTEMS. It is intriguing how ancient minds conceived of the innovations. People everywhere, throughout time, have desired to understand the complexities, beauty, and utility of the natural world within a spiritual domain. Intellectual maneuvers within a spiritual domain limit knowledge acquisition to a realm bound by subjectivity. It is in this realm that the ancients as well as moderns operated in the quest for the knowledge of how to sustain both the people and the life-giving environment. However, the objective mind finds it impossible to rationalize the mechanism that reveals knowledge.

Modern anthropologists and archaeologists have put forth several hypotheses of how the ancients acquired knowledge. The two most popular ideas reflect easy-to-recognize attitudes: Perhaps Native Americans stumbled upon their knowledge by accident, since there is no record of their using the European scientific method. Or perhaps Native Americans used a variation of the scientific method over a long period, since it provides a logical way to gain knowledge. Both ideas impose preconceived ideas on American Indians that presume methods foreign to the ancient cultural experience. Neither is adequate to define an entire continent of people. The first idea is a stereotypical assumption that American Indians are intellectually inferior. The second educated guess assumes that ancient ancestors were no more intelligent than the Ken Keyes's hundredth monkey, who learned simply by observing.

But consider this: Einstein himself said that one of the keys to his intelligence lay in his ability to visualize the problems he was working on and then to translate those visual images into the abstract language of mathematics. One of the most famous examples of this is the story that he developed his special theory of relativity out of daydreams visualizing what it would be like to ride through the universe on a beam of light (Cardoso).

With this in mind, an important question arises. Why does the human brain occupy more space than it needs, since by some estimates, the average person uses only ten percent of its potential? If the theory of evolution is true, why has natural selection not phased out the excess folds of our gray matter? Contrary to expectations, the excess gray matter is used for visualization, and visualization, as described by many Native American elders, is a vehicle that reveals knowl-

edge of the natural world, as illustrated by Einstein's daydreams. If the concept of Einstein's daydreams brings forth in the mind of the reader a mental image of a gaze beyond the windowpane, then the reader has acquired knowledge based on mental imagery. This is the whole point of oral history, a tradition rooted in mental imagery and visualization.

Sons and daughters of Manifest Destiny whittle away at a terrible legacy left by their ancestors, as strength returns slowly to the sons and daughters whose ancestors survived. Together, a vision of the future that reveals to the world the inalienable right of full recognition is possible. The right of self-determination and the implicit right to self-govern and unite as a sovereign nation is on the horizon. Native Americans all over the continent are embracing sovereignty on a path leading to the unity of their nations, with the ultimate goal of picking up the chards of a broken vessel and replenishing a parched dream.

MARIA CATALINA (2005)

NATS. The *nats* of Burma make up a structured system of animistic spirits, predating the advent of Theravāda Buddhism but coexisting with it and with other systems of divination and prediction such as astronomy and alchemy. The *nat* cult is oriented to handling immediate and personal crises and avoiding evil, whereas Buddhism, the dominant higher religious ideology in Burma, is concerned chiefly with rebirth and eventually with salvation. Most students of Burmese religion agree that the term *nat* refers to any one of a host of animistic spirits, including human beings who have died violent deaths; former royal figures; spirits in fields, trees, and rivers; and regional, territorial overlords. The *nats* that are propitiated in Burma are the *auk nats*, the lower active spirits. The *devas* of Hinduism are also called *nats*, but they are not a ritual entity in Burma. In the time of King Anawratha (c. 1044 CE), an official list of *nats* was compiled. Since then, the members of the list have changed, but the number, thirty-seven, remains constant. The thirty-seven official *nats* share with the remaining *nats* the capacity to cause harm and, sometimes, to offer protection. They need to be respected and propitiated if evil is to be warded off.

Anthropological studies of Burmese religion have discovered the surprising fact that the *nats* of Burma form a structured system. This is in contrast to similar systems of animistic spirits in other Theravāda Buddhist countries, Thailand, Sri Lanka, Laos, and Cambodia. The Thai *phī* and the Sinhala *yakā* spirits, which play the same role as the *nats*, do not form a structure as they do in the Burmese system. Here, the *nats* are differentiated on four levels: the territorial *nats* reign over a region; the village *nats* guard a human settlement; the *mizaing* and *hpazaing* are *nats* at the family level inherited from the mother and father, respectively; and finally there are *nats* connected with special activities such as travel, domestic protection, and other frequent and mundane activities.

Nats are often represented in carved figures or other symbolic modes such as the coconut and red cloth of the house-protecting *nat*, Min Maha Giri, found on a house pole in every Burmese home. There are also festivals held to honor certain *nats*. The most important *nat* festival, of national prominence, is the celebration consecrated to the Taungbyon brothers, a pair of *nats*. At some *nat* festivals, and at other occasions where many people are gathered, there is often dancing by *natgadaws*. These *nat* wives are said to be possessed by their *nat* spouses, and in the trance of possession

they offer prognostications for onlookers who feed them strong drink and tobacco. The *natgadaws* do not take actual husbands, since the *nats* are said to fill that particular role.

MANNING NASH (1987)
Revised Bibliography

NATURALISM. In the broadest sense, *naturalism* can denote any philosophy in which "nature" or "the natural" functions as the most general explanatory or normative concept. What counts as naturalism in a particular context depends upon how the term *nature* and its cognates are used. Given the long and varied history of such terms in Western thought, it should not be surprising that any two doctrines named "naturalism" may have little more than etymological connections in common.

HISTORY AND DEFINITIONS. Even in ancient Greece, "naturalism" designated several distinct positions. For the Cynics, naturalism consisted in severe condemnation of conventional values and artificial virtues. The virtuous man is one who lives naturally, but living naturally requires a rigorously ascetic practice in which all conventional and artificial goods are shunned. Stoic naturalism also sought detachment from the conventional and the artificial, and agreed that the virtuous man is one who lives naturally, but its conception of nature was articulated in an elaborate cosmology. Human nature, for the Stoics, is part of cosmic nature, and virtue is identified with conformity to natural law. Both Cynicism and Stoicism take us a great distance from Aristotle (384–322 BCE), who resisted any attempt to abstract the virtuous life from the *polis* but who nonetheless looked with favor upon something called "naturalism." Man, according to Ar-

istotle, is by nature political, and this conviction leaves no room for the contrasts Cynics and Stoics need to define their positions. His naturalism, unlike theirs, was directed mainly against Eleatic skepticism about change and against the denial of "nature" and "natural motion" by Democritus (460–363? BCE) and others. Aristotle aimed to develop and defend natural science as knowledge of what exists "by nature." The nature of a thing, for him, is its power of acting in a particular determinate way, as defined by its end. The study of man is thus continuous with physics, for to study man is to study a specific kind of natural body by seeking out its nature. Man stands within nature, which is an intelligible, teleological order of motions. If Aristotle's philosophy is definitive of classical naturalism, then Democritus would surely qualify as an antinaturalist, despite his materialism, though both are routinely referred to as naturalists by modern writers. "Naturalism" later acquires specifically pejorative connotations in some Platonic, gnostic, and Christian writings, where the natural is contrasted with the spiritual in a way foreign to Aristotle and Democritus alike.

These ancient usages have had some impact on recent discussions of naturalism, mainly via Christianity, which transmitted an unstable amalgam of Hebraic, Stoic, Platonic, and Aristotelian conceptions of nature to the modern world. Nor can the rediscovery and dissemination of ancient writings since the late medieval period be entirely discounted as an influence. Still, modern debates over naturalism are best viewed as responses to the rise of modern science. The central point at issue is the scope of scientific inquiry as it is now practiced, and the basic terms of debate are set by the development of the sciences since 1600, not by conceptions of nature inherited from antiquity.

"Naturalism," when used as the name of a general philosophical outlook in contemporary discussion, usually signifies the view that all objects, truths, and facts fall within the scope of scientific inquiry, that nothing is in principle insusceptible to scientific explanation. This view may usefully be termed unrestricted naturalism. It differs from restricted forms of naturalism in that its thesis is not confined to a specific domain of inquiry, such as ethics. An ethical naturalist holds that ethical truths, facts, or values fall within the scope of scientific inquiry. As a form of restricted naturalism, ethical naturalism can be defended without committing oneself to the unrestricted position. Furthermore, one can accept a form of unrestricted naturalism without committing oneself to, say, ethical naturalism, provided one is prepared to deny that there are ethical truths, facts, or values in the relevant sense. To adopt a naturalistic attitude toward something is to maintain that it falls within the scope of scientific inquiry. Unrestricted naturalists sometimes argue, however, that failure to bring a domain of putative truths or facts within the scope of scientific inquiry shows only that there are no truths or facts to be found there, thus calling that domain, rather than the scope of science, into question. Such arguments can bring unrestricted naturalists into conflict with those defend-

ing naturalistic approaches in a specific area, a fact responsible for much terminological confusion, not least of all in debates over religion.

Many different conceptions of scientific inquiry and its findings have flourished in the modern period, and the content of both restricted and unrestricted forms of naturalism has varied accordingly. Where materialism has reigned as a philosophy of science, “naturalism” and “materialism” have tended to be used interchangeably, and Democritus has made his way onto lists of early naturalists. Materialist versions of naturalism define themselves polemically over against supernaturalism and idealism, neither of which is compatible with an ontology designed to reduce everything that exists and happens to matter in motion. That is, both supernaturalism and idealism postulate entities and occurrences that fall outside the scope of scientific inquiry as materialists conceive it. But it is important to see that scientific inquiry can be conceived in other ways and associated with other sorts of ontological assumptions.

A group of twentieth-century American philosophers known as critical naturalists has consistently gone out of its way to deny materialist methodological and ontological principles. Critical naturalists often cite Aristotle and Baruch Spinoza (1632–1677) as the great representatives of the naturalistic tradition. Some, like Frederick Woodbridge (1867–1940), have made extensive use of ideas from such figures in their own constructive projects. Many have tried to make room, within a naturalistic outlook, for the human phenomena—such as mind, intention, and culture—formerly claimed as the special province of the idealists. Some have argued that, because naturalistic methods place no *a priori* constraints on the types of hypotheses one may consider in science, acceptance of naturalism involves no bias against supernaturalist ontologies as such. Hence, in recent philosophy, as in the remainder of this article, “naturalism” is not tied to a particular ontology, though a naturalist in this sense remains bound to embrace whatever ontological scruples and commitments the course of scientific inquiry, rightly understood, entails.

DEBATES OVER NATURALISM. The most common general charge leveled in the literature of the middle and late twentieth century against versions of unrestricted naturalism is that they cannot successfully account for themselves. Can naturalism account for itself without either falling into contradiction or arguing in a circle? Does naturalism in fact presuppose something that cannot be brought within the scope of scientific inquiry as naturalists construe it?

Taking these questions as their point of departure, some antinaturalists argue as follows. Naturalism is, in its unrestricted forms, a philosophical thesis about the validity and scope of scientific inquiry. How, then, is naturalism to be justified as a philosophical thesis? By appealing to scientific inquiry? That would be consistent with the naturalistic thesis, but it also seems circular. How can the validity and limitless scope of scientific inquiry be established by appealing to

scientific inquiry itself without begging the question? It seems that it cannot, and what this shows is that any attempt to vindicate the naturalist’s thesis without arguing in a circle necessarily makes an appeal to standards of judgment that do not belong to scientific inquiry *per se*. Hence, naturalism cannot be justified; the only noncircular means one could use in trying to justify it obviously contradicts it.

This line of argument may seem compelling, but it hardly forces naturalists to abandon their position. Does not the same problem arise for any standards or principles anyone might propose as valid and ultimate? If so, then naturalists are at least no worse off than their critics. The real question, naturalists will argue, is how critics intend to stop the regress of standards short of infinity without themselves arguing in a circle.

The antinaturalist can stop the regress, it would seem, only by invoking a set of standards that are self-justified, intuitively known, or demonstrably indispensable to rational thought as such. What, then, prevents naturalists from claiming similar status for the principles implicit in scientific practice? Once this question has been raised, naturalist and critic seem on equal footing: each seems to require arguments capable of certifying some set of principles as fundamental in the relevant sense. Furthermore, the debate can easily degenerate into a merely verbal dispute at this point, for it is not necessarily clear why the antinaturalist’s principles cannot be said to be part of scientific method—namely, the foundational part.

Increasingly, however, naturalists have expressed skepticism about such notions as self-justification and intuitive knowledge, whether defended by other naturalists or by their critics. So they have sought a more radical response to the problem, arguing that scientific inquiry is just the honorific title given to the continuing process of rational criticism and revision of inherited theory and practice. This process, while perhaps best exemplified in the natural sciences, is not confined to them and is essentially continuous from field to field. It derives its justification not from foundational principles on which it rests but rather from the way it helps adaptation to the environment through progressive self-correction. Justification is a dialectical affair directed toward the pragmatic resolution of problems. In this view, humankind is saved from infinite regress in justificatory arguments not by foundational principles but by the settling of real doubts, and if the process as a whole is circular, it is not viciously so. Naturalistic philosophy is simply scientific inquiry gone self-conscious, reflecting on itself. The great pragmatist, John Dewey (1859–1952), offered something like this defense and reformulation of naturalism, restated eloquently by W. V. O. Quine (1908–2000).

When some critics have charged naturalism with an inability to account for itself, they have argued somewhat differently from the way considered thus far. Their point is that defending naturalism and practicing science are human activities involving thought and purposeful behavior in the

pursuit of values, and that naturalism is unequipped to account for any such activity. This argument challenges naturalists to show that they can explain thought, intention, and value without violating naturalistic scruples. But then unrestricted naturalism, to be vindicated, must ultimately be prepared to either explain or explain away every domain of putative objects, truths, or facts in naturalistic terms. So the appraisal of unrestricted naturalism must sooner or later take up each member in a long series of analyses of restricted topics, one of which is religion.

NATURALISM AND RELIGION. What can naturalists make of traditional religious utterances, such as the theist's discourse about God? Assume for the moment that some of what the theist says is to be interpreted as asserting the existence of a supernatural being who created the universe. If the theist is right in making this assertion, presumably, the naturalist will be obliged to show that God can be brought within the scope of scientific inquiry. The naturalist will, in other words, have to construct a "natural theology." Some naturalists, such as the eighteenth-century Deists, have adopted this strategy, but most have deemed it unsuccessful, concluding instead that no supernatural being exists. If no such being exists, naturalists need not be held responsible to account for its existence scientifically. The task, in that event, would be to explain God's existence away while still making sense of religious behavior, including the theist's utterances about God, reports of religious experience, and so on.

If, however, the theist's utterances about God are not to be taken as true assertions about a supernatural being, how shall they be taken? One alternative is to say that they are true but elliptical assertions about something else, something that does fall within the scope of science. Some followers of the French sociologist Émile Durkheim (1859–1917) argue, along these lines, that religious utterances are best interpreted as symbolic assertions about society, that the actual object of religious worship is the social group, and that religious behavior can be fully explained in a systematic science of society. Similar proposals have been developed by other theorists who take economics or psychology, not sociology, as the appropriate idiom of reduction.

A second alternative is to claim that the problematic religious utterances are not properly viewed as assertions in the strict sense at all. Instead, they are to be assimilated to some other class of speech-acts, such as expressions of emotions, wishes, or moral prescriptions. An example of this approach would be the emotivist theory of religious language popular among logical positivists.

Third, a naturalist may take the apparent assertions in religious discourse at face value while ascribing false beliefs to those who utter them, a strategy much simpler than the others but also one that raises the additional question of how these allegedly false beliefs came to be accepted. Here again at least two options suggest themselves. It may be argued, on the one hand, that religious assertions—while not to be construed as nonpropositional expressions of emotions or de-

sires—are nonetheless determined by essentially nonrational forces in the human personality, society, or history. On the other hand, one could argue that religious beliefs, though now known to be false, arose under circumstances that tended to make them seem reasonable to reasonable people.

Those committed to defending traditional religious claims as true are not the only people interested in opposing the naturalist's attempts to explain religion. The other major source of antinaturalism in the study of religion is the claim, often made by thinkers in the hermeneutical tradition of Wilhelm Dilthey (1833–1911), that the objective procedures of scientific inquiry are insufficient for use in the study of human beings, least of all their religious and artistic self-expression. Human beings are, of course, objects within nature, and the naturalist's methods can teach a great deal about humankind as a natural species. But human beings are also spiritual, self-creating subjects. Understanding them involves determining the meaning that their behavior, verbal and nonverbal, has for them, and therefore calls for an interpretive approach distinct from the naturalist's explanatory methods.

Naturalists have responded to the hermeneutical tradition's antinaturalism in several ways. The most common sort of response can be seen in various attempts to reduce much of what hermeneutical theorists want to say about meaning and understanding to the languages of natural science. Critical and pragmatic naturalists move in another direction, accusing Dilthey and his followers of uncritically taking over unduly narrow conceptions of scientific inquiry from the materialists and positivists they otherwise oppose. Broaden the conception of scientific inquiry enough, and the line hermeneutical theorists have drawn between the natural sciences and humanistic studies (*Naturwissenschaften* and *Geisteswissenschaften*) will disappear—as will the rationale for viewing hermeneutical philosophy and naturalism as exclusive alternatives.

Finally, it should be noted that some naturalists have been as interested in reconstructing religion as they have been in criticizing or explaining it. Dissatisfied with traditional religion on naturalistic grounds, they have attempted to devise religious systems capable of fulfilling the essential personal or social functions they assign to religion without departing from naturalism as a creed. The most ambitious such attempt was that of Auguste Comte (1798–1857), the French positivist, who took the rituals of Roman Catholicism as models for his own conception of the sacraments and identified humanity as the proper object of religious devotion and service. Dewey's proposals, in contrast, were much less ambitious and involved no attempt to found an organized religion. According to Dewey, any ultimate end that serves to unify one's life and actions takes on a religious quality. Dewey's aim was to portray this-worldly concern with "the problems of men" as the optimal religious ideal. There have been other recent attempts to reconstruct religion in naturalistic terms, but none has won much of a following.

BIBLIOGRAPHY

The best place to begin a study of naturalism is with *Naturalism and the Human Spirit*, edited by Yervant H. Krikorian (New York, 1944), which includes characteristic essays by John Dewey, Sidney Hook, and John Herman Randall Jr., as well as an essay titled "Naturalism and Religion" by Sterling P. Lamprecht. No study of naturalism should end before taking up O. K. Bouwsma's essay "Naturalism," in his *Philosophical Essays* (Lincoln, Neb., 1965), pp. 71–83. George Santayana's five-volume work *The Life of Reason, or the Phases of Human Progress* (New York, 1905–1906) exerted considerable influence on American naturalism in the early twentieth century and includes a notable treatment of religion. John Dewey's account of naturalized religion appears in his book *A Common Faith* (New Haven, 1934). The most comprehensive recent naturalistic reconstruction of religion is probably Julian Huxley's *Religion without Revelation* (1927; reprint, New York, 1958). The most influential twentieth-century attack on naturalism may well be Edmund Husserl's "Philosophie als strenge Wissenschaft," *Logos* 1 (1910): 289–314. For classic statements of the hermeneutical tradition's antinaturalism, see Wilhelm Dilthey's *Gesammelte Schriften*, 2d ed. (Stuttgart, 1957–1960). W. V. O. Quine's pragmatic naturalism can be sampled in his *Ontological Relativity and Other Essays* (New York, 1969). The concerns of the hermeneutical tradition from Dilthey to Hans-Georg Gadamer and of pragmatic naturalism from Dewey to Quine come together most clearly in Richard Rorty's *Philosophy and the Mirror of Nature* (Princeton, 1979).

WORSHIP OF NATURE

NATURE: RELIGIOUS AND PHILOSOPHICAL SPECULATIONS

In the West, "natural philosophy" and "philosophy of nature" have developed side-by-side and at times have been confused. The first has been defined by Galileo, Auguste Comte, and Charles Darwin as the pursuit of a total but essentially objective knowledge of phenomena, whereas the second has oriented such thinkers as Gottfried W. Leibniz, Georg W. F. Hegel, and Henri Bergson toward an intuitive approach that nevertheless strives to be rigorous regarding the reality that underlies data derived from observation. Among the thinkers of this second category, those who have come more and more to be labeled *Naturphilosophen*, or "philosophers of nature," since the time of German Romanticism occupy a special place.

Since antiquity, the representatives of that tendency are generally committed to grasping the concrete character of nonmechanical, nonphysical reality or, as F. J. W. Schelling put it, the "productivity" concealed behind sensible appearances, without, as a rule, neglecting the study of appearances themselves. They are not satisfied with a natural philosophy based on empiricism alone. Their ideas indisputably bear the mark of the religious, indeed of Gnosticism—not in the dualistic sense this word evokes when it is applied to the Gnostics of the beginning of our own era, but in the sense of a frame of mind fixed on defining the nature of the relationships linking God, human beings, and the universe by means not relevant solely to the experimental method.

PRE-SOCRATICS, STOICISM, HERMETISM, AND THE EARLY MIDDLE AGES. The pre-Socratics hardly opposed matter to mind, soul to body, or subject to object, but they had a tendency to approach nature with a nondualistic, noncategorical attitude. In such a view, all being is concrete. Yet their thinking contained dynamic and creative contradictions. Cosmologies and anthropologies rested on pairs of opposites. The pre-Socratics had a sense of analogy and homology insofar as they did not think in purely Aristotelian categories. Their imaginary world was grounded in concrete nature, interpreting and molding it into living structures. Hence the importance of the elements (whose rich symbolism would later be taken up again by the alchemists): water for Thales, air for Anaximenes, fire for Heraclitus. For these physicist-metaphysicians, especially Heraclitus, the logic of antagonism was primordial. "Night and day," he said, "they are one." Hence the pre-Socratics' labyrinthine style, which seems obscure because it is made of paradoxes. Parmenides was already moving away from such categories of nature with his linear thought, his *doxa*, which tended to annul these contradictions. Thus, too, Anaxagoras, who saw in nature a thinking principle that is copresent in the ordering of the world, but that also separates the human being from the rest of the cosmos. But later, Empedocles affirmed six principles—resemblance and dispersion, plus the four elements—and presented the history of the world as the reconstitution of a dislocated unity.

Stoicism, over almost six centuries, paved the way for Neoplatonism and certain Gnostic and Hermetic currents. Indeed, it placed emphasis on the need to know the concrete universe, harmoniously blending wisdom and technique, and taught the necessity of a *savoir-faire* that rejects pure speculation and must lead to the knowledge of an organic whole, thus assuring the accord between things heavenly and terrestrial. That trait appeared again and again in a more systematic manner as one of the important aspects of Alexandrine Hermetism, whose teachings often affirm that God is known through the contemplation of the world. Hence the preference of the *Hermetica* texts for the particular, the *mirabilia*, over the abstract and the general; science is not “disinterested” but aims to rediscover the general by means of an enriching detour through the concrete and through individual objects

This focus on the concrete hardly occurs in Neoplatonism, where the intelligible reality, the realm of the mind to which one strives to gain access, has no purpose in explaining the world of the senses. Instead, it aids us in quitting this world in order to help us to enter the pure region where knowledge and happiness are possible. The essential thing is to go beyond the sensual, up to the world of ideas. Within diverse branches of early Gnosticism, the belief prevailed that the world is the work of an evil entity.

The ninth-century theologian John Scotus Eriugena, who was born in Ireland and lived at the court of Charles the Bald, authored *De divisione naturae* (or *Periphyseon*), which was to nourish much of subsequent Theosophical speculation up to the age of German idealism in the nineteenth century. The two kinds of nature he distinguished, namely *natura naturans* and *natura naturata* (i.e., creative nature and created nature), were later to inspire Jewish qaballistic literature.

In the same century, the Arabs translated many ancient texts and, inspired by Aristotle, wrote commentaries on them. But together with the rationalistic empiricism of Aristotle, and in the margins of a form of positivism, we see Arab thought also expressing a highly mythicized vision of a world ruled by spiritual forces that only intuition can aspire to grasp. The medieval West received this teaching by way of the Latin translations of Arabic texts that were often concerned with the theory and practice of medicine and magic.

The twelfth century saw a return to the cosmological themes of Greco-Roman antiquity, in other words, to a universe conceived and represented as an organic whole, subject to laws that must be sought in the light of analogy. But the “discovery” of laws would entail twofold consequences: on the one hand, a powerful process of secularization was set in motion, at the expense of a sense of the sacred. On the other hand, and conversely, a lasting renewal of what might be called the feeling of cosmic participation took place. This latter corresponded to the systematic and poetic elaboration of a network of relations between the visible and invisible realms of creation. The universe was approached by form of

philosophical speculation that was committed to deciphering living, concrete meanings. According to Jean de Meung, nature became the “chamberlain,” or vicar, of God—a God who, as it turned out, incarnated in stone in this age that saw the emergence of a great sacred art of the West.

Nature, its unity and its laws, is what interested the Platonism of the school of Chartres as it appeared in the works of William of Conches, who was much concerned with physics, propagated the teachings of Eriugena on the world soul, and undertook, like Bernard Silvester of Tours (*De Mundi universitate*, 1147), to integrate a Platonic philosophy of nature within Christianity. The Platonic doctrine of ideas, and the reflection on numbers, were of a nature to incite the intellect to remove from the sensible world any form of reality judged to be absolute, and to place it in the realm of the archetypes or *exempla*. But the school of Chartres did not succumb to this temptation inherent in classical Platonism. It rather tended to integrate the intellect with the material world and the natural sciences. Its debt to Arabic science in this respect is quite evident—especially in medical science, which had only recently been made accessible to the West.

In the thirteenth century two opposing tendencies divided philosophical and religious reflection. The Franciscan orientation, represented mainly by Bonaventure, showed renewed interest in all things in nature. This was followed by the Dominican orientation, derived from Aristotle and represented by Albertus Magnus and Thomas Aquinas, who elaborated a philosophy based mainly on concepts rather than on living, inter-related symbolic images. From another source came a third tendency, that of the school of Oxford, which shared with the spirit of Chartres a desire for universal intuition. Nature holds the largest place in the thought of Bonaventure, along with his mystical leanings. The “Seraphic Doctor” considered nature equal to the Bible and as a book to be deciphered. The spirit of Oxford blossomed further in the work of the early thirteenth-century bishop Robert Grosseteste. Neoplatonism and an interest in the sciences, two traits characteristic of both these English masters, appeared clearly in Grosseteste. His preferred subject, speculations on the nature of light, was to enjoy a long posterity. The nature of light as the “first corporeal form” (*lux*) accounts for the presence of all of the bodies of the universe and the constitution of the world by its expansion, its condensation, or its rarefaction. Grosseteste imagined that a point of light created by God was diffused in such a manner that a sphere of a finite radius was formed, which was to become the universe (a hypothesis that has been, duly or not, paralleled to the Big Bang theory). The limit of its power of diffusion determined the firmament, which in turn sent back a light (*lumen*), which in turn engendered the celestial spheres and the spheres of the elements. Adam Pulchrae Mullieris, another theologian of the light, prefigured several of Grosseteste’s intuitions with his *Liber de intelligentiis*.

Roger Bacon, a thirteenth-century Franciscan of Paris and Oxford, has been often presented as a rationalist precursor

sor of the experimental method of modern science. Nevertheless, what Bacon called “experience” (*experimentum*) should be taken not in its current, modern sense, but in the sense of “the work of an expert.” In this understanding, the practices of the alchemist and the astrologer as well fall under the heading of *experimentum*. Paracelsus would later go along similar paths when dealing with “experience” in medicine, by which he understood the study and knowledge of concealed natural forces. For Bacon, experimental science meant secret and traditional science, with the condition that concrete science not be separated from the Holy Scriptures but that the two be complementarily linked together.

To these works must be added what became a well-known genre in the thirteenth century, that of the *summae* (“sums”) and *specula* (“mirrors”), of which Alexander Neckam’s *De naturis rerum* is the first example. To this genre belong such works as the *Speculum majus* of Vincent of Beauvais, an exposé of natural history in the form of a commentary on the first chapters of *Genesis*. Aside from this, other works of the same sort worthy of note include *De natura rerum* by Thomas of Cantimpré, and Bartholomew the Englishman’s *De proprietatibus rerum*. Only occasionally do these works offer a philosophy of nature in the full sense of the term, but since they are replete with lots of histories and observations on the powers of plants, animals, and minerals, as well as on the heavenly signs, they prepared the way for the occult philosophy of the Renaissance.

FROM THE LATE MIDDLE AGES TO THE RENAISSANCE. The problem of nominalism versus realism, which was posed sharply in the fourteenth century, entailed a debate with high stakes for the construction of a philosophy of nature. Nominalism (contrary to realism) is loath to see in the laws and the realities of the sensible world a collection of analogous/homologous replicas of realities on high, or *exempla*. Nominalism emerged victorious from the debate, clearing the field for the development of modern science, beginning with physics. Thus the continuity between a spiritually structured universe and self-sufficient, purely physical laws, which had been sustained by “traditional” philosophies, was broken. At the same time, the influence of nominalism joined with that of Averroism and, in bringing about the downfall of the Avicennian concept of the universe, paved the way for an ongoing secularization of the cosmos.

The *Ars magna* of Ramón Lull, written in 1308 and inspired by Qabalah, was an instrument of knowledge that claimed to be applicable at all possible and imaginable levels, from God himself down to the lowest orders of nature, by way of the angels, the stars, and the four elements. Lull’s *Ars* played the role of a channel through which a part of the medieval Neoplatonism revived by Eriugena passed, in other words, a dynamic Platonism close to the Jewish mysticism that was to flourish in Florence and Spain. It was interpreted, along with other writings falsely attributed to him, as a form of Qabalah, although it was hardly so. A grandiose conception of nature is also found in the contemporary writings of

Peter of Abano. Astrological Hermetism makes up half of his encyclopedic work, of which the *Conciliator* is the most important volume. Here, nature is seen as controlled by the stars, and objects are filled with spirits.

In addition, alchemy played a big role. It had begun to regain currency in the West in the twelfth century. It assumed three forms, which may have been complementary in the minds of many alchemists, but which it is convenient to distinguish. These were, first, research into procedures of metallic transmutation (for example, the production of gold); second, a “spiritual” alchemy, in which the chemical metaphors served as an aid to meditation, with a conscious or unconscious transformation of the experimenter himself as the goal; and third, an alchemy presented as a philosophy of nature, as in Petrus Bonus’s *Pretiosa margarita novella*. In the middle of the fourteenth century, the Franciscan Jean De Rupescissa (or Jean de Roquetaillade) developed at length the idea that a “quintessence” is at work in each object, and he proposed theories on the four elements and the “three principles.” All such speculations herald Paracelsus’s work, but before him another great name emerged in the thought of the fifteenth-century: Nicholas of Cusa, the apostle of a total science in which the *ars coincidentiarum* is clearly distinguished from the *ars conjecturarum* of common science. The first corresponds to the principle of the intellectual knowledge of objects, the second to the principle of a purely rational knowledge. What he called the *docta ignorantia* is a form of superior knowledge, a gnosis of the coincidence of opposites, or state of the unity of all things.

The Renaissance promoted the revival of a philosophy of nature, primarily in Germanic countries, which were thenceforth the preserver of holistic worldviews; that is, embracing the fullness of the world. In the seventeenth century, the term *pansophy* was often bestowed on them, in order to emphasize their universalizing character. As early as the sixteenth century, Paracelsus, the famous physician of Einsiedeln, Basel, and Salzburg, played a decisive role, with his immense oeuvre and his abundant posterity. While preserving the Neoplatonic idea of intermediaries between humankind and the divine, he did so less as a spiritualist meditating on the nature of intermediary intellects than as a practitioner seeking to discover the analogical relationships between a concrete, living, dynamic heaven and the human being studied in all his constituent parts.

In opposition to Neoplatonism, nature for Paracelsus emerged directly from divine power. He distinguished two orders of suprasensible realities, or “lights.” There is the “light of grace,” of a uniquely spiritual order, a divine world to which human beings are related through their immortal spirit. This is the domain of mysticism proper; he hardly ventured to occupy himself with it, except in order to stress its ontological preeminence and existence. His domain of research was the other “light,” that of nature, or *philosophia sagax*, which he described as an autonomous power of revelation. Between these two lights he placed astronomy or astrol-

ogy as a third area or term. Everything that concerns these three realms, as well as biology, human psychology, and even the arts, emerges from nature's light and obeys the laws of analogy. Hence the focus on deciphering correspondences among metals, planets, parts of the human body, and so forth, with a view to improving, through observation and experimentation, our understanding of the complexity of nature's divinely created unity. Chemistry and medicine are emphasized in the search for such a comprehension. One must, as Paracelsus himself said, "acquire the wonders of God through the mediation of Nature."

Paracelsism spread through Germany and the rest of Europe at the end of the sixteenth century and the beginning of the seventeenth, at least two generations after the death of its initiator, whose work was not well known nor widely published until then. Among his successors and disciples, Gerhard Dorn, Alexander von Suchten, and Oswald Croll occupy an important place. Their philosophy, like their master's, is not autonomous but is set within a theology; it has a dynamic character bearing on all levels, up to the level of God himself, by no means a *deus otiosus*. The manner in which they conceive the organic unity of the world with its multiple hypostases always results in a kind of "sacred physics" far from the dryness that characterizes many cosmologies of the Middle Ages. Paracelsism corresponds to a new and influential irruption of a "physiological" cosmology—or cosmosophy, rather—in the West, and in the seventeenth century was to lead to developments operating in several directions: notably, a "chemical philosophy," more or less influenced by alchemy, and which the new scientific paradigms struggled to get rid of throughout the seventeenth and eighteenth centuries.

These pansophic outlooks fueled the inspiration of the Rosicrucian movement, whose first manifestations were the *Fama Fraternitatis* (1614) and the *Confessio Fraternitatis* (1615)—which were almost simultaneous with those of thinkers like Robert Fludd and Jakob Boehme. With Boehme, a new esoteric current appeared, namely the so-called Theosophical one (see below).

THE ROOTS OF ROMANTIC *NATURPHILOSOPHIE*. Among the precursors of Romantic *Naturphilosophie* are, in particular, Christian Theosophy, "mosaic physics," "physico-theology," the so-called "theology of electricity," the first experiments in animal magnetism, and also three new orientations that appeared toward the end of the eighteenth century on the stage of philosophy in general, and will be further explained below.

To begin with Christian Theosophy, an esoteric current that flourished from the beginning of the seventeenth century onward (notably with Boehme), one of its prevailing aspects is the search for dynamic correspondences between nature, human beings, and God (or divine entities) through an ongoing "illuminative" speculation bearing on the complex and dramatic relationships between these three, envisaged as *dramatis personae*. In the eighteenth century, Theosophical

discourses dealt more and more with the notion of "higher physics," or "sacred physics," as opposed to a merely rational variety. Such sacred physics set itself up against the desacralization of the universe. It was a matter of resacralizing both science and the world. Theosophy *stricto sensu* starts from a speculation that bears on the divine, whereas *Naturphilosophie* proper begins with an observation of natural phenomena, which it then tries to integrate into a holistic and spiritual worldview. But since Theosophers often transferred to the spirit or the divine itself the proprieties of physics, it is scarcely surprising that in some authors the distinction between *Naturphilosophie* and Theosophy tends to get blurred.

Mosaic physics also flourished in the seventeenth century. The term *physica sacra*, often linked to it, served to designate a reading of the Bible considered as the key to understanding another book, that of nature. The contents of both books were supposed to coincide. Jan Amos Comenius, for instance, represents this tendency. In the pre-Enlightenment era, at the end of the seventeenth century, first in England, then in other European countries, there arose a so-called physico-theology, which endeavored to reconcile scientific discoveries with faith (not necessarily with the Bible) as a reaction to mechanistic worldviews and Cartesian rationalism. Physico-theologians (for example, Friedrich Christian Lesser, *Lithotheologie*, 1735) were lavish in descriptions of animals (bees, mollusks, spiders, birds, etc.), plants, and natural phenomena (lightning, storms), to which they attributed symbolic and spiritual, albeit generally static, meanings.

In the context of the later widespread craze for experimentation with electricity and galvanism (1789, experiments of Galvani; 1800, Voltaic pile), the pre-Romantic period witnessed the success of Franz Anton Mesmer's theories, and the development of animal magnetism by Armand Marie de Puységur and his followers. Another result of the belief in a magnetic fluid pervading human beings and the whole universe was the so-called "theology of electricity." The latter was marked by a kind of spiritual realism represented by the Theosopher Friedrich Christoph Oetinger and other figures like Prokop Divisch, Johann Ludwig Fricker, Gottlieb Friedrich Rösler (e.g., their book *Theorie der meteorologischen Elektrizität*, 1765). This "theology" may be considered, at least with regard to Oetinger, as a kind of proto-*Naturphilosophie*.

Besides these three precursors, three further factors pertaining to the history of philosophy proper, are also relevant to the appearance of *Naturphilosophie*.

The influence of French naturalism. With Georges-Louis de Buffon's theoretical works and Denis Diderot's *Le rêve de d'Alembert* (1769), a new way of considering physics had begun to emerge. It began as a kind of literary exercise rather than a strictly scientific discourse, but as it became more popular it pervaded the culture of the time. Buffon, in particular, fostered a taste for synthesis (a typical trait of Romantic thought, along with the painful experience of human

limits) and promoted the theme of the soul of the world (*anima mundi*).

The philosophies of Immanuel Kant and Johann Gottlieb Fichte. In *Metaphysische Anfangsgründe der Naturwissenschaft* (Metaphysical foundations of natural science, 1786), which discussed the necessity of discovering the a priori principles at work behind empirical data, Kant presented as a constitutive characteristic of nature the two forces of Newtonian physics, attraction and repulsion, at a time when the notion of polarity was already spreading outside esoteric circles and flowing into various domains, including medicine. Leaning on some of Kant's ideas, which he extended to the utmost, Fichte proceeded to spread the idea that the world is a product of imagination (notably in *Grundlage der gesamten Wissenschaftslehre* [Foundations of the entire doctrine of science, 1794–1795]). Imagination was understood as resulting from a synthetic and spontaneous activity of the spirit (i.e., the thing in itself and our representation of it are identical).

Spinozan philosophy. Having been considered an atheist during most of the eighteenth century, Spinoza's religious ideas returned to center stage at the turn of the century, but were now interpreted as those of a man intoxicated with God. His "*Deus sive natura*" was no longer read as a disguised profession of materialistic faith, but as the affirmation that nature is something divine. At this time, there was a prevailing tendency to conceive of God as not identical with things but as the primordial center of energy from which the development of organic forms and the entire finite world proceeded. Indeed, *Naturphilosophie* generally avoids pantheism in favor of this pantheism (i.e., God is everywhere in nature, but outside also).

THE ESSENTIALS OF ROMANTIC NATURPHILOSOPHIE. *Naturphilosophie* proper appeared during the last years of the eighteenth century, heralded by two groundbreaking works, published almost simultaneously in 1798: F. J. W. Schelling's *Von der Weltseele* (On the soul of the world) and Franz von Baader's *Über das pythagoräische Quadrat in der Natur* (About the Pythagorean square in nature). Besides these two, mention must be made of the first writings of the theoretician in animal magnetism, Carl August von Eschenmayer (e.g., *Sätze aus der Naturmetaphysik auf chemische und medizinische Gegenstände angewandt* [Elements of the metaphysics of nature, applied to chemical and medical objects], 1797). Along with Baader, and even more than Schelling, Eschenmayer combined the data of the pansophic-esoteric legacy with the new spirit of Kantian philosophy. Among the further representatives of *Naturphilosophie*, the following authors and their representative works stand out: Karl Friedrich Burdach (*Blicke ins Leben* [Glimpses into life], 1842–1848); Wilhelm Butte (*Arithmetik des menschlichen Lebens* [Arithmetic of human life], 1811); Carl Gustav Carus (*Natur und Idee*, 1862); Joseph Ennemoser (*Der Magnetismus im Verhältnis zur Natur und Religion* [Magnetism as related to nature and religion], 1842); Gustav Theodor Fechner (*Zend-*

Avesta, 1851); Joseph Görres (*Aphorismen über Kunst, als Einleitung zu künftigen Aphorismen über Organonomie, Physik, Psychologie und Anthropologie* [Aphorisms on art, as an introduction to future aphorisms on organonomy, physics, psychology, and anthropology], 1802); Justinus Kerner (*Eine Erscheinung aus dem Nachtgebiete der Natur* [A manifestation from the night-side of nature], 1836); Dietrich Georg Kieser (in particular his contributions in the 1820s to the journal *Archiv für den Thierischen Magnetismus*); Giovanni Malfatti (*Studien über Anarchie und Hierarchie des Wissens* [Studies about anarchy and hierarchy of knowledge], 1843); Johann Friedrich von Meyer (in particular his contributions in the 1820s and 1830s to *Blätter für höhere Wahrheit* [Journal for higher truth]); Adam Müller (*Lehre vom Gegensatz* [The contradiction theory], 1804); Novalis (pseudonym of Friedrich von Hardenberg, *Das allgemeine Brouillon: Materialien zur Enzyklopädistik* [The general draft: Materials for my encyclopedic project], 1798–1799); Hans Christian Oersted (*Der Geist der Natur* [The spirit of nature], 1850–1851); Lorenz Oken (*Lehrbuch der Naturphilosophie* [Coursebook on *Naturphilosophie*], 1809); Johann Wilhelm Ritter (*Fragmente aus der Nachlasse eines jungen Physikers* [Fragments from the legacy of a young physicist], 1810); the painter Philipp Otto Runge (*Farbenkugel* [Ball of colors], 1810); Gotthilf Heinrich von Schubert (*Ansichten über die Nachtseite der Naturwissenschaft* [Views on the night sides of the science of nature], 1808); Henrik Steffens (*Grundzüge der philosophischen Naturwissenschaften* [The main traits of the philosophical science of nature], 1806); Gottfried Reinhold Trevisarus (*Die Erscheinungen und Gesetze des organischen Lebens* [The manifestations and laws of organic life], 1831–1833); Ignaz Troxler (*Über das Leben und sein Problem* [On life and its problem], 1806); Johann Jakob Wagner (*Organon der menschlichen Erkenntnis* [Organon of human knowledge], 1830). One should also mention, with respect to other cultural fields, such names as Louis-Claude de Saint-Martin (*L'Esprit des choses* [The spirit of things], 1802), William Paley (*Natural Theology*, 1802), and Sir Humphrey Davy (*Consolations in Travel*, 1830).

The Theosophical orientation proper is far from being the rule amongst these figures. It is conspicuous in Baader, Meyer, and Schubert, for example, but almost absent from the works of such authors as Burdach, Oken, and Wagner. However, most *Naturphilosophen* share three common tenets, which are explicitly or implicitly present in their discourse, and account for their proximity to esotericism in general, and to Theosophy in particular:

First, nature has a history of a mythical order. This ontological postulate functions as a poetic mainspring for research and speculation. The world is not made of eternal, immutable things but is, like the spirit, engaged in a process of a highly dramatic character. A quadruple polar structure underlies most of these speculations. The first pole is the undifferentiated chaos, or primordial light. From that, two opposite poles emerge, which are both opposed and comple-

mentary to one another and assume various forms, like fire and water, fire and light, masculine and feminine, attraction and repulsion. A fourth term then manifests, which reflects the first one and is the common product within which the two opposing terms combine. Such a quaternary is the basic structure, in fact a mythical narrative, identified by Schelling as “the repressed mystery of Christianity.” It is the story of the “Redeemed Redeemer,” that is, the metahistory of a captive light awakened by another light that had remained free. Hence the frequent use of the two notions of light and gravity (rather than darkness), the latter being understood as something by which the primitive energies have been engulfed, but from which they are still likely to reemerge. In a similar vein, Jakob Boehme had described nature as a fire whose embers human beings should rekindle and which in turn would redeem them.

The second tenet concerns the identity of spirit and nature, first expressed by Schelling. “Spirit” is understood as the universal, even divine one, in its relation to nature and to the human beings. Ontologically, this identity rests on a mythical conception of the history of nature, based on an epistemological plane where the negative or destructive opposition of the two is surmounted: Spirit becomes nature, nature becomes spiritualized. Oersted wrote: “The more you advance toward [the] agreement between Nature and Spirit. . . the more perfect you will find it and [the more you will see that] these two Natures are the seeds of one common root” (*Betrachtungen über die Geschichte der Chemie* [Considerations on the history of chemistry], 1807). This “philosophy of identity” (viz., Schelling) has remained the most suggestive idea of *Naturphilosophie*, because it bears on the perennial metaphysical question of the relationship between nature and spirit. By the same token, self-knowledge and knowledge of the world go hand in hand. Both are an initiatory journey and immersion into “the becoming” (*das Werden*). But this *Werden* is dramatic because it implies both order and disorder. The world that surrounds us, and we ourselves, bear witness to an ancient order that has been disrupted. The idea is conspicuous also in Romantic art and literature, which lavishly depict natural landscapes resulting from cataclysmic events, thus reflecting one of the essential themes developed by Theosophy, namely the belief in an original fall of human beings and nature. The interdependence of human being and nature, including the entire cosmos and the soul of the world, is the central idea underlying the research of such *Naturphilosophen* as Baader, Schubert, and Kerner in mesmerism, animal magnetism, and dreams.

Third, nature as a whole is a living net of correspondences to be deciphered and integrated into a holistic worldview. Nature is to be read as a text replete with symbolic implications, whose meaning lies beyond itself. A spirit speaks through it. As a consequence, rigorous experimental science is never more than an obligatory first step toward a comprehensive, holistic knowledge encompassing both *natura naturans* and *natura naturata* (i.e., the invisible as well as the visi-

ble processes at work within nature and the whole cosmos). Things always present themselves as symbols, which bring back to both the warp and woof of a universal web. Living structures are detected in crystals, celestial constellations, and electric phenomena. Mechanistic imaginary and the compartmentalization of science into sectors cut off from one another are replaced by an organic merging of all disciplines. Thus concrete science and metaphysics, or experimentation and meditation, are two sides of the same coin. Almost all representatives of this current were scholars with at least one scientific specialty, like chemistry, physics, geology, mine engineering, or medicine. The fragments of empirical reality require a “second reading.” Once reality has been subjected to scientific analysis, it needs to be deciphered symbolically in order to yield clusters of meaning. Consequently, a scientific fact is perceived as a sign, and signs respond to each other. Concepts borrowed from chemistry are transferred to astronomy or human psychology; notions pertaining to botany are used to describe inorganic processes or vice versa. It is not surprising that the Romantic image of the wise physician, characteristic of period literature, enjoyed a great success, based as it was on the analogy between medicine and poetry. In literature, such transfers from one domain to another often took the form of aphorisms (e.g., Novalis), a genre generally praised by German Romanticism. The Romantic writer Friedrich Schlegel claimed that “the combinatorial mind is truly prophetic,” and Schelling advocated a form of non-dogmatic polytheism: “Monotheism of the mind and of the heart, and polytheism of the imagination and of art, this is what we need” (1962, vol. 1, p. 70).

Goethe’s philosophy of nature is somewhat distinct from the current of *Naturphilosophie*. Admittedly, throughout his life he certainly maintained the notion of a vital universe, and his scientific works, especially those on the metamorphosis of plants and on colors, place him close to some leanings of the *Naturphilosophen*. But he was more interested in trying to grasp eternity in an instant, or infinity in an object (William Blake), than in discovering commonalities or correspondences between things, or in what the latter symbolize of the invisible. More generally, he remained aloof from Romanticism. Apart from brilliant exceptions like Ritter and Oersted, the *Naturphilosophen* did not make significant discoveries themselves, but they were keen to find and express truths of a different order, that of the absolute.

IN THE WAKE OF ROMANTIC *NATURPHILOSOPHIE*. After about sixty years, the current of *Naturphilosophie* faded away in the 1850s. It was probably the last period in which people—or, at least, the savants—had felt at home on earth. Gradually, an estrangement from nature had made headway: the view had begun to prevail that nature is hostile, and not a place where they could feel at home. Nature came to represent either “the other,” linked to a feeling of no longer being “at home in the world,” or conversely to a reflexive response against the increasing disenchantment of the world (a kind of last-ditch attempt at exorcizing the specter of disenchantment). This process had already been smoldering for quite

a few decades, as exemplified by Arthur Schopenhauer's *Die Welt als Wille und Vorstellung* (The world as will and representation, 1819), in which nature is considered as being outside the categories of understanding. In the second half of the nineteenth century, *Naturphilosophie* was definitely superseded by the advent of scientific, materialistic worldviews. However, it left numerous legacies. A number of celebrated philosophers in the twentieth century, like Ludwig Klages, Hermann Keyserling, and Max Scheler, have reclaimed some of its heritage, but in an essentially speculative manner, since very few of them were chemists, astrophysicists, or physicians.

Originally inspired by Goethe, Rudolf Steiner followed an orientation more akin to *Naturphilosophie* proper, which has consequently left its imprint upon the teachings and literature of the Anthroposophical Society until the present. Less directly but more importantly, the most obvious survival of *Naturphilosophie* is to be found in the theories of the unconscious. In this respect, works like Schubert's *Die Symbolik des Traums* (Symbolism of dreams, 1814), and perhaps even more Carus's *Psyche: Entwicklungsgeschichte der Seele* (Psyche: The historical development of the soul, 1846), certainly influenced the ideas of late nineteenth-century thinkers like Eduard von Hartmann (*Philosophie des Unbewussten* [Philosophy of the unconscious], 1869). Even more importantly, these theorists of the unconscious represent the historical roots of psychoanalysis, leading to the theories of Sigmund Freud (for whom the unconscious is rather monolithic, as it had been for Arthur Schopenhauer) and those of Carl Gustav Jung, who described the unconscious as a dynamically functioning quaternary. Jung may be considered the latest major representative of *Naturphilosophie*, given his views of alchemy (namely, that what alchemists saw in their crucible was a constellation of their own unconscious), and his theories on synchronicity as well.

Over the last decades, members of several scientific communities have adopted some conceptions pertaining to *Naturphilosophie*, whether they were aware of this tradition or not. For example, the idea of intelligent matter has been addressed by scientists like Valdemar Axel Firsoff (*Life, Mind, and Galaxies*, 1967) and Jean Charon (*L'Homme et l'Univers* [Man and the universe], 1974). The hypothesis that matter is modeled on the spirit has been developed in Arthur Koestler's *The Roots of Coincidence* (1972). Authors like David Bohm (*Wholeness and the Implicate Order*, 1980) and Fritjof Capra (*The Tao of Physics*, 1975) have developed "holistic" interpretations of modern physics, thus fostering a sort of visionary physics that has gained entrance into the literature of the New Age (see Hanegraaff) in the form of various speculations on the relationship between "science" and "consciousness," "science" and "tradition," and so on.

ANTOINE FAIVRE (1987 AND 2005)

NATURE: WORSHIP OF NATURE

What is ordinarily spoken of as “nature”—the physical world, including all living beings beyond the control of human culture—often appears to the religious consciousness as a manifestation of the sacred. Through nature, modes of being quite different from the specifically human reveal themselves to the religious imagination. The sun, the moon, and the earth, for example, can symbolize realities that transcend human experience. Throughout the history of religions, “nature” frequently is perceived as initiating a relationship with humankind, a relationship that is the foundation of human existence and well-being. In large part, this relationship is expressed in forms of adoration, a response of the total personality, or of an entire religious community, to the phenomena of nature.

The worship of nature underscores the fact that the sacred can appear in any guise. The religious person is confronted by the paradox that the sacred can manifest itself in material form without losing its essential character. In the worship of nature, radically different levels of existence are felt to interpenetrate and coexist. The possibilities of the human spirit become coextensive with the sacred capacities of the rest of the physical universe. The worship of nature thus highlights both the freedom of the sacred to appear in any form, and the capacity of the human being to recognize it for what it is in any expression. It also underlines the capacity of profane reality itself to become a transparent symbol of something other than itself, even while remaining what it is. In such a religious perception of the universe, nature transcends its brute physicality. It becomes a cipher, a symbol of something beyond itself. From this point of view, nature’s existence is like the human situation in the world. Its modes of being as a manifestation of the sacred become resources for understanding the human religious condition. In many traditions, in fact, the belief in the shared destiny of nature and humanity is highly elaborated, so that the objects of nature are held to possess the same essential qualities as human beings: emotions, life cycles, personalities, volition, and so on.

The value and function of nature thus goes beyond the concrete sphere to the mystery of the sacred as it appears in the fuller reaches of religious experience. Only by keeping this in mind will people understand the forms in which communities respond to powers revealed in the physical universe. The following provide a series of suggestive illustrations of worship of nature.

The sky is often revered as a manifestation of divinity or venerated as the locus of the gods. The *Konde* of east-central Africa adored *Mbamba* (also named *Kiara* or *Kyala*), a divinity who dwelt with his family in the heights above the sky. The *Konde* offer prayer and sacrifice to the god who dwells in the sky, especially at times when rain is called for. Many divinities of the sky originally lived on earth or with the first human beings. Eventually, they withdrew on high. Not much is recounted about them in myth. The *Samoyed*

peoples adored *Num*, a god who lived in the seventh heaven and whose name means “sky.” *Num* overspreads the entire universe and is identified not only with the sky but with the sea and the earth. *Tengri* (Sky) is the supreme being among *Mongols* (*Tengeri* among the *Buriats*).

Baiame is the supreme god among tribes of southeastern Australia (*Kamilaroi*, *Euahlayi*, and *Wiradjuri*). He welcomes the souls of the dead into his dwelling place beside the flowing waters of the *Milky Way*. His voice is thunder; he is omniscient. Although supreme beings of the sky like *Baiame* reveal important mysteries to the first ancestors before they withdraw on high, and although they play a major part in initiation ceremonies, they do not usually dominate liturgical life.

Objects fallen from the sky come from the sacred locus of the heavens and often become the objects of religious cults. For example, the *Numana* of the *Niger River* valley in West Africa, who accord an important place to the divinity of the sky, venerate small pebbles, which they believe have fallen from the sky. They install these sacred pebbles on top of cones of beaten earth some three feet high and offer sacrifices to them. Since the pebbles have fallen from the sky, they are believed to be fragments of the sky god. Actual meteorites are frequently the center of a cult associated with sky gods. In the same way, flints and other species of “thunder stones” or “rain stones” fallen from the sky are treated as sacred, for they are believed to be the arrowpoints shot by the god of lightning or by other celestial divinities.

Worship of the sun is widespread, especially at the times of the solstices. The *Chukchi* of northern Asia, for example, offer sacrifices to the light of the sun. Among the *Chagga* of *Mount Kilimanjaro* in Tanzania, *Ruwa* (Sun) is the supreme being, who receives sacrificial offerings in times of crisis. In societies engaged in intensive agriculture, the sun is worshiped in connection with the fertility of the crops and regenerative life of the cosmos. Such is the case with *Inti* in the *Inca* pantheon. The sun’s power in such cases is not limited to the fertility of foodstuffs but extends also to human progeny. Privileged groups of human beings reckon their descent from the sun as did the *Inca* nobles, the *Egyptian* pharaoh, and important chiefly families on the island of *Timor* that reckon they are the “children of the sun.” In many cultures the sun is believed to traverse the underworld at night. Therefore the sun becomes a sacred guide for the soul’s journey through the land of the dead. In the *Harvey Islands*, the dead cluster in groups to await the biannual postmortem trek. During the solstices the sun leads these groups through the netherworld. Veneration of the sun takes the form of following his tracks when he sets. The sun carries into heaven the warriors who have fallen in battle.

Frequently the sun is worshiped because of its heroic achievements, including the creation of human beings. The sun and the moon created human beings from gourds, according to the tradition of the *Apinagé* people of South America. In the tradition of the *Desána*, a *Tucano*-speaking

group of southern Colombia, the sun inseminated his daughter with light (through her eye) and caused the creation of the universe.

The moon is one of the most fascinating and rich religious characters. It has long been an object of worship in many cultures. The moon's shifting shape and changing disposition in the sky at various times of the night, day, and month makes it the focus of a wide range of associations that have led to its veneration. Sin, the Babylonian god of the moon, had important connections with the waters of the earth. Their ebb and flow were connected with the rhythmic capacities and periodic nature of Sin. Sin also created the grasses of the world.

The moon is frequently a lascivious being associated with the wanton powers of fertility. Often the moon is venerated as the source of sexual life and originator of reproductive processes such as menstruation and intercourse. The Canelos Quichua of eastern Ecuador, for example, treat Quilla, the moon, as a central supernatural being. When the new moon is immature, it is called *llullu Quilla*, the "green" or "unripe" moon. During these phases it is a prepubescent girl unable to conceive offspring or fashion pottery or prepare beer. The adult moon, *pucushca Quilla*, however, is a lascivious male whose incestuous exploits are recounted in myth. The moon's illicit exploits with his sister, the bird Jilucu, engendered the stars. When they discovered their origins, the stars wept and flooded the earth (Norman Whitten, *Sacha Runa: Ethnicity and Adaptation of Ecuadorian Jungle Quichua*, Urbana, Ill., 1976, p. 45).

Among the Siriono of eastern Bolivia, Yasi (Moon) is the most important supernatural being. He once lived on earth as a chief, but after creating the first human beings and teaching them the fundamentals of culture, he ascended into heaven. The waxing of the moon occurs as Yasi washes his face clean by degrees after returning from the hunt. The Siriono build lean-tos made of leaves in order to protect sleepers from exposure to the dangerous rays of the moon. These would cause blindness. Yasi provokes thunder and lightning by throwing jaguars and peccaries down to earth (Holmberg, 1960).

Mountains are a ubiquitous object of cult. In the Kuni-saki Peninsula of Japan, for example, a tradition that dates back to the Heian period establishes a systematic, metaphorical relationship between the image of the mountain and the salvific power of the *Lotus Sūtra* (Grapard, 1986, pp. 21–50). The sacred mountain of this peninsula represents the nine regions of the Pure Land and is an important pilgrimage center. Its eight valleys are the eight petals of the lotus blossom that represents the Diamond Mandala and the Womb Mandala. These structures become the basis for the architecture of temples, the divisions of the text of the *Lotus Sūtra of the Wondrous Law*, and the program for the spiritual lives and geographic travels of pilgrims. All of these isomorphic structures represent the Pure Land of the Dainichi Nyorai. "This mountain is the permanent residence of the

heart-mind of the Marvelous Law. It is the Lotus Pedestal on which the Buddha rests" (verses attributed to Enchin and quoted in Grapard, 1986, p. 50). The sacred mountain embodies the six realms (*rokudō*) of existence: that of the gods, human beings, titans, animals, hungry ghosts, and hells. Within these realms, arranged in a vertical hierarchy, all beings and all forms of rebirth have their place. Mount Haguro, another sacred mountain on the northern part of the Japanese island of Honshu, serves as the center of worship during four seasonal feasts. The New Year celebration is one of the most important and dramatic of these, for at that time the sacred combat between the old and the new year determines the outcome of the future year (Earhart, 1970; Blacker, 1975, chap. 2).

In South America, offerings are made to the mountains of the Andes throughout the year to sustain and stimulate the life of the community. The mountain is a divine body in whose life all beings participate and from whose abundance and well-being all benefit. The community cultivates food from the body of the mountain. It gives forth fluids (water, semen, milk, and blood) that sustain life. Sacrifices and offerings placed in specific holy sites on the mountain replenish the fat, the power source, of the mountain body (Bastien, 1985, pp. 595–611).

Waters are frequently presented as supernatural beings worthy of worship. Water, according to mythic accounts, is often the source of primal life. Such is the case in the Babylonian creation story recorded in the *Enuma elish*, wherein Apsu and Tiamat (fresh water and sea water, aspects of the primordial ocean) mingle chaotically to give rise to all subsequent forms of life. Springs, rivers, and irrigation waters are the centers of religious attention throughout the world. They are celebrated not only during the episodes of the agricultural cycle but also at moments of rebirth into initiatory societies and at moments of initiation into culture itself. Immersion water, standing in a stream or under a waterfall, or other forms of extended exposure to water serve as ordeals commonly associated with initiation. For the Akwē and Chavante peoples of Brazil, for example, the lengthy exposure of initiands to water recalls the time when mythical heroes created the world's contents at the time of the flood.

In Scandinavian mythology Ægir (the Sea) is the boundless ocean. His wife, Ran, casts her net through the ocean and drags human beings into its depths as sacrificial offerings. The nine daughters of Ægir and Ran represent the various modes and moments of the sea. All of these divine beings dwell in the magnificent castle at the bottom of the ocean where the gods occasionally gather around a miraculous caldron. Apparently the cult of disposing of caldrons at the bottom of seas or lakes is associated with this mythology.

Water monsters are also the object of cultic action. They are placated or combated to stave off a repetition of the cosmic deluge. Aquatic dragons embody the fertile principles manifest in moisture. They must be slain or tamed to release their fecund powers and to prevent drought. Thus the Chi-

nese dragon Yin gathers together all the waters of the world and controls the rain. Images of Yin were fashioned at times of drought and at the onset of the rains (Granet, 1926, vol. 1, pp. 353–356).

The earth is sacred in many traditions and is the object of devotion and affection. As the source of life, Pachamama (Mother Earth) of the Andes is worshiped on various occasions throughout the year. The agricultural cycle is coordinated with her menstrual periods, the times when she is open for conception. The earth is frequently a partner of the sky or of some other celestial fertilizing divinity. Among the Kuma of southern Africa, for example, the marriage of the sky and the earth makes the cosmos fertile. Liturgical life is directed toward the fruitful accomplishment of this union. Among North American Indian peoples such as the Pawnee, the Lakota, the Huron, the Zuni, and the Hopi, the earth is the fertile partner of the sky and the source of abundant life. The care extended to the earth takes involved forms of worship. The earth is also frequently the locus of burial. As such the earth becomes an ambivalent source of regenerative life, for it is a regeneration accomplished through devouring. All that is buried in the earth and rises to new life must undergo the decomposition of the seed. Rituals associated with the earth, such as agricultural orgies, frequently reenact this furious and destructive episode of degeneration in imitation of the experience of the seed in the earth.

Plants, trees, and vegetation also have their place in worship. The tree of life or the cosmic tree expresses the sacredness of the entire world. Scandinavian myth offers the example of Yggdrasill, the cosmic tree. Yggdrasill sinks its roots into the earth and into the netherworld where giants dwell. Divinities meet daily near the tree to pass judgment on the world's affairs. The Fountain of Wisdom flows from a spot near the tree as does the Fountain of Memory. Yggdrasill miraculously renews itself in spite of the fact that an enormous serpent named Níðhoggr (Nidhogg) gnaws at its roots. The universe will continue to exist because Yggdrasill perdures. An enormous eagle defends it from its enemies and the god Óðinn (Odin) tethers his horse to its branches.

Other kinds of vegetation also manifest sacred powers and divinities. Thus the Vedic and Puranic creation accounts identify the lotus floating upon the water as a manifestation of the divinity and of the universe. Miraculous trees, flowers, and fruits reveal the presence of divine powers. Rites of spring frequently center on plants, boughs, or trees that are treated as sacred. The fertility of the cosmos is symbolized by the union of male and female plants or by the blossoming of a bough from a specific species of plants. Around the world, the agricultural cycle is hedged around with religious acts directed toward the furthering of the powers of fertility manifest in various crops. In particular, the moments of sowing and reaping are marked by sacrifices. The seeds themselves undergo a form of sacrificial death as do the harvested stalks at the end of the growing season. The picking of first fruits and the gathering of the last sheaf of the fields is frequently the occasion for religious festival and ceremony.

Animals have also stimulated the religious imagination in such a way as to warrant devotion. Animals, birds, fish, snakes, and even insects have all become the focus of adoration in one culture or another. Often their bodies represent the transformed expression of supernatural beings that underwent metamorphosis at the beginning of time (Goldman, 1979).

Examples of the worship of nature could be multiplied endlessly. There is hardly any object in the natural cosmos that has not become the center of cult somewhere at one time or in one place or another. How this should be interpreted is a matter of extreme delicacy. In general modern interpreters have failed to settle on a satisfactory explanation. Even the term *nature* carries a range of connotations that obscure the meaning of sacred objects of cult in many cultures. Each generation of scholars in the last century spawned a number of interpretive theories in which the worship of nature figured as a large element in the assessment of religion in general. In fact, the effort to desacralize nature in the Western perception and to identify the perception of nature as sacred with "primitive" peoples played a large role in the foundation of the social sciences and in the self-understanding of the modern West (Cocchiara, 1948). Offering a nuanced interpretation of the worship of nature would require a detailed deconstruction of the cultural sciences as well as a subtle appreciation of the religious terminology of each culture in question. James G. Frazer contended that the worship of nature and the worship of the dead were the two most fundamental forms of natural religion (1926, pp. 16–17). F. Max Müller founded his school of comparative religious studies on the principle that myths spoke about nature. E. B. Tylor also established his influential theory of animism, a still-lingering interpretation of religion on the notion that human beings projected onto nature certain animate qualities of their own character, visible especially in dream and in the rational explanations of death. Claude Lévi-Strauss pushes this intellectualized perception of nature in the formation of religion even further, contending that religion involved the humanization of the laws of nature (Lévi-Strauss, 1966, p. 221). A politico-economic interpretation of religion points to the intricate unity between nature and human beings, bound together by common origins and by reciprocities visible in ritual. According to Michael Taussig (1980), it is ritual action that aligns human beings with the helping spirits of nature. These rituals are extended in the modern rites of labor, such as those associated with miners and farmhands. The rituals dedicated to nature are aimed at enlisting nature's power in the cause of liberation of human being in the cosmos. The worship of nature, in this view, is an example of cosmological principles and the rituals dedicated to nature are also the arenas where these principles are created, renewed, and reformed (Taussig, 1980). The worship of nature has also become an important object of scholarly study in order to study nature as a category in the conceptual schemes of different cultures (Ortner, 1974; MacCormack and Strathern, 1980).

General Works

The classic study of the sacred experience that underlies the worship of nature remains Mircea Eliade's *Patterns in Comparative Religion* (New York, 1958), which contains extensive discussions and bibliographies on many of the themes treated briefly above (sun, moon, water, earth, vegetation, et al.). For earlier discussions, see F. Max Müller's *Natural Religion* (London, 1888), E. B. Tylor's *Primitive Culture*, 2 vols. (1871; reprint, New York, 1970), and James G. Frazer's *The Worship of Nature* (London, 1926). Other helpful studies include *The Savage Mind* by Claude Lévi-Strauss (London, 1966) and *Menschenbilder früher Gesellschaften: Ethnologische Studien zum Verhältnis von Mensch und Natur*, edited by Klaus E. Müller (Frankfurt, 1983), which gathers together a number of essays on various aspects of nature (forests, stones, cultivated plants, and pastoral animals) and includes a bibliography.

NAVĀ'Ī, 'ALĪ SHĪR SEE 'ALĪ SHĪR NAVĀ'Ī

NAVAJO RELIGIOUS TRADITIONS. Because of its colonial origin, the designation *Navajo* is in the process of being replaced by the term *Diné*, a word derived from the phrase *Diyin Dine'é* (people with supernatural powers). For this reason, *Diné* will be used throughout this article. The Diné, whose population in the 2000s has been estimated at 180,462, now live primarily on the Diné Nation (a land reserve approximately 270,000 square miles in size) located within the four corners of northeastern Arizona, northwestern New Mexico, southeastern Utah, and southwestern Colorado. Archaeological and linguistic evidence suggests that the Diné were latecomers to the American Southwest, arriving between 1000 and 1525 CE. Through contact with the Spanish and Pueblo peoples they acquired horses, sheep, goats, and agriculture. Anthropologists generally attribute similarities between Diné and Pueblo cosmologies and practices to the fact that many Pueblo refugees began to live among the Diné following the Pueblo Revolt of 1680. Many Diné elders describe this period as one of mutual exchange, rather than of unilateral influence.

COSMOLOGY AND WORLDVIEW. The path of walking in beauty and harmony, known as *Hózhóójí*, is the basic philosophy of the Diné Nation and is the foundation for their culture, beliefs, and traditions. The path of *K'e* is based on a reciprocal relationship of kinship with the surrounding environment and the universe. The Diné *bá'ólta'í* (teacher, messenger) Wilson Aronilth Jr. explains: "According to our great forefathers' teaching, our clan system is the foundation of how we learn about our self image and self identity. . . . A wise Diné can look back into the values of his clan and see his true self" (Aronilth, 1991, p. 76). The Diné were instructed by the *Diyin Dine'é* to live within the boundaries of the four mountains located in New Mexico, Arizona, and Colorado. Instruction were given by the *Diyin Dine'é* to build a *hooghan* (round house). The primary function of the *hooghan* was as a place for ceremonies and prayers.

The Diné origin myth recounts the Diné *hajjínáí* (emergence) from a series of underworlds onto *Nahasdzáán* (the Earth's surface). Using a medicine bundle brought from the underworlds, in an all-night ceremony at the place of emergence, First Man, First Woman, and other *Diyin Dine'é* set in place the "inner forms" of natural phenomena (earth, sky, the sacred mountains, plants, and animals), creating the present world (the fourth world). The Diné creation story recounts that it is in the fourth world that 'Asdzáá Náleehé (Changing Woman) was born; she was impregnated by

Jónaa'éeí (Sun) and gave birth to twin sons, who killed various monsters that had been endangering the Diyin Dine'ée. Using the medicine bundle First Man had given her, 'Asdzáá Náleehé created maize. She also created the Diné (Earth-Surface People), from epidermal waste rubbed from her skin.

The Diné creation myth indicates that there is no dichotomy between the natural and supernatural in Diné religion. Furthermore, humans (the Earth-Surface People) and the Diyin Dine'ée are conceived of in terms of the same set of motivating forces: the notion of *nilch'i* (wind), the concept of *bii'gistiin* (inner form) or *bii'siztinií* (in-lying one), and the opposing notions of *hózhó* (harmony, balance) and *hóchó* (disharmony, disorder).

Wind is a unitary phenomenon that is the source of all life, movement, and behavior. However, wind has various aspects that have different functions and, hence, different names. Before the Emergence, winds are said to have given the means of life (i.e., breath) to the inhabitants of the underworlds. After the Emergence, mists of lights were placed along each of the cardinal directions and four sacred mountains were created in each direction. Each direction is said to have an "inner form" (*bii'gistiin*) as well as a closely associated wind. From the four directions these winds give the means of life, movement, thought, and communication to the natural phenomena, the Diyin Dine'ée, and the Diné. Wind's Child is sent to guide and advise the Earth-Surface People. Finally, each Diné also has a "wind within one" (*nilch'i biisinií*) that enters at birth and guides the individual.

Thus both natural phenomena and humans have inner forms or "in-lying ones" animated by wind. As Gary Witherspoon has written, "In most cases the Holy People of the fifth world are those who are the inner forms of various natural phenomena and forces, including animals. These in-lying ones are the controlling and animating powers of nature. Diné ritual is designed to control the Holy People who are the inner forms and controlling agents of natural phenomena" (Witherspoon, 1983, p. 575).

The Diyin Dine'ée are immune to danger, destruction, and death. They are not holy in the sense that they are virtuous, but rather in the sense that they are powerful. It is the responsibility of each Diné to maintain harmonious relations with the Diyin Dine'ée, though the Diyin Dine'ée may be persuaded to aid in the restoration of a person who has become ill through improper contact with them.

In Diné belief the term *hózhó* refers to a positive or ideal environment. As Witherspoon puts it, "The goal of Diné life in this world is to live to maturity in the condition described as *hózhó*, and to die of old age, the end result of which incorporates one into the universal beauty, harmony, and happiness described as 'Sa'áh naaghái, Bik'eh hózhó'" (Witherspoon, 1983, p. 573). The phrase "Sa'áh naaghái, bik'eh hózhó" (long life, filled with happiness and harmony) occurs in most ritual songs and prayers and clearly exemplifies the

Diné ideal. The foundation of the philosophy is the reciprocal relationship between the Diné and all of the entities in the universe, including animals, plants, the cosmos, and the earth that sustains all living things.

Illness is thought to be a state of *hóchó* that has resulted from the patient's contact with something "dangerous." Leland C. Wyman and Clyde Kluckhohn (1938, pp. 13–14) list four groups of "etiological factors" that can produce sickness:

1. Natural phenomena such as lightning, wind, and thunder.
2. Some kinds of animals, including bears, deer, coyotes, porcupines, snakes, eagles, and fish.
3. Coming into contact with ceremonial paraphernalia at inappropriate times.
4. Diné ghosts, aliens, witches, or werewolves.

Following such an encounter, a ceremony is required to restore the individual to the state of *hózhóójí*.

CHANTS AND CEREMONIES. Anthropologists have identified twenty-four chant complexes; only about eight were well known and frequently performed in the 1970s, while six were extinct and four were obsolete. There has been little agreement among either Diné consultants or anthropologists as to how these chants might be ordered into a system. (See Wyman and Kluckhohn, 1938; Haile, 1938; Reichard, 1950; Wyman, 1983; Witherspoon, 1983; and Werner et al., 1983, for various possibilities.)

Chants are associated with a number of rituals, the most important of which are the *Hózhóójí* and *Enemyway* ceremonies. The *Hózhóójí* (Blessingway) ceremony is of central importance for the Diné, and is intended to preserve a beautiful, peaceful, harmonious state of balance (*hózhó*). It is the foundation of the *Kinaaldá* ceremony, a puberty ritual for young girls. The *Enemyway* ceremony (*'anna'jí*), in contrast, is designed to counteract the evil effects of contact with non-Diné people killed in battle and is used to exorcise their spirits (ghosts). According to Wyman (1983, p. 541), it is one of a mostly obsolete group of ancient war ceremonials and is now classed together with other ceremonies collectively labeled *Evilway* (*hóchó'ójí*).

The Diné model of the cosmos is expressed in the setting of the ceremony itself. The chant takes place in the *hooghan*, which is circular like the horizon. Movement during a ritual is always clockwise or "in the direction of the sun." Men sit on the south side of the *hooghan*; women on the north side. The singer sits on the southwest side and the patient, when resting, sits on the northwest side. The east (where the door is located) is associated with the *Hayoókááí Hastiin Diyin* (Dawn Spirit Talking).

COMPARISONS. Although Diné elders do not make cross-cultural comparisons between Diné traditions and the traditions of other Native American Indians, some scholars, such as Louise Lamphere, note striking similarities between Diné

ceremonialism and that of both the Apache and the Pueblo. Both the Diné and the Apache place great emphasis on the goal of achieving long life, and both center their ceremonies on the individual—that is, on changing his or her state through prestation, the removal of evil objects, and identification with supernatural power. Like Pueblo religion, Diné religion entails a view of a cosmos that is structured as a bounded universe in which the present world is at the top of several layered worlds through which the ancestors emerged. While Diné ritual replicates the cosmos differently than Apache ritual, its use of color, sex, and directional symbolism find many parallels in Pueblo ritual and in the Pueblo worldview (see Heib, 1979; Tedlock, 1979; and Ortiz, 1969).

The similarities between the ceremonies of the Diné, the Apache, and the Pueblo suggest that there are unifying features to ceremonialism in native Southwest cultures. Southwest religion, like that of other Native American cultures; is closely tied to the natural environment. Native cosmologies are rooted in conceptions of time and space that imbue the local terrain with supernatural meaning. Natural objects are made into ritual objects and are used to attract positive supernatural power, to remove dangerous power, and to represent sacred presence. A ceremonial specialist using these objects and ritual actions communicates with the supernatural in order to ensure that natural and cultivated plant and animal life will continue to be abundant and that individual and communal health and prosperity are maintained.

Although many books are available with specific descriptions of ceremonies, rituals, chants, and prayers, the Diné emphasis on orality and holistic understanding suggests that long-term fieldwork and language acquisition are the most reliable and responsible methods of research.

LOUISE LAMPHERE (1987)

MARILYN NOTAH VERNEY (2005)

NAVARĀTRI ("nine nights"), also known as Durgotsava ("festival of the goddess Durgā"), is a festival celebrated in India and Nepal at the time of the vernal and autumnal equinoxes. The nine nights are followed by a festival known both as Daśarā (or Daśaharā, "destroying the ten [sins]") and as Vijayādaśamī ("victory on the tenth [day]"). Although the festival of the vernal equinox is not celebrated in all regions of India, it appears in modified form in local festivals dedicated to the Goddess. The great autumnal Navarātri, which takes place during the nine nights following the new moon in the lunar month of October–November, is pan-Indian and is regarded as an important rite performed to benefit a variety of aspects of Hindu life (see Kane, 1958, vol. 5, pt. 5, pp. 156–157).

The theology and function of the Goddess, particularly of Durgā and of all popular female deities, find expression in the Navarātri (Biardeau, 1981, pp. 142–156). Its main textual source is the *Devīmāhātmya* (Glorification of the Goddess), which is a section of the *Mar-kaṇḍeya Purāṇa* often extracted and regarded as a text in its own right. Ac-

ording to that text, the demons (*asuras*) at one time overcame the gods, and Mahiṣāsura, the Buffalo Demon, took the place of the king of the gods. From the palpable anger of the gods was formed the body of the Goddess, known variously as Mahāmāyā (“great illusion”), Caṇḍī (“the cruel”), Durgā (“unattainable”), and by other names. The Goddess, incarnate at the energy (*śakti*) of the gods, obtained weapons from the gods and in her various forms fought against the multifarious *asuras*, whose archetype is Mahiṣa.

When she is regarded as a virgin, as distinct from any male consorts, or as the supreme deity, the Goddess in India is depicted as a fearsome and terrible deity who demands blood sacrifices. From the defeated Buffalo Demon springs a *puruṣa*, a “man” who when sacrificed becomes a devotee of the Goddess. Navarātri is thus closely associated with sacrificial themes, although in most regions vegetable substitutes now take the place of sacrificial animals in the ritual. The many forms and aspects of the Goddess and of the *asuras* correspond with the various interests and evils of this earth, for the continuation of which she manifests herself. What is more precisely at stake in the story of the *Devīmāhātmya*, however, is Mahiṣāsura’s usurpation of the gods’ power over the world. Hence it follows that the Goddess’s close relationship with the king is a crucial element for the preservation of the Hindu cosmo-social order and for the prosperity of the kingdom as well.

The Navarātri is more complex in some regions of India than in others. In some areas it is primarily a festival marking the growing season. In others, it centers mostly around the worship of a local goddess, who may be thought of as the spouse of an untouchable. It may also be a highly ceremonialized and intricate festival, as in the former princely states, where the king was required to perform the Buffalo Sacrifice.

The main Navarātri ritual consists of installing the Goddess in the home and in the temple throughout the nine nights of the ceremony. In Tamil Nadu the Goddess is seated among many other images in a royal audience and is visited daily by women singing devotional songs; there, the ninth night is consecrated to the worship of Sarasvatī, the goddess of learning, and to *āyudhapūjā*, the worship of weapons and tools. In other regions young girls are worshiped as embodiments of the virgin Goddess. In Mysore (modern-day Karnataka) and Bastar the nine nights were a time of ascetic practices for the king.

In Bengal, the installation of the Goddess in a royal temple is an elaborate life-giving rite (see Östör, 1980, pp. 71ff.). The night between the eighth and ninth days serves as the climax to the ceremony as a whole. Nava-ratri is also an important popular festival in which the Bengalis build huge, richly decorated images of the Goddess. These icons of Devī are destroyed during the Vijayādaśamī rites. Large and excited crowds of people (who at times transgress the norms of conduct) parade the many images of the Goddess to bodies of water, where they are immersed.

Vijayādaśamī concerns primarily the *kṣatriya* caste. In royal states and in Nepal the king performs *āyudhapūjā*, officiates at parades of soldiers astride horses and elephants, and symbolically conquers the world by throwing arrows to the four directions. Ritually crossing the boundaries, the king goes toward the northeast to perform *śamīpūjā*, the worship of the *śamī* tree, traditionally associated with the sacred fire. This appears to be a ritual restatement of an event recounted in the *Mahābhārata* in which the heroes of the epic retrieve the weapons they had hidden in that tree. Seated in a royal audience, the king receives the renewed allegiance of his subjects. In some regions there are dramatic enactments of the victory of Viṣṇu’s incarnation as Rāma over Rāvaṇa, the demon-king of Sri Lanka. In former times, the end of Navarātri, which coincides with the end of the monsoon, marked the time for kings to return to their wars. Moreover, the close association between the *asura*-slayer, Devī, and the kingdom, which is under her protection, symbolically restores prosperity to everyone in the domain.

BIBLIOGRAPHY

Madeleine Biarreau’s *L’hindouisme: Anthropologie d’une civilisation* (Paris, 1981) gives an accurate idea of the Goddess in the Hindu conceptions. P. V. Kane’s *History of Dharmasāstra (Ancient and Medieval Religious and Civil Law)*, vol. 5, pt. 1 (Poona, 1958), pp. 154–194, remains useful for its textual references. For Navarātri celebrations in Bengal, Ákos Östör’s *The Play of the Gods: Locality, Ideology, Structure, and Time in the Festivals of a Bengali Town* (Chicago, 1980) is the most detailed and interesting study. See also Oscar Lewis’s *Village Life in Northern India* (Urbana, Ill., 1958) and Lawrence A. Babb’s *The Divine Hierarchy: Popular Hinduism in Central India* (New York, 1975).

MARIE-LOUISE REINICHE (1987)

NAZZĀM, AL-. Abū Ishāq Ibrāhīm ibn Sayyār al-Nazzām (c. AH 165–221/c. 782–836 CE) was an early Muslim theologian of the rationalist Mu‘tazilī school.

Born in poverty in the city of Basra, al-Nazzām rose to literary prominence through his keen wit and rhetorical skills, and eventually moved to Baghdad where he was granted a large salary by the state. His most notable poetry employed abstract theological terms and metaphors in praise of wine and the beauties of youths, but he was remembered (and criticized) especially for his theological views. He studied theology under his uncle, Abū al-Hudhayl al-‘Allāf (d. c. 841 CE), the founder of the Basra school of speculative Mu‘tazilī theology. He is also said to have applied his prodigious memory to the study of traditions (*ḥadīth*), Jewish and Christian scriptures and commentaries, Greek philosophy, and Iranian dualistic traditions. In Baghdad he caused a stir with his “new philosophy,” a non-atomistic system in which infinitely divisible bodies move by discrete instantaneous

leaps. He attracted a proverbially large number of disciples, who perpetuated aspects of his teaching for a century or so; but although the Baghdad school of the Muʿtazilah drew on some of his ideas, his physical theory soon lost out to Abū al-Hudhayl's atomism, and his thought was largely rejected by the Basra school. His own books are lost, but Josef van Ess has pieced together a broad, if still partly tentative, sketch of his thought from citations by later writers, including most notably his famous pupil, the celebrated litterateur and theologian, al-Jāhiz (d. 869 CE).

Seeking common ground from which to debate dualists such as the Manichaeans, al-Nazzām adopted an ontology akin to their view of the world as a mixture of opposites. He rejected Abū al-Hudhayl's view that the world consists of indivisible atoms in which qualities inhere as accidents, proposing instead that objects are combinations of perceptible, corporeal qualities that pervade one another and become hidden or manifest as things change. For example, coldness is among the normally manifest qualities of wood, but when it is set ablaze the previously latent quality of fire, itself composed of warmth and brightness, becomes manifest. Human beings cannot create or destroy such qualities, but the human spirit is capable of initiating changes in their arrangements (i.e., movements or actions, which are the only accidents recognized by al-Nazzām). The spirit, a subtle body, by nature wills only what is good, but because it is trapped in a perceptible body permeated by conflicting motivations, it can choose evil. The body implements the actions willed by the spirit, and God creates the effects of those actions in their objects, in accordance with the qualities he gave each object at creation.

Although al-Nazzām's ontology had many points in common with Stoic philosophy and Iranian dualistic traditions, he employed it in the defense of Islamic doctrines, citing the intermingling of opposite qualities, for example, as proof of a creator who brings them together. He proposed radical formulations of several cardinal Muʿtazilī principles: God's justice, God's oneness, and the createdness of the Qurʾān. Prompted by debates with dualists over the problem of evil, al-Nazzām went beyond the disputed Muʿtazilī thesis that God always does what is best (*aṣlah*), to claim that God is not even capable of injustice, or indeed of anything less than what is most salutary for his creatures (including animals). God does not will or create either good or bad human actions, except in the sense that he commands certain acts, and creates their effects in their objects. Against Christians, dualists, and even some Muslims who seemed to vitiate God's oneness by ascribing to him eternal partners, al-Nazzām adopted an extreme form of the Muʿtazilī teaching that God does not have real attributes coeternal with himself. He argued that to affirm one of God's attributes is not to ascribe a positive quality to God's essence, but merely to affirm that essence and to deny that it has the opposite quality. Only God's actions upon the created world can be described positively. One such action is his speech, the

Qurʾān, which the Muʿtazilah claimed is created rather than eternal. Al-Nazzām agreed, but whereas he considered human speech an attribute of the speaker (an accident and a movement by which the speaker breaks up and articulates a previously existent but formless sound), he claimed that God's speech is itself sound created in articulated form. Thus he could not describe God as speaking, or say that human recitation of the Qurʾān is itself the Qurʾān. Although he formalized the doctrine that the Qurʾān is a miraculous proof of Muḥammad's prophethood, he did not claim, as would later theologians, that its rhetorical style is intrinsically inimitable; instead he argued that Muḥammad's opponents had failed to match the Qurʾān's eloquence only because God had temporarily rendered them unable to do so. What he considered probative was the Qurʾān's content—its revelation of things that a human being could not otherwise know.

In theology al-Nazzām insisted that knowledge of God be arrived at through doubt and reason, but on rationally inscrutable points of law he insisted on following the letter of the Qurʾān. He blamed the prevailing chaos of conflicting legal opinions on those prominent companions of the prophet Muḥammad who had followed their own opinions in their rulings. His older contemporary, the famous jurist al-Shāfiʿī (d. 820 CE), had sought to bring Islamic law into full harmony with the Qurʾān by interpreting the Qurʾān almost exclusively in light of reports from the Prophet himself, by extending the reach of its provisions through reasoning by analogy, and by exploiting its linguistic ambiguities to resolve contradictions. Al-Nazzām took a diametrically opposite approach. He rejected the independent legal authority of reports (*ḥadīth*)—even those that the Muslim community accepted by consensus (*ijmāʿ*)—arguing that reports give certainty only when corroborated by rational or perceptual evidence, regardless of how many people transmit them. He also rejected most, if not all, analogical reasoning (*qiyās*), and insisted that the language of the Qurʾān be applied absolutely literally in the absence of specific qualifying evidence (which may, however, include reports or consensus). Some aspects of this approach were soon taken up by the Zāhirī school of law (now institutionally defunct), and he was much quoted by Shīʿī legal theorists, who shared his rejection of analogy and consensus and his antipathy for certain companions of the Prophet. Mainstream Sunnī legal theory, however, followed al-Shāfiʿī's lead.

BIBLIOGRAPHY

The only comprehensive European-language study of al-Nazzām is in Josef van Ess, *Theologie und Gesellschaft im 2. und 3. Jahrhundert Hidschra: Eine Geschichte des religiösen Denkens im frühen Islam* (Berlin, 1991–1997), vol. 3, pp. 296–418. Vol. 6, pp. 1–204, provides an annotated German translation of the citations on which van Ess based his study. The most detailed English overview is van Ess's article "Abū Eshāq. . .Nazzām" in *Encyclopaedia Iranica*, edited by Ehsan Yarshater (New York and London, 1982). Helpful works on specific aspects of al-Nazzām's thought include:

DAVID R. VISHANOFF (2005)

NDEMBU RELIGION. The Ndembu, also called the Lunda, number about sixty thousand and inhabit small villages in the district of Mwinilunga in the northwestern province of Zambia. Although their descent system is matrilineal, women leave home to marry into their husbands' villages, a system that sets up social tensions and, before the advent of Christianity, used to result in a high divorce rate. In this conflict-torn society, cult associations formerly had a great unifying power, calling together members from many different kinship groups to cooperate in rituals that gave moments of spiritual revelation, which in turn resolved conflicts and healed illness.

CULTS OF AFFLICTION. Among the Ndembu, affliction was seen as having a spiritual cause: the spirit of a dead matrilineal relative (*mukishi*) afflicted a living descendant, "coming out" in a range of different modes of spirit visitation. Thus the spirit might "come out in Nkula," the mode of menstrual troubles; Wubwang'u, the mode of twins; Isoma, the miscarriage mode; Ihamba, a spirit tooth wandering in the patient's body, needing ritual extraction; Wuyang'a, the mode for hunters; Tukuka, the mode of Western diseases; or Chihamba, the mode of the demigod of thunder. Wu-bwang'u and Ihamba afflictions still exist today.

The spirit "caught" a living relative in the first place because he or she had not honored the spirit's memory. When afflicted, an individual required a complex ritual, the mode

of which was determined by the consideration of symptoms and by divination. The ritual (*n'goma*, "drum") was performed by a cult association consisting of those who had already been afflicted in that mode. The aim was to bring the spirit up out of the ground (the place where the spirits dwell) so that by recognizing its existence and giving it a concrete form—as a figure, effigy, tooth, or voice—it could be revealed. *Ku-solola*, "to reveal," was a basic element of Ndembu religion and curative ritual. The religion taught: "what hurts you, when discovered and propitiated, helps you." Through the use of medicines, drumming and singing, and distinctive rites appropriate to each mode, the spirit was brought once more into the social milieu and would, at a switch point in the ritual, begin to do good instead of harm to the patient. Often what triggered the change was a sacrifice, which might be the beheading of a fowl or a blow on an effigy, signifying killing; while the victim embodied the spirit, the act gave a sense of innocence and *communitas*. Ndembu sacrifice was the point where the visible and invisible components of the cosmic order interpenetrated and exchanged qualities. When the spirit world and the world of the living were at one, the patient was healed.

LIFE-CRISIS RITUALS. A young girl or boy could not become a full member of the Ndembu people without an initiation ritual. The matrilineal character of the descent system emphasized the bond of breast feeding; thus, a forest shrub called *mudyi*, which has milky sap, was a dominant symbol for both girls' and boys' initiations. *Mudyi* represented the matrilineage itself and the virtues of good family living; its "milk" was the sensory pole of the symbol's meaning, hinting at the satisfactions associated with mother's milk—a pole that gave power to the ideological pole of goodness.

Both girls' and boys' initiations were rites of passage, and they are still performed in a truncated form. The novice passes ritually from childhood into a liminal time of seclusion when she or he is neither child nor adult. Finally the initiate is reincorporated into society as a full member.

Girls are initiated singly, at puberty; the initiate used to be laid down under a blanket at the foot of a milk tree for an entire day, while the women danced around her. At evening she was carried into a seclusion hut, where she received training for three months. At the end she performed a public dance and might then be married.

Boys from five to fifteen years of age are still circumcised in groups in a sacred enclosure away from the village. They are secluded there during healing, and in former times used to be visited by an *ikishi* dancer, a spirit from ancient times (not an ancestor spirit). Finally the boys would rejoin society in a public celebration that used to include a triumphal dance before the chief. In both rituals the place of ordeal and humiliation used to be called "the place of death"; symbolic death and rebirth were basic features of these and many of the curative rites.

Death itself was celebrated by a masked dancer (*ka-dang'u*) who was both mourner and clown. Among the fu-

nerary symbols were three trenches filled with white-, red-, and black-colored water, representing goodness, blood and ambivalence, and death; these trenches were known as “rivers” proceeding from Nzambi, the creator god. Formerly, a stilt walker, the head of the funerary society, would come to beat and initiate the small boys of the mourning camp. Medicines and rituals are still used to keep the ghost of the dead person quiet.

Thus Ndembu religion was directly concerned with human events, whether sickness, bad luck in hunting, conflict in the village, or phases in the maturation of an individual. It was mainly through sickness that an individual began to sense the presence of an ancestor spirit; thus it was the very irregularities of life, its negative events, that created the positive sense of the supernatural, especially when the spirit possessed a patient and she swayed, her body physically released by its presence. The palpable existence of spirits developed in the course of the experience of misfortune. This is not to be explained as a compensation mechanism; misfortune did more than arouse fantasies, for it triggered well-recognized faculties (*wanga*) that needed the stimulus of trouble, and then of social cooperation, in order to flower. Senior doctors still train their apprentices in those faculties and teach the appropriate material accompaniments of medicine, drumming, confession, and trance in order to exorcise evil spirits. In spite of the growth of Christianity, traditional healers are increasing in numbers. Owing to the suppression of ancestor cults, they do not appeal to the ancestor spirits of the patients, but instead are helped by tutelary spirits from among their own ancestors or from some strong departed personality. Formerly a doctor entered his vocation after being sick himself. In the case of an incipient diviner he might be troubled in his breathing until he gave in to the demands of his spirit and underwent the Kayong’u initiation.

SPIRITS. In the past, Ndembu religion centered upon ancestor spirits who communicated with humans frequently but unpredictably. Like the people’s own lives, their domain was process, not the absolute. Continually involved in human life, they could heal their descendants and make them sexually potent. Such spirits could also be reborn in their patrilineal descendants. They were often whimsical, difficult, and easily offended when forgotten, but beneficent when treated with respect. Thus all of humanity, past, present, and future, was strongly knit together. *Mukishi* ancestor spirits and the ancient *ikishi* spirits, however, are no longer recognized as necessary agents of healing or change in rites of passage.

The Ndembu also believed in the *mvevulu*, the spirit shadow that was thought to leave a person and wander about when he or she was asleep and dreaming. It was this “shadow” that left a person when he or she died. Certain evil spirits are still feared, principally the *mufu*, the dangerous ghost that arises when funerary rites have not been properly fulfilled, and the harmful *andumba* (sg., *ndumba*), familiars sent by witches in the shape of little men with their feet reversed, or in the form of hyenas, jackals, owls, or small rodents. Two

other types of beings are also feared: the leader of the *andumba*, the *kahwehu*, often the ghost of the witch’s murdered husband, who is said to have continued intercourse with her, and the *musalu*, or zombie, which can be raised from a corpse by a witch and sent out to kill.

GOD. The pre-Christian Ndembu recognized a creator god who was known as Nzambi. Having once created the world Nzambi never intervened in the lives of humans, and his role in religion was exiguous except in a negative sense. The Ndembu girl during her sacralization and seclusion was carefully shielded from his sight—as represented by the sun. This male god, the sun, and men and boys, must be absent from her scenes of rebirth. Nzambi’s place was far away above the world. He was thought to be connected with rain, animals, and fertility, and also with the moral order, which decreed piety to the dead and compassion to the living. Christians have appropriated the name *Nzambi* to translate the term *God*; and now even traditional healers pray to Nzambi, just as Ndembu Christians have been doing for decades.

BIBLIOGRAPHY

The works of Victor Turner are central to understanding Ndembu religion. His early study “Lunda Rites and Ceremonies” (1953), reprinted in *The Occasional Papers of the Rhodes-Livingstone Museum* (Manchester, 1974), provides a factual account of each Ndembu ritual. Four subsequent books provide analysis. *The Forest of Symbols: Aspects of Ndembu Ritual* (Ithaca, N. Y., 1967) is a collection of essays including discussions of the rite of circumcision, the funerary cult, initiation of a doctor, and hunters’ rites. *The Drums of Affliction: A Study of Religious Processes among the Ndembu of Zambia* (London, 1968) analyzes rites associated with menstruation, teeth, and girl’s initiation. *The Ritual Process: Structure and Anti-Structure* (Chicago, 1969) studies curative rites and the twin ritual. *Revelation and Divination in Ndembu Ritual* (Ithaca, N. Y., 1975) analyzes the ritual drama Chihamba and compares its symbolism with that of Western religion. I have recently analyzed the work of a modern Ndembu doctor-priest in “Philip Kabwita, Ghost Doctor: The Ndembu in 1985,” *Drama Review* 10, no. 4 (1986).
